# FOREWORD

To contribute to achieving these strategic goals, the Ho Chi Minh City University of Economics and Finance (UEF), in collaboration with the Southern Affairs Department – Ministry of Science and Technology and the Ho Chi Minh City University of Technology (HUTECH), is proud to organize the 2nd International Conference on Economics and Business in the Digital Era (iCEBD 2025). This year's theme, "Development and Integration in the Digital Era: Innovation for Sustainability", reflects our commitment to fostering innovation and sustainable development in an era of rapid digital transformation.

The conference serves as a global platform for scientists, experts, policymakers, and business leaders to exchange knowledge and collaborate across key domains, including economics, finance, accounting, business management, trade, marketing, and cutting-edge digital technologies. Particular emphasis is placed on interdisciplinary innovation and its role in driving economic sustainability and social well-being.

For iCEBD 2025, the organizing committee has received high-quality research contributions from scholars and practitioners worldwide. Selected papers will undergo a rigorous peer-review process and be published in the conference proceedings with an international ISBN and indexed journals, ensuring academic integrity and impact.

We are honored to welcome distinguished keynote speakers and contributors who will share their insights and expertise in digital transformation, sustainable business models, and global economic integration. Their contributions will undoubtedly enrich discussions and inspire future research and policy development.

On behalf of the organizing committee, we extend our sincere appreciation to all scholars, researchers, and practitioners participating in iCEBD 2025. We also express our deep gratitude to our keynote speakers, panelists, and sponsors for their invaluable support.

We hope that iCEBD 2025 will provide all participants with meaningful insights, fruitful discussions, and valuable networking opportunities to advance the sustainable development of digital economies.

Wishing you a successful and inspiring conference.

Sincerely,

**ON BEHALF OF THE**
**ORGANIZING COMMITTEE**
**CHAIRMAN**

**Dr. Ngô Minh Hải**

# TABLE OF CONTENTS

# INTERNATIONAL SCIENTIFIC CONFERENCE

**SESION 1: ECONOMICS ..... 1**

**CORPORATE SOCIAL RESPONSIBILITY AND CORPORATE SUSTAINABILITY ..... 2**

Trinh Doan Tuan Linh[1*], Nguyen Ngoc Khai[2] , Pham Thanh Loc[3] ..... 2

**THE FUNCTION OF SWOT AND PEST SITUATION ANALYSIS IN GLOBAL CORPORATIONS' GREEN AND SUSTAINABLE DEVELOPMENT PLANS ..... 12**

Vo Ngoc Thao[1] ..... 12

**COMPETITIVE TRADE OPENNESS IMPROVES SOVEREIGN SOLVENCY IN LOW-AND MIDDLE-INCOME COUNTRIES – A PANEL VECTOR AUTOREGRESSION ANALYSIS ..... 22**

Tung Nguyen-Thanh[1,2, *], Syed Mansoob Mursheda[1], Hoai Nguyen Trong[2] ..... 22

# CORPORATE SOCIAL RESPONSIBILITY AND CORPORATE SUSTAINABILITY

**Trinh Doan Tuan Linh[1*], Nguyen Ngoc Khai[2] , Pham Thanh Loc[3]**

[1,2,3]Industrial University of Ho Chi Minh City, Vietnam
*Corresponding: trinhdoantuanlinh@iuh.edu.vn

**ABSTRACT**

The relationship between corporate social responsibility (CSR) and corporate sustainability is a significant topic of investigation and discussion. This study evaluates the impact of CSR on corporate sustainability in Vietnam using the Feasible Generalized Least Squares (FGLS) method. Data were collected from the annual reports and financial statements of companies recognized in the annual list of the 100 sustainable enterprises published by the Vietnam Chamber of Commerce and Industry (VCCI). Our findings reveal that CSR positively influences corporate sustainability in terms of legal responsibilities. However, it has a negative effect when viewed through the lens of economic, philanthropic, and ethical responsibilities. This indicates that companies can improve their sustainability outcomes by focusing on legal CSR initiatives while working to enhance the effectiveness of their efforts in economic, philanthropic, and ethical responsibilities to reduce any detrimental effects on corporate sustainability.

*Keywords:* “corporate social responsibility”, “corporate sustainability”, “csr”, “fgls”, “vcci”

## I. INTRODUCTION

Corporate social responsibility (CSR) has emerged as a pivotal topic of discussion among organizations and scholars in recent years. The fundamental concept behind CSR encompasses the expectation that corporations, companies, and organizations uphold specific standards and practices in social and environmental performance while simultaneously fulfilling their financial and legal obligations (Ashrafi et al., 2018). As societal demands for responsible corporate behavior intensify, organizations find themselves under increasing pressure to address their environmental impacts proactively. CSR effectively serves as a response mechanism for organizations striving to meet these expectations and sustain their operations responsibly. In an era where market dynamics are marked by heightened awareness of social and environmental issues, companies must embrace CSR to maintain their competitive edge and foster public trust. The growing consciousness among consumers regarding socially responsible investments necessitates that companies exhibit a commitment to the environment in which they operate. This trend is particularly relevant for next-generation organizations that aim to align their operations with societal values while ensuring sustainable development. While the roots of CSR can be traced back to the mid-20th century, many managers still encounter challenges when it comes to understanding its practical implementation and implications (Saxena & Hussain, 2015).

The discourse surrounding the impact of effective CSR practices on corporate sustainability is well-documented in the literature. Numerous studies substantiate the correlation between CSR engagement and corporate sustainability, revealing that companies that actively participate in socially responsible activities tend to perform better in the long run. However, the degree of this impact remains a topic of debate. The literature highlights ongoing discussions regarding whether shareholder interests align with those of other stakeholders. The inconsistent findings in research may stem from varying perspectives on CSR’s role within corporations. Two dominant views permeate the CSR literature. The first viewpoint posits that CSR initiatives can be aligned with shareholder wealth maximization. Influential studies suggest that responsible business practices not only benefit society but also contribute positively to a company’s financial performance (Deng et al., 2013; Servaes & Tamayo, 2013). In contrast, the opposing perspective asserts that the singular social responsibility of corporations is to generate profit, indicating that CSR initiatives can sometimes detract from corporate assets and shareholder value (Aupperle et al., 1985; Krüger, 2015). In light of the considerable attention surrounding CSR, a crucial question remains unanswered: Does corporate social responsibility play a significant role in enabling companies in Vietnam to achieve sustainability? This study seeks to enhance the understanding of CSR's impact on the sustainability of Vietnamese companies. Specifically, we will analyze how CSR

initiatives influence the sustainability of firms listed in the annual ranking of sustainable companies published by the Vietnam Chamber of Commerce and Industry (VCCI). The originality of this study lies in its focus on sustainable companies, which provides a unique opportunity to explore whether CSR contributes to their sustainable practices.

In conclusion, as the dialogue surrounding CSR continues to evolve, it remains essential for organizations in Vietnam to evaluate the effectiveness and implications of their CSR strategies. By doing so, companies can better navigate the complexities of social responsibility, potentially leading to improved sustainability outcomes and enhanced stakeholder relations. This study aims to contribute to the body of knowledge on CSR and its significance in fostering sustainable development within the context of Vietnamese enterprises.

## II. LITERATURE OVERVIEW

The concept of corporate social responsibility (CSR) has evolved significantly since its emergence in the twentieth century, particularly from the early 1950s to the present (Diemont et al., 2016). Initial discussions surrounding CSR have given rise to various related topics, including public responsibility, corporate social responsiveness, sustainability, corporate social performance, corporate citizenship, global responsibility, social entrepreneurship, and corporate accountability (Ghobadian et al., 2015). The growing prominence of CSR has attracted the attention of businesses and individuals alike since the 1960s. Despite the extensive discourse on CSR, a definitive consensus on its definition remains elusive, with varying interpretations arising from different perspectives on the subject (De George, 2011). A pivotal contribution to the understanding of CSR was made by Carroll (1991), who expanded the concept beyond traditional economic and legal responsibilities to include ethical and philanthropic dimensions. His framework reflects the increasing societal concerns regarding ethical business practices. CSR is often utilized as an umbrella term to encompass various aspects of corporate responsibilities, including economic, legal, ethical, and voluntary expectations from the community (Ghobadian et al., 2015). Economic and legal responsibilities denote a company's commitment to maximizing profits while adhering to the regulations set forth by governing bodies (Balqiah et al., 2017). Conversely, ethical and voluntary responsibilities encompass the ethical standards and discretionary expectations that stakeholders hold for corporations (Nastiti et al., 2017). Despite numerous scholars proposing distinct criteria for assessing CSR, Carroll's (1991) framework remains the most widely adopted measure. The notion of "sustainability" initially centered around resource conservation and gained widespread recognition following the Earth Summit, convened by the World Commission on Environment and Development (WCED) in 1987. Notably, the definition of sustainability and sustainable corporate practices remains varied and inconsistent across different countries and contexts. Elkington (1997) examined over 100 definitions of sustainability and introduced the "Triple Bottom Line" model, which consists of three interconnected pillars: economic profitability, social responsibility, and environmental stewardship. Prugh and Assadourian (2003) suggested that many companies perceive sustainability merely as a standalone concept related to responsible environmental and labor management. This is often demonstrated through "Corporate Sustainability Reports" that focus narrowly on indicators like energy consumption, waste production, and employee health and safety.

In Vietnam, the criteria for evaluating sustainable enterprises have been developed since 2016, with the Vietnam Chamber of Commerce and Industry (VCCI) scoring and announcing the "100 Sustainable Enterprises" list annually. This initiative aligns with the guidance from the Vietnamese government as outlined in Notice No. 398/TB-VPCP dated December 15, 2016. The evaluation process employs the Corporate Sustainability Index (CSI), which includes 130 criteria aimed at assessing the sustainability of enterprises across several dimensions: economic efficiency, corporate governance, environmental impact, labor rights, and social contributions. This study will evaluate sustainable enterprises using the CSI 2024 index as established by VCCI. The relationship between corporate social responsibility (CSR) and corporate sustainability has been a longstanding area of interest for researchers. A multitude of influential studies suggests that CSR initiatives can often align with shareholder wealth maximization (Deng et al., 2013; Edmans, 2011; Flammer, 2013; Servaes and Tamayo, 2013). In contrast, the opposing view is rooted in Friedman's (1970) famous assertion that the primary social responsibility of firms is profit generation. This perspective posits that CSR initiatives can prove detrimental to corporate assets (Aupperle et al., 1985; Bénabou and Tirole, 2010; Krüger, 2015). Empirical research results regarding the connection between CSR and corporate performance often yield mixed conclusions. For instance, Okafor et al. (2021) and Cheung et al. (2010) have illustrated that although active involvement in CSR might not yield immediate profit increases, it can significantly mitigate risks to brand valuation

over time. Furthermore, Lin et al. (2009) highlighted that companies engaging in CSR benefit not only from enhanced business reputations but also by improving the quality of life for their employees and the communities they serve. Such efforts not only fortify brand image and engender customer trust but also enhance competitiveness in the marketplace. By committing to social initiatives, businesses can generate lasting value for both the community and society at large, therefore contributing to holistic sustainable development. Samaibekova et al. (2021) found that the integration of corporate social responsibility into business practices is critical for establishing corporate sustainability and fostering growth. Conversely, Saxena and Hussain (2015) argued that while it may seem logical to suggest that only sustainable organizations adopt socially responsible practices, empirical results indicated that the impact of CSR on corporate sustainability was minimal. One potential explanation for this lack of significant correlation is that a company's CSR activities often lack tangible connections to its core operations.

The literature review illustrates that the influence of CSR on corporate performance and sustainability is a topic fraught with debate. While some scholars argue that CSR initiatives lead to positive outcomes, others suggest the opposite, asserting that CSR may not yield significant benefits. The majority of literature, however, tends to agree that implementing CSR in a thoughtful and effective manner can contribute to sustainable corporate development. The discrepancies between study findings frequently arise from varying factors, such as the selection of data, the specific industries examined, the scope of the studies, and the methodologies employed. This study seeks to investigate the causal relationship between CSR and corporate sustainability in Vietnam by employing an analytical framework based on Carroll's (1991) CSR model. The research will utilize the Corporate Sustainability Index (CSI) 2024, as published by the Vietnam Chamber of Commerce and Industry (VCCI), to measure corporate sustainability outcomes. The hypothesis driving this research posits that CSR activities will have both positive and negative implications for corporate sustainability within the Vietnamese context. The framework of corporate social responsibility proposed by Carroll provides a comprehensive lens through which to analyze the various facets of corporate accountability. The four domains of responsibility outlined in Carroll's model—economic, legal, ethical, and philanthropic—serve as critical indicators for evaluating corporate performance. Economic responsibilities demand that companies efficiently pursue profits, thereby ensuring their financial viability and the welfare of their employees. Legal responsibilities reinforce the importance of adhering to applicable laws and regulations, ensuring that companies operate within the boundaries dictated by societal rules. Ethical responsibilities delve deeper into the moral obligations of businesses, pushing them to cultivate fair practices, transparency, and integrity in their dealings. This facet of CSR often addresses the expectations of stakeholders beyond mere compliance, encouraging corporations to engage in practices that are inherently "right" and beneficial to society. Finally, philanthropic responsibilities extend beyond compliance and ethics, inviting companies to contribute to societal welfare through charitable actions, community involvement, and supporting social causes. When it comes to assessing corporate sustainability, the CSI index plays a pivotal role by providing a multifaceted evaluation of corporate performance. The CSI includes criteria that capture various aspects of sustainability—economic efficiency, effective governance, environmental stewardship, treatment of labor, and social responsibility—ensuring that a comprehensive view of corporate sustainability is obtained. By employing this index, we will be able to analyze how well companies demonstrate their commitment to sustainability in alignment with their CSR activities, offering insights into the relationship between being socially responsible and being sustainable. The empirical phase of this research will involve the collection and analysis of data from Vietnamese companies recognized on the VCCI's list of sustainable enterprises. By examining how these companies practice CSR and the subsequent impact of these practices on their sustainability performance, we aim to generate actionable insights that will benefit both academia and practitioners.

In summary, while there remains a lack of consensus on the relationship between CSR and corporate sustainability, this study intends to contribute to our understanding of how CSR efforts can influence sustainability outcomes in Vietnam. Through the lens of Carroll's CSR framework and utilizing the CSI index for measurement, we will explore the complexities of this relationship. Ultimately, we believe that a nuanced exploration of the interplay between CSR and corporate sustainability will illuminate pathways for Vietnamese firms in their pursuit of both social responsibility and sustainable development. This research not only highlights the potential for CSR initiatives to enhance corporate sustainability but also aims to inform better practices and policies that can foster a harmonious relationship between

businesses and the communities they serve.

## III. METHODS AND DATA

### 3.1 Econometric model

To assess the impact of corporate social responsibility on corporate sustainability in Vietnam. To achieve the research objectives and based on theory and related studies, we build the research model as follows:

$$CS_{it} = \beta_0 + \beta_1 ESR_{it} + \beta_2 LSR_{it} + \beta_3 PSR_{it} + \beta_4 SIZE_{it} + \beta_5 PRF_{it} + \beta_6 OPE_{it} + \beta_7 LARit + U_{it}$$

Where t and i are the year and company, respectively, $\beta_0$ is the constant term/intercept, $\beta_1 - \beta_7$ are the regression coefficients and $U_{it}$ is the disturbance term. The dependent variable CS (corporate sustainability). The explanatory variables representing CSR include: ESR (Economic responsibility), LSR (Legal responsibility), PRS (Philanthropic and ethical responsibility). The control variables include: SIZE (Total assets), PRF (Profit after tax), OPE (Total operating expenses), LAR (Total employees). Details of the variables are described in Table 1.

The literature presents a variety of variables for measuring corporate social responsibility (CSR). However, the most widely adopted method of assessing CSR is based on the factors proposed by Carroll. In this article, the authors evaluate CSR using the following dimensions: ESR (Economic Responsibility), LSR (Legal Responsibility), and PSR (Philanthropic and Ethical Responsibilities) as defined by Carroll (1991). Additionally, the authors incorporate control variables such as total assets (SIZE), total operating expenses (OPE), and total employees (LAR), which are regarded as indicators of business size. Larger companies typically enjoy higher profits and enhanced growth opportunities (Pratheepan, 2014; Ahmed & Nicholls, 1994). Improved business performance can lead to increased profitability, thus impacting profit after tax (PRF) and overall business development (Abor, 2005).

The impact of corporate social responsibility on corporate sustainability is assessed through the regression coefficients (β1 – β3) within the model. Specifically, if these coefficients are positive and statistically significant, it indicates that CSR positively influences corporate sustainability. Conversely, if the coefficients are negative and statistically significant, this suggests that CSR has a detrimental effect on corporate sustainability. If the regression coefficients do not show statistical significance, it implies that CSR has no effect on corporate sustainability.

**Table 1 - Description of the variables and data source**

| Variable | Symbol | Measure | Data source |
|---|---|---|---|
| | | ***Dependent variable*** | |
| Corporate sustainability | CS | Corporate sustainability index (CSI 2024) | Firms financial statements/Annual report |
| | | ***Explanatory variables*** (***Corporate social responsibility)*** | |
| Economic responsibility | ESR | Return on sales | Firms financial statements/Annual report |
| Legal responsibility | LSR | Pay to state budget/Revenue | Firms financial statements/Annual report |
| Philanthropic and ethical responsibilities | PSR | Total Charity/Profit | Firms financial statements/Annual report |
| | | ***Control variables*** | |
| Total Assets | SIZE | Total assets of the enterprise | Firms financial statements/Annual report |
| Profit After Tax | PRF | Profit of the enterprise | Firms financial statements/Annual report |
| Total Operating Expenses | OPE | Total Operating Expenses of the enterprise | Firms financial statements/Annual report |
| Total Employees | LAR | Total Employees of the enterprise | Firms financial statements/Annual report |

### 3.2 Hypothesis

The literature review reveals that corporate social responsibility (CSR) significantly influences the sustainability of business operations, with varying impacts from each factor. There is a shared aspiration among society, businesses, and governments that CSR will serve as a catalyst for enhancing the sustainability of business practices. In this study, the authors propose the following hypotheses:

*$H_1$ - Economic responsibility has a positive impact on corporate sustainability.*

*$H_2$ - Legal responsibility has a positive impact on corporate sustainability.*

*$H_3$ - Philanthropic and ethical responsibility has a positive impact on corporate sustainability.*

In this study, the estimation and testing methods are carried out as follows: First, the models are estimated using three approaches: ordinary least squares (OLS), fixed effects model (FEM), and random effects model (REM). Subsequently, the F-test and Hausman test are employed to determine the most suitable method. Next, the authors assess the presence of heteroskedasticity and autocorrelation using the Modified Wald test and the Wooldridge test. Following this, the Feasible Generalized Least Squares (FGLS) estimation method is applied to address these identified issues. The detailed results of the model estimation and tests are presented in Tables 4 and 5.

### 3.3 Samples and data

The population examined in this study consists of sustainable enterprises recognized and ranked annually by the Vietnam Chamber of Commerce and Industry (VCCI). The sample was selected based on specific criteria: only those companies that have appeared on the list of 100 sustainable enterprises for a minimum of five consecutive years and have published financial statements or annual reports were included. Ultimately, a total of 19 enterprises met these criteria. Data were gathered from the companies' financial statements, annual reports, and consolidated reports from the Vietnam Statistical Office.

**Table 2 - Descriptive statistics of variables**

| Variable | Obs | Mean | Std. Dev. | Min | Max |
|---|---|---|---|---|---|
| PBV | 95 | 859.3368 | 15.7193 | 825 | 899 |
| ESR | 95 | 13.9214 | 10.5653 | -10.85 | 49 |
| LSR | 95 | 9.1260 | 7.3193 | 0.0050 | 38.3659 |
| PSR | 73 | 2.7513 | 7.3847 | -0.9764 | 60 |
| SIZE | 95 | 24.4863 | 49.0679 | 0.338 | 221.102 |
| PRF | 95 | 1.6085 | 5.6710 | -1.529 | 51.79 |
| OPE | 95 | 10.0792 | 15.1491 | 0.2532 | 52.53 |
| LAR | 95 | 4.8609 | 13.4027 | 0.172 | 128 |

*Source: Authors' calculations with stata 14 software*

Data presented in Table 2 illustrates the average values of the variables within the research model. Most variables have 95 observations; however, the PSR variable (Philanthropic and Ethical Responsibility) contains only 73 observations. This discrepancy arises because some companies have not disclosed data regarding their charitable activities for certain years. Fortunately, this limitation is not deemed significant and does not impact the results of the model estimation.

The minimum value of the LSR variable (Legal Responsibility) is -0.9764. This occurs because, during the Covid-19 pandemic, some companies incurred expenses for charitable activities that exceeded their profits to support the community. The average score for the CS index (Corporate Sustainability) is approximately 859, with a standard deviation of 15.7, indicating that there is not a substantial variability in the corporate sustainability scores among the businesses. Additionally, some companies lack historical data, which results in their scores not meeting the specific average value of 825.

The average value of the ESR variable (Economic Responsibility) stands at 13.9. This ratio can fluctuate annually based on the operational activities of the businesses, with most companies in the research group reporting above-average figures. These fluctuations are influenced by significant events, such as the Covid-19 pandemic, which

adversely affected profit after tax (PRF), resulting in a minimum value of -1.529 and a decrease in overall business activities.

Lastly, the average index for the PSR variable (Budget Payment/Revenue) is 9.12. Some companies report lower values due to poor overall performance, while others fall into special tax categories that exempt them from certain tax obligations.

## IV. RESULTS AND DISCUSSION

First, we assess multicollinearity within the model. The correlation between the variables is illustrated in the correlation coefficient matrix presented in Table 3. The correlation coefficient quantifies the extent of the linear relationship between the variables. Analysis of the correlation coefficient matrix reveals that all correlations among pairs of independent variables in the model are below 0.8. Franke (2010) notes that correlation coefficients exceeding 0.8 can indicate multicollinearity issues in the model. Consequently, this finding indicates that all independent variables exhibit low correlation with one another, thereby ensuring that multicollinearity does not impact the results of the regression model.

**Table 3 - Correlation matrix**

| | **PBV** | **ESR** | **LSR** | **PSR** | **SIZE** | **PRF** | **OPE** | **LAR** |
|---|---|---|---|---|---|---|---|---|
| **PBV** | 1.0000 | -0.3125 | 0.0379 | 0.0274 | -0.2838 | -0.1265 | -0.2474 | -0.2360 |
| **ESR** | -0.3125 | 1.0000 | 0.2696 | -0.2009 | -0.2617 | 0.1680 | 0.4707 | 0.0386 |
| **LSR** | 0.0379 | 0.2696 | 1.0000 | 0.0372 | -0.2625 | 0.2402 | 0.3524 | 0.0675 |
| **PSR** | 0.0274 | -0.2009 | 0.0372 | 1.0000 | -0.1167 | -0.0846 | 0.0591 | -0.0626 |
| **SIZE** | -0.2838 | -0.2617 | -0.2625 | -0.1167 | 1.0000 | -0.3874 | 0.0091 | 0.4444 |
| **PRF** | -0.1265 | 0.1680 | 0.2402 | -0.0846 | -0.3874 | 1.0000 | -0.0039 | -0.0921 |
| **OPE** | -0.2474 | 0.4707 | 0.3524 | 0.0591 | 0.0091 | -0.0039 | 1.0000 | 0.3012 |
| **LAR** | -0.2360 | 0.0386 | 0.0675 | -0.0626 | 0.4444 | -0.0921 | 0.3012 | 1.0000 |

*Source: Authors' calculations with stata 14 software*

Next, we estimate the research model using three methods: Ordinary Least Squares (OLS), Random Effects Model (REM), and Fixed Effects Model (FEM) to identify the most appropriate model. Simultaneously, we examine the presence of heteroskedasticity and autocorrelation within the selected model. The results of the estimations are detailed in Table 4.

**Table 4 - Model estimation results using OLS, FEM, REM methods**

| **Variables** | **OLS** | **FEM** | **REM** |
|---|---|---|---|
| | Coef/p-value | Coef/p-value | Coef/p-value |
| ESR | -0.9189/0.002 | -0.3438/0.013 | -0.3616/0.004 |
| LSR | 0.3106/0.269 | -0.0487/0.563 | -0.0404/0.614 |
| PSR | -0.3114/0216 | -0.0698/0.292 | -0.0743/0.236 |
| SIZE | -0.0871/0.001 | -0.0161/0.490 | -0.0217/0.270 |
| PRF | -0.0209/0.015 | -0.0015/0.660 | -0.0019/0.574 |
| OPE | -0.0049/0.547 | 0.0004/0.873 | 0.0000/0.926 |
| LAR | -0.0028/0.797 | -0.0089/0.045 | -0.0089/0.029 |
| Constant | 879.7121/0.000 | 867.3881/0.000 | 867.7766 /0.000 |
| F test | | 0.0000 | |
| Hausman test | | 0.9980 | |
| Wooldridge test | | 0.0133 | |
| Breusch and Pagan LM test | | 0.0000 | |

*Source: Authors' calculations with stata 14 software*

The results presented in Table 4 indicate that the F-test for the model using the Fixed Effects Model (FEM) method yields a value of 0.000, suggesting that this model is more appropriate than the Ordinary Least Squares (OLS) method.

The Hausman test results reveal a p-value greater than the 5% significance level, indicating that the Fixed Effects estimation method (FEM) is more suitable than the Random Effects Model (REM).

Furthermore, the Breusch and Pagan LM test serves to assess the appropriateness of both the REM and OLS models while also checking for heteroskedasticity within the REM model. With a significance level (Prob>chibar2 = 0.0000) well below 0.05, the REM model is confirmed as the most suitable option, and the test results reveal the presence of heteroskedasticity. Additionally, the Wooldridge test indicates an autocorrelation phenomenon between the observed variables, as evidenced by a significance level (Prob>F = 0.0133) below 0.05.

To address the issues of autocorrelation and heteroskedasticity, we employ the Feasible Generalized Least Squares (FGLS) regression method, which allows us to obtain the most reliable estimation results by mitigating these two phenomena.

**Table 5 - Cross-sectional time-series FGLS regression results**

| Variables | Coefficient | Std-error | Z | P>\|Z\| | [95% Conf. Interval] | |
|---|---|---|---|---|---|---|
| ESR | -0.3412 | 0.1063 | -3.21 | 0.001 | -0.5496 | -0.1329 |
| LSR | 0.1124 | 0.0547 | 2.06 | 0.040 | 0.0053 | 0.2196 |
| PSR | -0.0861 | 0.0403 | -2.14 | 0.033 | -0.1650 | -0.0071 |
| SIZE | -0.0402 | 0.0151 | -2.66 | 0.008 | -0.0698 | -0.0105 |
| PRF | -0.0054 | 0.0003 | -1.56 | 0.119 | -0.0122 | 0.0014 |
| OPE | -0.0025 | 0.0016 | -1.53 | 0.126 | -0.0056 | 0.0007 |
| LAR | -0.0026 | 0.0073 | -0.36 | 0.722 | -0.0169 | 0.0117 |
| Cons | 868.3905 | 1.9453 | 446.41 | 0.000 | 864.5778 | 872.2032 |
| **F - test** | | | | 0.0009 | | |

*Source: Authors' calculations with stata 14 software*

The data presented in Table 5 details the results of model estimations aimed at assessing the impact of corporate social responsibility (CSR) on the sustainability of enterprises in Vietnam. The findings indicate that the p-value from the F-test is 0.0009, which is below the 5% significance threshold, thus confirming the suitability of the research model. When examining the variable representing Economic Responsibilities (ESR) as a measure of corporate social responsibility, we find a regression coefficient of -0.341, which is both negative and statistically significant at the 1% level. This suggests that Economic Responsibilities (ESR) negatively affect corporate sustainability, leading to the rejection of hypothesis H1. Specifically, an increase of 1% in the ESR ratio corresponds to a decrease of approximately 0.3412 percentage points in the average sustainability level of enterprises in Vietnam. In the analysis involving the variable Legal Responsibilities (LSR), which also represents corporate social responsibility, the model yields a regression coefficient of 0.1124. This coefficient is positive and statistically significant at the 5% level, indicating that CSR, when measured through Legal Responsibilities (LSR), has a positive impact on corporate sustainability, and we accept hypothesis H2. This finding implies that a 1% increase in LSR will lead to an average increase of 0.1124 percentage points in sustainability among enterprises. Lastly, the estimation results for the variable Philanthropic and Ethical Responsibilities (PSR) reveal a regression coefficient of -0.0861, which is negative and statistically significant at the 5% level. Thus, CSR measured through Philanthropic and Ethical Responsibilities (PSR) negatively influences corporate performance, resulting in the rejection of hypothesis H3. In practical terms, a 1% increase in the PSR ratio would lead to an average decline of 0.0861 percentage points in sustainability across the firms included in the sample.

In conclusion, corporate social responsibility (CSR) exerts both negative and positive influences on the sustainability of enterprises in Vietnam. This finding is aligned with previous empirical research. For example, Newman et al. (2018; 2020) highlighted that community-related social responsibility can adversely affect financial performance, which in turn impacts the sustainability of businesses. Similarly, Ebner and Baumgartner (2006) found that while an emphasis on philanthropic responsibilities might influence revenue or profit margins, it can also enhance a company's image and promote business growth. Additionally, research by Bagnoli and Watts (2003) and Malesky et al. (2015) indicates that adhering to legal responsibilities or compliance obligations can improve operational efficiency, thereby enhancing business sustainability. The research period from 2019 to 2023 coincides with significant disruptions

caused by the Covid-19 pandemic, as well as shifts in the global economy and politics, which may explain why the findings did not meet the expectations of the research team. Nonetheless, these results allow us to tentatively accept the relationships between CSR variables and corporate sustainability. The findings underscore that corporate sustainability is a pressing issue for businesses, with success in this area depending not only on economic performance but also on the influence of corporate activities on broader social engagements (Lawler & Worley, 2012). Investing time and resources into developing CSR initiatives aimed at sustainability may be challenging, but when viewed as a valuable resource, corporate social responsibility holds the promise of fostering long-term development and achieving sustainability in the future.

## V. CONCLUSION

The relationship between corporate social responsibility (CSR) and corporate sustainability (CS) has garnered considerable attention from scholars and is extensively discussed in the literature. Prior research has approached the concepts of CSR and corporate sustainability through various lenses, utilizing different datasets, criteria, and methodologies, leading to diverse findings regarding the impact of CSR on sustainability. The current study focuses on analyzing the effect of CSR on the sustainability of enterprises in Vietnam from 2019 to 2023.

Utilizing annual panel data covering five years, the study employs the Feasible Generalized Least Squares (FGLS) method for estimation. The findings reveal that CSR has both positive and negative influences on corporate sustainability. Specifically, CSR initiatives centered on legal responsibilities exhibit a positive impact on sustainability, while efforts related to economic responsibilities, philanthropy, and ethical responsibilities have a negative effect. This indicates that current practices related to economic, philanthropic, and ethical responsibilities require improvement to mitigate their adverse impacts, while enhancing the execution of CSR through legal responsibilities could help to bolster corporate sustainability among Vietnamese enterprises. The results of this research carry important policy implications for businesses in Vietnam and local governance structures. To ensure that CSR effectively enhances corporate sustainability, business managers should focus on adequately fulfilling legal responsibilities, as the analysis indicates a positive relationship between legal compliance and sustainability outcomes. Conversely, for CSR initiatives based on economic, philanthropic, and ethical responsibilities, managers need to assess and enhance their implementation effectiveness to ensure they contribute positively to sustainability. Moreover, these findings offer significant insights for policymakers aiming to foster sustainable business practices that create jobs, reduce unemployment, attract foreign direct investment (FDI), and promote economic growth in Vietnam. The Vietnamese government should work to enhance the business and investment environment by refining institutions and regulations to facilitate effective and sustainable corporate operations.

Finally, Like any empirical research, the current study has certain limitations. First, despite the authors' diligent efforts to gather data, our sample consisted of only 19 out of the 100 sustainable enterprises published annually by the Vietnam Chamber of Industry and Commerce (VCCI), due to data constraints. Future research could benefit from including a larger number of enterprises to better test their hypotheses. Second, this study focused on a limited set of variables representing corporate social responsibility, utilizing just three indicators based on Carroll's (1991) analytical framework. This narrow selection may not fully capture the breadth of CSR activities being implemented. Future studies should consider expanding the range of indicators to include additional variables that represent a more diverse array of CSR efforts, thereby providing a more comprehensive exploration of their impact on corporate sustainability. Third, the analysis period in this study spans only five years, which may not adequately represent long-term corporate sustainability trends. Subsequent research could extend the timeframe to at least a decade to uncover broader insights regarding the impact of CSR on corporate performance and sustainability in Vietnam.

# THE FUNCTION OF SWOT AND PEST SITUATION ANALYSIS IN GLOBAL CORPORATIONS' GREEN AND SUSTAINABLE DEVELOPMENT PLANS

**Vo Ngoc Thao**[1]

[1] Postgraduate Faculty, Saigon University.
*Corresponding: thaongocvo2304@gmail.com

**ABSTRACT**

The context and development environment of three well-known companies—Chase Sapphire, which represents Chase's financial services industry; Vingroup, one of the biggest corporations in Vietnam; and LEGO, the largest toy manufacturer in the world—are clarified by the article using PEST (Political, Economic, Social, and Technological) and SWOT (Strengths, Weaknesses, Opportunities, and Threats) analyses. Every business operates in a separate industry and deals with particular possibilities, problems, and outside influences. Nevertheless, each business guarantees robust growth and development despite the variations and diversity in green and sustainable development plans. Using PEST and SWOT analysis to create green and sustainable development strategies for growth and development is a lesson that many multinational corporations around the world may learn from this.

*Key words:* "Challenges", "Economics", "Opportunities", "Politics", "Technology"

## I. INTRODUCTION

International businesses face significant environmental, social, and economic issues in the context of globalization and growing calls for sustainable development. In addition to being a strategic decision, the trend toward green and sustainable development has become essential for businesses to meet stakeholder expectations, international norms, and competitive advantage.

Two crucial strategic tools that assist multinational corporations (MNCs) in making wise decisions and adjusting to the business environment are PEST and SWOT analysis. The original results from these two approaches can support long-term strategy in the following ways when used in the context of green and sustainable development:

### 1.1. PEST analysis for sustainable and green development

Political, Economic, Social, and Technological (PEST) analysis aids businesses in comprehending how the outside world influences their operations. PEST can highlight significant elements from the standpoint of sustainable development, including:

Political: measures like carbon taxes and ESG (Environmental, Social, Governance) rules that promote sustainable growth. global accords to reduce greenhouse gas emissions (COP, SDGs). push from the government to utilize green energy.

Economic: the effects of sustainable financing, green investment, and the circular economy. Green business concepts present opportunities. Green technology's high upfront expenditures and effect on earnings. Social: increasing consumer knowledge of sustainable consumption. The influence of corporate social responsibility (CSR) on brands. shifts in the workforce and the need for environmentally friendly workplaces.

Technological: Monitoring and improving sustainable supply chains through the use of green technologies like blockchain, AI, and IoT. innovation in resource conservation and clean production. expanding the operational use of renewable energy.

### 1.2. SWOT analysis in a long-term plan

Businesses can evaluate their internal strengths and possibilities for sustainable development by using the SWOT analysis (Strengths, Weaknesses, possibilities, and Threats).

Strengths: The advantage of green branding draws in eco-aware clients.

Large scale facilitates cost optimization throughout the shift to a sustainable business strategy. availability of green investment and funding.

Weaknesses: Making the switch to a green model may temporarily disrupt operations. high R&D expenses for environmentally friendly technology. insufficient internal ESG management competence.

Possibilities include rising consumer demand for eco-friendly goods. backing for sustainable development from financial institutions and governments. chances to collaborate with entrepreneurs in green technologies. Risks: Intense rivalry among the green business industry. Manufacturing processes and supply chains are impacted by climate change. stricter environmental standards that must be strictly adhered to.

### 1.3. Using PEST and SWOT analysis in multinational firms' sustainable development plans

Businesses can use the following tactics based on the results of PEST and SWOT analysis:

Corporate governance with an ESG focus: Include sustainable development objectives in the overarching plan. Invest more in green technology: Reduce carbon emissions and optimize supply chains with data and AI. Increase the range of green products offered: Fulfill consumer demand and seize long-term commercial prospects. Work together with governments and organizations: Benefit from green investment funding and supportive policies. Create business models that are circular: Minimize waste, maximize energy, and reuse resources.

Multinational firms can spot trends, opportunities, and difficulties by using PEST and SWOT analysis into their green growth strategies. This helps them make well-informed decisions that will lead to a sustainable and environmentally conscious economy.

Specific and thorough citations on the primary concerns of the research topic are provided in the documents that follow.

SWOT analysis is mentioned as a crucial technique in corporate strategy in the book "Marketing Management (16th ed.)" that gives an overview of marketing strategy (Kotler, P., & Keller, K. L, 2022).

Details on PEST and SWOT analysis in strategic planning are provided in the paper "Exploring Corporate Strategy: Text and Cases (12th ed.)" with a focus on sustainable development and the global corporate context (Johnson, G., Scholes, K., & Whittington, R, 2020).

The corporate strategy analysis models included in the book "Contemporary Strategy Analysis (11th ed.)" include PEST and SWOT analysis, which are crucial for creating green strategies. (R. M. Grant, 2021).

The concept of competitive advantage and sustainable growth strategy based on business environment analysis, related to PEST and SWOT, is introduced by the author of the book "Competitive Advantage: Creating and Sustaining Superior Performance" (Porter, M. E., 2008).

The book "The Green Swans: The Coming Boom in Regenerative Capitalism" highlights how analytical models might support environmentally conscious corporate practices and sustainable innovation (Elkington, J., 2018).

Trends in sustainable development and the influence of political, economic, and technological elements on global company strategy are examined in the OECD report "The Future of Business Sustainability" (OECD, 2021).

Two crucial instruments in marketing and strategic management are PEST and SWOT analyses. In order to develop effective strategies, they are meant to assist organisations in comprehending both external and internal influencing variables. Although each firm has a different method based on their industry and operational environment, LEGO, Chase Sapphire, and Vingroup have all used PEST and SWOT analysis to find and implement environmentally friendly and sustainable growth plans. Here are the main distinctions in each company's strategic direction as well as how they have utilised these analytics to develop their green and sustainable growth plans.

## II. SUPPLIES AND TECHNIQUES

### 2.1. Research methodology and techniques

#### 2.1.1 Methods of research

This study assesses the use of SWOT and PEST scenario analysis in the green and sustainable development strategy of multinational corporations using a combination of qualitative and quantitative approaches. Particular techniques consist of:

– Review of Literature: Through scholarly publications, monographs, company reports, and international

organizations, compile and evaluate prior research on the use of PEST and SWOT in sustainable business strategy.

– Method of qualitative research: Interviews with experts: Interview researchers, strategists, and managers at multinational companies that use PEST and SWOT analysis for sustainable development in-depth. Content analysis: To create useful application models, examine the corporate reports and green development plans of businesses like Unilever, Tesla, Nestlé, IKEA, and others.

– Method of quantitative research: Analysis of secondary data: To assess the strategy's efficacy, consult financial reports, ESG (Environmental, Social, and Governance) reports, and corporate sustainability metrics. Statistical analysis: Assess the relationship between internal factors (SWOT) and company outcomes, as well as the influence of political, economic, social, and technical (PEST) aspects on sustainable strategy, using SPSS or Stata software.

**2.1.2. Methodology of research**

This study combines theoretical and empirical analysis using positivist and interpretive methodologies:

– Interpretivism Method:used to comprehend how companies use SWOT and PEST into their sustainability plans.based on case studies to extract knowledge from actual companies.

– The positivist Method: Test theories regarding the connection between PEST, SWOT, and a company's sustainability performance using quantitative data. Make use of sustainability performance metrics like CO2 emission reduction and the Dow Jones Sustainability Index (DJSI).

**2.1.3. Methodical examination of related research**

– The use of SWOT and PEST in strategic management and its application to sustainable development are examined in the paper "Contemporary Strategy Analysis (11th ed.)" (Grant, R. M., 2021).

– A corporate strategy model that includes an examination of the influence of PEST elements on sustainability may be found in the book "Exploring Corporate Strategy: Text and Cases (12th ed.)" (Johnson, G., Scholes, K., & Whittington, R, 2020).

– Competitive advantage and sustainable development are achieved by combining business environmental variables, according to the author of the book "Competitive Advantage: Creating and Sustaining Superior Performance" (Porter, M. E, 2008).

– According to Elkington (2018), the book "The Green Swans: The Coming Boom in Regenerative Capitalism" examines how companies might grow sustainably by implementing long-term strategies based on SWOT and PEST.

– The paper "A Viewpoint on Global Businesses and Climate Change: Insights from "An Inconvenient Truth"?" examines the employment of green practices by multinational firms to reduce the effects of climate change (Kolk, A., & Pinkse, J, 2008).

– In relation to PEST analysis, the publication "The Future of Business Sustainability" evaluates the sustainable development patterns of businesses (OECD, 2021).

– The PEST model is extended to PESTEL (containing environmental and legal aspects) and used to company strategy in the paper "Developing a Multi-Criteria Decision Making Model for PESTEL Analysis" (Yüksel, I., 2012).

**2.2. History of PEST situation analysis**

Political, Economic, Social, and Technological is what PEST analysis stands for. Businesses can use this external environment analysis methodology to find elements that may have an impact on their operations and business plans.

In order to better understand how environmental elements impact businesses, economic and management researchers developed PEST analysis in the 1960s and 1970s. Later, this model was broadened to incorporate other elements like legal and environmental considerations, and it was dubbed PESTEL or PESTLE.

**2.3. History of SWOT analysis**

A management technique called SWOT analysis is used to assess an organization's, project's, or business situation's Strengths, Weaknesses, Opportunities, and Threats.

Under the direction of Albert Humphrey, a research team at the Stanford Research Institute created the SWOT

model in the 1960s and 1970s. Finding out why organisations fail throughout the planning phase was the goal of the original study. Since then, SWOT analysis has grown in popularity and usage as a c For determining the internal and external elements influencing a firm, SWOT analysis is a helpful tool. SWOT analysis is frequently used in business initiative evaluation and strategic planning. PEST and SWOT differ in the following ways: company strategy tool.

### 2.4.Compare PEST and SWOT

**Scope**: SWOT encompasses both internal and external elements, whereas PEST concentrates on external factors over which the company has no influence.

**Purpose**: SWOT analysis assists firms in understanding their place in the business environment and identifying the strategies they need, whereas PEST is frequently used to analyse a company's macroenvironment.

By supporting one another, these two models can give companies a more thorough understanding of their place in the larger socio economic framework. (Assouline, S, 2019).

## III. RESULTS AND DISCUSSION ON PEST SITUATION ANALYSIS AND SWOT ANALYSIS OF LEGO AND CHASE SAPPHIRE AND VINGROUP

### 3.1. LEGO SWOT analysis and PEST situation analysis

One of the most well-known brands in the world, LEGO has a long history of success. It makes more than $4 billion a year and is the world's second-largest toy company as of 2021. **(IBISWorld, 2021).**

The following macroenvironmental elements that may have an impact on LEGO's activities are examined using PEST scenario analysis:

| **Political** | **Economic** |
|---|---|
| – To safeguard children's health, LEGO must adhere to stringent product safety regulations. +Since LEGO is a worldwide brand, adjustments to import and export duties will have an impact on their earnings, particularly in major regions like the US and China.(Business Source Ultimate, 2021). | – Consumer spending is impacted by the state of the world economy, particularly when it comes to non-essential things like LEGO toys. + Although LEGO toys are more expensive than traditional toys, their strong brand value and price retention draw middle-class and upper-class families. |
| **Social** | **Technological** |
| – Thanks to technological advancements, children now have more entertainment options, which eventually decreases their interest in conventional toys. Since their products foster children's creativity and logical thinking,<br>– LEGO takes advantage of the STEM and STEAM education trends. | – LEGO has introduced a number of technologically advanced goods that appeal to tech-savvy consumers, like LEGO Mindstorms and LEGO Boost.<br>– LEGO can maximise the sales process by utilising the e-commerce platform to reach global customers. |

The following elements are among the strengths, weaknesses, opportunities, and threats that LEGO's business may face and are examined using SWOT situational analysis:

| **Strengths+** | **Weaknesses -** |
|---|---|
| – LEGO has put together a group of seasoned professionals that are committed to creating innovative designs, technologies, and products. According to Assouline (2019), LEGO is already a well-known brand, particularly among kids and young people, with items available in more than 150 countries.<br>– A wide range of themes in a high-quality product line that caters to a variety of age groups and interests. Famous businesses like Marvel, Harry Potter, and Star Wars have partnered with LEGO. | – Because LEGO uses high-quality materials to make its products, manufacturing expenses might be considerable.<br>– LEGO products can be pricey, which may limit their attractiveness to consumers on a budget.<br>– Limited customer base: remains primarily limited to children and families (The Times 100, 2019). Due to rivalry from other toy businesses and video and digital games, LEGO may have a restricted market share and room for growth (The Times 100, 2019). |
| **Opportunities +** | **Threats -** |

| | |
|---|---|
| – Growing the education market: LEGO has the chance to increase the number of STEM-related educational products it offers in classrooms.<br>– Green consumption trend: To keep up with this trend, LEGO might increase the number of products made from recycled plastic or eco-friendly materials.<br>– In order to provide fans with fresh and fascinating building experiences, LEGO has the chance to form strategic alliances with other well-known companies and franchises. (2019, The Times 100). | – Competition from alternative products: Children's attention is being drawn to digital games and smartphone apps, which is lowering the market for conventional toys.<br>– Price fluctuations for raw materials: Since plastic is the primary raw material used in LEGO, changes in the price of raw materials may have an impact on production costs.<br>– Intellectual property rights must be upheld by LEGO. LEGO faces the threat of counterfeiters stealing its designs and intellectual property as it develops new goods (The Times 100, 2019). |

Suggestions derived from the examination of LEGO: 1. Creating mobile gaming applications with LEGO characters and sets might give fans a new opportunity to interact with the brand and increase sales of connected goods. 2. Virtual Building: establishing a platform for virtual construction where enthusiasts can construct and share their own LEGO creations. 3. LEGO emphasises techniques that integrate the digital and physical worlds (Cordon et al., 2016). LEGO mapped their current core value offer to the market opportunity using PEST and SWOT studies. The secret to LEGO's success is its constant adjustment to shifting consumer tastes and industry trends, all the while maintaining its investment in R&D to keep its products appealing and relevant. lead clients.

### 3.2. SWOT and PEST scenario analysis of Chase Sapphire

PEST analysis helps businesses better comprehend the value framework by providing insight into external elements from both local and global perspectives. These factors include the following:

| **Political** | **Economic** |
|---|---|
| – Credit cards are impacted by government policies and regulations, modifications to consumer protection legislation, and government rules pertaining to privacy and the security of financial data. Ultimate Business Source, 2021).<br>– Chase must guarantee adherence to stringent security regulations, particularly with regard to personal data protection laws like the CCPA (USA) and GDPR (EU). The banking sector is subject to stringent government regulations, including those pertaining to interest rates, debt management. | – The state of the economy has an impact on credit card usage and consumer spending. effects of international economic variables on the travel and hospitality sector. Since personal consumption is still at 7.59% in 2022, there may be more demand for Chase goods.<br>– Banks rely significantly on interest rates, which have a direct impact on their bottom line. Chase Sapphire has an opportunity as customers seek integrated, convenient financial services with alluring benefits.(European Business Magazine, 2024). |
| **Social** | **Technological** |
| – Customers who want a high-end experience are the objective of Chase Sapphire's incentive programs for middle- and high-end clients.<br>– As consumers' awareness of privacy and financial security grows, they seek out high-security services.<br>– The focus on sustainable tourism is growing due to trends in tourism and hospitality. Millennials are becoming a target market as a result of shifting demographics.. (IBISWorld, 2021). | – Technological developments that produce mobile payment options have affected the credit card sector. Digital marketing and data analytics are becoming more and more crucial for identifying and interacting with consumers. (IBISWorld, 2021).<br>– Chase Sapphire makes extensive use of technology in digital banking services to give clients a simple and adaptable experience. Chase has a competitive edge thanks to AI's application to enhance security and customer service. |

The following elements are among the SWOT analysis's strengths, weaknesses, opportunities, and threats that could have an impact on Chase Sapphire's operations:

| Strengths+ | Weaknesses - |
|---|---|
| – Chase Sapphire is renowned for its strategic alliances with lodging and travel businesses as well as its top-tier rewards and perks programs. enticing promotional and introductory deals for new clients. IBISWorld (2021).<br>– Chase uses cutting-edge technology to protect consumer data and transactions. By offering superior customer service via its wide retail network, JP Morgan Chase has achieved a competitive edge. | – The high annual fee required by Chase Sapphire may deter many clients and restrict opportunities for development in other areas. Some consumers may be deterred by the Sapphire card's high annual fee. When compared to comparable credit cards, the card's overseas transaction fees might not be competitive. Some consumers might find the conditions to be too onerous in order to qualify for the bonus.(Gonzales, R, 2017). |
| **Opportunities +** | **Threats -** |
| – Chase can increase its consumer base by leveraging digital trends. Chase might broaden its reward programs to attract consumers who enjoy luxury goods and travel.<br>– By 2050, the Asian market will account for almost 60% of the global GDP because toits growing population and GDP, which presents Chase with a significant chance to grow its market share (Sturgess, 2017). | – Traditional banks are facing a serious threat from fintech and digital banks. The potential of fraud and security issues rises in tandem with the growth in online transactions.<br>– The state of the economy may have an impact on consumers' purchasing power. The profitability of credit card firms may be impacted by changes to legislation or regulations. (Chin Tiong Tan - Lipika Bhattacharya, 2020). |

It is evident from PEST and SWOT studies that Chase Sapphire faces both opportunities and difficulties in both its internal and external contexts. Chase Sapphire can keep setting itself apart from its rivals and expanding its clientele by implementing a varied marketing approach. However, in keeping with long-standing customs and aiming for further development, Chase must keep providing high-tech products to address global issues and add value for consumers and society.

### 3.3. Vingroup's SWOT and PEST situation analyses

Vingroup's operations may be impacted by the following macro environmental elements, which are examined using PEST analysis:

| Political | Economic |
|---|---|
| – The political climate in Vietnam is relatively stable, which makes it easy for businesses to grow, particularly big companies like Vingroup. Vingroup benefits from the government's pro-business policies in Vietnam.<br>– Vingroup operates in a variety of industries, including real estate and auto manufacturing, so it must abide by stringent regulations. | – The constant GDP growth rate in Vietnam has created favourable conditions for Vingroup's operational industries, including healthcare, real estate, and commerce. Vietnam's economic expansion makes it possible for Vingroup to grow in a number of industries, including healthcare and education. As the country integrates globally, several foreign businesses invest, putting pressure on Vingroup. **(Cordon et al., 2016).** |
| **Social** | **Technology** |
| – Vingroup can grow in sectors like Vinmec (healthcare) and Vinschool (education) as a result of consumers' growing interest in these areas.<br>– In order to maintain a competitive edge, Vingroup must recruit top talent, which is difficult in a competitive market.<br>– Customers are more interested in upscale, convenient services for products like VinHomes and VinPearl. Environmentally friendly products are becoming more and | – Vingroup is making significant investments in the technology sector, particularly in VinFast and VinAI, which help the group stay competitive and stay up to date with technological trends.<br>– VinFast is one of the first companies in Vietnam to introduce electric vehicles and is aiming for international markets, particularly those that prioritise eco-friendly technology. Vingroup is improving |

| | |
|---|---|
| more popular, giving Vingroup the chance to create VinFast. | customer experience and streamlining procedures by digitally converting businesses including VinMart, VinSchool, and Vinmec. |

The following elements are among the ways that Pham Nhat Vuong's Vingroup uses SWOT analysis to maximise opportunities, strengthen strengths, and reduce risks:

| **Strengths +** | **Weaknesses -** |
|---|---|
| – Vingroup is a well-known and reliable brand in Vietnam, with a broad range of investments in industries including technology, real estate, cars, healthcare, and education. Vingroup's multi-sector operations allow it to reduce business risks and capitalise on opportunities across many industries.<br>– Vingroup is able to invest in major initiatives because to its strong financial resources, particularly in the manufacturing of electric vehicles and technology.To improve its competitive position, Vingroup concentrates on emerging technological sectors like smart real estate, artificial intelligence, and electric cars. | – A significant amount of Vingroup's revenue still comes from real estate, so any changes in this market could have a negative impact on the business. Resources are needed to invest in new fields like VinFast and VinAI. High risks and a large investment, particularly in the early phases of development.<br>– Vingroup struggles to recruit and retain tech expertise in the face of fierce competition from global tech firms. |
| **Opportunities +** | **Threats -** |
| – Vingroup has the chance to grow its market and offer more high-quality goods and services because of the steady economic growth and the expanding middle class.<br>– As consumers' interest in green, eco-friendly products grows, Vingroup has the chance to develop its technology products and the Vin Fast electric car line. Vingroup intends to bring VinFast to the worldwide market, which is a fantastic chance to solidify its position as a global player and boost sales.( Hong Hiep Le, 2019). | – Vingroup faces intense competition, particularly in the electric vehicle sector, due to the participation of numerous large foreign corporations in its operations.<br>– Vingroup's revenue and operating costs can be impacted by factors like inflation and market fluctuations, particularly for projects requiring significant investment capital. Business strategies may be impacted by modifications to management rules and laws, particularly in the automotive and real estate sectors. |

Pham Nhat Vuong's Vingroup can maximise opportunities, strengthen strengths, and reduce risks by having a solid understanding of PEST and SWOT scenarios. Vingroup must, however, encourage digital transformation, create high-value goods and services, and diversify its investment portfolio to lessen its reliance on real estate if it is to maintain sustainable development. create and capitalise on emerging trends like international development and green technologies.

### 3.4. To ascertain each company's green and sustainable growth plan and the variations in their strategic orientation, Vingroup, LEGO, and Chase Sapphire Study employed PEST Situation Analysis and SWOT Analysis.

#### 3.4.1. LEGO: Green and Sustainable Development Strategy:

**A Sustainable Development Path for the Toy Industry.**

In order to support sustainable development activities, LEGO has used PEST and SWOT analysis, particularly in its supply chain and products:

– Making the switch to recycled materials: According to the PEST analysis, LEGO has been substituting recycled and bioplastics for conventional plastics in its products after observing pressure from societal and political considerations regarding the need to utilise environmentally friendly materials.

– Cutting emissions: As part of its efforts to lessen its carbon footprint, LEGO plans to run its manufacturing process entirely on renewable energy. The demand for eco-friendly products is rising, according to the economic study, which

enables LEGO to transition to a green production model while maintaining profitability.

– Product-based environmental education: LEGO integrates sustainable development and environmental education into its STEM product sets to help kids learn about environmental protection from a young age.

**Disparities in the Strategic Path**

Being an educational toy company, LEGO has the benefit of emphasising the incorporation of environmental consciousness into their products. In addition to modifying materials, LEGO's plan aims to educate consumers and change the way the next generation thinks about environmental conservation.

### 3.4.2. Chase Sapphire: A Financial Services Approach to Sustainable Development

**Strategy for Green and Sustainable Development**

Targeting the upscale clientele, Chase Sapphire, a division of JPMorgan Chase Bank, has modified its sustainable growth strategy using PEST and SWOT analysis:

– Investing in green projects: Chase Sapphire is dedicated to using loans and financial investments to support renewable energy and sustainable development initiatives. The US government has prioritised sustainable energy initiatives, according to PEST data, therefore Chase can follow the trend and create an eco-friendly image by funding these projects.

Offering green banking services: Chase Sapphire has created "green" financial solutions, including savings accounts devoted to ecological initiatives and credit cards that do not use conventional plastic.

– Improving security and cutting emissions with digital technology: Chase uses digital technology and digital banking to cut down on printed paper, lower its operational carbon footprint, and use high-security technologies to safeguard the privacy of its customers.

**Strategic Direction Differentiation**

For its affluent clientele, who are more concerned with environmental preservation and ethical consumption, Chase Sapphire has a distinct focus on eco-friendly financial goods. Instead of concentrating on consumer goods, Chase's sustainable development prioritises funding and investment for environmentally friendly projects.

### 3.4.3. Vingroup: Multi-Sector Green and Sustainable Development Strategy with Sustainable DevelopmentStrategy

Vingroup has used PEST and SWOT analysis to create sustainable business plans that work for a range of industries, including healthcare, education, real estate, and auto manufacturing:

– VinFast electric car development: PEST study demonstrates the global and Vietnamese trends towards green consumption. To cut pollution and advance a sustainable transportation future, Vingroup is concentrating on creating VinFast electric cars. This is Vingroup's primary approach to foreign market expansion, satisfying the demand for the use of electric vehicles.

– Creating eco-friendly communities and green buildings: Vingroup has created eco-friendly metropolitan regions with water recycling and energy-efficient building designs. This project offers people a green living environment and satisfies the growing need for ecologically friendly housing.

– Promoting sustainable healthcare and education: Vingroup creates comprehensive, eco-friendly healthcare and education services in the healthcare and education sector, from reducing medical waste to employing renewable energy to teaching students about environmental preservation.

**Disparities in the Strategic Path**

Vingroup's sustainable development approach is more extensive than those of LEGO and Chase Sapphire, impacting a wide range of sectors, including real estate, healthcare, education, and vehicles. In addition to creating eco-friendly products, Vingroup is committed to creating a sustainable ecosystem, from green homes to public services that promote sustainable growth.

## 3.5. Compare Vingroup, LEGO, and Chase Sapphire's approaches to green development

| Company | An emphasis on green development | Disparities in the Strategic Path |
|---|---|---|
| LEGO | Emphasise eco-friendly items and teach kids about protecting the environment. | By integrating education with toys, green development raises consumer awareness in a way that lasts. |
| Chase Sapphire | Invest in sustainable financial products and ecological initiatives, with a particular emphasis on financial services. | Green financial goods and investments in eco-friendly projects are the main for cusses of sustainable development. |
| Vingroup | creating eco-friendly cities, electric cars, and sustainable health and education. | Building a sustainable multi-sector ecosystem, directly impacting the community and international markets. . (Einhorn, B et all, 2020 ) |

## IV. CONCLUSION

Based on PEST and SWOT analysis, LEGO, Chase Sapphire, and Vingroup each have unique strategies for sustainable development. Chase Sapphire concentrates on green financial products and investing in eco-friendly projects, whereas LEGO uses green development as an educational tool. With its advantages across several industries, Vingroup has established a sustainable ecosystem and for cusses on green consumption across a wide range of industries, including electric automobiles, real estate, healthcare, and education. This amply illustrates how each company's approach to sustainable development can be tailored to suit its geography and industry. Many multinational corporations worldwide can learn from the development strategies and success of the three organisations to employ PEST and SWOT analysis when creating sustainable and green development plans for expansion. and grow.

**ABSTRACT**

Globalization and digitalization raise demand of goods and have wide-ranging impacts. Today, logistics is a crucial component of a supply chain supported by internet platforms concerned with consumer pleasure and service. To fill in the gaps in the evaluation of variables that impact perception, buying behavior, and service satisfaction, particularly when shopping online, customers' willingness to pay for the logistics service should be studied. The paper presents an investigation into challenges and concepts concerning customer willingness to pay as well as research methodologies based on peer-reviewed materials. As a consequence, cost, time, dependability, flexibility, and value-added services are utilized to evaluate client payment behavior. In particular, value-added services in logistics are unnecessary extras that enhance a product or service, often based on the cost-to-make ratio. In addition, customer's willingness to pay is also depending on respondent characteristics, with age and gender being moderate factors. The stated preference approach is used to comprehend and assess consumer preferences. The purpose of this article is to reflect the elements influencing stated choice in anticipating consumer behavior and to assist managers in providing more cost-effective service and improved distribution on online platforms.

# DEVELOPING SHARING ECONOMY IN TOURISM FORWARDS POVERTY REDUCTION IN THE NOTHERN MOUTAIN PROVINCES OF VIETNAM

**Vu Thi Tam [1] *, Ngo Phuc Hanh [1]**

[1]Public policy institute – Academy of Policy and Development – MPI;
*Corresponding: vutam278@gmail.com

**ASTRACT**

The sharing economy model (SE) is becoming increasingly popular due to the development of science and technology and there is a great deal of interest in the potential of these models such as efficient use of resources; economic, social, cultural and environmental benefits; creating new markets... This study will focus on analyzing the prospects of the SE model in the tourism sector associated with the national goal of poverty reduction in the northern mountain region of Vietnam. The study uses the Cronbach Alpha test method; T - test based on survey data with a scale of 200 samples in 03 Nothern mountain provinces including Phu Tho, Yen Bai and Ha Giang. The research results revealed that: The SE model in tourism brings economic opportunities for poverty reduction in these 3 provinces.

*Key words*: "Sharing economy", "tourism", "Poverty reduction", "Mountain provinces"

## I. INTRODUCTION

### 1.1. Background of the study

Sharing and collaborative behaviors have deep historical roots, serving as essential components for both survival and the development of social bonds (Miguel et al., 2022). While early forms of SE were primarily motivated by community building, social connections, charity, and non-monetary transactions, the contemporary model is increasingly driven by commercial interests. The global economic downturn prompted a reassessment of consumer spending habits, leading to innovative approaches for utilizing underutilized assets through peer-to-peer interactions on online platforms. This shift fostered a move towards sharing and collaboration over ownership. The rise of the SE was significantly influenced by the financial crisis in the early 2010s, coinciding with the rapid adoption and expansion of a new generation of digital multi-sided platform services. According to Google Trends, awareness of the term "SE" surged in 2013 (Bergh et al., 2021), marking the onset of its rapid growth in popularity in subsequent years.

The raise of variety global sharing platforms in mobility (i.e. Uber, Lyft, Grab…), accommodation (i.e. Airbnb; CouchSurfing…) and food supply (i.e Eat With), has challenged the traditional tourism structures by introducing an inclusive model (Fang et al, 2016). This model offers incredible potential to enable much greater access for communities which have often been excluded from or are unable to meet their needs through the traditional one (Belk 2014).

Other the hands, the rise of SE in tourism has been driven by contemporary trends and tourist preferences that favor engaging experiences over conventional, impersonal mass travel. Nowadays, tourists seek to immerse themselves in the local environment, demonstrating a heightened appreciation for the authentic uncontrived contexts (Tussyadiah et al., 2015; Forno et al., 2015). These emerging trends reflect a contemporary tourism demand model referred to in the literature as "relational tourism". This model emphasizes human interactions that rely on creativity and engagement with local contexts and services typically provided by small businesses or SMEs. Here, local culture serves as the cornerstone of genuine tourist experiences (Richards, G. 2014). And according to Paulauskaite et al. (2017), a key factor of authenticity within sharing platforms like Airbnb is the notion of "living like a local," while experience co-creation enhances these feelings of authenticity. Other contributing factors to the growth and proliferation of SE practices in tourism include innovations in digital technology that provide quality data sharing platforms; advancements in digital payment systems that enable peer-to-peer transactions after services are rendered; and the increasing of smartphones owners (Bakker et al, 2018).

In the tourism sector specifically, there are numerous platforms and mobile applications to support consumer and provider. The Timbro SE Index (SEI) represents the first global index dedicated to assessing this model; 4,651 services candidates in 213 countries were collected and evaluated however classifies only 286 as true SE services (Bergh et al,

2021). Current practices within this sector appear most pronounced in areas such as accommodation, transportation, food supply chains, tours, and guided experiences (Bergh et al, 2021).

As the population grow rapidly and economic activities broaden, nations such as Vietnam—especially its northern mountainous provinces—confront challenges that threaten their prosperity. The Sustainable Development Goals tackle these global issues by a comprehensive framework aimed at fostering a more equitable, sustainable, and peaceful world (Mensah, J. 2019). Advocates of the SE model contend that it offers a viable solution for alleviating poverty by optimizing the underutilized assets and reducing inequality through income generation for individuals from diverse socio-economicbackgrounds (Szymanska, A.I. 2021). Furthermore, the research of Dabbous and Tarhini (2019) show that the SE model provides the opportunity to become micro-entrepreneurs to individuals from diffirent socio-economic backgrounds, thereby bringing in more income through their available assets. Similarly, the potential for profit or additional income opportunities significantly influences participation in providing tourism services within the sharing economy (Gazzola et al., 2018). This perspective is also reflected in analyses conducted by other researchers. In agreement, Lai Thi Tuyet Lan (2020) and Navickas et el (2020) suggest that developing the SE in the tourism industry, such as Airbnb's accommodation-sharing platform, contributes to increased income and job creation for local residents.

Sharing activities in tourism transformed it into a more inclusive business model compared to traditional approaches by creating new opportunities for impoverished and low-income group. While previous studies examined the opportunities and challenges of shared tourism activities broadly (Pizam, A. 2014; Bremser, K and Alonso-Almeida M, 2017; Skalska, T 2017), evaluating the specific impact of these activities on low-income communities remains challenging. This difficulty arises from a lack of analytical research exploring how shared tourism models influence low-income populations, coupled with their generally low participation rates in such initiatives (Business for Social Responsibility, 2016).

### 1.2. Research Questions

To address this gap, the study seeks to answer key research questions regarding the current situation of the SE in tourism and its potential opportunities for poverty reduction in the northern mountainous provinces of Vietnam.

The primary research question is: What opportunities does the SE in tourism present for poverty alleviation in these northern provinces, and how can Vietnam governmen constrains the potential opportunities for poverty reduction? The next research question focuses on analyzing current situation of the SE in tourism and finding solutions to encourage participation in tourism activities of SE, particularly among low-income group.

## II. MATERIAL AND METHOD

### 2.1. Conceptual Foundation

#### 2.1.1. Sharing Economy

In recent years, there has been significant growth in the variety of terms used to describe a particular economic model. It facilitates the utilization of assets and skills at levels closer to the full potential while optimizing limited resources and underutilized assets through cooperative matches among diverse needs. Terms such as collaborative consumption, collaborative economy, on-demand economy, zero-marginal-cost economy, crowd sourcing, crowd-based capitalism, and SE have emerged prominently. While these terms refer to the same underlying economic framework, each offers distinct perspectives on its nature and application. (Kostakis and Bauwens, 2014; Sundararajan, 2016; Selloni, 2017; Aluchna and Rock, 2018).

#### 2.1.2. Sharing Economy in tourism

The SE in the tourism sector is highly diverse and continuously evolving, encompassing a broad range of areas where individuals are willing and able to share resources. This tourism-SE leverages innovative ideas and technologies to enhance granting access to tourism assets, thereby generating revenue from existing surplus goods and services. The core of this concept is the principle of shared consumption, which prioritizes access over ownership.

#### 2.1.3. Poverty reduction

Poverty is a phenomenon that extends beyond the lack of basic necessities such as water, healthcare, food, education, housing, and clothing. Futher more, it also encompasses secure employment for building human capital and

achieving social status, along with inadequate physical safety, limited voice in decision-making, and restricted opportunities for self-improvement. In this context, Sen, Amartya (1999) defines poverty as the inability to fulfull fundamental needs, including adequate nutrition, access to healthcare for maintaining a healthy life a healthy life, and acquisition of necessary skills for social and economic participation. This perspective aligns with the characterization provided World Bank (2022) which refers poverty not only as a lack of income but also insufficiency in meeting essential basic needs and achieving human development. Therefore, poverty reduction addressing widespread attention and a sustained effort aimed at identifying factors contributing to its long-term mitigation.

### 2.2. Research method

#### 2.2.1 Research Hypotheses

H1- The SE in tourism industry offers valuable economic opportunities for impoverished communities in the northern mountainous provinces of Vietnam.

H2 - The SE in tourism industry offers valuable social opportunities for impoverished communities in the northern mountainous provinces of Vietnam.

H3 - The SE in tourism industry offers valuable environmental opportunities for impoverished communities in the northern mountainous provinces of Vietnam.

#### 2.2.2. Data collection

The survey method was used in order to answer the research questions. A questionnaire is designed to collect data related to SE current situation in tourism and indicat its potential impacts on the poverty reduction in the Northern mountain provinces of Vietnam. It is consisted of two parts, the first part aims at identifies SE practices in tourism in the Northern mountain provinces of Vietnam. The purpose of next part is exploring the potential opportunities of SE practices in tourism for poverty reduction in the Vietnam's Northern mountain provinces conducted from previous literature using five Likert scale. The questionnaire was pre-tested by experienced academics, representatives of platforms, participants of sharing in tourism activities, and representatives of tourism governmental agencies in Vietnam. A survey of 200 individuals was administrated in three ways (Email and messenger; Telephone; Face to face interview) during the period of November 2023 to March 2024. The number of valid questionnaires reached 176 respondents which represent 88%.

#### 2.2.3 Data Analysis Approach

Descriptive analysis is used to describe the current situation of SE in tourism in the Northern mountain provinces of Vietnam.

Mean and Std. Deviation are calculated to evaluate the potential opportunities of SE in tourism for the poor in the Vietnam northern mountain provinces. Potential opportunities are devided into 3 pillars: Economic pillar; Social pillar and environmental pillar.

- One sample T test is used to determine the significance of the research hypotheses.

## III. RESULT AND DISCUSSION

### 3.1. Current landscape of sharing economy in Tourism in the provinces of Northern Vietnam.

The first question directly anwsered about the level of participation in SE activities related to tourism in the Northern provinces of Vietnam. It can be seen that about 53.6% of respondents rated their level of participation as low. Meanwhile, 34% voted as moderate, and only 12.4% considered it high. Futhermore, participants indicated that accommodation was the predominant practice within the SE in tourism in the Northern provinces of Vietnam, accounting for 82.2%, followed by transportation at 10.9%, and guiding services at 27%. However, most responses fell within the moderate to low range, consistent with their earlier assessments regarding participation levels in SE activities.

When asked about income levels among participants engaged in these activities in the Northern provinces of Vietnam, responses revealed that 66.7% identified themselves as middle-income earners, while 23% classified themselves as high-income earners and just 10.3% reported a low-income status. These findings suggest a limited engagement from poorer and lower-income groups.

Regarding motivations for participating in SE activities within tourism in the Northern provinces of Vietnam, economic factors emerged as paramount, with unanimous agreement (100%) among respondents.

Lastly, when participants were asked to identify barriers to involvement in SE activities related to tourism in the Northern provinces of Vietnam —drawing insights work—results highlighted several challenges: all respondents agreed on a lack of awareness regarding opportunities (100%), followed by low personal capacity (73,86%).

**Table 3.1 - Factors hindering suppliers from participating in tourism - sharing economy in the provinces of Northern Vietnam**

| Barriers | Number of participation | % |
|---|---|---|
| Lack of knowledge of the opportunities | 176 | 100 |
| Low personal capacity | 130 | 73,86 |
| Lack of trust between (people, date, System, process) | 55 | 31,25 |
| Lack of infrastructure | 37 | 21 |
| Complex monetary payment transactions | 40 | 22,72 |

### 3.2. Potential opportunities of sharing economy in tourism for poverty alleviation in the Northern Vietnam's provinces

Respondents evaluate the potential opportunities under three main pillar economic, social and environmental by using 5 Likert scale (between very liely and very unlikely) and the results are illustrated in table (2).

**Table 3.2 - Mean, Std. Deviation, Skewness, and Kurtosis of feasible benefits**

| | Mean | Std. Deviation | Variance | Skewness | | Kurtosis | |
|---|---|---|---|---|---|---|---|
| | Statistic | Statistic | Statistic | Statistic | Std. Error | Statistic | Std. Error |
| **I. Economic** | | | | | | | |
| Create jobs for the underemployed | 4.1649 | 1.06732 | 1.139 | .229 | .245 | .858 | .485 |
| Enable individuals to increase their income | 4.8247 | .38216 | .146 | .035 | .245 | .032 | .485 |
| -Enable vulnerable or underserved groups (women) | 3.7629 | 1.14358 | 1.308 | .085 | .245 | .176 | .485 |
| Make finding a new or part time job easier | 3.9691 | .97311 | .947 | .045 | .245 | .149 | .485 |
| Allow resource reallocation in weak communities | 3.0515 | 1.07213 | 1.883 | .043 | .245 | .025 | .485 |
| **II. Social** | | | | | | | |
| Stimulate Community capacity building | 4.1959 | 1.27997 | 1.638 | .172 | .245 | .837 | .485 |
| Enhance cultural Development | 4.0206 | .96802 | .937 | .119 | .245 | .567 | .485 |
| Dimish social inequality | 4.1340 | 1.11995 | 1.742 | .362 | .245 | .747 | .485 |
| **III. Environment** | | | | | | | |
| Reduce material in construction | 2.6701 | 1.09733 | 1.953 | .308 | .245 | .185 | .485 |
| Reduce energy and water consumption | 1.8557 | .96813 | .937 | .281 | .245 | 1.048 | .485 |
| Decrease waste production | 1.7526 | .89012 | .792 | .874 | .245 | .137 | .485 |

The survey result indicates that enable individual to increase their income (4.8247)"is the most likely opportunities. The following are the stimulate community capacity-building"(4.1959); create jobs for the underemployed (4.1649);"diminish social inequality"(4.1340); enhance cultural and behavior development"(4.0206)"and finding a new or additional part time job easier (3.9691). In contrast, decrease waste production"(1.7526)"is the very unlike opportunities.

### 3.3. Hypotheses Testing:

One sample T test is used to test the hypotheses. It tests what scientists call the null hypothesis and a claim is shown to be valid by demonstrating the improbability of the counter-claim that follows from its denial.

**Table 3.3 - One-sample t test**

| H0: mean = 3 vs. Ha: mean > 3 | | | | | | |
|---|---|---|---|---|---|---|
| | t-value | Df | Sig. (2-tailed) | Mean Difference | 95% Confidence Interval of the Difference | |
| | | | | | Lower | Upper |
| H1 | 8.4436 | 96 | 0.0000 | 0.8568 | 0.655376 | 1.058224 |
| H2 | 5.7861 | 96 | 0.0000 | 0.6443 | 0.655376 | 1.058224 |
| H3 | -9.0691 | 96 | 0.9980 | -0.0928 | -0.708638 | -1.105762 |

For H1: The null hypothesis is rejected as the p-value is (0.0000), and the alternative is accepted.

For H2: The null hypothesis is rejected as the p-value is (0.0000), and the alternative is accepted.

For H3: The null hypothesis is accepted as the p-value is (0.9980), and the alternative is rejected.

These results lead to accepting H1 and H2 that SE in tourism offers economic and social opportunities for the poor in the provinces of Nothern Vietnam, denying H3 that SE in tourism delivers environmental advantages for the poor in the nothern provinces in Vietnam.

## IV. CONCLUSION

The academic literature, along with broader practical discussions, posits that the SE within the tourism sector represents a sustainable and inclusive business model that optimizes surplus resources. Through its varied practices—spanning accommodation, transportation, and tour guidance—the SE has generated economic, social, and environmental benefits conducive to sustainable poverty alleviation in the northern provinces of Vietnam. It is strongly recommended to implement a strategic vision that promotes a sharing model within the tourism sector of northern Vietnam, leveraging these opportunities to improve livelihoods for impoverished and low-income communities.

For this strategy to succeed, it is imperative that the following solutions be implemented.

Firstly, it is essential to raise awareness of sharing activities within the tourism sector and their potential to enhance the livelihoods of local populations. This can be achieved by promoting greater inclusion throughout all supply chains related to tourist services and disseminating cultural paradigms and norms that embrace the sharing economy within impoverished and low-income communities. Secondly, providing financial and technical support is crucial. Finally, it is important to design training programs that identify community potentials while addressing existing barriers.

This study has limitations concerning data collection; specifically, the survey primarily targets respondents in three northern mountainous provinces of Vietnam, resulting in a small sample size. Expanding the research to include a more diverse population could improve accuracy and generalizability of findings. Additionally, another limitation of this study lies in its exclusive focus on opportunities without addressing potential challenges.

Future research should investigate the potential challenges associated with the sharing economy in tourism for marginalized populations. It should also propose strategies for overcoming barriers to participation in sharing economy activities within the northern provinces of Vietnam.

# ECONOMIC DEVELOPMENT AND ENVIRONMENTAL PROTECTION IN HO CHI MINH CITY: THEORETICAL AND PRACTICAL

**Mai Thi Hong Ha[1, 2]**

[1]Faculty of philosophy, University of Social Sciences and Humanities, Ho Chi Minh City, Vietnam
[2]Viet Nam National University, Ho Chi Minh City, Vietnam
* Corresponding: 22922900204@hcmussh.edu.vn

**ABSTRACT**

Ho Chi Minh City, as the nation's center of economy, culture, and science-technology, aims to "build a smart, rapid, and sustainable city while maintaining its role as the economic locomotive of the country". This objective emphasizes "harmonious development of the economy, culture, and society; environmental protection; and adaptation to climate change" (Ho Chi Minh City Party Committee, 2020, p. 168). The city has achieved notable accomplishments in economic development and environmental protection, contributing to improved living standards for its residents and laying a solid foundation for more rapid and sustainable growth in the future. However, the city still faces numerous challenges in economic development that hinder sustainable growth, with unresolved environmental issues and increasingly complex climate change posing significant obstacles. This article explores the theoretical and practical foundations of economic development and environmental protection in Ho Chi Minh City, offering solutions to leverage achievements and mitigate challenges to enhance this relationship in the future.

*Keywords:* "Economic development", "environmental protection", "Ho Chi Minh City", "sustainable development"

## I. INTRODUCTION

Ho Chi Minh City, with a natural land area accounting for only 0.6% of the country's total area and a population of 9.2 million, holds a significant position as an economic, cultural, scientific-technological, and educational-training center of Vietnam. The city has achieved remarkable economic development, maintaining a high economic growth rate, possessing the largest economic scale in the country, contributing approximately one-fifth of the national GDP and more than one-fourth of the state budget revenue, and leading the nation in FDI attraction, import-export activities, and the number of active enterprises, which account for nearly 30% of the country's total. On this basis, environmental protection efforts have become increasingly effective, contributing to improving the quality of life for the city's residents. These transformations demonstrate the city's commitment to "harmonizing economic and socio-cultural development, protecting the environment, and adapting to climate change" (Ho Chi Minh City Party Committee, 2020, p. 168).

However, in recent years, Ho Chi Minh City's economic growth rate has shown signs of slowing down. At the same time, rapid population growth, climate change, and increasingly complex environmental pollution issues pose significant challenges. Therefore, to realize the goal of "building a smart, fast, and sustainable city while maintaining its role as the country's economic locomotive" (Ho Chi Minh City Party Committee, 2020, p. 40), the city must properly address the relationship between economic development and environmental protection.

## II. RESEARCH METHODOLOGY

In this article, the author employs the dialectical materialism and historical materialism methodologies. Additionally, the research is grounded in Marxist methodological principles such as objectivity, comprehensiveness, development, and historical specificity. Specific research methods utilized include analysis and synthesis, comparison and contrast, historical and logical approaches, interdisciplinary research methods, and the systematization and philosophical generalization method (Tri, N.M., & Hoa, L.T., 2023).

## III. RESEARCH RESULTS

### 3.1. Theoretical framework of economic development and environmental protection

The term "economic development" is defined from various perspectives and research objectives. According to the Dictionary of Economics, "Economic development is the process of economic transformation associated with structural

changes in the economy through industrialization, an increase in gross domestic product, and per capita income" (Nguyen Van Ngoc, 2006, pp. 410-411). The Vietnamese Encyclopedia defines it as "the process of transforming the national economy by increasing production and improving the standard of living of the population" (Vietnamese Encyclopedia, vol. 3, 2003, p. 425). These definitions view economic development as a comprehensive process of economic growth, structural transformation towards rationality, efficiency, and modernization, integrating economic development with social justice and progress.

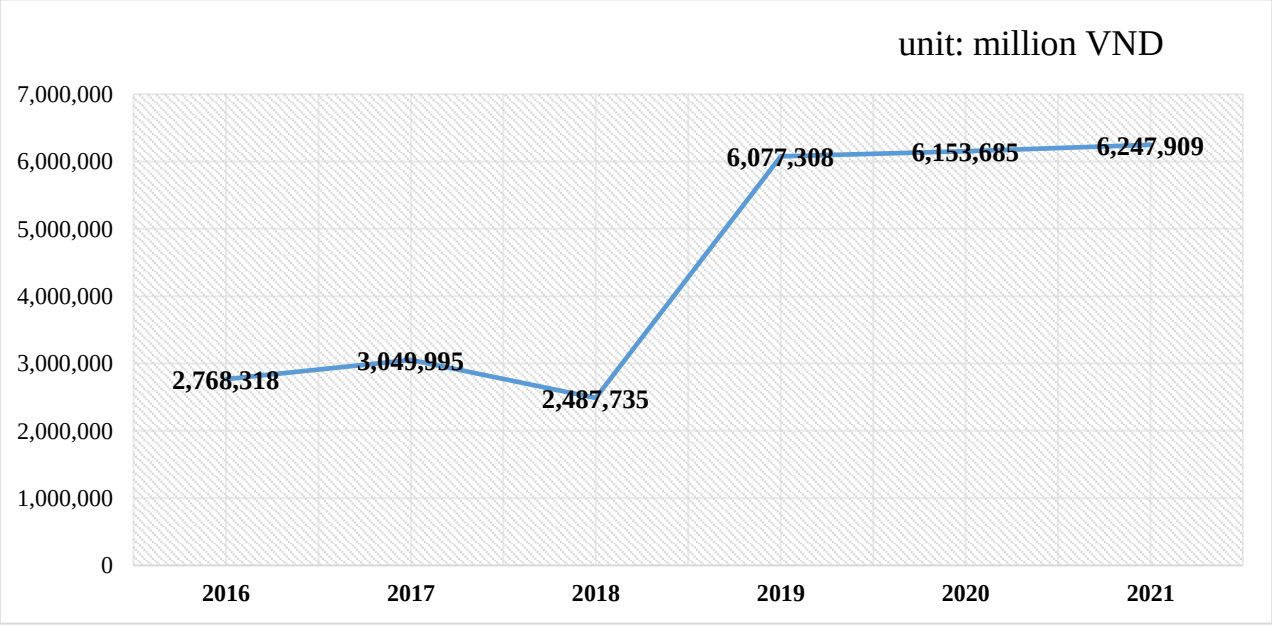
Environmental protection is defined by the 2020 Vietnam Environmental Protection Law as "activities that prevent and mitigate adverse impacts on the environment; respond to environmental incidents; remedy pollution and environmental degradation; improve environmental quality; utilize natural resources and biodiversity rationally; and respond to climate change" (Environmental Protection Law, 2020, Article 3, Clause 2). Humans are the main agents of environmental protection, and it is both a responsibility and an obligation for everyone.

Economic development and environmental protection are two fundamental pillars of sustainable development, inseparable from each other and from the remaining pillar, which aims to achieve "a development that meets the needs of the present generation without compromising the ability of future generations to meet their own needs" (UENP, 2011, p. 107). In essence, sustainable development represents a holistic approach to progress, acknowledging the interdependence of economic, social, and environmental factors to achieve long-term prosperity while preserving and enhancing the well-being of both present and future generations (Tri, N. M., 2024). From an economic perspective, sustainability "requires ensuring long-term economic growth through efficient and high-performance methods on a large scale" (Tri, N. M., 2024). From an environmental perspective, sustainability emphasizes that social progress should not come at the expense of environmental degradation, highlighting the importance of protecting ecosystems and ensuring that future generations can benefit from natural resources and a pristine environment. Throughout the development process, the responsible exploitation and use of natural resources are crucial, along with efforts to protect, nurture, and rejuvenate them, maintain ecological balance and biodiversity, and minimize environmental degradation (Tri, N. M., 2024). Therefore, the dialectical relationship between economic development and environmental protection is reflected in the following key aspects:

First, economic development has a significant impact on environmental protection. Economic growth provides the material foundation for environmental protection, as increased social wealth and accumulation enable structural transformation towards modernization, allowing for the rational and scientific use of natural resources, waste reduction, efficiency improvement, and environmental protection. Economically developed nations possess sufficient financial resources to invest in green infrastructure, such as modern public transportation systems that reduce CO2 emissions or ecosystem restoration projects that generate income for local populations while effectively preventing environmentally harmful activities. Economic growth also fosters advancements in science and technology, promoting a transition in production methods towards "wise resource utilization, pollution reduction, environmental protection and restoration, improved quality of life, and responsible economic development" (Tri, N. M., 2024). However, if economic development prioritizes short-term profits while neglecting environmental concerns, excessive resource exploitation and pollution emissions beyond the ecosystem's absorption capacity can lead to severe environmental degradation, which in turn becomes a constraint on future economic growth. "Studies estimating the loss of environmental resources relative to GDP suggest figures ranging from a few percent to over 10%" (Do Phu Hai, 2018). Therefore, a comprehensive socio-economic development strategy must be aligned with a synchronized environmental protection strategy to maximize the positive impacts of economic progress on environmental sustainability.

Second, environmental protection can either promote or hinder economic development in the following ways: (1) Environmental protection serves as a driver for rapid and sustainable economic development by safeguarding productive capacities, maintaining essential inputs for production, and creating favorable conditions for broad and deep economic growth. According to Stern, strict environmental policies can drive technological innovation, thereby increasing labor productivity (Stern, D. I., 2004). Measures such as developing renewable energy, improving energy efficiency, and managing resources sustainably can help reduce production costs in the long run (Porter & Van der Linde, 1995), laying the foundation for green production, a green economy, and green consumption. (2) Environmental protection contributes to comprehensive human development, which is a key driver of sustainable economic growth.

The natural environment is an “inorganic body” of human beings, and any damage or imbalance in it impedes human development. Since people are both the subjects and the ultimate goal of sustainable development, the Human Development Index serves as a key measure of sustainability. (3) Environmental protection ensures political and social stability and national security, which are prerequisites for rapid and sustainable economic development. According to the OECD, countries with effective environmental protection strategies tend to have more stable economies and higher competitiveness in the global market (OECD, 2011). (4) However, environmental protection may also impose constraints on economic development due to the financial and human resource allocations required for implementation. Effective and sustainable environmental protection measures are often costly, requiring long-term, coordinated efforts, which may reduce short-term economic incentives. In certain cases, economic benefits must be sacrificed to achieve environmental sustainability.



Thus, sustainable development is built on the balanced and harmonious integration of economic growth and environmental protection. Consequently, one of Vietnam’s key development orientations is to “harmonize economic growth with cultural, social, and environmental protection while adapting to climate change” (Communist Party of Vietnam, 2021, vol. I, p. 214), serving as the foundation and guideline for localities, including Ho Chi Minh City, in formulating appropriate development strategies.

### 3.2. Economic development and environmental protection practices in Ho Chi Minh City

Ho Chi Minh City has a development history of over 300 years, experiencing various ups and downs. Despite occupying only 0.6% of the country's total area and having a population of 9.2 million, the city has firmly established itself as a special urban center and a major hub for economy, culture, education and training, science and technology, as well as an important gateway for international exchange and integration. The city has achieved remarkable accomplishments in balancing economic development and environmental protection, specifically:

First, Ho Chi Minh City has consistently maintained a high economic growth rate. During the 2016–2020 period, the average growth rate was 6.41%, 1.62 times higher than the national average (Ho Chi Minh City Party Committee, 2020, p. 98). In 2022, the city recorded a growth rate of 9.03%, while in 2023, it was 5.81%. The economic structure has shifted towards modernization, with the proportion of agriculture, forestry, and fisheries accounting for 0.51% in 2023, industry and construction making up 21.83%, services contributing 64.92%, and product taxes (excluding subsidies) at 12.74% (Ho Chi Minh City Statistics Office, 2024, p. 7). Based on this economic development, the city's state budget allocated for environmental protection has continuously increased, as illustrated in Chart 1.

**The state budget capital for environmental protection in Ho Chi Minh City from 2016 to 2021.**

*Source: Author compiled from the Ho Chi Minh City Environmental Status Report 2021 (Ho Chi Minh City Department of Natural Resources and Environment, 2021, p. 135)*

During the period 2019–2021, the city allocated VND 18,478,902 million to environmental protection, an increase of over 200% compared to the period 2016–2018 (VND 8,306,048 million). Additionally, the city invested VND 5,453 billion in the flood reduction program during 2016–2020, putting 44 projects into operation, resulting in a significant positive shift as the number of flood-prone areas decreased, while flood depth and duration were also reduced. A general assessment states that "Environmental pollution is gradually being controlled, and the program to relocate pollution-causing facilities in the city is continuing to be implemented. The environmental pollution reduction program has achieved significant results" (Ho Chi Minh City Party Committee, 2020, pp. 116–117).

Furthermore, the city has increased investment in science and technology to create a material foundation for the effective and sustainable exploitation of resources, linking economic development with environmental protection. From 2016 to 2019, investment reached VND 43,908 billion per year, with an estimated VND 6,800 billion in 2020, averaging VND 10,142 billion per year (Ho Chi Minh City Party Committee, 2020, p. 234). The Total Factor Productivity (TFP) contribution to annual GRDP increased by 37.53% from 2016 to 2019 (Ho Chi Minh City Party Committee, 2020, p. 226), with science and technology contributing 74% to TFP growth. Labor productivity during 2016–2020 grew at an average of 5.17% per year, supporting a shift in production towards more efficient resource use. These foundations allow the city to focus on solutions to prevent environmental re-pollution trends within the 2020–2030 pollution reduction program while gradually refining its environmental protection strategy, improving environmental quality, adapting to climate change, and working towards achieving sustainable development goals by 2030.

Secondly, environmental protection activities achieved remarkable results during 2016–2020, creating significant environmental improvements and contributing to enhancing the quality of life for city residents. Specifically, pollution prevention and remediation efforts met their targets, particularly in waste collection and treatment. Currently, 100% of export processing zones, industrial parks, and high-tech zones have centralized wastewater treatment systems and automatic wastewater monitoring systems transmitting data to regulatory authorities; 97% of industrial production facilities have wastewater treatment systems (Ho Chi Minh City Department of Natural Resources and Environment, 2021, p. 35). Moreover, 100% of household solid waste, hazardous waste, and medical waste are collected, transported, treated, recycled, and reused in compliance with environmental standards (Ho Chi Minh City Department of Natural Resources and Environment, 2021, p. 97). The total area of forests and scattered green trees reached 84,442.88 hectares, with a forest coverage rate of over 40% (Ho Chi Minh City Department of Natural Resources and Environment, 2021, p. 132). Many initiatives have been launched to raise public awareness about environmental protection, including community-driven models such as "Reducing Plastic Bag Use", "Turning Trash into Cash", "Green Sundays", "Green - Clean - Beautiful Boarding Houses", and "Turning Landfills into Flower Gardens", among others.

The city's achievements in environmental protection have provided a strong impetus for economic growth, especially in tourism, which has rapidly developed by leveraging the city's geographical, transportation, and diverse tourism business ecosystem advantages. Ho Chi Minh City has "4,426 tourist accommodation establishments with over 46,800 rooms" (Ho Chi Minh City Department of Natural Resources and Environment, 2021, p. 47). As a result, eight out of nine key service sectors recorded positive growth in 2023: trade increased by 10.17%; transportation and warehousing by 7.64%; accommodation and food services by 16.37%; information and communications by 5.94%; finance, banking, and insurance by 5.69%; professional, scientific, and technological activities by 6.61%; education and training by 7.03%; and healthcare and social assistance by 3.24% (Ho Chi Minh City Statistics Office, 2024, p. 7). Furthermore, environmental advantages have been a crucial factor in maintaining a high Human Development Index (HDI) for the city. From 2016 to 2020, Ho Chi Minh City's HDI consistently remained above 0.777, higher than the national average, reaching 0.795 in 2020, ranking second nationwide. Additionally, the average life expectancy of city residents was 76.5 years. These positive environmental transformations have strengthened public trust in the city's Party Committee and government, serving as a powerful motivation for the city's continued development towards becoming a "civilized and compassionate city".

However, there are still many limitations and shortcomings in balancing economic development and environmental protection. As a result, the city's economic growth rate and labor productivity increase have not been high and have shown signs of slowing down. The proportion of FDI attraction is no longer at a high level, and environmental issues

have become increasingly complex, including water, air, and noise pollution. Additionally, the burden of waste, wastewater, and garbage collection and treatment is growing. According to statistics, the city's industrial sector emits more than 17.6 million tons of CO2eq annually, with the chemical industry accounting for 63%. In terms of transportation, road vehicles release over 13.4 million tons of CO2eq per year, with motorcycles—numbering over 7.3 million—being the largest source of emissions (Phien An, 2022). According to IQAir, Ho Chi Minh City's PM2.5 fine dust levels are currently 4.2 times higher than the World Health Organization (WHO) standard, leading to nearly 1,400 deaths annually due to air pollution (Hoang Tho - Thanh Thao, 2024). Moreover, the city faces increasing economic losses due to climate change, with flood-related damages amounting to up to USD 250 million per year, potentially rising to over USD 350–500 million annually by 2030 if climate change worsens. Specifically for Ho Chi Minh City, economic losses from climate change could reach USD 50 million annually (Nguyen Nga, 2024).

The causes of these limitations and shortcomings stem from the fact that the city's economic development and environmental protection strategies and policies have not been comprehensively formulated, still contain many inconsistencies, and urban planning and management remain overlapping and conflicting. The legal framework for resource exploitation and environmental protection is still incomplete and inconsistent, lagging behind practical changes. Additionally, most manufacturing enterprises in the city are small and medium-sized, often using outdated technology and prioritizing profit over waste collection and treatment, exacerbating pollution while yielding low economic efficiency. In daily life, a significant portion of the population lacks environmental awareness, and sustainable consumption habits are not yet fully developed. Therefore, in the coming period, the city must implement comprehensive and decisive solutions to overcome these limitations, minimize negative impacts, and fully capitalize on the achievements made in balancing economic development and environmental protection.

### 3.3. Solutions for implementing the relationship between economic development and environmental protection in Ho Chi Minh City in the current period

First, the Party Committee and the city government need to enhance the awareness of their staff, thereby facilitating changes in strategic planning and policies for economic and social development that align with practical realities. This will enable the establishment of directions, tasks, and solutions that both promote rapid economic growth and effectively protect the environment. Strategies play a foundational role in this relationship, creating mechanisms to further stimulate innovation and scientific-technological development in the direction of a green economy and a circular economy. It is essential to boldly reform mechanisms and policies to encourage and mobilize all resources and entities in economic development and environmental protection, thereby generating substantial collective strength to carry out the proposed tasks. There should be active creativity in communication efforts to engage the public in environmental protection and promote sustainable economic development through changing consumption behavior towards greener practices.

Second, businesses need to strictly adhere to regulations regarding production processes, environmental protection, and resource conservation during production. There should be appropriate investments in waste collection and treatment activities as per general regulations. Companies should maximize the utilization of the city’s resources and incentives to improve technology, enhance resource efficiency and product value, and gradually transition to environmentally friendly, green production methods. Businesses should actively participate in community environmental protection activities initiated by the city and residents, demonstrating their social responsibility.

Third, residents need to have a comprehensive and accurate understanding of environmental issues and take practical and specific actions in their daily lives and production activities. As responsible citizens, they should actively engage in local environmental protection activities and, as consumers, prioritize purchasing and consuming environmentally friendly products while minimizing the use of single-use items. Furthermore, they should contribute positively to the economic development of the city. Everyone, depending on their position and role, can make different contributions to the city’s economic development and environmental protection.

To effectively implement the relationship between economic development and environmental protection in Ho Chi Minh City, it is necessary to carry out the solutions fully and effectively targeting different stakeholders. This will allow the city to leverage its advantages and achievements while addressing challenges to create a strong collective force,

tapping into both internal and external resources to facilitate rapid and sustainable development in the next phase.

## IV. CONCLUSION

Thus, economic development and environmental protection in Ho Chi Minh City mutually influence and stimulate each other, enabling the city to maintain its role as the economic locomotive of the country and the southern economic region while improving the quality of life for its residents. However, there are still many limitations that hinder economic growth and increase pollution, primarily due to the inadequate handling of this relationship in practice. For the city's economy to develop sustainably, it requires the efforts of the Party Committee, the government, and the people in formulating strategies, institutionalizing them into specific policies, and ensuring the voluntary and serious compliance of every citizen. Only then can the city truly become a "civilized, modern, and compassionate urban center".

# EXPLORING E-PROCUREMENT'S ROLE IN MITIGATING CORRUPTION AMIDST BUREAUCRATIC CHALLENGES

**Sayyid Aranjaya[1], Yuh-Jia Chen[1]**
[1]Faculty of Management, National Dong Hwa University, Hualien, Taiwan, ROC.
*Corresponding: 611235201@gms.ndhu.edu.tw

**ABSTRACT**

This study examines the persistent corruption in Indonesia's government procurement sector, despite the use of e-procurement systems designed to enhance transparency and efficiency. Indonesia was chosen as the study context due to its strong economic growth and the highest GDP in ASEAN, contrasting with its low GDP per capita and poor corruption ranking. Employing both the Theory of Planned Behavior (TPB) and the Technology Acceptance Model (TAM), this study explores how behavioral factors—such as financial temptation and monetary intelligence—interact with technological acceptance to influence e-procurement adoption and effectiveness. Findings indicate that while e-procurement enhances administrative efficiency and transparency, it falls short in preventing corruption due to human factors. Bureaucrats' susceptibility to financial temptations and self-serving motives undermines the system's impact. The study highlights the need for integrating robust technological solutions with cultural and ethical reforms, including anti-corruption education, stricter enforcement mechanisms, and incentive structures to reduce reliance on material rewards. By addressing both technical and behavioral dimensions, this research provides actionable insights for strengthening public procurement integrity and reducing corruption risks in rapidly developing economies like Indonesia.

*Keywords*: “behavior”, “bureaucrats”, “corruption”, “e-procurement”, “technology”

## I. INTRODUCTION

Corruption remains a pervasive issue in Indonesia’s government procurement sector, despite measures like the e-procurement system. Indonesia was chosen for this study due to its economic and governance paradoxes: it exhibits strong economic growth and the highest GDP in ASEAN but lags in GDP per capita compared to neighboring countries and consistently ranks poorly on global corruption indices (Transparency International, 2023; World Bank, 2022). Key behavioral factors, such as temptation and monetary intelligence, drive unethical actions, including corruption (Tang & Sutarso, 2013). Collusion between bureaucrats and private parties to manipulate tenders, inflate prices, or accept bribes persists, undermining the effectiveness of technological solutions (Gorsira et al., 2016; Aidt et al., 2020; Komakech, 2016). These practices highlight the influence of entrenched social norms and weak enforcement mechanisms (Armitage & Conner, 2001). This study emphasizes the need for combining technological innovations with cultural and regulatory reforms to combat corruption effectively in Indonesia and similar developing economies.

To address corruption, the Indonesian government implemented an e-procurement system, designed to enhance transparency and efficiency in procurement processes by minimizing face-to-face interactions and digitizing tender submissions and contract management (Tukamuhabwa et al., 2017; Weigang et al., 2020). Despite these efforts, high-profile cases like the electronic identity card (e-KTP) scandal highlight the continued prevalence of corruption due to human factors, including unethical intentions among bureaucrats (Huang & Xia, 2019). Understanding these persistent issues requires examining both behavioral and technological factors, as explored in this study. Evidence from studies such as Kish-Gephart et al. (2010) also underscores how perceived behavioral control can undermine the effectiveness of such systems. Aboelmaged (2010) demonstrates the utility of combining both theory to looks at factors influencing e-procurement adoption.

While e-procurement reduces face-to-face interactions and improves transparency, it often fails to deter corruption due to persistent human motivations (Tukamuhabwa et al., 2017; Weigang et al., 2020). TPB has has been accustomed to examine unethical intentions by analyzing three factors’ attitudes, subjective norms, and also perceived behavioral control (Ajzen, 1991; Armitage & Conner, 2001), but its application within the context of e-procurement remains limited (Tang & Chen, 2008; Gorsira et al., 2018). Similarly, the TAM focuses on perceived usefulness and ease of use

(Davis, 1989; Venkatesh et al., 2003) but does not fully address ethical dimensions or why corruption persists despite technology adoption (Kish-Gephart et al., 2010; Weigang et al., 2020).

This study uses TPB and TAM to investigate why corruption persists in Indonesia's e-procurement system. TPB highlights how attitudes, subjective norms, and perceived behavioral control shape intentions to engage in corruption (Ajzen, 1991; Armitage & Conner, 2001; Kish-Gephart et al., 2010), while TAM examines the impact of perceived usefulness and ease of use on e-procurement acceptance (Davis, 1989; Venkatesh et al., 2003). However, technological acceptance alone cannot mitigate corruption risks, as individual motivations and opportunity structures play key roles (Tang & Chen, 2008). This study underscores the need for robust, user-friendly technology that deters corrupt practices, along with ethics training, organizational reforms, and enhanced internal controls to strengthen e-procurement's deterrence capabilities and promote integrity in government procurement.

## II. MATERIAL AND METHOD

### Government Procurement of Goods and Services in Indonesia

Indonesia has undertaken significant reforms in government procurement to enhance transparency, efficiency, and accountability, aligning with economic development goals and reducing corruption (Setiawan & Azizah, 2021). The foundational framework, established by Presidential Regulation No. 16/2018, replaced the older regulation (No. 54/2010), emphasizing international standards, transparency, and strategic alignment with national development objectives (Hamid, 2020). Subsequent updates, including Presidential Regulation No. 12/2021 and No. 17/2023, introduced better contract management, delay mitigation mechanisms, and improved monitoring systems, ensuring procurement activities remain efficient and responsive to administrative and market needs (Suharto et al., 2022).

The implementation of e-procurement by the National Procurement Agency represents a significant advancement in Indonesia's procurement system (LKPP) and its digital platform, e-Katalog. This platform reduces human intervention, minimizes corruption, and enhances transparency, enabling swift and cost-efficient procurement from pre-approved vendors (Liu & Pratama, 2022). Studies show e-Katalog has led to a 20% reduction in procurement time and increased cost efficiency (Siregar, 2023). Additionally, its audit trails reinforce anti-corruption measures and accountability (Nasution & Rachmat, 2022), making it a cornerstone of Indonesia's modern procurement strategy.

Despite these advancements, challenges remain, particularly in combating corruption, limited vendor competition, and inefficiencies at the local government level (Transparency International, 2023). Technological and infrastructural gaps in rural areas further hinder e-procurement adoption (Mardiana et al., 2023). Addressing these issues requires ongoing reforms and capacity-building efforts to ensure procurement improvements benefit all regions equally. Overall, these systematic reforms and innovations not only enhance public sector efficiency but also foster public trust in government operations.

### Overview of the Theory of Planned Behavior and Its Utilization in Corruption Studies

Researchers like Tang and Sutarso (2013) have expanded TPB by highlighting the role of temptation and monetary intelligence in shaping corrupt intentions. Their findings reveal that financial temptation, coupled with low cognitive restraint, significantly increases susceptibility to unethical behavior, particularly in environments with weak norms or low perceived consequences (Tang & Sutarso, 2013; Svensson, 2013; Bandura, 1999; Treviño et al., 2006). In government procurement, TPB shows how attitudes and subjective norms influence corrupt practices despite measures like e-procurement, as permissive cultures and weak enforcement persist (Tukamuhabwa et al., 2017; Transparency International, 2023). Tang and Sutarso (2013) further demonstrate that temptation mediates ethical lapses when corruption is perceived as low-risk or socially acceptable (Tang & Chiu, 2003; Graham et al., 2005). This underscores the need for fostering ethical cultures and enhancing detection risks to reduce corruption (Gorsira et al., 2018; Restubog et al., 2011), integrating ethical reinforcement with robust monitoring systems for effective anti-corruption strategies (Huang & Xia, 2019).

### Technology Acceptance Model 2 Concerning E-Procurement and Corruption

This theory developed by Davis (1989), simplifies technology acceptance into two key constructs: Perceived Usefulness (PU) and Perceived Ease of Use (PEOU). PU refers to the conviction that technology enhances job performance, while PEOU indicates the conviction that technology necessitates minimal exertion. Both directly

influence Behavioral Intention (BI), leading to Actual System Use (Venkatesh & Davis, 2000). Widely applied in various sectors, including e-government and e-procurement, TAM explains how user perceptions drive technology adoption (Al-Gahtani, Hubona, & Wang, 2007; Venkatesh, Thong, & Xu, 2012).

TAM 2, an extension by Venkatesh and Davis (2000), incorporates social and cognitive elements such as Subjective Norms, Image, and Job Relevance, they also implemented elements such as Output Quality, and Result Demonstrability. These additions address the social pressures and task relevance influencing technology acceptance, particularly in structured environments like government organizations (Rana, Dwivedi, & Williams, 2015). Job Relevance, the perceived alignment of technology with professional tasks, observable benefits of its use, are particularly relevant for e-procurement. These constructs explain how systems designed to improve efficiency and transparency gain user acceptance (Chang, Hwang, & Hung, 2014). E-procurement's potential to reduce corruption by standardizing processes and minimizing discretion underscores the importance of its adoption, which is heavily influenced by TAM 2 constructs (Huang & Benyoucef, 2014).

Research indicates that social influences (e.g., Subjective Norms and Image) and task alignment (e.g., Job Relevance and Result Demonstrability) are crucial for the adoption of e-procurement in governmental contexts. Perceived benefits, such as enhanced transparency and accountability, further strengthen user intentions (Carter & Bélanger, 2005; Weerakkody & El-Haddadeh, 2011). TAM 2 offers a comprehensive framework for comprehending and promoting technology acceptance in public administration, offering practical insights for reducing resistance and enhancing system effectiveness in combating corruption (Venkatesh & Davis, 2000; Chang et al., 2014).

**Hyphothesis**

The e-procurement system in Indonesia's government was designed to enhance transparency and efficiency, yet it remains undermined by bureaucrats' attitudes, peer influences, and perceived control over corrupt practices, as described in the TPB (Ajzen, 1991). Research has demonstrated that unethical decisions are significantly influenced by social norms and perceived control (Armitage & Conner, 2001; Kish-Gephart et al., 2010). Tang and Sutarso (2012) further highlight that temptation, encompassing impulsive behavior and low self-control, can lead to poor monetary intelligence (MI) and unethical actions. Even with temptation controlled, unethical behaviors persist, with men displaying stronger direct tendencies toward corruption, while women's actions are mediated by MI. These findings reveal systemic and behavioral challenges to curbing corruption through e-procurement.

In order to enhance the behavioral perspective, this study incorporates the TAM2 to investigate technological acceptance in the adoption of e-procurement. TAM2 extends the original TAM by incorporating factors like Job Relevance, particularly critical for bureaucrats engaged in procurement tasks. Job Relevance ensures users perceive e-procurement as directly beneficial to their roles, fostering effective adoption as an anti-corruption tool (Venkatesh & Davis, 2000; Ifinedo, 2011; Al Awadhi & Morris, 2009; Rana et al., 2015). Aligning the system with bureaucrats' specific responsibilities enhances their commitment to its use and the broader goal of procurement integrity.

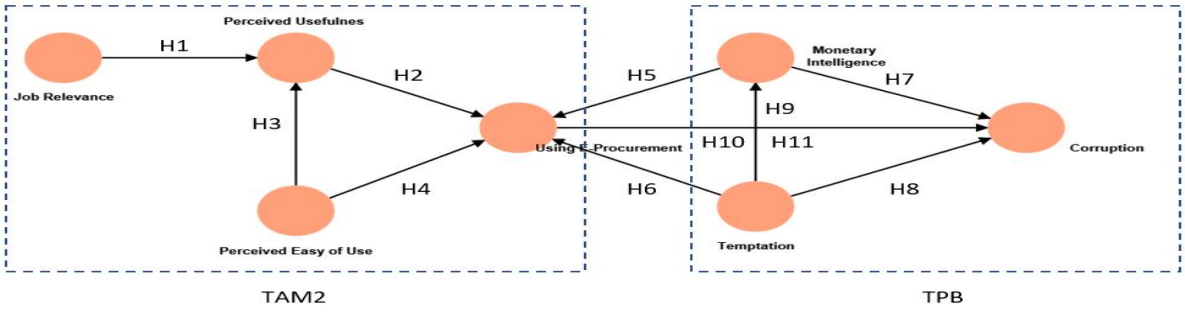

**Figure 1. Proposed Theoretical Framework**

**Hypothesis 1.** Job Relevance has a significant positive effect on Perceived Usefulness. Bureaucrats who feel that e-procurement is relevant to their tasks will find the system more useful.

**Hypothesis 2.** Perceived Usefulness has a significant positive effect on the use of the e-procurement system (Using E-Procurement) Bureaucrats who feel that e-procurement is useful are more likely to use the system actively. Perceived Usefulness has a significant positive effect on the use of the e-procurement system.

**Hypothesis 3.** Perceived Ease of Use has a significant positive effect on Perceived Usefulness. If bureaucrats find e-procurement easy to use, they will also consider it more useful.

**Hypothesis 4.** Perceived Ease of Use does not have a significant effect on the use of the e-procurement system (Using E-Procurement) because its use is mandatory. The use of e-procurement is still carried out by bureaucrats because of obligations, not because they feel the system is easy to use.

**Hypothesis 5.** Monetary Intelligence has a significant negative effect on the use of the e-procurement system (Using E-Procurement). Bureaucrats with a mindset that tends to focus on financial gain may be less likely to utilize e-procurement effectively.

**Hypothesis 6.** Temptation does not affect the use of e-procurement because it is mandatory, but temptation makes bureaucrats continue to look for loopholes to commit corruption through the system. Bureaucrats continue to use e-procurement because it is mandatory, but the temptation of corruption makes them abuse this system.

**Hypothesis 7.** Monetary Intelligence has a significant positive effect on the level of corruption. Bureaucrats who focus on financial gain are more susceptible to corruption, even in a supervised environment such as the e-procurement system.

**Hypothesis 8.** Temptation has a significant positive effect on the level of corruption. Bureaucrats who are easily tempted are more likely to engage in corruption even though e-procurement exists.

**Hypothesis 9.** Monetary Intelligence has a significant positive effect on Temptation.The way bureaucrats think about money affects their level of temptation to commit corruption.

**Hypothesis 10.** Using E-Procurement does not have a significant effect on preventing corruption. Although e-procurement is designed to reduce corruption, corruption still occurs due to external factors, so its implementation is not effective in preventing corruption directly.

**Hypothesis 11.** Temptation has an indirect influence on corruption through the use of e-procurement. Temptation can affect how bureaucrats use e-procurement, which in turn can contribute to corruption, even though e-procurement is implemented, the effect of temptation remains and can be reflected through system abuse or other means outside the system.

To complement the behavioral perspective, this framework integrates the TAM2 to examine technological acceptance in the adoption of e-procurement. TAM2 extends the original TAM by incorporating factors like Job Relevance, particularly critical for bureaucrats engaged in procurement tasks. Job Relevance ensures users perceive e-procurement as directly beneficial to their roles, fostering effective adoption as an anti-corruption tool (Venkatesh & Davis, 2000; Ifinedo, 2011; Al Awadhi & Morris, 2009; Rana et al., 2015). Aligning the system with bureaucrats' specific responsibilities enhances their commitment to its use and the broader goal of procurement integrity.

This framework emphasizes that both behavioral and technological factors shape corruption in e-procurement. Technological factors like Job Relevance and perceived usefulness are expected to significantly enhance system adoption, whereas ease of use and mandatory usage may not directly deter corruption. Behavioral factors such as monetary intelligence and temptation play critical roles; high MI may paradoxically increase both temptation and corruption while reducing system utilization. Temptation, although not directly affecting system use due to its mandatory nature, may drive efforts to exploit loopholes, indirectly fueling corruption. Thus, merely implementing e-procurement is insufficient to curb corruption. Policymakers should prioritize enhancing the system’s relevance and perceived usefulness while addressing behavioral drivers like temptation and unethical practices to strengthen the integrity of procurement processes.

**Questionnaire Design**

This study utilizes validated measurement scales within the TPB framework to assess key constructs. Susceptibility to temptation is measured using a 19-item scale capturing five factors related to unethical decision-making (Tang & Sutarso, 2013). For corruption, two scales assess bribery intentions and past behaviors without explicitly mentioning "corruption" to reduce social desirability bias (Gorsira et al., 2018; Transparency International, 2013; And & Ahmad, 2020). A Five-point Likert scale measures temptation (Likert, 1932), while a seven-point scale measures corruption-

related behaviors (Gorsira et al., 2018). Respondents are prompted to self-assess potential unethical actions using validated methodologies (Ajzen, 1991; Fishbein & Ajzen, 1975; Mazar, Amir, & Ariely, 2008; Kaptein, 2015). These tools provide a robust framework for evaluating psychological and behavioral dimensions of unethical behavior.

This study uses validated TAM2 scales with a seven-point Likert scale (1 = Strongly Disagree, 7 = Strongly Agree) to assess key constructs. "Intention to Use" is measured with a three-item scale by Venkatesh and Davis (2000), while Perceived Ease of Use and Perceived Usefulness are evaluated using scales by Davis et al. (1989) and Agarwal and Prasad (1997). Job Relevance is assessed through Venkatesh and Davis (2000), focusing on system applicability and output quality. Scales were translated into Bahasa Indonesia using AI-supported translations (GPT-4.0) and verified through human review, aligning with the rise of AI in research (Kunst & Bierwiaczonek, 2023). These measures comprehensively analyze psychological factors in technology adoption.

**Data Collection**

This study surveyed 86 government bureaucrats with procurement responsibilities using a two-wave sequential design via online Google Forms. This method ensured convenience and minimized respondent fatigue while capturing complementary dimensions of data (Dillman et al., 2014; Fowler, 2014; Lavrakas, 2008). Surveys were sent directly to respondents' mobile numbers, enhancing participation (Qiao & Cummings, 2008; Qiao, Thai, & Cummings, 2009; Choi et al., 2020). The first wave collected baseline data on TAM constructs, while the second examined TPB-related outcomes and corruption, clarifying cause-and-effect relationships (Menard, 2002; Babbie, 2010). Non-repetitive questionnaires maintained engagement and improved response quality (Fowler, 2014; Lavrakas, 2008).

To further ensure the validity of the findings and address potential biases, the study incorporates several strategies to prevent common method variance (CMV). Temporal separation was introduced by providing a time gap between the waves to reduce response bias (Podsakoff et al., 2003). Different types of questions and response scales were used in each wave to introduce variation and mitigate response patterns (MacKenzie & Podsakoff, 2012). Respondents were assured of anonymity to encourage honest and candid responses, particularly on sensitive topics (Chang et al., 2010). Additionally, the instruments underwent rigorous trial phases to ensure clarity and to avoid overlap between constructs, further enhancing the reliability of the measurements (Liang et al., 2007). These measures collectively contributed to the robustness of the study design and minimized potential biases in the data collection process.

**Structural Model**

This study utilizes Partial Least Squares (PLS) in SmartPLS to develop a structural model exploring relationships among latent variables based on the theoretical framework. Following Hair et al. (2014), constructs like Behavioral Intention (BI) and User Behavior (UB) were included with observed indicators in a path model. Model fit indices such as SRMR, d_ULS, d_G, and Chi-Square were evaluated against established criteria (Henseler et al., 2015; Hu & Bentler, 1999). R-squared values assessed variance explained by the model. Mediation analysis, performed via bootstrapping with 5,000 samples in SmartPLS 4, examined BI's mediating role between constructs like performance expectancy, effort expectancy, social influence, and perceived security on use behavior (Hair et al., 2017). Bootstrapping provided precise confidence intervals for testing indirect effects.

## III. RESULT AND DISCUSSION

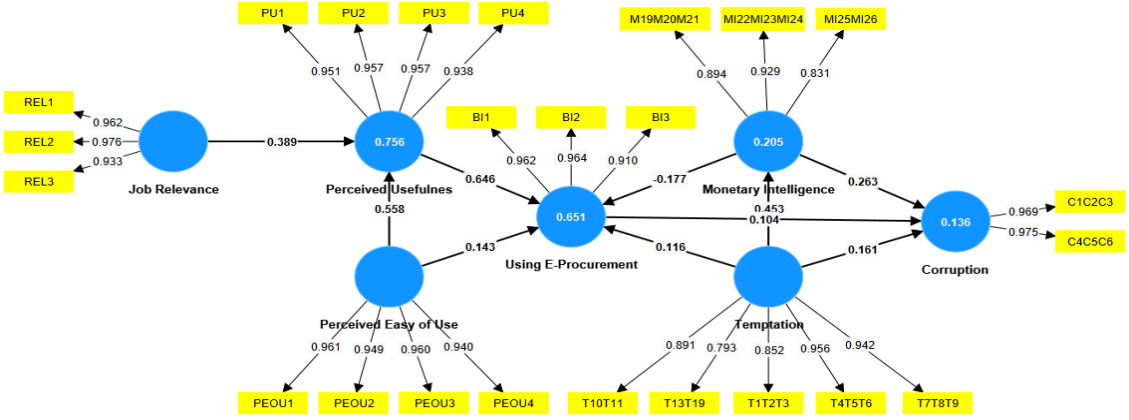

**Figure 2. PLS-SEM Algorithms Results**

According to the findings of the factor loading assessment in this study, numerous items failed to satisfy the established threshold value criteria (usually ≥ 0.7). Therefore, the following items were eliminated from the analysis to ensure construct validity and reliability.

**Table 1. Deleted Factors**

| Construct | Code | Monetary Intelligence | Temptation |
|---|---|---|---|
| Social Moral Values | T12 | | 0.445 |
| Motivator | MI4 | 0.606 | |
| | MI5 | 0.701 | |
| | MI6 | 0.697 | |
| Importance | MI7 | 0.684 | |
| | MI8 | 0.637 | |
| | MI9 | 0.594 | |
| Make Money | MI10 | 0.408 | |
| | MI11 | 0.319 | |
| | MI12 | 0.279 | |
| Budget Money | MI13 | -0.095 | |
| | MI14 | -0.095 | |
| | MI15 | -0.05 | |
| Donate | MI16 | -0.025 | |
| | MI17 | 0 | |
| | MI18 | 0.014 | |
| Power | MI27 | 0.461 | |
| Contribute | MI28 | 0.431 | |
| | MI29 | 0.44 | |
| | MI30 | 0.393 | |

The results of the structural equation modeling, as presented in the table, indicate that all hypotheses were supported based on the theoretical framework. The path coefficients between constructs are statistically significant for the majority of them, with p-values below 0.05, demonstrating the robustness of the proposed relationships. Specifically, key relationships such as Job Relevance → Perceived Usefulness (p = 0.003), Monetary Intelligence → Corruption (p = 0.046), and Perceived Ease of Use → Perceived Usefulness (p = 0.000) were confirmed with significant path coefficients and high T-statistics.

**Table 2. Path Coefficients**

| | Original sample | Sample mean | Standard Deviation | T statistic | P values |
|---|---|---|---|---|---|
| JR → PU | 0.389 | 0.370 | 0.131 | 2.963 | 0.003 |
| MI → C | 0.263 | 0.236 | 0.132 | 1.994 | 0.046 |
| MI → BI (using e-proc.) | -0.177 | -0.180 | 0.067 | 2.626 | 0.009 |
| PEOU → PU | 0.558 | 0.578 | 0.127 | 4.385 | 0.000 |
| PEOU → BI | 0.143 | 0.179 | 0.154 | 0.930 | 0.352 |
| PU → BI | 0.646 | 0.612 | 0.149 | 4.333 | 0.000 |
| T → C | 0.161 | 0.165 | 0.080 | 2.006 | 0.045 |
| T → MI | 0.453 | 0.463 | 0.096 | 4.707 | 0.000 |
| T → BI | 0.116 | 0.123 | 0.078 | 1.495 | 0.135 |
| BI → C | 0.104 | 0.078 | 0.125 | 0.831 | 0.406 |

It is worth noting that certain paths, such as Temptation → Using E-Procurement (p = 0.135) and Using E-Procurement → Corruption (p = 0.406), were not statistically significant. However, this lack of significance is consistent with the theoretical assumptions and supports the hypothesis that these relationships are weak or negligible.

These results validate the conceptual framework by confirming the expected nature of both significant and non-significant relationships. Overall, the findings demonstrate the reliability of the model in explaining the proposed relationships within the data.

**Table3. Total Indirect Effects**

| | Original sample | Sample mean | Standard Deviation | T statistic | P values |
|---|---|---|---|---|---|
| JR → C | 0.026 | 0.017 | 0.033 | 0.794 | 0.427 |
| JR → BI | 0.251 | 0.234 | 0.111 | 2.266 | 0.023 |
| MI → C | -0.018 | -0.014 | 0.025 | 0.723 | 0.470 |
| PEOU → C | 0.053 | 0.042 | 0.069 | 0.763 | 0.446 |
| PEOU → BI | 0.361 | 0.347 | 0.102 | 3.531 | 0.000 |
| PU → C | 0.067 | 0.046 | 0.078 | 0.857 | 0.391 |
| T → C | 0.123 | 0.114 | 0.073 | 1.684 | 0.092 |
| T → BI | -0.080 | -0.083 | 0.037 | 2.162 | 0.031 |

The results of the structural equation modeling (SEM) for total indirect effects, as shown in the table, provide further validation of the theoretical framework. Several indirect relationships between constructs were found to be statistically significant, with p-values below 0.05. Notably, the indirect effects of **Job Relevance → Using E-Procurement** ($p$ = 0.023), **Perceived Ease of Use → Using E-Procurement** ($p$ = 0.000), and **Temptation → Using E-Procurement** ($p$ = 0.031) were confirmed, indicating meaningful mediating effects within the model. On the other hand, some indirect effects, such as **Job Relevance → Corruption** (p = 0.427), **Monetary Intelligence → Corruption** ($p$ = 0.470), and **Perceived Ease of Use → Corruption** ($p$ = 0.446), were not statistically significant. These findings align with the theoretical assumptions and provide evidence that these relationships are not strong or are less relevant in the context of this study. This mix of significant and non-significant results aligns with the hypothesized framework and highlights the nuanced interactions within the model. Overall, the findings demonstrate that the proposed indirect pathways effectively capture the dynamics between constructs and support the validity of the model.

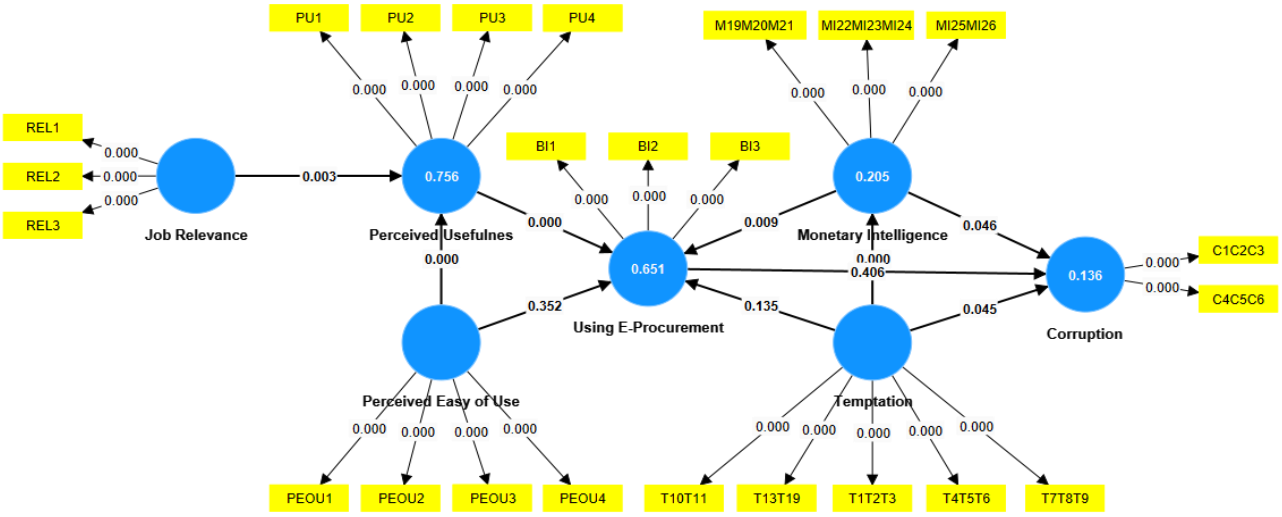

**Figure 3. Bootstrapping results**

The structural equation modeling (SEM) results, as depicted in the diagram, demonstrate that the majority of hypothesized relationships between the latent constructs were supported, with significant path coefficients (indicated by the values along the arrows). These findings confirm the validity of the proposed theoretical model. Each construct is measured by multiple indicators, and the factor loadings, shown as numbers between constructs and their indicators, support strong convergent validity. Interestingly, some relationships in the model were not statistically significant; however, this lack of significance aligns with and supports specific hypotheses. These results suggest that certain relationships were expected to be weak or negligible based on theoretical assumptions, and the findings provide empirical confirmation of this expectation. Overall, these findings validate the conceptual framework, confirming that all hypotheses—both significant and non-significant—were consistent with the theoretical predictions, demonstrating

the robustness and nuanced understanding provided by the model. Validate all hypothesis.

**Hypothesis 1.** Job Relevance has a significant positive effect on Perceived Usefulness. From the "Path coefficients" table, the path coefficient of Job Relevance → Perceived Usefulness is 0.389 with a T-statistics value = 2.963 and p-value = 0.003, indicating a positive and significant effect.

**Hypothesis 2.** Perceived Usefulness has a significant positive effect on the use of the e-procurement system (Using E-Procurement**)** The path coefficient Perceived Usefulness → Using E-Procurement is 0.646 with a T-statistics value = 4.333 and p-value = 0.000, indicating a significant positive effect.

**Hypothesis 3**. Perceived Ease of Use has a significant positive effect on Perceived Usefulness**.** Evaluation: The path coefficient of Perceived Ease of Use → Perceived Usefulness is 0.558 with a T-statistics value = 4.385 and p-value = 0.000, indicating a significant positive effect.

**Hypothesis 4**. Perceived Ease of Use does not have a significant effect on the use of the e-procurement system (Using E-Procurement) because its use is mandatory. The path coefficient of Perceived Ease of Use → Using E-Procurement is 0.143 with a T-statistics value = 0.930 and p-value = 0.352, which indicates no significant effect.

**Hypothesis 5.** Monetary Intelligence has a significant negative effect on the use of the e-procurement system (Using E-Procurement). The path coefficient of Monetary Intelligence → Using E-Procurement is -0.177 with a T-statistics value = 2.626 and p-value = 0.009, indicating a significant negative effect

**Hypothesis 6**. Temptation does not affect the use of e-procurement because it is mandatory, but temptation makes bureaucrats continue to look for loopholes to commit corruption through the system. Evaluation: For Temptation → Using E-Procurement, the coefficient is 0.116 with a T-statistics value = 1.495 and p-value = 0.135, indicating no significant effect. For Temptation → Corruption, the coefficient is 0.453 with a T-statistics value = 4.707 and p-value = 0.000, indicating a significant effect.

**Hypothesis 7.** Monetary Intelligence has a significant positive effect on the level of corruption. The path coefficient of Monetary Intelligence → Corruption is 0.263 with a T-statistics value = 1.994 and p-value = 0.046, indicating a significant positive effect at the 5% confidence level.

**Hypothesis 8.** Temptation has a significant positive effect on the level of corruption. The path coefficient of Temptation → Corruption is 0.453 with a T-statistics value = 4.707 and p-value = 0.000, indicating a significant positive effect.

**Hypothesis 9.** Monetary Intelligence has a significant positive effect on Temptation. The path coefficient of Monetary Intelligence → Temptation is 0.463 with a T-statistics value = 4.707 and p-value = 0.000, indicating a significant positive effect.

**Hypothesis 10.** Using E-Procurement does not have a significant effect on preventing corruption. The path coefficient Using E-Procurement → Corruption is 0.104 with a T-statistics value = 0.831 and p-value = 0.406, indicating no significant effect.

**Hypothesis 11.** Temptation has an indirect influence on corruption through the use of e-procurement. Temptation → Corruption through Using E-Procurement shows an indirect effect of 0.114, with a T-statistics value = 1.684 and p-value = 0.092. In other words, it is approaching significant

## IV. CONCLUSION

The study demonstrates that while e-procurement improves efficiency and transparency, it is insufficient to prevent corruption due to human factors like monetary intelligence and temptation. Perceived usefulness (PU) emerges as a key factor in adoption, influenced by job relevance (coefficient: 0.389; p-value = 0.003) and ease of use (coefficient: 0.558; p-value = 0.000). However, its mandatory nature reduces the impact of usability (coefficient: 0.143; p-value = 0.352), overshadowing motivational elements.

Human factors present significant challenges to corruption prevention. Bureaucrats with high monetary intelligence, focusing on financial gain, are less likely to use the system effectively (coefficient: -0.177; p-value = 0.009). Temptation remains a pivotal driver of corruption, with a strong direct influence (coefficient: 0.453; p-value = 0.000). Furthermore, the study highlights the interplay between monetary intelligence and temptation, where a

heightened focus on financial gain increases susceptibility to corruption (coefficient: 0.463; p-value = 0.000). These dynamics indicate that e-procurement alone cannot deter corrupt practices; a cultural and behavioral transformation is necessary.

E-procurement enhances procedural transparency but struggles with corruption due to external factors. To address these issues, technological advancements should prioritize security, usability, and fraud prevention. Simultaneously, non-technical interventions such as anti-corruption education, fostering integrity, and reforming bureaucratic culture are critical. Establishing robust monitoring systems, stricter law enforcement, and automated controls can help prevent system abuse. Providing non-financial incentives to reduce the emphasis on material rewards is also essential for promoting ethical behavior. A holistic approach combining these measures is necessary to maximize e-procurement's potential as an anti-corruption tool.

Designing an effective e-procurement system to mitigate corruption risks requires a multi-pronged approach that integrates technological and behavioral strategies. One fundamental measure is the full digitalization of procurement processes to enhance transparency, ensuring that bidding, contract awarding, and payment procedures are conducted through an end-to-end e-procurement platform without manual intervention. Publicly accessible procurement dashboards should be utilized to facilitate real-time monitoring by civil society, journalists, and independent auditors, reducing opportunities for illicit transactions (Nasution & Rachmat, 2022). Additionally, making e-procurement mandatory for all public tenders ensures strict regulatory compliance, preventing bureaucrats from bypassing the system and reinforcing accountability through legal repercussions for off-system procurement (Transparency International, 2023).

Advanced automation mechanisms, including smart contracts and blockchain-based payment verification systems, can ensure that payments are released only upon fulfillment of contract terms, thus reducing the risk of kickbacks and fraudulent financial transactions. AI-driven audit trails further enhance compliance by automatically verifying adherence to procurement regulations (Aboelmaged, 2010). Additionally, a risk-scoring system should be developed to assess vendors based on past performance, pricing anomalies, and links to corruption cases. Automated background checks on procurement officials can help identify potential conflicts of interest and financial discrepancies, thereby strengthening internal oversight (Ajzen, 1991).

# FORECASTING VIETNAM'S CPI USING DEEP LEARNING ALGORITHM

**Dang Thi Kiem Hong[1,*]**

[1]Department of Management Information Systems, University Of Finance and Accountancy, Quang Ngai, Vietnam.
*Corresponding: dangthikiemhong@tckt.edu.vn.

**ABSTRACT**

Forecasting macroeconomic indicators plays an important role in macroeconomic planning. It is an important analytical tool for the financial and monetary strategies of countries. Governments and central banks rely on macroeconomic forecasting to formulate and implement monetary, fiscal and regulatory policies. With the advancement of computer science in the 4.0 era, the application of machine learning algorithms to forecast macroeconomic indicators is easier and more popular. In this paper, we present how to use deep learning algorithms to forecast the Customer Price Index (CPI) of Vietnam, with monthly data from January 1995 to December 2023. We present how to set up a CPI forecasting model using Deep Neural Networks (DNN), Recurrent Neural Networks (RNN), Long Short - Term Memory (LSTM), Bidirectional Long Short-Term Memory Network (BiLSTM) and a Scalar extension of LSTM (s-LSTM). The forecasting results show an accuracy of over 99% and a fairly small mean square error (MSE). This proves that the proposed deep learning algorithms are suitable for forecasting CPI in Vietnam.

*Keywords:* “DNN”, “Forcasting VietNam’s CPI”, “LSTM”, “RNN”, “s-LSTM”.

## I. INTRODUCTION

The Consumer Price Index (CPI) is a statistical measure expressed as a percentage, reflecting the relative change in the prices of consumer goods and services over time. CPI is commonly used to measure inflation, which quantifies the general rate of price increase within an economy over a specific period. High inflation can diminish consumer purchasing power, destabilize the economy, and reduce real income. On the other hand, moderate inflation is often considered beneficial for the economy as it promotes spending and investment. Forecasting the CPI entails predicting its future value. This is a critical task, providing valuable insights into macroeconomic, enabling policymakers, businesses, investors, and individuals to make well-informed decisions regarding resource allocation and economic planning.

Current research on CPI forecasting can be broadly categorized into three primary directions. The first approach leverages tranditional statistical methods such as Vector Autoregressive (VAR), Generalized Autoregressive Conditional Heteroskedasticity (GARCH), Autoregressive Integrated Moving Average (ARIMA), state-space methods [1] [14][20]. The second approach employs machine learning and deep learning algorithms, including neural networks and other advanced predictive techniques [4][5][12][16][19]. Recent advancements in computational power and the proliferation of data have catalyzed the exploration of machine learning (ML) methods as viable alternatives to traditional forecasting techniques. The third approach integrates statistical models with machine learning or deep learning methodologies [3]][7][9][13], aiming to capitalize on the complementary strengths of both paradigms. The following are some typical studies of recent approaches.

Lit et al. (2019-2023) [14] has created a time series forecasting software (Time series Lab - TSL) including time series forecasting models such as structural models, ARIMA, score-driven models, model averaging, machine learning models (XGBoost Regression). Momo et al. (2021) [16] proposed forecasting the inflation rate by employing various machine learning algorithms, including Support Vector Regression (SVR), Random Forest Regressor (RFR), Decision Tree, AdaBoost, Gradient Boosting, and XGBoost. Their study utilized a statistical dataset obtained from CEIC dataset, comprising 107 records spanning nine years, from January 2012 to October 2020. The models demonstrated satisfactory accuracy when applied to variables such as the CPI, food, non-food, clothing and footwear, and transportation. Among the evaluated models, AdaBoost achieved the most favorable performance, yielding the lowest Mean Squared Error (MSE) value of 0.041. Pratap et al. (2019) [19] reviewed the paradigm of machine learning and applied it to forecasting inflation in India. Various machine learning algorithms were trained and evaluated for their forecasting accuracy in comparison with traditional statistical methods. The findings indicated that machine learning approaches generally

outperformed conventional statistical models in terms of predictive performance. N Sibal et al. (2024) [17] forecasted the Saudi Arabian Consumer Price Index using six machine learning methods: Decision Tree (Tree), k-Nearest Neighbors (kNN), Linear Regression (LR), Neural Networks (NN), Random Forest (RF), and Support Vector Machine (SVM). These methods were applied to historical CPI data from January 2013 to November 2020, utilizing the Orange 3 data mining and analytics platform. The results indicate that the multilayer perceptron (MLP) neural network model outperforms all other machine learning approaches, achieving predictions closest to the actual CPI, and may be used to forecast the CPI for up to 3 years beyond the latest training data. Lee et al. (2024) [12] studied evaluating the performance of five ML techniques: Autoregressive Integrated Moving Average (ARIMA), Geometric Brownian Motion (GBM), Gated Recurrent Unit (GRU), Long Short-Term Memory (LSTM), and Adaptive Neuro-Fuzzy Inference System (ANFIS), in predicting Malaysia's CPI from October 2022 to September 2023. Results indicate that GRU model performs best, exhibiting the lowest MSE. Feng et al. (2024) [9] approached separately constructs the LSTM and the Vector Autoregression (VAR) model, a classic econometric approach for time series forecasting, based on 23 factors that affect CPI directly or indirectly. The results showed that the error of the LSTM was significantly lower than that of the VAR in forecasting China's CPI, while the VAR model provided an explicit explanation of the factors of CPI forecasting through the Granger causality test. Kong et al. (2024) [10] exploited the power of LSTM in time series forecasting, proposing a simple but effective algorithm called P-sLSTM, which is built on sLSTM (LSTM with scalar memory, scalar update, and new memory mixing) by combining patching and channel independence. These modifications significantly improve the performance of sLSTM in time series forecasting, achieving state-of-the-art results.

In Vietnam, there are also some studies on forecasting inflation index. Vuong Quoc Duy and Huynh Hai Au (2014) [1] used the Box-Jenkins method (1976) to model and forecast Vietnam's inflation rate. The results showed that the most suitable model was ARIMA(1,0,1), (2,0,3) and forecasted that in the next 12 months, inflation in Vietnam will fluctuate insignificantly, except for the first month of 2014. However, the results of this study also partly provide practical information for investors as well as policy makers in finding appropriate solutions to prevent and minimize damage caused by inflation. Pham Thi Thanh Xuan et al. (2020) [4] forecasted inflation for Vietnam by applying artificial neural networks (ANN) with the back-propagation algorithm. Monthly Vietman's inflation data from 2000 to 2018. The studying showed that actual and predicted inflation were relatively close. This has contributed to other domestic and foreign studies confirming that the ANN model used in macroeconomic forecasting in general and inflation in particular is effective and reliable. Nguyen Huong Ly, Hoang Thi Thu Ha (2022) [3] used the Seasonal Autoregressive Integrated Moving Average (SARIMA), RNN, LSTM and combined forecasting models to forecast monthly inflation index of Vietnam in the period 2000 - 2021. The results showed that LSTM gave better results than SARIMA in the short term, but worse in the long term, and the combined forecast gave the best forecasting results in both the short and long term. However, the forecasting results were not as good as expected because part of the data was in the pandemic period, so there was a large error in inflation forecasting.

Above is an overview of some studies applying machine learning in forecasting CPI. There are not many studies applying machine learning algorithms on Vietnamese data, and the models used have not been updated. Therefore, research on applying machine learning algorithms in forecasting CPI in Vietnam is really necessary. Deep learning is a subset of machine learning that focuses on utilizing neural networks to perform tasks such as classification, regression, and representation learning. In this paper, we introduce five Deep learning models included Deep Neural Networks (DNN), Recurrent Neural Networks (RNN), Long Short - Term Memory (LSTM), Bidirectional Long Short-Term Memory Network (BiLSTM) and a Scalar extension of LSTM (s-LSTM) to predict Vietnam's CPI, ultilizing monthly data from January 2015 to December 2023. The forecasting results of all models show an accuracy of over 99% and a fairly small mean square error (MSE). This proves that the proposed deep learning algorithms are suitable for forecasting CPI in Vietnam.

## II. MATERIAL AND METHOD

### 2.1. Preliminaries

#### 2.1.1. Deep Neural Networks (DNN)

Basically, artificial neural networks (ANN) are a computational model, they are built based on the structure and function of neural networks in Biology (although the structure of ANN will be affected by a flow of information). It is a collection of layers to perform a specific task. Each layer consists of a collection of nodes to operate together. These networks usually consist of an input layer, one to two hidden layers, and an output layer.

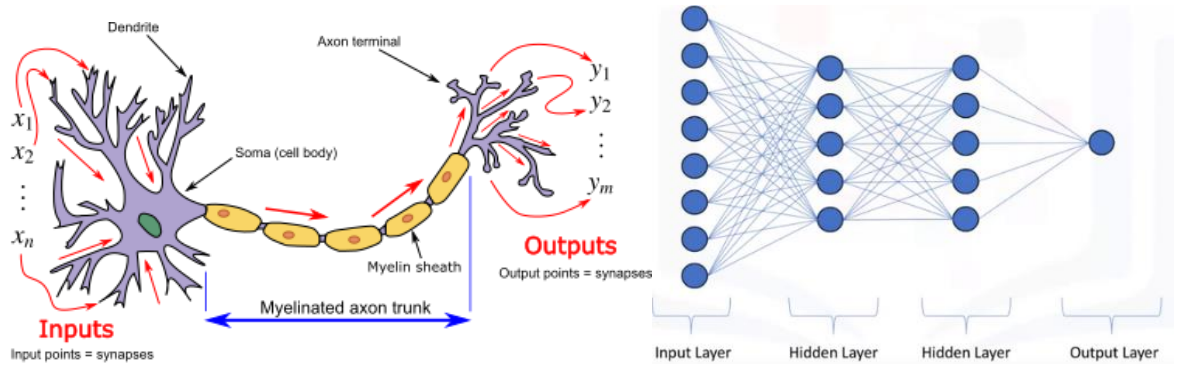

**Figure 1. Structure of a typical neuron 0.**

DNN have a complex hidden layer structure with a wide variety of different layers, such as a convolutional layer, max-pooling layer, dense layer, and other unique layers. These additional layers help the model better understand problems and provide optimal solutions to complex projects. DNN are also called Multi-layer Perceptrons (MLP).

Layers: The set of input data $x_i$ $(i = \overline{1,n})$ is called the input layer; the set of values of $y_j$ $(j = \overline{1,m})$ is called the output layer. Beside input layers and output layers, hidden layers are generally denoted by $l-th$ layer.

**Nodes:** Input data, output results, and the computing nodes are collectively called units. The input of the hidden layers is denoted by z, the output of each unit is denoted by a after applying the activation function to z. The output at each hidden layer does not have to be 2, and does not have to be the same across all layers. The output of the i-th unit in the l-th layer is denoted by $a_i^{(l)}$ and the number of units in the l-th layer (excluding bias) is $d^l$, we have $a^l \in \mathbf{R}^{d^l}$.

**Weight and Bias**: In a Perceptron with one layer, the parameter w is called the weight. The element $w_{i,j}^{(l)}$ is the parameter in the connection between the i-th node of the $(l-1)$ -th layer and the j-th node of the $l$-th layer. Consider the input as the 0-th layer, the weights form the matrix. This is the weight matrix connecting the $(l-1)$-th layer and the $l$-th layer. There are L weight matrices for an MLP with L layers: $W^{(l)}, l = 1,2,\ldots,L$. The bias term plays a important role in helping the model fit the data better by adding flexibility to the activation of a neuron. We denote $b^l$ is the bias added to the weighted sum of inputs for the $l$-th layer before applying the activation function.

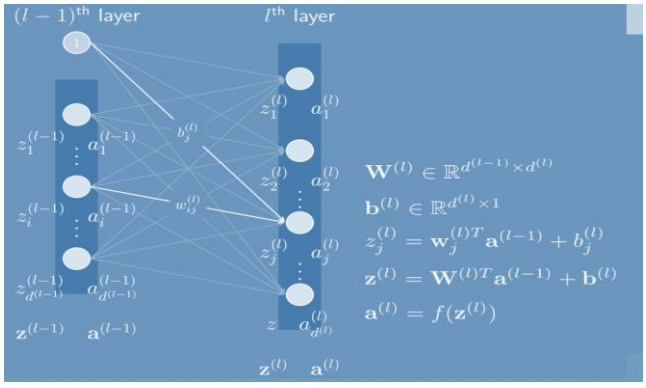

**Figure 2. The relation between *l* - 1 layer and *l* layer 0**

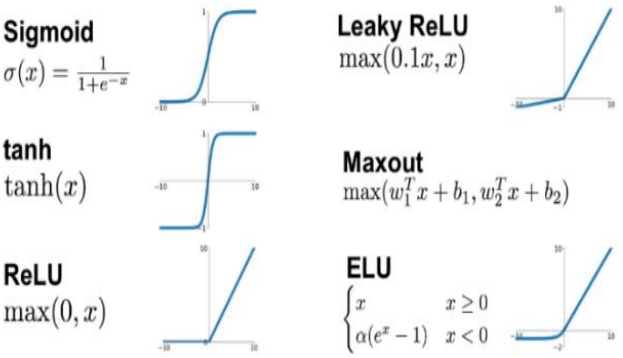

**Figure 3. Some form of activation function**

**Activation functions:** introduce non-linearity into the model, enabling it to learn complex relationships. An output of an unit (excluding input units) calculated based on the formula:

$$a_i^{(l)} = f\left(w_i^{(l)T} a^{(l-1)} + b_i^{(l)}\right) = f\left(z_i^{(l)}\right)$$

Where $z_i^{(l)} = \sum_{j=1}^{d^{(l-1)}} w_{i,j}^{(l)} a_j^{(l-1)} + b_i^{(l)}$, f (·) is a (nonlinear) activation function (figure 3).

In vector form: $a^{(l)} = f\left(W^{(l)T} a^{(l-1)} + b^{(l)}\right) \in R^{d^{(l)}}$

**Loss functions**: measures the difference between the predicted output and the actual target value, such as

– Mean Square Error (MSE):

$$J_0(\mathbf{W}, \mathbf{b}, \mathbf{X}, \mathbf{Y}) = \frac{1}{N}\sum_{n=1}^{N}\|y_n - \hat{y}_n\|_2^2 = \frac{1}{N}\sum_{n=1}^{N}\|y_n - a_n^{(L)}\|_2^2 .$$

– Mean absolute error (MAE):

$$J_0(\mathbf{W}, \mathbf{b}, \mathbf{X}, \mathbf{Y}) = \frac{1}{N}\sum_{n-1}^{N}|y_n - \hat{y}_n| = \frac{1}{N}\sum_{n=1}^{N}|y_n - a_n^{(L)}|.$$

– Cross-entropy:

$$J_0(\mathbf{W}, \mathbf{b}, \mathbf{X}, \mathbf{Y}) = -\sum_{n-1}^{N}\left(y_n \log a_n^{(L)} + (1 - y_n)\log\left(1 - a_n^{(L)}\right)\right)$$

Where, $\{(x_n, y_n)\}_{n=1}^{N}$ are the training data pairs; $\hat{y}_n$ are the predicted outputs of the model. Note that at the last layer $\hat{y}_n$ are the predicted outputs of xn through the model. In the end layer Lth: $\hat{y}_n = a_n^{(L)}$. To find the parameters W, b for the model, we need to solve the minimization problem: $\hat{y}_n = a_n^{(L)}$ The simplest and most popular method for optimizing MLP is Gradient Descent (GD). In general, J(W, b, X, Y) is not a convex function, so we cannot be sure whether the obtained extrema is the global extrema. However, with a properly chosen initial approximation, the Gradient Descent method usually still gives a good enough solution (parameter set W, b).

**2.1.2. Recurrent neutral networks (RNNs)**

RNNs were introduced by John Hopfield in 1982 and have since become a significant paradigm in Deep learning. RNNs is a type of artificial neural network architecture specifically designed to process sequence data, where information from previous steps in the sequence is linked and influences the current prediction. The term "recurrent" refers to the repetitive nature of performing the same task for each component in the sequence. In which, the output at the current time depends on the computation results from previous time steps. Training an RNN follows a process similar to that of training a traditional neural network. However, the value at each output depends not only on the calculation at the current step but also on the results from previous steps.

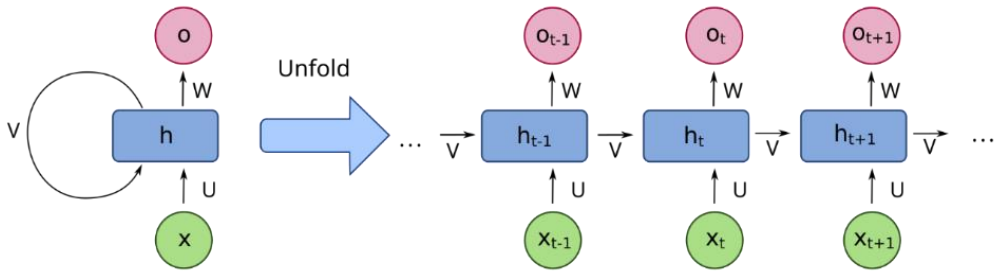

**Figure 4. Simple Recurrent Neural Network.**

In **figure 4**, the reverse arrow is the loop. On the left is the condensed image of the network (representing the loop). On the right is the network after it has been expanded. It is worth noting that the network will no longer receive a simple signal vector *x*, but a series of signal vectors $x_1, x_2, ..., x_t$ corresponding to the input signal of the data point $t = 1 \to t$ at the current time. Furthermore, the network will also produce hidden results, equivalent to the output signal vector at that time *t*. The hidden state at time *t*, is calculated by

$$h_t = \sigma_h(W_h x_t + U_h h_{t-1} + b_h),$$

Where $x_i$ is input at time *t*, $h_{t-1}$ is hidden state at time $t - 1$, $W_h$ is weight matrix for connections input-to-hidden, $U_h$ is weight matrix for connections hidden-to-hidden, $b_h$ is bias of hidden state and $\sigma_h$ is activation function of hidden state, commonly used function Tanh

$$\left(Tanh(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}}\right)$$

### 2.1.3. Long Short-Term Memory (LSTM)

LSTM is a specialized architecture of RNNs introduced by Hochreiter & Schmidhuber (1997) as a solution to the challenge of relying on distant past information, which traditional RNNs struggle to retain effectively. LSTM is well-suited for predictive and sequencing tasks, exceling at capturing long-term dependencies. Its applications extend to time series related-problems. Unlike traditional neural networks, LSTM incorporates feedback connections, allowing it to process entire sequences of data rather than individual data points. The core innovation of LSTM lies in the cell state, which acts as a "conveyor belt" to allow information to flow through the network with minimal modifications. Symbol $X_t^{train}$ is the input training data. **Figure 5** shows the structure of an LSTM network, which consists of one or more hidden layers, an input layer, and an output layer with three primary gates:

**Forget gate:** The forget gate determines whether information from the previous time step should be retained or discarded. It takes two inputs $h_{t-1}$ and $X_t^{train}$ and returns a value between 0 and 1 via the sigmoid function for each state cell value. A value of 1 represents 'retain all information' and 0 represents 'forget all information'. Mathematically, it is expressed as:

$$f_t = \sigma\left(W_f \times \left[h_{t-1}, X_t^{train}\right] + b_f\right)$$

where $f_t$ is forget state activation at time $t$, $h_{t-1}$ is hidden state at time $t-1$, $W_f$ is forget gate weights, $b_f$ is forget gate bias, $\sigma(x) = 1/(1+e^{-x})$ is sigmoid activation function.

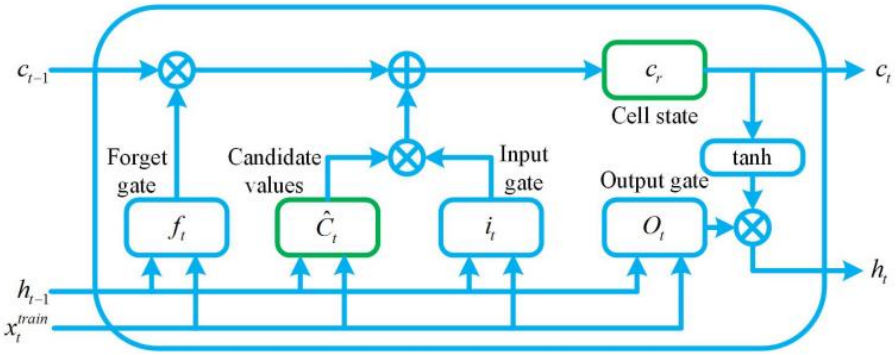

**Figure 5. Structure of LSTM 0**

**Input gate:** The input gate decides which new information should be stored in the cell state. It involves two steps. The first step, a sigmoid layer determines which values to update. The second step, a tanh layer generates a candidate vector for the new state values. The results from these layers are combined to update the cell state. This process is expressed as:

$$i_t = \sigma\left(W_i \times \left[h_{t-1}, X_t^{train}\right] + b_i\right),\ \hat{C}_t = tanh\left(W_c \times \left[h_{t-1}, X_t^{train}\right] + b_c\right)$$

The new cell state is updated as: $C_t = f_t * C_{t-1} + i_t * \hat{C}_t$, where $i_t$ is input gate activation at time *t*, $\hat{C}_t$ is candidates cell state at time *t*.

**Output gate:** The output gate determines what information to output. First a sigmoid function identifies the relevant parts of the cell state. Then, the cell state is passed through a tanh function to scale the values between [-1,1] and this result is multiplied by the output of the sigmoid gate. The formula is:

$$O_t = \sigma(W_o[h_{t-1}, x_t] + b_o), h_t = O_t * tanh(C_t),$$

where $o_t$ is output gate activation at time *t*, $h_t$ is hidden state at time *t*.

### 2.1.4. Bidirectional Long-short term memory (BiLSTM)

BiLSTM was introduced in 1997 by Schuster and Paliwal. It connects two hidden layers operating in opposite directions to the same output, allowing the model to access both past (backward) and future (forward) states simultaneously. BiLSTM does not require fixed input data and can leverage future input information from the current

state. At a given time step t, the minibatch input is denoted as $X_t \in \boldsymbol{R}^{n\times d}$, where n is the number of samples, and d is the dimensionality of the input features. The activation function for the hidden layer is represented as $\emptyset$. In the two-dimensional architecture, we assume that the forward and reverse hidden states of this time step are respectively $\vec{H}_t \in \boldsymbol{R}^{n\times h}$ and $\overleftarrow{H}_t \in \boldsymbol{R}^{n\times h}$, h here denotes the number of hidden nodes. We compute the forward and backward updates of the hidden state as follows:

$$\vec{H}_t = \emptyset\left(X_t W_{xh}^{(f)} + \vec{H}_{t-1} W_{hh}^{(f)} + b_h^{(f)}\right), \overleftarrow{H}_t = \emptyset\left(X_t W_{xh}^{(b)} + \vec{H}_{t+1} W_{hh}^{(b)} + b_h^{(b)}\right)$$

Where $W_{xh}^{(f)} \in \boldsymbol{R}^{d\times h}, W_{xh}^{(b)} \in R^{d\times h}$ are input weights for forward and backward states; $W_{hh}^{(f)} \in \boldsymbol{R}^{h\times h}, W_{hh}^{(b)} \in R^{h\times h}$ are recurrent weights for forward and backward states; $b_h^{(f)} \in \boldsymbol{R}^{1\times h}, b_h^{(b)} \in \boldsymbol{R}^{1\times h}$ are bias terms for forward and backward states.

The hidden states $\vec{H}_t, \overleftarrow{H}_t$ are concatenated to form the final hidden state $H_t = \left(\vec{H}_t, \overleftarrow{H}_t\right) \in \boldsymbol{R}^{n\times 2h}$ which is passes to the output layer. In deep bidirectional recurrent neural networks, this information is propagated as input to subsequent bidirectional layers. The output layer computes the final output $O_t \in R^{n\times q}$ ($q$ is dimensionality of the output) as follows:

$$O_t = H_t W_{hq} + b_q,$$

where $W_{hq} \in \boldsymbol{R}^{2h\times q}$ is output weights and $b_q \in \boldsymbol{R}^{1\times q}$ is output bias.

The forward and backward directions can have different numbers of hidden nodes, allowing for more flexibility compared to traditional RNNs. **Figure 6** illustrates the structure of a BiLSTM with a single hidden layer. The principle of BiLSTM is to divide the neurons of a conventional RNN into two directions, one for the positive time direction (forward state) and the other for the negative time direction (backward state). The outputs of these two states do not interact with the opposite direction's inputs. By leveraging both time directions, BiLSTM can utilize past and future input information within the current time frame. This feature differentiates it from standard RNNs, which require a delay to incorporate future information.

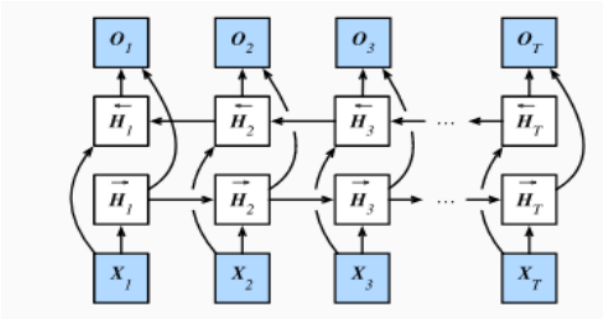

**Figure 6. Bidirectional recurrent neural network structure.**

### 2.1.5. Scalar Long Short-Term Memory (s-LSTM)

s-LSTM is an extension of the traditional LSTM architecture, recently introduced as part of the xLSTM framework by Beck et al (2024) 0. It enhances the LSTM by incorporating exponential gating and a new memory mixing mechanism. sLSTM uses exponential ( $\exp(x)$ ) or sigmoid function ( $\sigma$ ) instead of linear functions at the forget and input gates.

Forget gate: The sLSTM allows for the use of either a sigmoid or exponential activation function in the forget gate, whereas traditional LSTM strictly uses sigmoid. The forget gate in sLSTM is represented as

$$f_t = \sigma\left(W_f \times \left[h_{t-1}, X_t^{train}\right] + b_f\right) \text{ or } f_t = exp\left(W_f \times \left[h_{t-1}, X_t^{train}\right] + b_f\right)$$

where $f_t$ is forget gate activation at time *t*, $W_f$ is forget gate weight matrix, $b_f$ is forget gate bias and $\left[h_{t-1}, X_t^{train}\right]$ is concatenated hidden state and input vector.

Input gate: In sLSTM, the input gate replaces the sigmoid activation function in traditional LSTMs with an exponential function. This is defined as:

$$i_t = exp\left(W_i \times \left[h_{t-1}, X_t^{train}\right] + b_i\right)$$

where $i_t$ is input gate activation at time t, $W_i$ is input gate weight matrix and $b_i$ is Input gate bias.

Normalizer State and Hidden State: The sLSTM introduces a normalizer state $n_t$ to stabilize calculations over long sequences and modifies the hidden state calculation as follows:

$$h_t = o_t \, \boldsymbol{R} \, \tilde{h}_t, \tilde{h}_t = c_t \, \boldsymbol{R} \, n_t^{-1}$$

where the normalizer state is updated as: $n_t = f_t \boldsymbol{R} n_{t-1} + i_t$

These modifications on the exponential gating in both the forget and input gates provides more flexibility in controlling information flow, while the normalizer state helps in stabilizing the hidden state calculations over long sequences.

### 2.2. Method

#### 2.2.1 Data Preprocessing and Normalization

We collected monthly Consumer Price Index (CPI) data for Vietnam from January 1995 to December 2023 from the website of General Statistics Office of Vietnam (https://www.gso.gov.vn/). The dataset consists of two columns: the time in months and years, and the CPI, resulting in a total of 347 data points.

To prepare the data for modeling, we implemented a dataset window with three parameters: window_size = 20, batch_size = 32, and shuffle_buffer = 500. The window_size parameter determines the length of each dataset window in the time series. A window is a subset of the data series used as input for the model. A rolling window with size 20 is used to separate data, meaning we predict the CPI for the next month based on historical data from the previous 20 month. This approach results in a point-by-point prediction. The batch_size parameter defines the number of data samples processed simultaneously during each training iteration. For example, if batch_size = 32, each training session will handle 32 windows of data at a time. The shuffle_buffer parameter specifies the buffer size used to shuffle the data before feeding it into the model. We set the buffer size equal to the length of the sequence to optimize memory usage. During training, the training window is initialized with all real training data. The window is then shifted to include the next real data point at its end to predict the next point and so forth.

To standardize the data, we applied the "min-max" normalization method to scale the values to the interval $[0,1]$, using the following formula:

$$X_t^n = \frac{X_t - \min(X_t)}{\max(X_t) - \min(X_t)}$$

where $X_t^n$ represents the normalized data. After predictions are made, it is necessary to denormalize the results to obtain the original CPI values. The denormalization process is given by:

$$\hat{X}_t = \hat{X}_t^n \left[\max(X_t) - \min(X_t)\right] + \min(X_t) \quad (1)$$

where $\hat{X}_t^n$ represents the normalized predicted data, and $\hat{X}_t$ is the corresponding value after denormalization.

#### 2.2.2 Training setting

We trained deep learning models, including DNN, RNN, LSTM, BiLSTM, and s-LSTM in Python programming language. Below, we detail the architecture and methodology of each model:

**DNN Model:** The DNN model represents a fundamental deep learning approach, constructed as a series of layers where the output of one layer serves as the input for the next. This simple model consists of three Dense layers with 30, 10, and 1 neurons, respectively, and employs the ReLU activation function. The Mean Squared Error (MSE) loss function and the Stochastic Gradient Descent (SGD) algorithm are used to optimize the model weights during training. Additionally, a learning rate scheduler is implemented to adjust the learning rate dynamically. For the CPI dataset, we chose the learning rate equal $5\times10^{-6}$ to a fixed value and used 100 epochs.

**LSTM Model:** We built the LSTM which comprises six layers arranged in the following sequence: an LSTM layer, a dropout layer, another LSTM layer, an additional LSTM layer, a dropout layer, and finally, a Dense layer. Each LSTM layer contains 50 neurons and is structured to maintain and adjust information across time steps, making it well-

suited for handling long sequential data. We used three LSTM layers, the first two LSTM layers have the parameter return_sequences=True, ensuring that they return the full output sequence at each time step for the subsequent layers; the last LSTM layer has return_sequences=False, returning only the output at the last time step, which serves as input to the Dense layer. Dropout layers, with a dropout rate of 0.2, are included to prevent overfitting. The Dense layer reshapes the output with a single neuron and employs a linear activation function. We chose the learning rate equal $10^{-6}$ , used the MSE loss function and the ADAM optimizer due to its efficiency and suitability for large datasets with extensive parameters.

**RNN model:** The RNN model is designed as a Sequential model to process and predict time series data. It includes the following layers A Lambda layer to transform the input data with input_shape=window_size. A SimpleRNN layer with 40 neurons and return_sequences=True, ensuring that the result sequence is returned at each time step for subsequent layers. Another SimpleRNN layer, also with 40 neurons, but return_sequences=False, returning only the output at the last time step. A Dense layer as the output layer with one neuron and no activation function, predicting the value at each time step. In this model, we also chose the learning rate equal $10^{-6}$, used the MSE loss function and the ADAM optimizer.

**BiLSTM model***:* The BiLSTM model uses Bidirectional LSTM layers to capture sequential relationships in the data from both temporal directions - past to present and vice versa. This model includes five layers: A Lambda layer to add a dimension to the input data, converting it into a 3D tensor (batch_size, window_size, 1) to meet the input requirements of LSTM layers. The first Bidirectional LSTM layer with 32 neurons and return_sequences=True, enabling the entire output sequence to be passed to subsequent layers. The second Bidirectional LSTM layer with 32 neurons, but without return_sequences=True, ensuring it only returns the output at the last time step. A Dense layer with one neuron as the output layer for time series predictions. We also chose the learning rate equal $10^{-6}$, used the ADAM optimizer and the MSE loss function for this model.

**sLSTM model:** The sLSTM model employs an sLSTMCell layer, a variant of LSTM that uses an exponential function in the forget and input gates. We built the sLSTM architecture with three layers: An Input layer to receive the data, an RNN layer with sLSTMCell containing 50 neurons and an output Dense layer with one neuron. We chose the learning rate equal $10^{-6}$, used the ADAM optimizer and MSE loss function for optimization and training.

**2.2.3. Forecasting and accuracy evaluation**

We used forecasting method which describes a sliding window-based forecasting approach for time series data, enabling models to learn from temporal dependencies effectively. Firstly, a time series dataset is converted into sliding windows of fixed size (window_size), where each window acts as a small sequence of data points used for prediction. The sliding windows move step-by-step (with a shift of 1 by default), ensuring that every point in the series contributes to the prediction. Secondly, the windows are flattened into batches for efficient processing. Larger batches (batch_size) are created, and prefetching is used to optimize input/output operations during prediction. Third, the trained model is applied to the prepared dataset of sliding windows. It processes these windows to generate predictions for the next time step or steps, depending on the model's configuration. After that, the predictions are flattened (squeezed) to remove unnecessary dimensions, resulting in a clean, one-dimensional output array containing the forecasted values.

The forecasting models aim to minimize the following loss function:

$$L = \min \sum_{t=k+1}^{k+T} \left\| X_t - \hat{X}_t \right\|^2$$

where $T$ represents the number of prediction intervals, i.e. $t = 1,...,k$ are observations (training input data), $t = k+1,...,k+T$ are the predictions (training output data); and $\hat{X}_t$ are given by (1), $\|.\|$ is the Euclidean norm.

The accuracy is calculated as:

$$Accuracy = 1 - \frac{1}{T} \sum_{t=k+1}^{k+T} \left| \frac{X_t - \hat{X}_t}{X_t} \right|$$

## III. RESULT AND DISCUSSION

### 3.1. Results

We conducted model training and forecasting for Vietnam's CPI using DNN, RNN, LSTM, BiLSTM, and s-LSTM models. The results for MSE, accuracy, training time, and forecasting time are summarized in **Table 1**. This result represent the average performance over 10 runs for each model, trained with 100 epochs on a laptop equipped with an Intel(R) Core(TM) i7-5600U CPU @ 2.60GHz 2.60 GHz.

**Table 1. Summary of results MSE, Accuracy, training time, and forecast time.**

| | DNN | LSTM | RNN | BiLSTM | sLSTM |
|---|---|---|---|---|---|
| **MSE** | 0.3544209 | 0.299408 | 0.391363 | 0.302579 | **0.29527** |
| **Accuracy** | 0.995509 | 0.995461 | 0.995102 | 0.995848 | **0.995951** |
| **Training time** | 22.91688 | **16.56191** | 21.4725 | 49.57649 | 21.63822 |
| **Forecasting time** | 0.47436 | 1.56916 | 0.63755 | 2.72748 | **0.30306** |

Figures 7 to 11 are comparison of Actual vs Predicted CPI on the validation set using DNN, LSTM, RNN, BiLSTM, s-LSTM models, respectively.

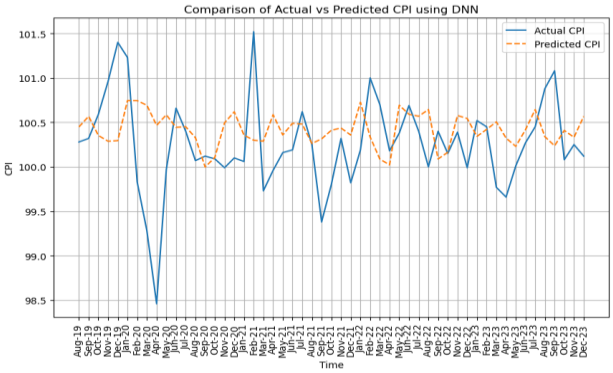

**Figure 7. CPI forecast graph using DNN**

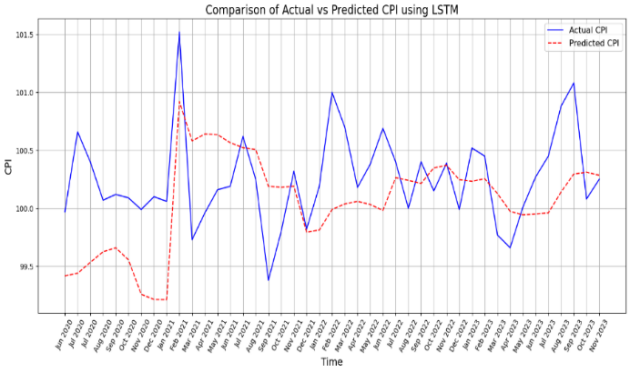

**Figure 8. CPI forecast graph using LSTM**

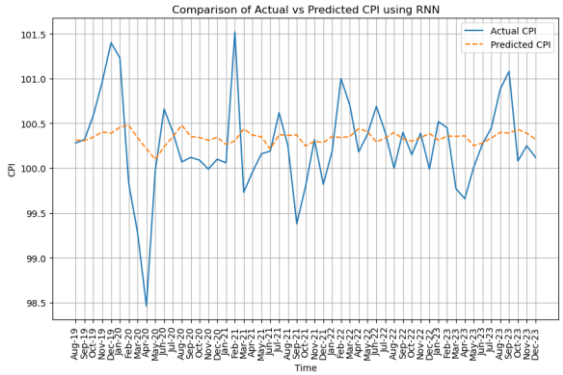

**Figure 9. CPI forecast graph using RNN**

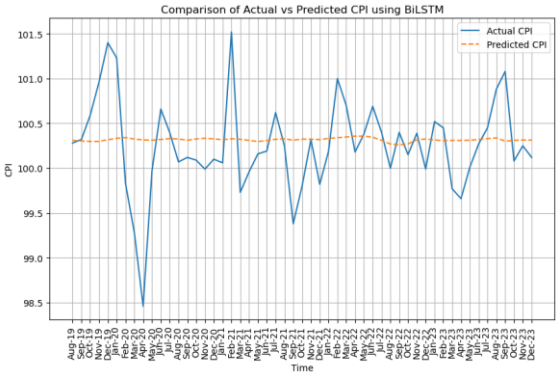

**Figure 10. CPI forecast graph using BiLSTM**

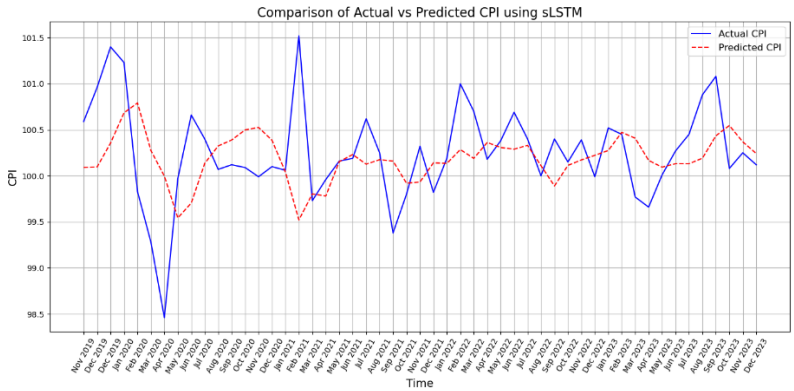

**Figure 11. CPI forecast graph using s-LSTM.**

### 3.2. Analysis of results and discussion

From the summary results in **Table 1**, it can be observed that the DNN, RNN, LSTM, BiLSTM, and s-LTSM models are all highly suitable for forecasting CPI, achieving high accuracy rates exceeding 99% and low MSE values. Among them, the sLSTM model demonstrated the best performance, achieving the highest accuracy of 99.5961% and the lowest MSE of 0.29527. Additionally, the LSTM model achieved the second-lowest MSE of 0.299408 and recorded the fastest training time of 16.56191 seconds. Meanwhile, the s-LSTM model achieved the fastest forecasting time of 0.30306 seconds. These results highlight that the deep learning models implemented in this study provide highly accurate CPI forecasts with competitive computational efficiency. According to Kong et al (2024) 0, multiple sLSTM blocks can be stacked together to form deeper networks, referred to as Ps-LSTM, which enhanced the model's capacity to capture complex temporal dependencies in sequential data. This suggests that the s-LSTM model has great potential in forecasting time series data in general and CPI in particular.

## IV. CONCLUSION

Forecasting macroeconomic indicators, including CPI, is inherently challenging due to the scarcity of data and the necessity to consider multiple influencing factors. In this study, we employed deep learning algorithms to forecast Vietnam's CPI. Based on the analysis of results, we propose the use of our LSTM model and its extension, the sLSTM model, as effective approaches for CPI forecasting. In future work, we plan to continue researching and applying more flexible machine learning models, optimizing hyperparameters, selecting appropriate features, or combining with other methodologies to develop more comprehensive forecasting models. This will enable us to analyze and address additional aspects of forecasting with greater precision.

# DIGITAL TRANSFORMATION AND ISSUES ARISING IN IMPROVING THE ORGANIZATION AND OPERATION OF URBAN GOVERNMENT IN VIETNAM TODAY

**Nguyen Thu Ha[1]**

[1]Faculty Of State And Law, Ho Chi Minh Cadre Academy.
*Corresponding: ng.tha@hcmca.edu.vn

**ABSTRACT**

Digital transformation is an inevitable trend for the economic, cultural and social development of countries, building a digital government increases the efficiency of governments at all levels, contributes to preventing and combating corruption and negativity, and increases openness and transparency. Therefore, the issue of researching and perfecting the organization and operation of urban governments in Vietnam today is an objective reality that requires research. Based on identifying the research problem, the article focuses on analyzing the theoretical basis and requirements of digital transformation associated with innovation in the organizational model and operation methods of urban governments. Using the method of analysis and comparison to study the requirements of digital transformation, the article will raise issues and policy suggestions to contribute to perfecting the organization and operation of urban governments in Vietnam today, in order to build and operate urban government governance models in a streamlined, effective and efficient manner.

*Keywords:* "digital transformation", "digital transformation requirements", "urban government"

## I. INTRODUCTION

There are currently many studies and concepts about Digital Transformation. Digital transformation can be understood as the use of digital technology, in addition to the improvements and support of traditional methods, to encourage and promote innovation (Kaputa et al., 2022). More specifically, digital transformation is a process of improving an object by activating significant changes in its properties, based on the combination of information, electronic devices, communication technology and online connections (Vital, 2019). This process, which requires an organized, well-planned approach, with the participation of all stakeholders, both inside and outside the organization, is often referred to as a digital transformation strategy, to exploit the potential and impact of new technology quickly and creatively (Bones, 2016). Digital transformation is the change in culture, organization and operations of an organization, industry or ecosystem through the intelligent integration of digital technologies, processes and capabilities at all levels and functions in an organized and strategic manner (i-SCOOP, 2018). In short, digital transformation is defined as the use of digital data and technology to comprehensively and comprehensively change all aspects of economic and social life, reshaping the way we live, work and relate to each other (N.T, 2020). In the context of urban government, digital transformation not only focuses on technology but also requires changes in leadership thinking, organizational structure and operating methods. Digital transformation is associated with a new public governance model, emphasizing the application of information technology and innovation to reform organizations, enhance transparency and interaction between government and citizens.

Urban government plays a central role in managing urban resources, providing public services and regulating social development. Digital transformation helps urban government improve management capacity, increase transparency and operational efficiency, and facilitate citizen participation in the decision-making process. It can be said that perfecting the organization and operation of urban government in Vietnam is an urgent requirement to meet the needs of socio-economic development and improve the quality of life for people.

In particular, the urban government organization model suitable to the circumstances and socio-economic situation of the city and the country will be the driving force to exploit the strengths of the city, to propose reasonable urban planning policies and plans, contributing to promoting the development of the city in particular as well as the development of the region and the country in general. Especially in the context of digital transformation playing an

important role in perfecting the organization and operation of urban government in Vietnam today. Specifically, since the recent 13th Party Congress, in the documents, urban development is considered a "strategy" and special attention is paid to the strategy, thinking, vision, tools and policies for urban and urban economic development. In the documents of the 13th Party Congress, the task is set out: "Continue to perfect the organization of local government in accordance with rural areas, urban areas, islands, administrative units, special economic zones according to the law; implement and summarize the pilot urban government to build and operate urban government governance models in a streamlined, effective and efficient manner"( (Documents of the XIII Congress, 2021). This is an important basis for cities nationwide to have more opportunities to develop in a more systematic and synchronous manner in the new context and situation.

In which, each urban area is a unified entity in terms of economy - society - population, closely bound and interdependent in production, business, service and consumption activities. Therefore, it is required that the urban government must be a government built on the basis of promoting dynamism and responsiveness in management, solving work with high work efficiency, ensuring accuracy and timeliness. State management activities in urban areas are complex, diverse with a large volume of work. Urban authorities must manage unified technical infrastructure in water supply and drainage, electricity supply, public lighting, education, health protection, environmental sanitation, traffic, and communications. At the same time, managing social infrastructure in terms of housing, services, commerce, education - training, scientific research, health care, culture, sports, food, entertainment, recreation, political security, order, social safety, etc. This shows that the organization and tasks and powers of urban governments cannot be the same as those of rural governments, especially in the context of digital transformation taking place strongly as it is today.

From the content of the organizational structure and operation of urban governments, the author determines the research content to clarify the theoretical basis and requirements of digital transformation associated with innovation in the organizational model and operation methods of urban governments in Vietnam today, within the scope of the research is the organization and operation of urban governments in the context of digital transformation. This is new content that needs to be analyzed and clarified in both theory and practice.

## II. MATERIAL AND METHOD

### 2.1. Theoretical basis of digital transformation for improving the organization and operation of urban government

Digital transformation in urban government is the process of applying digital technologies, big data, artificial intelligence (AI), Internet of Things (IoT) and other information technology solutions to modernize and optimize the organization and operation of urban government. Digital transformation can include:

- Technology: Using new technologies such as social media, smartphones, tablets and/or other technological devices.
- Organization: Changes in the organization's operations or creating new business models.
- Society: Human impacts such as user experience, openness or resistance/resistance to change (Reis, J et al., (2018).

This process not only focuses on digitizing current processes but also promotes administrative reform, innovation in management models, more efficient public service delivery and increased citizen participation in urban management activities. Digital transformation also changes the way cities/municipalities operate, and goes beyond digitizing processes by changing basic tasks and processes in cities/municipalities (Caponio et al., 2015). In some countries around the world, successful digital transformation models have been built by urban authorities in state governance such as:

+ Denmark: is the leading country in Europe in digital transformation. In terms of internet use, almost all Danes are online (95%) and scored highest (100 points) on the availability of domestic and cross-border online public services for 865 businesses, 88% of citizens interact digitally with public authorities at least once. Denmark has made the transition such as mandatory citizen accounts for government payments (NemKonto); secure electronic authentication solution (NemID), each person has a means of personal identification and secure online authentication; establishing a number of common portals such as personal health data (sundhed.dk), a single access point to all public services (borger.dk) and a dedicated public service portal for businesses (virk.dk). Digital learning tools and materials for everyone are widely

available; many basic public sector data are online and freely accessible (Nguyen Thi Huong, 2020). Denmark's digital transformation strategy focuses on creating a centralized IT infrastructure that links government agencies, local authorities with common services to implement digital infrastructure solutions, data reuse, data security, and digital welfare.

+ Estonia is one of the countries along with Denmark that has been very successful in digital transformation when building a state management government. This country has 1.3 million citizens and 867 standard services such as e-tax and personal ID. Citizens access 99% of state services, except for marriage, divorce, and real estate transactions. Each person living and working in the country has a unique ID to log into the system; 67% of citizens use the portal regularly and nearly half participate in online voting without leaving home.

+ French Republic: DCANT Program 2018-2020 (Program for the Development of e-Government from Central to Local Levels in France). The ambition of this Program is to "build together a seamless and effective local digital service". Citizens are the central target of the State and local governments in providing online public services. (Government, 2021).

+ Boston: A Digital City Transforming Urban Living, The city of Boston has emerged as a pioneer in digital transformation, leveraging digital technology to enhance urban living. The city's "Citizens Connect" platform serves as a digital hub for residents to interact with various city departments, report issues, and access municipal services. Boston has also implemented a mobile app that allows citizens to pay parking tickets, renew their licences, and receive real-time updates on city events and services. These digital initiatives have fostered a sense of community and empowered citizens to engage with the city administration more effectively (OECD, 2024).

Vietnam's urban government has been organized corresponding to equivalent administrative-territorial units and urban types are ranked equivalent to the administrative hierarchy of the territory. Selecting and building a government model suitable to political, economic, cultural conditions and specific development goals is a legitimate requirement of each locality. Implementing the innovation of the urban government organization model in a number of centrally-run cities is one of the issues that our Party and State pay special attention to. In July 2012, the Central Steering Committee for the development of a pilot project on the urban government organization model issued Plan No. 78/KH-BCĐTWCQDT "On developing a pilot project on the urban government organization model" with the "Outline of the pilot project on the urban government organization model". It clearly stated the viewpoint: The innovation of the organization and operation of local governments is posing the necessary requirement to clarify the difference between urban and rural areas, thereby determining the organizational model, regulating the functions, tasks, authority, responsibility and appropriate operating mechanism for urban and rural governments to ensure the unity, smoothness, effectiveness and efficiency of management at each level of government.

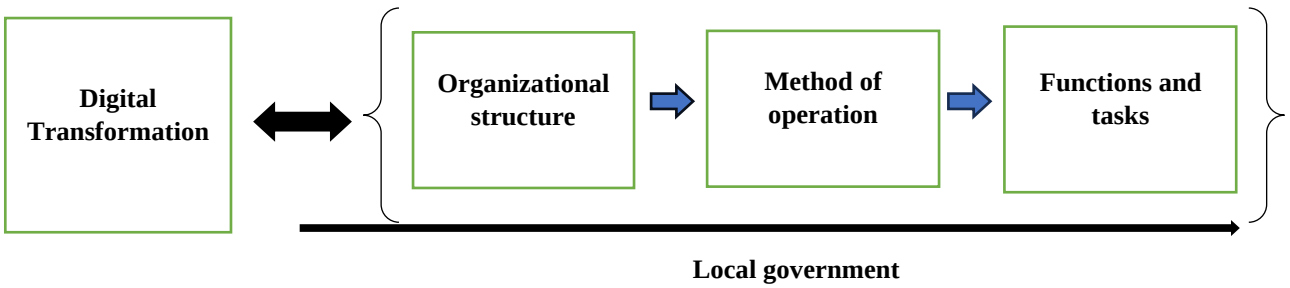
Resolution No. 27-NQ/TW dated November 9, 2022 of the 6th Conference of the Party Central Committee (13th tenure) on continuing to build and perfect the socialist rule-of-law State of Vietnam in the new period has set out the task of "Perfecting the organization of local governments suitable for urban, rural, mountainous, island areas, and special administrative-economic units; reducing appropriate levels of government in a number of localities; building a model of local government governance suitable for each locality, associated with the development requirements of regions and economic zones". Pursuant to the "open regulations" on the organization of local governments of the 2013 Constitution, the Law on Organization of Local Government 2015 (amended and supplemented in 2019) stipulates in Clause 1, Article 2: "Local governments are organized in administrative units of the Socialist Republic of Vietnam prescribed in Article 2 of this Law in accordance with the characteristics of rural, urban, island, and special administrative-economic units".

Resolution No. 76/NQ-CP dated July 15, 2021 of the Government promulgating the Overall Program for State Administrative Reform for the 2021-2030 period has set forth the requirement to "Research, amend, supplement, and perfect regulations on the organization of local governments in the direction of more clearly defining the organization of the administrative apparatus of urban, rural, island, and special administrative-economic units". Including the task of "Piloting the model of urban government under the provincial level, special administrative-economic units in places with sufficient conditions".

The 13th National Party Congress documents set out the task of "Continuing to perfect the organization of local

governments in accordance with rural, urban, island, and special administrative and economic units according to the law; implementing and summarizing the pilot urban government to build and operate urban government governance models in a streamlined, effective and efficient manner". Based on the Party's viewpoints and policies and the provisions of the 2013 Constitution and the 2015 Law on Organization of Local Government, the National Assembly issued Resolution No. 97/2019/QH14 dated November 27, 2019 on "Piloting the organization of the urban government model in Hanoi City"; Resolution No. 119/2020/QH14 dated June 19, 2020 "On piloting the organization of the CQDT model and some specific mechanisms and policies for the development of Da Nang City". Pursuant to the provisions of the Law on Organization of Local Government, amended and supplemented in 2019, the National Assembly issued Resolution No. 131/2020/QH14 dated November 16, 2020 on "Organization of urban government in Ho Chi Minh City". These are the localities taking the lead in building urban government in the new context, thereby summarizing the pilot implementation of the urban government model and specific mechanisms and policies for some localities will serve as a basis for early completion of the urban government institution... Continue to perfect the state management function on urban areas from the Central to local government levels; clearly define the functions and tasks of the focal state management agency on urban development at the Central and local levels, especially in the context that the whole country is focusing on promoting the implementation of the National Digital Transformation Program with three key pillars: Digital Government; Digital Economy; Digital Society.

**2.2. Research method**



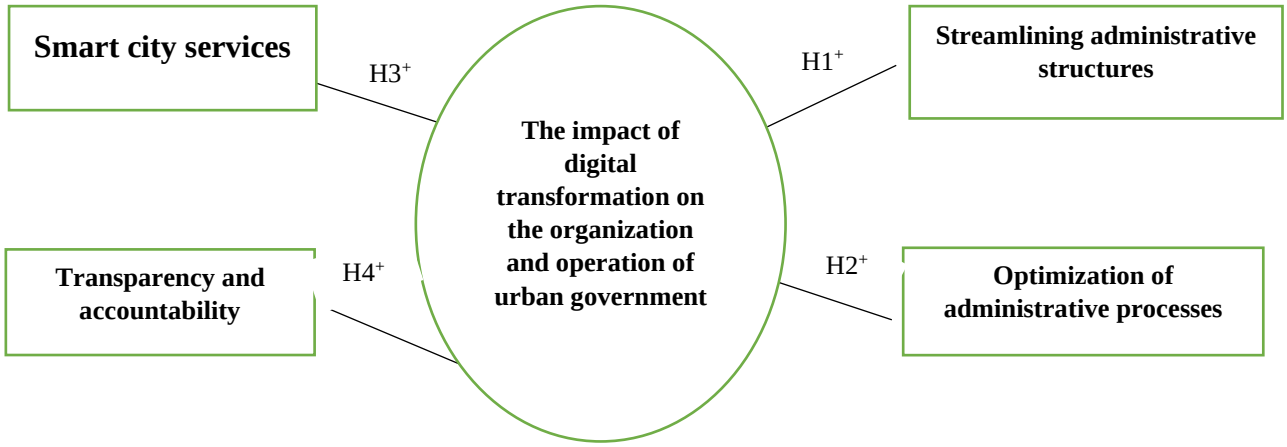
To analyze the requirements of digital transformation and propose policies to improve the organization and operation of urban governments in Vietnam, the research tools and methods that the author used are: secondary data analysis by collecting and synthesizing reports, legal documents, scientific documents related to digital transformation and urban management from government agencies, domestic and foreign organizations, previous studies. This provides a theoretical and practical foundation to identify basic requirements. Next, in-depth interview method was deployed to collect primary data. Interview subjects were management leaders at relevant departments in some localities that are building urban government. This method helps identify issues raised in the context of digital transformation, thereby suggesting policies to contribute to improving the organization and operation of urban governments in Vietnam today.

The impact of digital transformation in the organization and operation of urban governments is reflected in two aspects:

– In the organizational structure and operation of urban government when performing functions, tasks, and powers based on certain digital platforms. From management, operation, dialogue with people and businesses in all aspects, economic, cultural, social, educational, health fields...

– Digital transformation changes the way urban government apparatus operates, functions, and is organized to be more effective, transparent, and public.

**Fig. 2.2. Diagram of the relationship between digital transformation and the organization of urban government activities**



Digital transformation impacts the organizational structure and operation of local governments. This impact process includes changes in the organizational structure of urban government apparatus, operating methods, management processes and public services to suit and meet the requirements of digital transformation. The impact of digital transformation on the operation of local governments can reverse the problem: from the change in operating methods, it is required to consider and perfect the organizational structure and functions, tasks and operations of local

governments. Based on clarifying the relationship and impact of digital transformation on the organization and operation of local governments, the study suggests a number of solutions to meet the practical requirements in the process of building urban governments.

## III. RESULT AND DISCUSSION

### 3.1. Impact of digital transformation on the organization and operation of urban government

Research on the impact of digital transformation on the organization and operation of urban governments has received the attention of many researchers around the world. Swen and Reinhard (2020) highlight three main factors affecting the success of digital transformation for governments and organizations, including: the application of new technology, information and communication technology in operations, and digital capacity of leaders. Swen and Reinhard (2020) analyze the key factors for digital transformation as a multi-level model, starting from the individual and group levels to the organizational level. Meanwhile, Reis et al. (2018) classify the meaning of digital transformation into three groups: technological, organizational, and social. The technological group involves the use of new technologies such as social media and embedded devices. The organizational group involves the application of new models or changes to current processes. The study highlights digital transformation as a major challenge for the region's government organizational innovation system that requires strategic action across three key pillars: culture and skills, IT infrastructure, and ecosystem.

**H1:** Digital transformation helps eliminate intermediaries in the management apparatus, reducing bureaucracy and overlapping functions. The organizational structure is leaner and more flexible, instead of the traditional rigid hierarchical model. The trend of forming smart urban operation centers helps the government centralize data and coordinate more effectively.

**H2:** Optimization of administrative processes helps optimize administrative processes through digitizing records, applying data management systems and implementing e-government. As a result, administrative procedures are processed more quickly and transparently, minimizing bureaucracy and errors. In addition, technology also facilitates the provision of online public services, helping people easily access and perform procedures without having to go directly to government agencies. On the other hand, information technology promotes the smart city model, allowing the application of artificial intelligence (AI), big data and the Internet of Things (IoT) in traffic management, environment, security and many other areas. However, a significant challenge lies in the existence of legacy information systems that are incompatible with modern technology. These outdated systems can hinder the integration of new digital solutions, making it difficult for governments to keep up with technological advances. In addition, the prevalence of data and isolated systems hinder information sharing between different government departments and agencies. This fragmentation can lead to inefficiencies, delays and difficulties in providing comprehensive services to citizens.

**H3:** Digital transformation will revolutionize public services through digital government transformation and pioneering e-government initiatives. Citizens enjoy the convenience of accessing essential services from the comfort of their homes, reducing administrative barriers and improving overall efficiency. Digital transformation in government enables processes to be streamlined, paperwork reduced and repetitive tasks automated. This not only saves time and

resources but also improves accuracy and consistency in service delivery.

**H4:** Digital transformation promotes transparency and accountability. Digital systems provide a clear audit trail of transactions, making it easier to track and monitor government activities. This transparency helps prevent corruption and fosters public trust. Digital platforms allow citizens to access information on government budgets, policies and performance, empowering them to hold their governments accountable. The development of digital public services can lead to significant cost reductions. By automating processes, reducing paperwork and optimizing resource allocation, governments can save on operational costs. Additionally, digital services can generate revenue through online payments and fees, contributing to financial sustainability.

In addition, the application of technology in the digital transformation process in smart urban management helps save time and improve the management efficiency of the government. For example, cities are now deploying smart lighting systems, security surveillance cameras, and smart traffic management. These solutions not only optimize operating costs but also improve the quality of life of people. From there, they help urban authorities participate in the international integration process and become members of the World Intelligent Community Forum (ICF). In short, digital transformation not only helps urban authorities innovate their organization and operation methods but also brings about clear socio-economic efficiency, from improving the quality of public services, improving the living environment, to promoting sustainable development, but is also the key to building a modern, flexible and sustainable urban authority.

### 3.2. Requirements and discussion

Local authorities stand on the brink of a significant transformation, partly driven by harnessing digital tools and processes to enhance their capacities. There is immense potential for digitalization driven and enabled by local governments. It can spur economic growth, transparency, improved governance efficiency, and environmental sustainability. In a 2023 study on Digitalization: A Game Changer for Local Governments and Communities - Enhancing Capacities to Deploy Transformative Solutions. This report highlights how digitalization can revolutionize local governance, enhance community resilience, and simplify the path to a sustainable and equitable society. Digitalization helps cut costs and improve the efficiency of local government operations. Despite clear benefits, adopting digitalization is challenging, especially for cities in the Global South, where local governments face increased skills and technology gaps, infrastructure deficits, socio-economic barriers, and governance issues. This digital divide, which is more pronounced in developing regions, hampers the effective deployment of digital solutions.

Additionally, local governments should establish Digital Transformation Task Forces composed of members from various departments and tech experts. Such task forces are critical for ensuring a comprehensive and continuous approach to digitalization, spanning different administrative periods. The brief also emphasizes the importance of implementing Digital Literacy Programs. These program are crucial for equipping government employees and citizens with the necessary skills to use and benefit from digital technologies effectively.

Digital transformation is creating profound changes to the organizational structure and operating methods of urban governments, requiring management agencies to make appropriate adjustments to keep up with development trends. First of all, the most important requirement is to restructure the administrative apparatus towards streamlining, flexibility and digitalization. Urban governments need to reduce intermediaries, integrate technology platforms to automate work processes, thereby improving operational efficiency and minimizing cumbersome administrative procedures.

In addition, a significant challenge lies in the existence of legacy systems that are incompatible with modern technology. These outdated systems can hinder the integration of new digital solutions, making it difficult for governments to keep up with technological advances.

Integrating new technologies with legacy systems poses a technical challenge. Many government agencies rely on legacy information technology systems that are incompatible with modern digital technologies. Integrating new systems with these legacy setups can be complex, time-consuming, and costly, hindering the seamless implementation of digital transformation projects and initiatives.

To continue, protecting sensitive data is a top concern for governments. The public sector handles a large amount

of sensitive citizen information, and any breach of this data can have serious consequences. Ensuring robust cybersecurity measures and implementing strict data protection protocols for classified information is essential to maintaining public trust and preventing data breaches. Research on Digital transformation of local government: A case study from Greece (A Bousdekis, D Kardaras, 2020). This article lists five main challenges that local governments face when implementing digital transformation, including: Cybersecurity risks and security capabilities; The existence of information silos within the organization; Lack of resources and budget; Digital skills gap in the workforce.; rganizational culture that resists change.

A lack of effective coordination between government agencies can hinder digital transformation efforts. Successful digital transformation requires collaboration and alignment across different departments and agencies. However, bureaucratic silos and fragmented decision-making processes often hinder such collaboration, making it difficult to achieve a cohesive digital transformation strategy.

According to a study Reflections on Three Decades of Digital Transformation in Local Government (M Gasco Hernandez, 2024): This article summarizes three decades of digital transformation in local government, highlighting: The lack of organizational capacity in many local governments to implement digital transformation processes. This suggests that investment in capacity and skills development for human resources is needed to ensure the success of digital transformation projects. So, improving digital capacity for staff and civil servants is an urgent requirement. Digital transformation is not only about applying technology but also requires people to have sufficient knowledge and skills to effectively exploit digital tools. Therefore, urban authorities need to organize training and development programs on information technology, network security and data management to ensure that staff can operate the system effectively.

Another important requirement is to enhance connectivity and integration between agencies and units. Digital transformation requires a synchronous and interconnected management system between levels of government to avoid data fragmentation or overlap. Building a centralized database and applying artificial intelligence and big data will help improve decision-making and optimize operations.

In addition, ensuring information security and safety is a major challenge in the digital transformation process. As administrative activities gradually move to the digital environment, the risk of cyber attacks and data leaks is increasing. Therefore, urban authorities need to build a strong security system, deploy data encryption solutions and establish strict control mechanisms to protect personal information and important city data.

Finally, increasing citizen participation in the urban management process through digital platforms is also an important requirement. Authorities need to develop online public service portals, on-site reflection applications and digital communication channels so that people can easily contribute opinions, monitor government activities and participate in the decision-making process. This not only enhances transparency but also helps urban authorities operate more effectively.

In general, facing the strong impact of digital transformation, urban authorities need to innovate their organizational structure and operating methods towards a more modern, flexible and transparent direction. Timely adaptation to these requirements will help the government improve its management capacity, improve the quality of public services and better meet the needs of people in the digital age.

## IV. CONCLUSION

Digital transformation is not only an inevitable trend but also a strategic solution to improve the organization and operation of urban governments in Vietnam. This not only contributes to improving the organization and operation of urban governments but also creates a foundation to promote sustainable development and international integration. The synchronous combination of legal reform, human resource capacity improvement, and application of modern technology will help urban governments become more flexible, effective, and better meet the needs of society.

Researching the impact of digital transformation on the organization and operation of urban governments has great theoretical and practical significance. In theory, this study contributes to clarifying how digital transformation promotes the modernization of public administration, innovates the organizational model and operation methods of urban governments, thereby adding to the knowledge system on public management in the context of the 4.0 industrial

revolution. In practice, the study provides a scientific basis for developing policies and solutions to improve management efficiency, improve the quality of public services, and enhance transparency and accountability of urban authorities. At the same time, this study also helps guide the implementation of digital technology applications in smart urban construction, improve the relationship between the government and the people, promote sustainable socio-economic development, and increase the competitiveness of Vietnamese cities in the period of international integration.

# GREEN DIGITAL MARKETING STRATEGY: A SUSTAINABLE PATH FOR BUSINESSES IN THE DIGITAL AGE

**Doan Van Trai[1*]**

[1]Faculty Business Administration, Ho Chi Minh City University of Industry and Trade, Vietnam
*Corresponding: traidv@huit.edu.vn

## ABSTRACT

In recent years, digital marketing has gradually changed how companies communicate with customers worldwide. The increasing use of social media platforms and communication between customers and businesses give rise to new business models. Businesses are under increasing pressure to adopt sustainable practices - not only in their physical operations but also in their digital marketing strategies. Companies have considered digital marketing strategies not only as their present but also as their future. That's why they are also more conscious about the environment. A green digital marketing strategy combines the goals of sustainable business practices with digital marketing tools and channels, promoting both environmental responsibility and business growth. As more consumers demand transparency and eco-friendly practices from brands, organizations can leverage green digital marketing to build trust, enhance brand loyalty, and reduce their carbon footprint.

*Keywords*: “digital marketing”, “strategies”, “green digital marketing”, “sustainable”, “businesses”

## I. INTRODUCTION

Amidst globalization and rapid technological advancements, businesses are increasingly compelled to incorporate sustainability into their strategic planning. The pressing issues of climate change, environmental degradation, and resource scarcity necessitate a shift in corporate operations. Digital marketing has emerged as a crucial instrument, offering both an opportunity and an obligation for companies to not only meet commercial objectives but also to aid in sustainable progress. "Green Digital Marketing" extends beyond the promotion of eco-friendly products; it encompasses the utilization of digital platforms and strategies in a manner that minimally impacts the environment. Recognizing this significance, companies are adopting green digital marketing strategies to forge a sustainable trajectory for their future operations, ensuring growth that is both enduring and profitable.

This article seeks to explore the meaning of Green Digital Marketing in today's digital era and analyze the advantages it offers to both businesses and society. Additionally, it highlights the strategy's benefits and limitations. Consequently, it provides targeted recommendations for companies to implement sustainable strategies in the digital age.

Green Digital Marketing is an essential path that offers economic advantages while fostering sustainable development, addressing the demands of both the market and society in the digital age.

## II. MATERIAL AND METHOD

Since relevant research documents need to collected evaluation, it is important to choose their sources carefully. After a thorough review of the available literature from various sources, it was found that studies connecting green marketing topics with digital marketing are scarce and not widely available. Therefore, this article will select information from peer-reviewed journals on the topics of green marketing and digital marketing to investigate the connection between them.

Green digital marketing combines modern marketing strategies with the goal of protecting the environment. According to the American Marketing Association (AMA), "Green Marketing" or "Green Marketing" is the marketing of products or services based on environmental factors or perceptions. Research on the impact of green 4Ps marketing strategies on consumer purchase decisions shows that integrating environmental factors into products, prices, distribution and promotion can promote green purchase intentions and contribute to sustainable development goals.

Moreover, the distribution (Place) strategy in green marketing involves selecting environmentally responsible supply chains and minimizing transportation emissions, which aligns with sustainable development goals. Lastly,

promotional strategies in green marketing emphasize the use of digital platforms to raise awareness, educate consumers, and encourage sustainable consumption patterns. Promotional messages might include highlighting a company's commitment to sustainability, its use of renewable energy, or its efforts to reduce waste.

Research on the impact of these green 4Ps on consumer purchasing decisions has demonstrated that by integrating environmental factors into their marketing efforts, businesses can not only influence consumer behavior but also make a meaningful contribution to sustainable development goals. As consumers increasingly seek to make purchases that align with their values, green marketing offers businesses the opportunity to lead by example, drive positive environmental change, and foster long-term customer loyalty. Through effective green digital marketing, companies can not only grow their market share but also play a critical role in advancing sustainability at a global scale.

### 2.1. Theoretical Framework and Conceptual Understanding

#### 2.1.1. Green Digital Marketing Definition

The concept of "green products" has led to the development of "green advertising." It is well-established that product advertising significantly influences consumer behavior. Research has demonstrated that effective advertising strategies can alter daily habits and behaviors, increasing the likelihood of certain products being consumed. The advertising strategies and efforts aimed at encouraging the consumption of green products are known as green advertising (Ottman, 2007). The phrase "green marketing" was initially coined in the late 1980s and early 1990s by Polonsky and Everitt.

A green digital marketing strategy in the sustainability era focuses on harmonizing online marketing efforts with environmental, social, and economic sustainability goals (Table 1). Companies leverage digital tools and strategies to endorse sustainable practices, minimize environmental footprint, involve consumers in eco-friendly actions, and cultivate a brand reputation that reflects sustainable principles. Sustainability and digital marketing are becoming more intertwined.

Green marketing involves reducing a product's environmental footprint by redesigning the product, adopting sustainable manufacturing practices, and conducting comprehensive marketing campaigns. Its goal is to endorse eco-friendly products and cater to the growing demand for sustainable consumption (Dahhan & Arenkov, 2021). The primary aim of green marketing is to market these eco-conscious products effectively and attract consumers who prioritize environmental responsibility.

Grasping the difference between green marketing and sustainability marketing is essential. Green marketing is about advertising eco-friendly products, whereas sustainability marketing adopts a wider view, encompassing the whole community, its social goals, and environmental conservation efforts. It requires the engagement of national and local governments, businesses, and citizens, as well as vital resources like human expertise, financial support, and infrastructure (Burksiene et al., 2018).

**Table 1: Definition and criteria of green digital marketing**

| Criteria | Green Marketing | Sustainable Marketing |
|---|---|---|
| **Concept** | Advertising eco-friendly products to reduce environmental impact. | Focuses on social, environmental, and economic sustainability goals, including the community and environment. |
| **Goal** | Market eco-friendly products, promoting sustainable consumption. | Promote sustainable development across the entire ecosystem, including social and economic factors. |
| **Scope** | Narrow, only includes products and activities with a positive environmental impact. | Broader, includes government, community, businesses, and social goals. |
| **Strategy** | Use advertising strategies to encourage the consumption of eco-friendly products. | Promote collaboration among stakeholders, ensuring all activities and products meet sustainability requirements. |
| **Influencing Factors** | Primarily focuses on the environment. | Includes the environment, society, and the economy. |

| | | |
|---|---|---|
| **Example** | Advertising organic products, recycled products, products that reduce environmental impact. | Strategies to promote the development of sustainable businesses and inclusive societies. |

**2.1.2. Benefits of Green Digital Marketing**

For businesses, adopting a green marketing strategy represents a fresh and sustainable approach to business growth, offering numerous advantages. Implementing such strategies effectively helps companies cultivate a positive and credible brand image among consumers. By making public commitments to environmental protection, companies not only boost their reputation but also garner significant goodwill from customers who are concerned about environmental issues. This enables the brand to distinguish itself in the marketplace and secure a lasting competitive edge.

An increasing number of consumers are prioritizing brands that demonstrate social responsibility and a commitment to environmental protection. A green marketing strategy not only attracts these customers but also fosters loyalty through empathy and shared values. This presents businesses with the opportunity to cultivate long-term relationships with a customer base that is dedicated to supporting sustainable practices.

Strategies like content optimization, minimizing digital waste, and adopting sustainable technologies are not only beneficial for the environment but also aid businesses in reducing long-term operational costs. For instance, opting for green hosting services or producing evergreen content can significantly lower energy expenses and make resource use more efficient, leading to enduring financial advantages.

Moreover, being transparent about environmental conservation efforts can help companies establish trust with their customers, particularly when they publicize actions such as utilizing green supply chains or investing in carbon offset programs. When customers perceive a genuine commitment, they are more likely to remain loyal to the brand and promote a favorable image of the company within the community.

Optimizing business practices, such as enhancing website speed, creating mobile-friendly emails, and minimizing digital waste, not only reduces environmental impact but also elevates the user experience. A swift, effective, and user-centric website can lead to higher conversion rates and enable brands to engage more potential customers via online platforms.

Moreover, with the tightening of environmental regulations in numerous countries, companies must adopt sustainable strategies to avoid obsolescence. Those who lead in green marketing initiatives not only comply with legal mandates with ease but also position themselves as innovators, setting trends and gaining a competitive edge in the dynamic marketplace.

Adopting a sustainable approach, businesses are urged to find innovative solutions in production, marketing, and management. This strategy not only reduces negative environmental impacts but also fosters the innovation of products, services, and operations. Such innovation adds unique value and strengthens a business's market competitiveness.

Companies with sustainable practices often become preferred partners for collaboration, attracting investors and opening doors to funding and strategic alliances. Embracing a green identity yields immediate advantages and paves the way for enduring, valuable business relationships.

**2.1.3. Challenges and Barriers**

Green Digital Marketing Strategy: A Sustainable Path for Businesses in the Digital Age presents numerous benefits but also comes with its own set of challenges. Businesses transitioning to sustainable practices, like adopting green web hosting or obtaining eco-certifications, often face higher initial costs. Small businesses, constrained by limited budgets, may struggle with these changes. Insufficient financial resources can hinder businesses, causing them to lag and scale down operations. Additionally, many organizations lack the necessary knowledge or expertise to effectively implement sustainable digital marketing strategies, resulting in poorly executed initiatives that fail to achieve the intended impact.

While a green strategy aims to reduce environmental impact, businesses must ensure that these practices do not compromise marketing performance or ROI, which can be challenging to balance. The disparity in costs can create difficulties for businesses in managing and finding suitable solutions to balance their expenses.

Moreover, environmentally conscious consumers are becoming increasingly skeptical of "greenwashing" claims - false or exaggerated assertions about sustainability. Businesses must prioritize transparency and authenticity in their

efforts to foster trust, secure customer loyalty, and mitigate risks.

Businesses must monitor the environmental impact of their digital marketing efforts, including energy consumption and carbon emissions. This necessitates advanced tools and metrics, which may not be readily accessible to all companies. Consequently, businesses need to invest in these tools while also balancing costs to prevent excessive financial loss.

Sustainability initiatives often become secondary when businesses are under immediate pressures, such as achieving revenue targets or facing intense market competition. This makes it challenging to focus on long-term environmental goals. With the competitive market intensifying, businesses must consider multiple factors to chart the correct course for development.

As the field of sustainable practices is ever-changing, businesses are required to keep abreast of the latest standards, certifications, and technologies to remain compliant and efficient.

International and regional regulations: Environmental protection and sustainable development policies not only differ between countries but also have distinct differences between regions such as the EU, the US, and Asian markets. For example, regulations in the European Union (EU) for marketing green products require companies to meet stringent environmental standards and product certifications, while in other countries like the US or Southeast Asian nations, these standards may not be as strict or uniform.

Government incentives for sustainable businesses: Many countries have policies that incentivize businesses to adopt sustainable practices, such as tax credits or reduced taxes for companies with environmental initiatives. However, not all countries have clear or strong policies to support businesses in implementing green digital marketing strategies. Small and medium-sized enterprises (SMEs), in particular, often struggle to find financial support to adopt green technologies or energy-saving initiatives, which makes it difficult to implement green digital marketing strategies.

Ensuring transparency and reducing greenwashing: Regulations regarding certification and transparency in promoting green products can be very strict, requiring businesses to clearly prove that their products have a positive environmental impact. Failure to comply with these standards can result in heavy fines or damage to the company's reputation. However, achieving these certifications can be costly and complicated, especially for smaller businesses. The lack of a unified global certification system makes it challenging for businesses to build and maintain customer trust.

Investment in technology and infrastructure: Energy-saving technologies, green data storage, and eco-friendly digital advertising technologies often require significant investments in infrastructure and finances. Many countries do not have strong enough policies to encourage businesses, particularly small and medium-sized enterprises, to invest in green technologies. Therefore, these businesses may face difficulties when trying to implement green digital marketing strategies.

**2.2. Research method**

To examine Green Digital Marketing effectively, the following methods are proposed:

Case Study Analysis: Examining the digital marketing strategies of companies like Patagonia and Google to understand the practical implementation of green initiatives.

Survey and Consumer Insights: Conducting surveys to gather data on consumer perceptions and preferences related to sustainable practices in digital marketing.

Comparative Analysis: Comparing traditional and green digital marketing approaches to evaluate their efficiency, cost-effectiveness, and impact on consumer behavior.

Environmental Impact Assessment: Utilizing tools to measure the carbon footprint of digital marketing activities, such as energy consumption in web hosting or the ecological costs of digital ads.

These methods provide a comprehensive understanding of the effectiveness and challenges associated with green digital marketing.

The table below summarizes case studies from companies such as Patagonia, Google, and consumer behavior data in Vietnam, which help clarify how green digital marketing strategies deliver environmental benefits, increase customer

loyalty, and create sustainable competitive advantage.

## III. RESULTS AND DISCUSSION

### 3.1. Case Studies

Companies are acknowledging the need to incorporate sustainable practices into their online marketing strategies. They strive for commercial success while also fostering sustainability-driven innovation and contributing to a greener future, aligning with the United Nations' Sustainable Development Goals and the 2030 Agenda for humanity (Table 2).

**Table 2: Case studies of green digital marketing**

| Company | Key Strategy | Results / Insights |
|---|---|---|
| **Patagonia** | "Don't Buy This Jacket" campaign on Black Friday. | Promoted mindful shopping, emphasizing reuse and recycling of garments. |
| | "Worn Wear" initiative encouraging clothing repairs and trade-ins. | Built a community loyal to the brand by using social media to highlight environmental issues like climate change, plastic pollution, and recycling. |
| **Google** | Carbon-neutral since 2007 and 100% renewable energy since 2017. | Optimized data centers using AI, reducing electricity consumption by 30%. |
| | Promotes eco-friendly products through Google Ads and raises awareness through YouTube. | Supports small businesses in promoting green products and services through digital platforms. |
| **Vietnam Consumers** | 72% of Vietnamese consumers are willing to pay more for green and fitness products. | Green consumption demand in Vietnam has increased by 15% per year from 2021-2023. |
| | 86% of consumers prefer brands with a positive environmental and social impact. | 80% of consumers are concerned about the long-term harmful effects of artificial materials. |
| **Global Consumer Trends** | 85% of UK consumers made more sustainable purchasing choices in 2023. | A shift towards eco-conscious consumerism, with sustainability now influencing brand trust and loyalty. |
| | 78% of consumers consider sustainability in purchase decisions. | 73% of consumers will switch brands to support companies with strong environmental commitments. |
| **Consumer Motivation** | 70% of consumers are willing to switch brands for superior quality. | Product quality (durability, aesthetics, sustainability, and energy efficiency) is a key deciding factor in brand loyalty. |
| | 51% of global consumers consider environmental sustainability more important today. | Younger consumers (18-34) are more likely to avoid animal products for environmental reasons. |

In addition, Google actively promotes green digital marketing. The Google Ads program enables small businesses to advertise eco-friendly products and services. Concurrently, Google leverages YouTube to disseminate information on sustainability efforts and to raise awareness about the benefits of renewable energy.

A 2022 study by IBM and the National Retail Federation (NRF) found that 71% of consumers are willing to pay more for brands that are transparent and committed to sustainability. Notably, 49% of these consumers said sustainability was a deciding factor when choosing a product. The study, which involved 16,000 consumers from various countries, reflects a clear shift in global consumer behavior and attitudes.

According to a 2020 Capgemini Research Institute report, 79% of consumers said they had changed their purchasing preferences to align with sustainability criteria, while 53% had switched to products from brands with sustainability commitments in the past 12 months. This was confirmed by a real-world test involving 7,500 consumers in 12 countries, demonstrating that sustainability is becoming an indispensable factor in consumers' purchasing decisions.

In a recent study by the Harvard Business Review, brands with sustainable positioning grew 4 to 6 times faster than

conventional brands. A key takeaway was that consumers today not only care about being "green," but also value authenticity and a brand story. This suggests that companies need to be transparent and truly committed to sustainability values to gain the trust and loyalty of their customers.

A real-life example of sustainable marketing success is Unilever's campaign. In a campaign in the UK and the Netherlands, Unilever found that products with sustainable branding grew 69% faster than conventional products (Figure 1). Brands such as Dove, Seventh Generation, and Ben & Jerry's have made a significant difference through their strong environmental and social commitments, demonstrating that when brands implement truly sustainable strategies, they are embraced and trusted by consumers.

To further consolidate your data and better understand consumer behavior, you can conduct A/B tests to test the effectiveness of your sustainable marketing strategy. In this test, you can split your consumer groups into Group A and Group B. Group A will be exposed to regular product ads, while Group B will be exposed to ads that emphasize sustainability (such as using recycled materials or reducing environmental impact). You can then measure metrics like click-through rate (CTR), conversion rate (CVR), and cost per acquisition (CPA) to see how sustainability influences your customers' purchasing decisions.

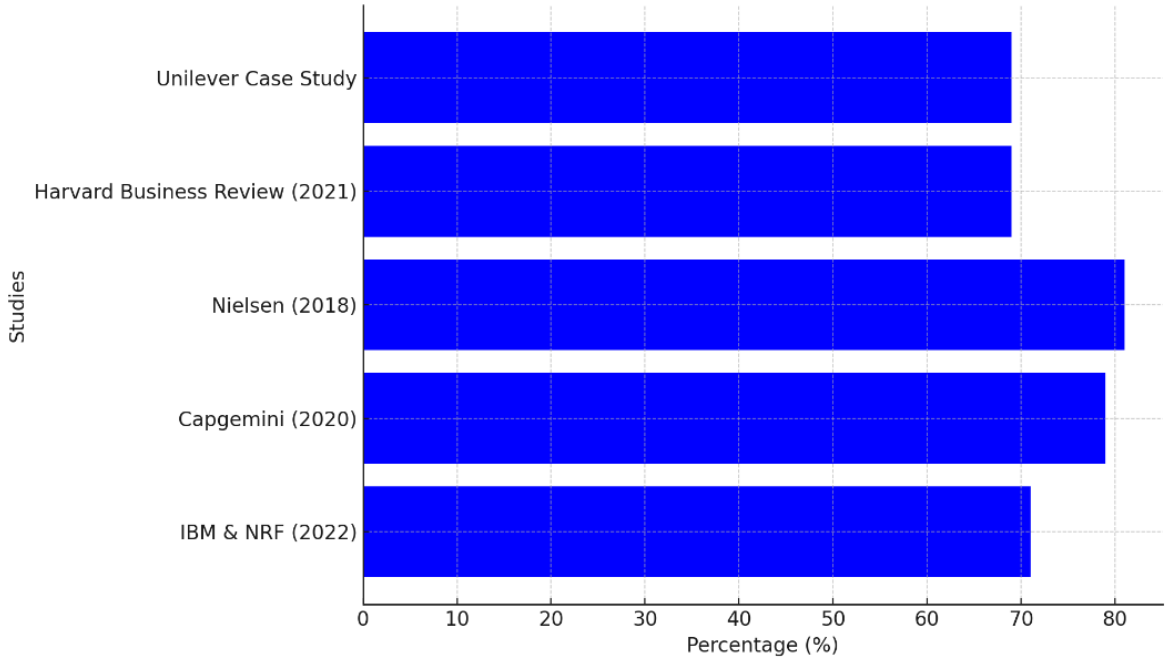

**Figure 1: Consumer Sustainability trends from various studies**

### 3.2. Lessons Learned

Through the examples of the aforementioned businesses, companies aiming to integrate sustainability into their long-term digital marketing strategies should take note of the lessons these businesses have provided. Honesty in sustainability commitments is crucial to avoid greenwashing - making false sustainability claims. Transparency is key to building customer trust and loyalty. Moreover, creatively leveraging digital platforms can amplify the message's impact.

Digital solutions like AI, Big Data, and renewable energy can reduce operational costs and enhance efficiency. Companies should invest in energy management and resource-efficient platforms. As demonstrated by Patagonia and Google, cultivating a sustainable customer community is vital. It involves actively addressing social and environmental issues and delivering genuine value through products and services.

Companies should focus beyond products to establish sustainable supply chains and operational processes. Partnering with like-minded organizations can broaden the positive impact. The experiences of Patagonia and Google offer successful frameworks and highlight that Green Digital Marketing is a continuous process that demands innovation and dedication.

### 3.3. Key Strategies for Green Digital Marketing

In digital marketing, companies have the opportunity to use diverse strategies, tools and channels to promote awareness of environmental, social, and economic challenges, thereby educating and involving the public in sustainable initiatives.

Incorporating sustainability into digital marketing strategies is crucial for companies seeking to resonate with contemporary consumer values and make a positive environmental impact. Sustainable content creation is a key element, with brands disseminating eco-friendly messages, such as sustainable living tips and their own environmental impact reduction efforts. Businesses can also diminish digital waste by focusing on durable, evergreen content that remains pertinent. This tactic reduces excess while fine-tuning media to decrease server load, boost website performance, and save energy.

Energy-efficient website optimization is another vital aspect. Firms can opt for green web hosting services powered by renewable energy sources, significantly cutting their digital carbon footprint. Enhancing website speed and efficiency not only improves user experience but also reduces the energy used during extended data processing. Through these practices, companies can seamlessly integrate sustainability into their marketing, attracting eco-aware consumers and fostering a more sustainable future.

To promote sustainability in digital marketing, companies can implement eco-friendly social media campaigns. By advocating for practices like using recyclable materials, reducing waste, and backing environmental projects, brands can showcase their dedication to sustainability. Engaging interactive content, such as infographics, videos, and captivating posts, can effectively communicate messages of social responsibility, increasing awareness and prompting action. Partnering with influencers or environmental advocates can also enhance these initiatives, using their influence to endorse eco-friendly habits and motivate the audience.

In the realm of sustainable email marketing, limiting the number of emails sent ensures that the content remains significant and impactful, preventing superfluous digital waste. Employing segmented email lists to customize communications for distinct audience segments boosts relevance and interaction. Moreover, designing emails for mobile optimization reduces file sizes, facilitating efficient transmission and lowering the energy required for email distribution. These strategies, when combined, form a comprehensive approach to sustainable marketing, nurturing customer loyalty and advancing ecological objectives.

Businesses can adopt sustainable digital advertising practices by focusing on targeted and efficient campaigns that reduce unnecessary impressions and clicks. Concentrating on specific audiences helps brands cut down on the energy consumption from excessive ad placements. Moreover, robust Search Engine Optimization (SEO) strategies can enhance organic search visibility, lessening the dependence on energy-heavy paid advertising, which not only reduces environmental impact but also boosts long-term cost savings.

Transparency is essential for trust-building, and businesses can promote carbon footprint transparency by demonstrating their dedication to sustainability. Showcasing the eco-friendly practices of their suppliers and partners underlines the commitment to a sustainable supply chain. Additionally, investing in carbon offset programs shows accountability and a proactive approach to reducing environmental impact. These strategies collectively establish businesses as responsible and progressive, attracting consumers who are mindful of the environment.

Businesses can enhance their sustainability efforts by actively endorsing green initiatives. For example, pledging to donate a share of profits to environmental organizations or projects not only showcases corporate social responsibility but also appeals to eco-aware consumers. Moreover, obtaining and displaying green certifications on websites and digital platforms indicates adherence to environmental standards, fostering trust and credibility.

In terms of data privacy and ethical marketing, transparency is crucial. Companies should be explicit about their methods of collecting, utilizing, and storing customer data, thereby nurturing trust and accountability. Minimizing excessive tracking not only addresses privacy concerns but also curtails superfluous resource use, in line with sustainable practices.

Furthermore, embracing green analytics allows businesses to monitor the ecological impact of their digital marketing endeavors. Analyzing metrics like website energy use, ad impressions, and email open rates can pinpoint improvement opportunities and help fine-tune strategies to reduce environmental footprints. Through these measures,

companies can pursue growth while upholding responsibility, aiding in the pursuit of a sustainable future.

While the steps above provide a solid foundation, a deeper discussion about how companies can implement GDM authentically is invaluable. Authenticity in Green Digital Marketing (GDM) is vital. Consumers are increasingly aware of greenwashing, where companies falsely claim sustainability efforts. To genuinely implement GDM, companies must ensure that their sustainability practices are transparent, measurable, and backed by credible data. This can include showcasing the actual reductions in energy use, carbon emissions, or waste generated through their digital marketing activities.

Patagonia is widely regarded as a pioneer in Green Digital Marketing (GDM). The company has built its reputation by not only producing eco-friendly products but also by embedding sustainability into its digital marketing campaigns. One of the most notable examples is its "Don't Buy This Jacket" campaign, which urged consumers to buy less, promoting the idea of responsible consumption and reducing unnecessary purchases. This campaign gained massive attention, with 2.4 million people visiting the company's website in the first 24 hours alone.

Patagonia also uses its digital platforms to share environmental issues, such as the impacts of climate change, and advocates for using recycled materials. On social media, the company regularly posts infographics, videos, and interactive content that not only raise awareness but also provide practical advice on reducing environmental footprints. This has helped them grow a loyal customer base of eco-conscious consumers who are increasingly interested in sustainable living. Patagonia's sustainability messaging on digital channels resonates strongly with millennials, as 60% of millennials are willing to pay more for sustainable products.

Google has been at the forefront of integrating sustainability into its digital marketing and operations. Since 2007, Google has been carbon-neutral and committed to running its operations entirely on 100% renewable energy. In 2017, the company reached its goal of running all data centers and offices on renewable energy sources, reducing its digital carbon footprint.

In terms of Green Digital Marketing, Google promotes sustainable practices through Google Ads, which supports businesses that are committed to environmental goals. For instance, Google's "Google Green" initiative encourages advertisers to promote eco-friendly products. One of its major achievements is optimizing its data centers to use 50% less energy than traditional data centers, significantly reducing the environmental impact of its services.

Through initiatives like this, Google not only demonstrates its environmental commitment but also helps thousands of advertisers reach audiences interested in sustainability. Google Cloud, for example, offers energy-efficient storage solutions that contribute to sustainable digital marketing practices by reducing the energy demands of clients' operations.

Unilever, the multinational consumer goods company, is another example of a brand that integrates sustainability into its digital marketing efforts. Unilever has made sustainability a core element of its advertising strategy. The company's Sustainable Living Brands – such as Dove, Seventh Generation, and Ben & Jerry's – have generated significant consumer interest and loyalty. According to their 2020 report, these brands accounted for 70% of Unilever's total growth.

Unilever's sustainable digital marketing campaigns often feature interactive content that educates consumers about issues like climate change, water conservation, and ethical sourcing. For instance, Dove's #ShowUs campaign aimed to challenge beauty standards while promoting positive environmental actions. This campaign reached over 3 billion people across digital platforms. Unilever also works with Google and Facebook to target eco-conscious consumers more effectively, using data to tailor ads to people interested in sustainability.

IKEA has embraced sustainable e-commerce practices, ensuring that sustainability is embedded into both its digital marketing and operational strategies. IKEA has pledged to become climate positive by 2030, aiming to reduce more carbon than its value chain emits. To promote this, IKEA runs digital campaigns that focus on recycling, reusing, and reducing waste.

For example, their "Circular IKEA" campaign highlights their efforts to encourage customers to buy sustainable products and recycle old furniture. IKEA's online platforms feature content designed to educate customers about sustainability in home decor. In 2020, IKEA launched a campaign that showed consumers how to upcycle old furniture

to reduce waste. This initiative alone led to a 20% increase in consumer engagement with IKEA's sustainability section on its website.

IKEA's digital sustainability efforts also include offering products with eco-friendly certifications, such as FSC-certified wood, through its e-commerce platforms. Moreover, IKEA has committed to climate-neutral delivery options for its customers, aligning with its sustainability goals. 25% of customers in Sweden, for example, choose carbon-neutral delivery when ordering online.

Microsoft has set a bold goal to become carbon negative by 2030, meaning the company plans to remove more carbon than it emits. The company's digital marketing efforts focus on promoting its eco-friendly technologies and its progress toward carbon neutrality. In addition to running its operations on renewable energy, Microsoft supports sustainable development goals through its Azure Cloud services and products like Microsoft Teams, which help reduce physical travel and emissions related to business operations.

Microsoft uses its digital platforms to share insights on sustainability technology and promote initiatives such as AI for Earth, which uses artificial intelligence to address climate change and protect biodiversity. By focusing on eco-friendly digital solutions, Microsoft helps its customers reduce their environmental impact, making digital transformation a central part of sustainable marketing.

### 3.4. Scientific and practical significance

#### 3.4.1. Scientific significance

**Contributing to the theoretical basis of Green Digital Marketing**

This research plays a crucial role in developing and systematizing the concept of Green Digital Marketing, clarifying related concepts such as "green marketing" and "sustainability marketing." Understanding the differences between these concepts helps shape marketing strategies that align with consumer trends and corporate sustainability goals in the digital era.

**Integrating sustainability elements into digital marketing**

The study analyzes practical strategies that businesses can apply, such as optimizing content, minimizing digital waste, and using environmentally friendly technology. These findings not only expand the scope of digital marketing but also guide future research on the relationship between digitalization and sustainable development.

**Assessing the environmental impact of digital marketing**

One highlight of the research is the provision of tools and methods to measure carbon emissions and energy consumption in digital marketing activities. This helps raise awareness of the environmental impact of marketing campaigns, thereby driving businesses towards strategies that minimize negative impacts and improve sustainability.

**Providing an empirical research framework**

Through analyzing real-life cases such as Patagonia and Google, the study has built a valuable empirical frame of reference. These cases illustrate how leading businesses have successfully integrated sustainability into their digital marketing strategies, thereby creating a useful reference platform for other businesses and researchers.

#### 3.4.2. Practical significance

**Support businesses in building sustainable strategies**

Research provides practical solutions, such as using green web hosting and optimizing environmentally friendly content and emails. These measures help businesses not only reduce costs but also minimize negative impacts on the environment. These strategies improve business efficiency and enhance competitiveness in a market that prioritizes sustainability.

**Enhance consumer loyalty**

As more consumers become concerned about environmental issues, applying green marketing strategies helps businesses build trust and loyalty from customers. The study highlights that businesses can leverage sustainability as a tool to differentiate themselves and maintain long-term relationships with customers.

**Promote Innovation and Competition**

Research indicates that green digital marketing not only aids businesses in adhering to environmental regulations but also fosters innovation in products and services. These enhancements help businesses bolster their competitive edge, especially as consumers become increasingly stringent about sustainability criteria.

**Green Economic Development in Vietnam**

With data showing that 72% of Vietnamese consumers are willing to pay more for green products, the study provides strategic guidance for local businesses to capitalize on sustainable consumption trends. This approach not only yields economic benefits but also contributes to the country's sustainable development goals.

**Policy Planning Support**

By offering practical information on effective green marketing strategies, this research can assist authorities in formulating policies to encourage the growth of green digital marketing. These policies will play a crucial role in steering Vietnamese businesses towards environmental protection and sustainable development goals (Table 3).

**Table 3: Effective of green marketing strategies**

| Strategic Elements | Specific Strategy | Benefits and Impact |
|---|---|---|
| Technological innovation | - Optimize sustainable content (create environmental content and reduce digital waste). | - Minimize waste of digital resources.<br>- Improve website performance and speed, save energy. |
| | - Use green web hosting (hosted on servers that use renewable energy) | - Reduce the carbon impact of running websites and digital platforms. |
| | - Optimize email campaigns (limit sending unnecessary emails, optimize file size) | - Minimize energy consumption during email transmission and distribution. |
| Consumer Engagement | - Building sustainable communities (engaging consumers in environmentally friendly actions). | - Increasing customer engagement and loyalty.<br>- Creating a community of shared sustainable values. |
| | - Promote green consumption habits (create campaigns that emphasize the importance of recycling and using sustainable products) | - Encourage consumers to participate in environmental protection actions. |
| | - Create interactive media campaigns (such as infographics, videos on environmental issues). | - Attract consumers' attention and create changes in consumer behavior. |
| Regulatory Compliance | - Ensure transparency in sustainability claims (no greenwashing). | - Build customer trust and loyalty.<br>- Ensure compliance with environmental and advertising regulations. |
| | - Achieve green certification (e.g. carbon-neutral certification or use of renewable energy). | - Increase brand credibility and reputation.<br>- Meet legal requirements and international standards for environmental protection.. |
| | - Ensure compliance with national and international environmental standards (e.g. ISO 14001 on environmental management). | - Ensure that the business operates within the legal framework, minimizing legal risks and protecting the environment. |

## IV. CONCLUSION

Green Digital Marketing is not just a new trend in the marketing industry; it's an essential strategy for businesses to adapt to the digital age's challenges and opportunities. As the world grapples with severe environmental issues like climate change, resource depletion, and global pollution, businesses must not shirk their responsibility to protect the planet. Adopting a green marketing strategy helps businesses align with increasing consumer sustainability expectations, yielding long-term economic benefits and strengthening their brand.

Case studies from companies like Patagonia and Google show that integrating eco-friendly digital strategies can lead to significant economic and social advantages. Patagonia has cultivated a devoted customer base by promoting sustainability through innovative campaigns. Google has demonstrated how technology can reduce energy use and

carbon emissions, encouraging other companies to embark on the green path. These instances underscore that embracing sustainable practices is not just ethically sound but also a smart business move.

Nevertheless, implementing Green Digital Marketing comes with its set of challenges. Businesses might confront hurdles such as upfront investment costs, consumer misconceptions about green claims, or the intricacies of adhering to environmental regulations across different nations. However, surmounting these obstacles can yield immense rewards, aiding businesses in becoming more adaptable and inventive, and generating enduring value for society and the environment.

To thrive on this journey, businesses must embed green practices throughout their entire operation, from product creation and service provision to promotional tactics. This necessitates substantial investment in technology, innovative marketing content, and stakeholder collaboration. Moreover, educating employees and fostering an understanding of sustainable principles will not only enhance operational efficiency but also disseminate the company's vision and mission to the community.

Green Digital Marketing not only addresses environmental issues but also creates new avenues for brand development, fosters innovation, and ensures sustainable growth. In an era of swift digital transformation and escalating consumer expectations, the synergy between technology and ecological stewardship will become a critical success factor for businesses. By embracing a green approach, companies position themselves as industry leaders and catalysts for positive change, contributing to a more sustainable future for forthcoming generations.

**Recommandations for Businesses**

To achieve sustainable development, businesses need to develop a long-term strategy that incorporates environmentally friendly activities throughout their operations, from production, distribution to marketing. Important steps include switching to recycled materials, adopting energy-saving technologies and reducing waste. Businesses should also set internal environmental standards such as reducing paper use and implementing energy management systems at production facilities. These initiatives not only reduce the ecological footprint but also enhance the company’s reputation for social responsibility, attracting environmentally conscious consumers.

To improve research on green digital marketing, one point that needs to be clarified is the distinction between the application of this strategy to large corporations and small and medium-sized enterprises (SMEs). Large enterprises often have resource advantages, including large budgets, teams of experts, and advanced technologies, which make it easier for them to implement green digital marketing strategies. They can invest in technologies such as artificial intelligence (AI), blockchain, or expensive digital platforms, while maintaining sustainability initiatives at scale.

Engaging stakeholders is crucial for amplifying the effects of sustainability strategies. Businesses can garner support from non-governmental organizations (NGOs), suppliers, and partners committed to sustainable practices. For instance, partnering with NGOs can aid in executing environmental projects or engaging in public awareness efforts. Concurrently, sourcing from suppliers that prioritize eco-friendly materials can assist companies in developing a sustainable supply chain. Moreover, collaborating with peers in the industry can lead to collective actions, such as resource sharing or joint ventures aimed at cutting down carbon footprints. Such collaborations not only enhance business value but also reinforce their role in the worldwide endeavor for environmental conservation.

To enhance the practical application of green digital marketing, digital tools and platforms such as artificial intelligence (AI) and blockchain can play an important role. AI helps optimize marketing campaigns by analyzing consumer behavior and predicting green consumption trends, thereby personalizing advertising messages and minimizing resource waste. AI also supports the automation of tasks in marketing campaigns, helping to save energy and reduce environmental impact. Meanwhile, blockchain enhances transparency in the supply chain, helping consumers verify the origin and environmental impact of products, and providing electronic certification for green products. Blockchain also enables the use of smart contracts to automate transactions related to green marketing, helping to reduce costs and increase sustainability.

The strategies discussed emphasize the importance of adopting green practices, training employees, and collaborating with stakeholders. These steps are crucial for businesses to not only attain sustainability but also to preserve a competitive edge in today's market.

To effectively implement green digital marketing, businesses need a practical framework or clear roadmap. Here are some key recommendations:

| | |
|---|---|
| **Phase 1: Assessment and Planning** | - Assess the environmental and sustainability goals the company aims to achieve (carbon reduction, energy savings, waste reduction).<br>- Identify key performance indicators (KPIs) such as CO2 emission reduction, renewable energy usage, and resource consumption reduction in marketing campaigns. |
| | - Assess the company's current resources (budget, technology, human resources) to implement the green digital marketing strategy.<br>- Differentiate strategies for large businesses and small businesses, and adjust plans |
| | - Build a detailed roadmap for green digital marketing strategies, including technology selection, digital platforms, and specific implementation steps.<br>- Ensure the plan is long-term and sustainable, helping the company achieve environmental goals within 3-5 years. |
| **Phase 2: Implement Green Technologies** | - Transition to green web hosting and platforms that use renewable energy.<br>- Optimize SEO and AI to reduce energy consumption in online advertising campaigns. |
| | - Implement blockchain to track the supply chain and certify eco-friendly products, increasing transparency and consumer trust. |
| | - Create evergreen content to save resources and reduce digital waste.<br>- Use AI tools to analyze and optimize advertising campaigns, minimizing resource and energy waste.. |
| **Phase 3: Training and Awareness Building** | - Organize workshops or training sessions to raise employee awareness about the importance of green digital marketing and necessary skills..<br>- Create a network of employees to share sustainable initiatives and help employees become change agents in the community. |
| | - Provide tools and policies to support employees in implementing sustainable actions in their daily work, such as reducing paper use or increasing the use of online tools. |
| **Phase 4: Collaboration and Strengthening Relationships** | - Seek environmentally committed partners (such as NGOs, suppliers of eco-friendly materials) to build a sustainable supply chain.<br>- Collaborate with international organizations and other businesses in the industry to share resources, improve processes, and reduce carbon emissions. |
| **Phase 5: Measurement and Improvement** | - Set up a system to measure effectiveness (using metrics such as carbon footprint, energy consumption, consumer engagement).<br>- Publicly disclose results of the green digital marketing strategy, including reduced emissions, renewable energy use, and environmental protection initiatives. |

**Developed Economies: High Consumer Awareness and Digital Penetration**

In developed economies such as the United States, European Union, and Japan, consumers tend to have high levels of environmental awareness and are increasingly looking for brands that align with their values. These regions are also characterized by advanced digital infrastructure, allowing for a more sophisticated application of Green Digital Marketing (GDM).

Sustainability Certifications & Transparency: In markets like the EU, where environmental standards are strict, businesses can benefit from eco-labels and sustainability certifications (e.g., EU Ecolabel, Fair Trade). For instance, companies in these regions often use digital platforms to showcase carbon-neutral status or eco-friendly product lines, which are highly valued by consumers.

Digital Campaigns Focused on Education: Businesses in developed economies can run detailed, data-driven digital campaigns that educate consumers about specific sustainability issues. For example, Patagonia and Unilever use their digital platforms to provide in-depth content on the importance of climate action, recycling, and ethical sourcing.

**Emerging Economies: Growing Eco-Consciousness and Developing Digital Infrastructure**

In emerging economies such as India, Brazil, and South Africa, the level of consumer environmental awareness is growing, but it may not be as widespread as in developed countries. Digital infrastructure is improving, and smartphones are becoming increasingly popular, making digital marketing an ideal channel to promote sustainable practices. However, challenges related to affordability and access to sustainable alternatives still exist.

Localized Sustainable Messaging: Brands can tailor their green marketing campaigns to address local environmental concerns. For instance, in India, issues like water scarcity, plastic pollution, and air quality are major environmental concerns. Brands can create educational content on how their products or services help address these issues, such as offering water-efficient or pollution-reducing products.

Cost-Effective Sustainability Initiatives: Many consumers in emerging markets are still focused on price sensitivity, so businesses need to balance sustainability with affordability. Offering products that reduce long-term costs, like energy-efficient appliances or recyclable packaging, can be a compelling strategy. IKEA, for example, has launched affordable sustainable products in countries like China and India, promoting them through targeted digital ads and social media content.

Mobile-First Marketing: In countries with large mobile user bases like Brazil and India, mobile-first marketing strategies are essential. Businesses can leverage WhatsApp, Facebook, and other social media platforms to engage consumers with simple, informative campaigns on sustainable products or services.

**Low-Income Economies: Limited Resources and Focus on Basic Needs**

In low-income economies, such as those in parts of Sub-Saharan Africa or Southeast Asia, the primary focus for consumers is often on basic needs such as food, water, and shelter. However, there is a growing interest in sustainability, particularly among urban populations and youth.

Sustainability as a Value Proposition: In low-income economies, green marketing campaigns need to emphasize the long-term value of sustainability. For example, affordable products that reduce waste, lower utility bills (like energy-efficient lighting), or help with waste management can be marketed as solutions that improve quality of life, even on a budget.

Partnering with Local Organizations: To reach consumers who may have limited access to digital platforms or high-end green products, businesses can partner with local NGOs or community organizations to promote sustainable products. These partnerships can help build trust and awareness in communities that might be skeptical about the benefits of sustainability.

**Cross-Cultural Adaptation and International Markets**

As globalization continues to expand, multinational corporations must consider cross-cultural factors when implementing GDM strategies. While sustainability may be a top priority in some regions, it may not hold the same weight in others.

Cultural Sensitivity: When implementing Green Digital Marketing across multiple countries, businesses need to adapt their messaging to resonate with local cultures and values. For example, what works in Europe (where environmental concerns are highly prioritized) may need to be adjusted for regions where economic growth and job creation are more pressing concerns.

Global Campaigns with Local Messaging: Brands like Coca-Cola and Nestlé have successfully implemented global sustainability campaigns by customizing messages for different markets. Coca-Cola, for instance, ran a global recycling campaign, but its messaging varied to highlight different environmental issues depending on the country, such as water scarcity in India or plastic waste in the U.S.

By understanding the specific economic contexts in which they operate, businesses can better adapt their Green Digital Marketing (GDM) strategies to local realities. In developed economies, companies can focus on highly sophisticated sustainability messaging through digital channels that emphasize eco-friendly certifications and long-term benefits. In emerging markets, businesses may need to balance affordability with sustainability and focus on mobile-first marketing. In low-income economies, marketing must focus on the long-term value of sustainability and partner

with local organizations to reach more people.

# APPLICATION OF ARTIFICIAL INTELLIGENCE IN EVALUATING RICE BRANDS ON MULTIMEDIA COMMUNICATION NETWORKS IN THE DIGITAL ERA

**Ngo Ho Anh Khoa[1], Vo Khuong Duy[2], Nguyen Anh Duy[2]**

[1]Quanmetry, France.
[2]Adhightech Ltd. Co. , Vietnam
Corresponding: nguyenanhduy@adhigtechn.com

**ABSTRACT**

Artificial intelligence (AI) has now become a transformative technology, serving as a vital assistant for all activities in the modern world. The application of AI across various industries is no longer unfamiliar, including its use in agriculture in Vietnam. Notably, as Vietnam is currently the third-largest rice exporter globally, numerous rice brands, both large and small, have emerged. However, the evaluation of these brands' quality remains limited and lacks standardized methods, making it difficult for consumers to choose suitable products. Therefore, this study aims to present a method that applies AI to search, analyze, and provide periodic evaluations of Vietnamese rice brands. This approach seeks to help consumers make informed decisions more easily while enhancing the competitiveness and quality of Vietnamese rice brands.

*Key words:* "rice brands evaluation", "vietnamese rice brands", "artificial intelligence (AI)", "AI applications"

## I. INTRODUCTION

### 1.1. The Current Situation of Rice Industry Brands in Vietnam

For many generations, rice has been one of the closely considered staple foodaresthe life of Vietnamese people. As a country with a long history in agricultural cultivation, up to the specialty of rice farming, Vietnam holds an advanced position among the top countries in both exporting and importing large quantities of rice in tandem with the domestic and foreign markets. This has contributed to building a solid financial foundation for the whole nation and the agricultural sector in particular. However, this robust development has posed significant challenges. An increasing number of rice brands have appeared in the domestic market, ranging from small-scale operations to major brands. This has left consumers confused when trying to find reliable and suitable products.

Undeniably, branding has a key role in the growing phase of the rice industry's distribution and production setup. Trust and goodwill generated in the minds of consumers are additional benefits that enhance the reputation of business partners and the general community. With a good brand image, it becomes very easy to draw the attention of organizations and other forms of investment for reinforcing infrastructural production and improving product quality. Moreover, a robust brand enables businesses to expand their distribution networks and establish long-term relationships with customers, creating opportunities to boost sales and achieve sustainable growth. Finally, an outstanding brand also serves as a crucial foundation for businesses to enter international markets, thereby elevating the status of Vietnam's rice industry on the global stage. Therefore, investing in brand building and development is not only a core element but also a long-term strategy to ensure the solid growth of enterprises in this sector.

The process of building a brand for the rice industry involves numerous issues that need attention. According to industry expert Mr. Pham Thai Binh, Chairman of the Board of Directors of Trung An Hi-Tech Joint Stock Company (Cần Thơ City), "Building a brand for Vietnamese rice should not stop at the element of delicious quality but must meet various other criteria. Developing a brand for each type of rice and rice variety should focus on the diverse demands and tastes of international consumers. Most importantly, the rice must meet green, clean, and food safety standards, which are currently the top priority" (Tam, K., Quoc, C., and Dau, B., 2023).

### 1.2. Challenges of Vietnam's Rice Industry

As mentioned in the previous section, Vietnam's rice industry is currently facing numerous significant challenges. One of these is the fierce competition among domestic brands. While each brand strives to create its unique identity,

consumers often struggle to differentiate between the quality and pricing of various products. Additionally, climate change severely affects rice production and quality, increasing market volatility. Uneven product quality remains an unresolved issue, causing confusion and eroding consumer trust. These challenges underline the urgent need for a transparent and comprehensive evaluation system to help consumers choose the best products while encouraging enterprises to improve production standards.

However, Vietnamese consumers tend to buy rice based on experience and pay little attention to branding. Changing consumer awareness and habits is a long and challenging process. Exploiting this gap, many businesses imitate the names of established rice brands to profit, disregarding consumer health.

The proliferation of brand imitation has become more severe since 2019, when Vietnam's ST25 rice, developed by Mr. Ho Quang Cua and his company, earned the title of "World's Best Rice." According to Tien Phong Daily, on April 5, 2024, the Hanoi Market Management Department launched inspections across six rice trading locations in Hoang Mai District, Hai Ba Trung District, and Hoai Duc District. Inspection results revealed signs of trademark violations involving Ong Cua Rice products at certain establishments (Tuyen, P., 2024).

The issue of counterfeit and imitation rice brands is not only prevalent in major cities like Hanoi and Ho Chi Minh City but has also spread to provinces and localities across the country, including Soc Trang, the birthplace of the ST25 rice variety. Exploiting the brand's reputation, many individuals and businesses have arbitrarily labeled their packaging with the ST25 name without ensuring a clear origin. This undermines consumer trust and causes severe damage to the reputation of legitimate businesses.

This issue not only diminishes the value of Vietnamese rice brands on the international stage but also hinders businesses from expanding their markets. Addressing this problem requires close coordination among stakeholders. The government needs to intensify inspections, strictly penalize violations, and support intellectual property rights protection. Businesses should adopt anti-counterfeiting technologies such as QR code labels, while consumers should raise awareness and prioritize products with clear origins to help eliminate counterfeit and imitation goods (Tam, K., Dau, B., and Manh, T., 2021).

### 1.3. The Absence of a Rice Brand Evaluation System

Currently, the evaluation of rice brands in Vietnam remains limited, with no official and comprehensive tool publicly available. Most evaluations are conducted using manual methods such as surveys, industry workshops, or programs like "Building a National Brand for Vietnamese Rice" (Tam, K. and team, 2024). The evaluation of rice brands in Vietnam is still under development. The ASEAN-Japan Center (AJC) has collaborated with experts to share branding experiences for agricultural products, including rice (Dung, H. T., and Quoc, C., 2024). Additionally, policies aimed at enhancing the value and position of Vietnamese rice brands are being promoted by the Ministry of Agriculture and Rural Development (Khanh, N., 2024).

In this context, amidst the rapid development of social media and artificial intelligence (AI) technology, the application of AI in evaluating rice brands is a highly promising solution. This is the first study to apply AI in assessing rice quality, while all previous studies or evaluation methods have been limited to traditional quantitative and statistical tools. AI applications can not only measure the effectiveness of indicators on social media—where consumers can easily access, use, and trust information—but also provide objective and comprehensive evaluations of the quality, reputation, and competitiveness of rice brands in the digital era. This will create greater transparency and reliability within the industry, effectively meeting the needs of consumers and stakeholders.

### 1.4. Methods for Evaluating Rice Brands

In modern society, trust and reputation are built brandwise, which put businesses or organizations in a strong good place. For rice trading enterprises branding is not only a tool for enhancing competitiveness but also a bridge that can attract customers. Currently, the evaluation of rice brands in Vietnam primarily relies on traditional and manual methods, with no specialized tools available for assessing specific rice brands.

As one of the world's leading rice producers, Vietnam regularly organizes quality rice evaluation competitions to honor outstanding rice varieties and promote the development of the rice production industry. One notable example is the "*Vietnam Delicious Rice Contest*", periodically organized by agricultural associations, organizations, or related

entities. The contest is to find out the best rice varieties in Vietnam which will increase the value of Vietnamese rice brands both at home and abroad because it will be held in two categories including fragrant rice and glutinous rice. Participating rice varieties must be developed in Vietnam, officially circulated or tested, with a purity level of ≥98%, and free from poor-quality grains (*e.g., yellow, damaged, immature, or red-striped grains*) (Hai, T., & Phien, C., 2022).

On the international stage, one of the most prominent events for evaluating rice quality is the "World's Best Rice Contest," organized annually by The Rice Trader. This event allows countries to showcase their finest rice varieties and assert their positions in the global market. In recent years, Vietnamese rice brands have consistently achieved high awards, demonstrating significant advancements in quality and farming techniques. Notably, the ST25 rice variety made a strong impression by winning first prize twice, in 2019 and 2023 (Tam, K., and Dung, H. T., 2023). .It confirms not only the quality of rice but also raises the reputation and credibility of Vietnamese agricultural products in the world market.

Also, the International Rice Research Institute (IRRI) holds yearly contests and awards to celebrate great research and development in the rice field. In Southeast Asia, the ASEAN Rice Trade Forum is a yearly event that looks at helping and checking rice quality throughout the region.

Overall, evaluation criteria in both domestic and international competitions are based on: *flavor, stickiness, fluffiness, grain shape, color, and nutritional quality*. These criteria are built on the physical properties of rice grains, such as milling rate, whiteness, shape, and chemical characteristics, including nutritional content, protein levels, and aroma, to comprehensively assess quality. Such events and competitions help identify and honor rice varieties that meet high-quality standards. However, being recognized as delicious does not necessarily mean the rice is distributed by a reputable brand. Therefore, additional methods are needed to directly evaluate brands. Brand evaluations primarily rely on third-party services, as there is no direct and efficient tool for businesses or users to perform this independently. This measurement process is typically conducted by companies specializing in brand evaluation services. In Vietnam, companies such as Mibrands and Nielsen Vietnam are reputable providers of market survey and brand analysis services.

For Mibrands, this is a company highly active in the field of market research and marketing services, providing solutions to help businesses better understand their market and customers. Mibrands focuses on delivering market research solutions to evaluate brands across four main groups: *1. Market Potential and Trend Research (Market Census):* Identifying opportunities and prominent trends*; 2. Contextual Research (Positioning Context):* Evaluating brand positioning within a competitive context; *3. Customer Psychology and Behavior Research (Customer Usage & Attitudes):* Understanding customer needs and habits; *4. Communication Campaign Effectiveness Evaluation (Communication Efficiency Score):* This set of solutions makes Mibrands stand out as it includes an index system co-developed by Mibrands and SurveyTrue, in collaboration with professors from RMIT University (Ho Chi Minh City), initiated in 2014 (SurveyTrue, 2022). The indices include: *Ad Recognition (measuring customer reach and recall):* Immediate Recognition Index (Self-awareness index); Clear Recognition with Assistance Index (Ads-prompted awareness index); Unclear Recognition with Assistance Index (Ads-unclear awareness index); *Ad Perception (evaluating customer emotions and opinions):* Campaign Awareness Index (Ads-Perception Index); Campaign Feeling Index (Ads-Feeling Index); Ad-Personal Relevance Index (Ads-Relevant Index); *Ad Impact (measuring influence on purchasing behavior*): Impact on Brand Affection Index (VVOB Love Index); Ad Effectiveness on Behavior Change Index (Perception & Behavior Change Index).

Another company, Nielsen Holdings PLC, was established in 1923 by Arthur Nielsen. It is a global market research and advertising company headquartered in New York, USA. Operating in over 100 countries, Nielsen provides data and analytics to help businesses better understand their customers and consumer behavior. Nielsen utilizes tools like Nielsen Ratings to measure television audiences, conduct consumer surveys, analyze sales data, and track shopping behavior. To analyze the "health" of a brand, Nielsen uses the following measurement indices for market research:

### 1.4.1. Volume Sale & Share / Value Sale & Share

These indices focus on measuring the scale and value of revenue from products or services over a specific period.

Volume Share: Measures the percentage of a brand's goods compared to the total goods in the entire market (Son, T. P., 2016). The formula is defined as:

$$Volume\ Share\ (\%)\ =\ (\frac{Your\ Volume\ Sale}{Total\ Market\ Volume\ Sale})\ \times\ 100 \quad (1)$$

Value Share: Determines the percentage of a brand's revenue within the total market revenue, using the formula:

$$Value\ Share\ (\%)\ =\ (\frac{Your\ Value\ Sale}{Total\ Market\ Value\ Sale})\ \times\ 100 \quad (2)$$

### 1.4.2. Market Share

Market share reflects the extent of a brand's dominance in total revenue or sales across the industry during a specific period (Hayes, A., 2024). The formula is:

$$Market\ Share\ (\%)\ =\ (\frac{Company\ Sales}{Industry\ Total\ Sales})\ \times\ 100 \quad (3)$$

### 1.4.3. Ratings & Share

The Ratings and Share indices are mainly used for measuring media and audience engagement, providing insights into the reach and participation of target audiences.

Rating: The percentage of an audience within the total target group watching a specific program (The VAB., 2024). The formula:

$$Rating\ \%\ =\ Share\ \%\ x\ Households\ Using\ Television\ \%\ (HUT\ \%) \quad (4)$$

Share: Evaluates the dominance of a program compared to the total audience watching TV at that time (The VAB., 2024). The formula:

$$Share\ (\%)\ =\ (\frac{Rating\ \%}{HUT\ \%})\ \times\ 100 \quad (5)$$

### 1.4.4. Consumer Insights

Consumer behavior analysis (Gimasys, 2024) provides detailed data on customer preferences, habits, and trends. Notable indices include:

Purchase Frequency: The frequency of consumer purchases over a period.

Average Basket Size: The average quantity or value of items in each shopping trip.

Customer Lifetime Value (CLV): The estimated value a customer brings to the business throughout their shopping lifecycle.

**Fig 1. Customer Insight (Source: Gimasys)**

These indices are not only tools for evaluating business performance but also help businesses optimize marketing, distribution, and product development strategies based on proven consumer trends through real-world data.

While traditional brand evaluation methods such as direct surveys and interviews are still widely used, they

increasingly reveal limitations in the current context. These methods require significant human and time resources and often lack accuracy, especially when dealing with complex and inconsistent data. Furthermore, the collected data is often not systematically organized or digitized, making it challenging to comprehensively compare and evaluate brands, particularly in the rice industry, a field with growing competition and highly specialized products.

This outdated evaluation approach struggles to keep up with modern trends, where technology and big data play an increasingly critical role. Developing modern evaluation tools that leverage technology and data analytics not only helps rice industry businesses optimize brand strategies but also supports them in improving product quality and building market credibility. Moreover, in the digital era, where social media plays a significant role in shaping consumer perceptions, a reputable rice brand with positive reviews not only fosters customer trust and loyalty but also attracts investment opportunities from financial funds or government entities. This provides a vital competitive advantage, contributing to enhancing the business's position in both domestic and international markets.

## II. MATERIAL AND METHODOLOGY

### 2.1 The Development of Contemporary AI Systems

The year 2024 marks a significant leap in artificial intelligence, where this technology has not only reached new heights but also become a focal point of investment from major corporations worldwide. Renowned models like ChatGPT (OpenAI), Gemini (Google), Claude (Anthropic), and Copilot (Microsoft) have become icons of groundbreaking development, providing effective solutions across various fields. While ChatGPT and Gemini lead in the chatbot domain, text-to-image tools like DALL-E 3 (OpenAI) and Stable Diffusion (Stability AI) have revolutionized digital art creation. Moreover, AI plays a pivotal role in healthcare with applications like IBM Watson Healthcare and Ada Health, offering smarter and more precise healthcare solutions.

Notably, NVIDIA is leading the AI chip manufacturing market with its H100 product line (Hanh, N., 2024), laying the foundation for an intense race in high-tech fields. Advances in AI chip manufacturing not only transform the industry but also drive fierce competition among large and medium-sized corporations globally. This promises to create a dynamic global economy where businesses continually innovate to maintain their positions in a challenging market.

Today, artificial intelligence does not just play the role of a tool but also an inspirational driver behind the creation and improvement of quality life in all sectors. ChatGPT, however, not the first nor the smartest product, has created a media explosion and, because of its fame, blinded people to recognize the true essence of artificial intelligence. With its powerful natural language processing capabilities, ChatGPT effectively supports learning, research, and content creation.

Simultaneously, apart from open-source models, we also evaluate models available via APIs, such as Gemini-1.5-pro and GPT-3.5-turbo, provided by Google and OpenAI. Gemini-1.5-pro is a mixture-of-experts model (Jacobs et al., 1991; Zhang et al., 2021), designed with a structure comprising multiple "experts" (sub-networks). Its unique feature is that only a few experts are activated for each input token, optimizing pre-training performance and accelerating inference processes. ChatGPT, built by OpenAI on the Transformer model platform developed by Google, is based on a deep learning architecture using the self-attention mechanism. This allows the model to capture relationships between words in a sentence without relying on sequential architecture (Anh, T. N., 2024). However, the GPT version only uses a decoder to predict the next word in a text sequence. Concurrently, Claude AI, an equally prominent chatbot, is considered a strong competitor to ChatGPT due to its superior technical specifications. Claude 3.5 Sonnet features a context length of 200k tokens and outputs up to 8192 tokens, while ChatGPT API reaches only 128k tokens and outputs 4096 tokens (Zhu Liang, 2024). Provided by Anthropic through Google’s Vertex AI platform, Claude supports advanced AI application development. Vertex AI helps businesses efficiently build and manage machine learning models (Doan, N., 2024). Claude’s notable APIs include Claude 3.5 Sonnet, Claude 3.5 Haiku, and Claude 3 Opus.

Not to be outdone by other industry "giants," CEO Mark Zuckerberg has heavily invested in the AI technology race. The result is LLaMa 3.1, an AI model developed by Meta Platforms Inc., marking the first release with configurations of up to 405 billion parameters (Meta, 2024). This model was built in collaboration with NVIDIA, leveraging the power of 16,000 H100 GPUs, NVIDIA’s flagship chips (Dang, H., 2024).

On another note, locally-run large language models (LLMs) are becoming a significant development trend due to

advantages such as greater control, lower operating costs, significantly reduced latency, and superior data security (Awan A. A., 2023). These benefits not only help businesses and organizations optimize performance but also offer flexibility for customization to meet specific needs. Recently, several locally-run LLMs in Vietnam have gained attention thanks to exceptional technological advancements and applicability. Notable examples include Phở GPT, introduced at the Vietnam AI Day event organized by VinAI and the New Turning Institute (Dang, N., 2023). Phở GPT offers the PhoGPT-4B model, with 3.7 billion parameters, trained from scratch on a massive Vietnamese dataset comprising 102 billion tokens, a context length of up to 8192, and a vocabulary of 20,000 token types (Nguyen, D. Q.. et al., 2023). Additionally, models like Vistral-7b-chat (Nguyen, C. V. et al., 2023) and VinaLLaMA-7B-chat (Nguyen, Q. et al., 2023) are developed through supervised fine-tuning (SFT) (Xu et al., 2023; Ding et al., 2023) based on open-source models (e.g., LLaMA-2 and Mistral), utilizing Vietnamese language text datasets. Openchat-3.5, developed by Wang et al. (2023), is a fine-tuned version of LLaMA-2 through Reinforcement Learning from Feedback (RLFT) (Ouyang et al., 2022; Rafailov et al., 2023). The research group introduced a Conditional-RLFT technique using an English text corpus with diverse content and mixed quality. They confidently assert that Openchat-3.5 is the first 7B model to achieve performance equivalent to ChatGPT. To optimize deployment, these open-source models have been converted to the Q5_K GGUF format for efficient local operation.

### 2.2. Evaluation Process

The study utilizes two independent models to evaluate the output quality based on the same input dataset: the ChatGPT model and a unique prompt structure called PPN. ChatGPT, a pre-developed AI platform, is accessed directly via API.

Meanwhile, the experimental custom model, developed by Adhightech and built upon the Openchat-3.5-7B framework, is a tailored solution applied in this study. The distinctive PPN prompt structure is designed to filter and extract “positive” (p) and “negative” (n) keywords or phrases from the articles. Each article’s score is determined by the total occurrences of positive and negative elements.

$$E_m^i = \{E\mathrm{p}_m^i;\ E\mathrm{n}_m^i\} = \{\sum_{s=1}^{j} p_s^{ai};\ \sum_{r=1}^{k} n_r^{ai}\} \quad (6)$$

Here, $a_i$ represents the ***i***-th article in the dataset, while ***j*** and ***k*** denote the counts of positive and negative keywords, respectively. The parameter ***m*** indicates the total number of articles in the dataset. The assessment of a brand's sentiment *positive* or *negative* is derived using the following calculation:

$$E_{all} = \{\frac{\sum_{t=1}^{m} Ep_m^{ai}}{m};\ \frac{\sum_{t=1}^{m} En_m^{ai}}{m}\} \quad (7)$$

This method, initially proposed by (Ngo-Ho, A.-K. et al.,2024a), utilizes a large language model (LLM) through a chatbot API to identify and quantify positive and negative keywords (Ngo Ho, A. K., 2021). The formula provides a quantitative relationship between these keyword categories by measuring their occurrences and interrelations. Leveraging OpenAI’s LLM technology, this algorithm has been validated in multiple recent studies focusing on Vietnamese language applications, such as (Ngo-Ho, A.-K. et al.,2024b). Despite its demonstrated effectiveness, this approach remains novel, with limited studies exploring its comparative performance or adaptations.

## III. EXPERIMENT AND DISCUSSION

### 3.1 Evaluation Dataset

The study employs a simple Python script to collect articles related to a specific brand within a defined time frame. This script retrieves data using the Google search engine while excluding content originating from the brand’s official website or associated pages displayed in Fig. 2.

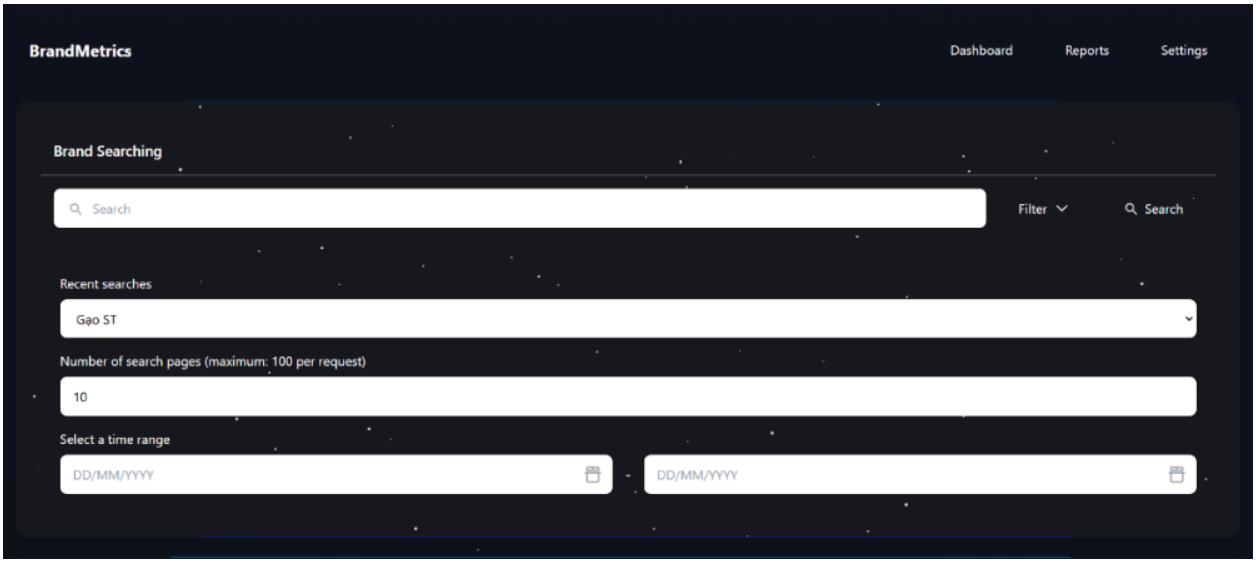

**Fig 2. User interface of the university brand evaluation system (demo)**

Using the brand's name as the primary keyword, the program gathers all links returned by Google, accesses each link, extracts text content, and filters out advertisements or irrelevant information. The processed content is saved as text files (.txt) without including images or charts. This method ensures comprehensive data collection about the brand within the specified time period. The workflow is clearly depicted in the sequential diagram in Fig. 3.

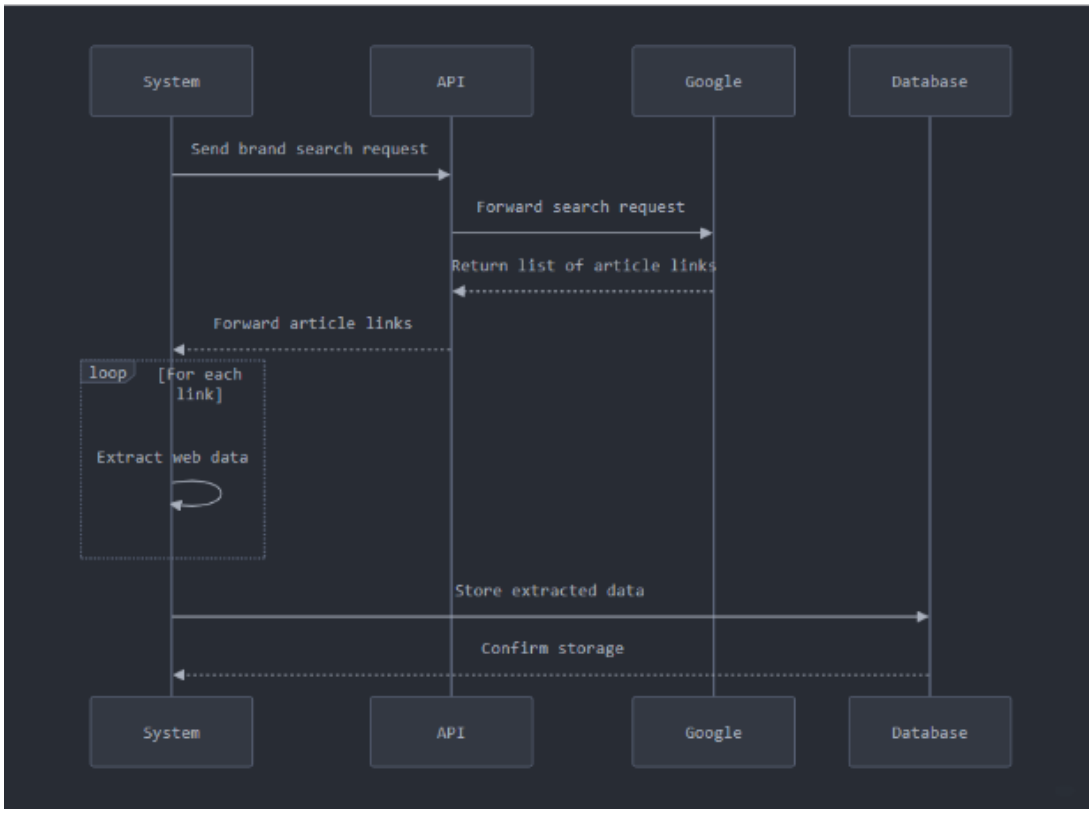

**Fig 3. Sequence Diagram of system**

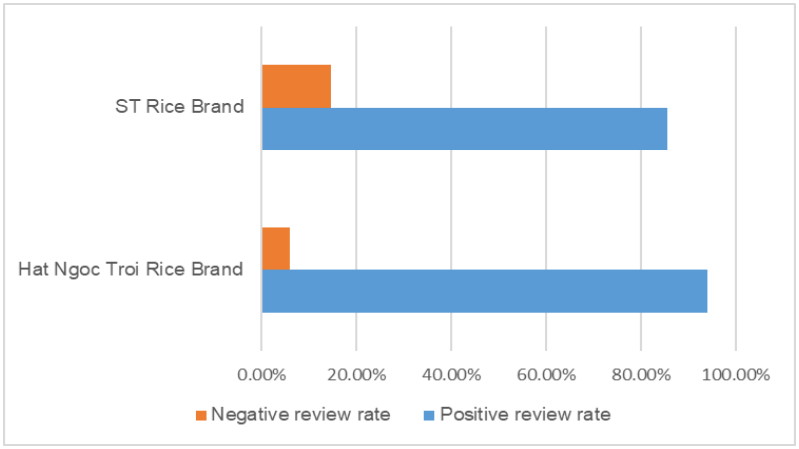
### 3.2 Case Study

To illustrate the research findings, the study employs a representative case study comparing the "ST Rice Brand" and the "Hat Ngoc Troi Rice Brand" on social media platforms. The database for this case study is derived from the program outlined in section 3.2, Evaluation Process. This case study relies on the retrieval of all posts about these two brands during a six-year period, spanning from January 1, 2019, to December 1, 2024. The evaluation dataset comprises 200 articles on the "ST Rice Brand" and the "Hat Ngoc Troi Rice Brand," sourced based on Google indexing results. The trial run of the evaluation tool yielded the following results in Fig 4:

**Fig 4. Test results for the keywords “ST Rice” and “Hat Ngoc Troi Rice”**

It is evident that the results, though complex in reflecting positive and negative sentiments for a particular brand, have been simplified into practical, identifiable ratios (Fig 5.):



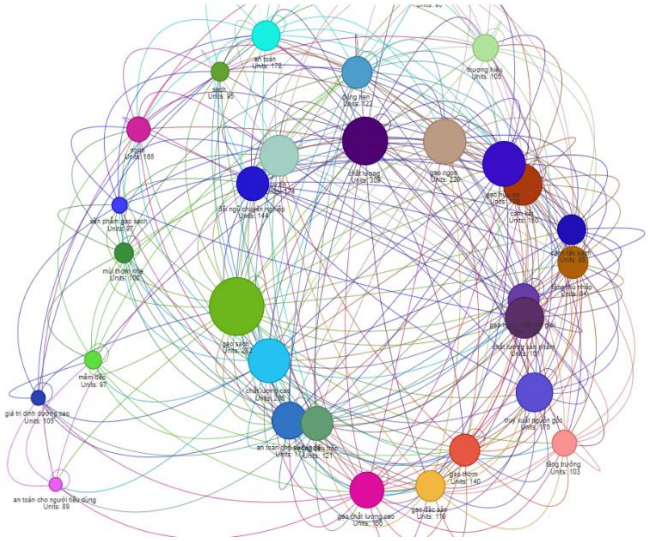


**Fig 5. Comparison test results for “ST Rice” and “Hat Ngoc Troi Rice”**

The study acknowledges that these results remain rudimentary, as they do not yet account for the severity or weight of specific positive and negative keywords/phrases. The assessment currently relies solely on their frequency of appearance on multimedia platforms. A more sophisticated system is under development to address these limitations.

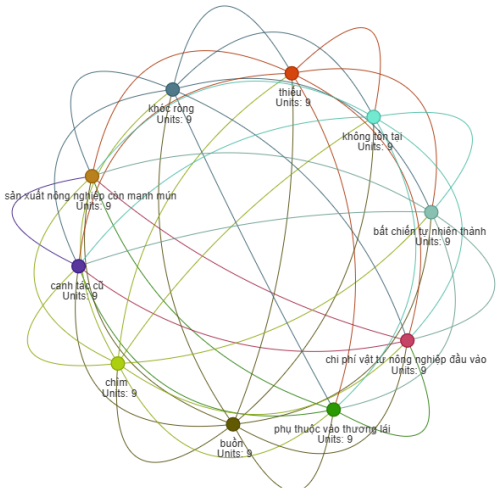

**Fig 6 Positive Keyword Chart (Example: AAn Rice)** **Fig 7 Negative Keyword Chart (Example: Gạo A An)**

Results from additional keyword testing, within a specified time frame, are presented below. It is noted that these do not represent a comprehensive evaluation of the entire study period (Table 1):

**Table 1. Brand evaluation of some rice-brands in Vietnam (randomly selected)**

| Rice brand | Positive Rate (%) | Negative Rate (%) |
|---|---|---|
| ST Rice | 85.47 | 14.53 |
| AAn Rice | 93.31 | 6.69 |
| TigiFood Rice | 87.22 | 12.78 |
| Hat Ngoc Troi Rice | 94.05 | 5.95 |
| Jasmine Rice | 85.26 | 14.74 |

Currently, there is no specific evaluation tool designed to comprehensively analyze and measure rice brands, especially on social media platforms. Assessing rice brands predominantly relies on specialized brand evaluation firms and market research companies employing traditional methods such as direct surveys and individual interviews. While these methods provide valuable data, they are often time-consuming, labor-intensive, and costly. Additionally, they struggle to accurately reflect the rapid changes in consumer trends and opinions in the online environment. This underscores the urgent need for a modern tool capable of leveraging big data and analyzing social media information to provide comprehensive, accurate, and timely evaluations.

## IV. CONCLUSION

In conclusion, this study is the first in Vietnam to apply artificial intelligence (AI) technology in evaluating rice brands on social media and communication platforms. This approach is not only an inevitable trend but also brings significant practical value. In the context of Vietnam's rice industry facing challenges such as counterfeit products and consumer confusion, AI has introduced a novel approach, surpassing traditional evaluation methods. With its ability to collect, process, and analyze vast amounts of data from diverse sources, AI provides comprehensive, objective, and timely evaluations. The research findings also reveal that modern AI models not only assist in detecting fraudulent activities but also enhance brand credibility by delivering reliable information to consumers. This not only helps Vietnamese rice brands improve their communication strategies but also contributes to building trust and confidence among customers. Currently, the study primarily focuses on extracting information from Google data. In the future, the research will aim to expand by incorporating more data from social media platforms such as Facebook, X (formerly Twitter), TikTok, and Shopee to increase the accuracy of evaluations. Overall, AI is not just a tool but a strategic solution for protecting and developing rice brands in the digital era.

# DIGITAL INNOVATION AND CHANGING CONSUMER BEHAVIOR: A PATHWAY TO SUSTAINABLE SMES GROWTH IN RURAL VIETNAM

**Nguyen, Thi Lan Huong[1*], Pham, Tra My[2]**

[1]Faculty of Business Administration, Ho Chi Minh City University of Economics and Finance, Vietnam
[2]Faculty of Business Administration, Ho Chi Minh City University of Economics and Finance, Vietnam
*Corresponding: huongntl@uef.edu.vn

**ABSTRACT**

The rapid advancement of digital technologies has transformed global business landscapes, emphasizing the need for enterprises to adopt innovative practices. In Vietnam, small and medium-sized enterprises (SMEs), particularly in rural areas, face unique challenges in digital transformation due to disparities in infrastructure, digital literacy, and socio-cultural dynamics. Addressing these issues is critical to fostering equitable and sustainable economic growth. This study aims to identify the key factors influencing digital adoption among Vietnamese SMEs, with a specific focus on rural contexts. Guided by the Unified Theory of Acceptance and Use of Technology (UTAUT), the research integrates complementary frameworks such as the Technology Acceptance Model (TAM), Theory of Planned Behavior (TPB), and Technology-Organization-Environment (TOE) to provide a holistic understanding of individual and organizational adoption behaviors.The findings highlight significant barriers, including infrastructural constraints, cultural resistance, and skepticism toward digital platforms. At the same time, enablers such as community-driven trust-building, localized content, and performance-enhancing digital tools are identified as pivotal in overcoming these obstacles. The study emphasizes the importance of tailored strategies that align with the socio-cultural realities of rural Vietnam.Looking forward, this research underscores the need for investments in digital infrastructure, targeted digital literacy programs, and longitudinal studies that explore the evolution of digital adoption behaviors. By advancing UTAUT's application in resource-constrained environments, this study contributes actionable insights to bridge the rural-urban digital divide and support sustainable growth for Vietnamese SMEs in the digital economy.

## I. INTRODUCTION

### 1.1. Digital Innovation landscape

Since the 2010s, the Fourth Industrial Revolution has profoundly transformed various aspects of human life. During this period, the concept of "digital innovation" and its applications has gained significant attention, becoming a key global focus for nations and enterprises (TM Anh, 2021). According to Kagermann (2015) and Pink (2005), digital innovation has been marked by swift technological advancements, including the widespread use of mobile devices, increased internet access, and the incorporation of artificial intelligence and machine learning. These developments undeniably exert profound effects on individuals and businesses (Rogers, 2003; Davis, 1989).

This evolving consumer landscape underscores the imperative for corporations to reevaluate their business strategies and embrace digital transformation (Hewavitharana, T., 2021; Mihardjo et al., 2019). Digital transformation, which involves leveraging digital technologies to alter business models and operations fundamentally, aims to create new value and opportunities (Fitzgerald et al., 2014; Frank et al., 2019; Crupi, et al., 2020). In the context of Industry 4.0, digital transformation has become a necessity rather than an option, as corporations face competition from new market entrants offering innovative business models (Mihardjo et al., 2019). By adopting digital tools, businesses can enhance customer engagement, broaden their market reach, improve operational efficiency, and reinforce their competitive advantages in this dynamic market (Boratyńska, K., 2019).

### 1.2. Outlook in Vietnam

In Vietnam, the outlook for digital transformation is more promising than ever. The robust development of internet infrastructure, coupled with the increasing prevalence of mobile device usage, has significantly enhanced the country's

readiness for digital transformation.On November 19th, 1997, Vietnam entered its technological era with the introduction of internet access to its citizens. After nearly three decades, by 2023, the country's internet penetration rate reached 79%, placing it 39th globally, with approximately 77.93 million people online (Adtima & RMIT University, 2023; Group M, 2024a; Statista, 2025). Furthermore, internet infrastructure in Vietnam has also rapidly evolved, improving both in speed and cellular data capabilities. As of February 2023, Vietnam also ranked 39th globally in fixed internet speed Group M, 2024. The development of cellular data has progressed significantly through the generations from 1G to the latest 5G technology, which offers speeds 40 times higher than 4G and twice that of current 5G technologies (Group M, 2024a). On the other hand, mobile internet usage in Vietnam has seen substantial growth, with an estimated 81 million users in 2023, accounting for about 80.7% of the population (Statista, 2025). The Vietnamese government aims for universal smartphone usage by the end of 2024. (EdTech Agency, 2023).

This interconnected progression has made the internet become an integral part of daily life in Vietnam, with individuals spending an average of 6.4 hours online per day in 2023, ranking the country 26th globally in internet usage (Adtima & RMIT University, 2023). While activities such as social networking, chatting, entertainment, and information-seeking remain prevalent, there has been a notable shift in consumer behavior. The adoption of online shopping increased from 55% to 66%, and the use of e-wallets rose from 39% to 45%, highlighting a growing preference for digital purchasing methods (Group M, 2024a). Vietnam's e-commerce market is projected to grow by 25% in 2023, with revenue surpassing $20 billion, and expected to double, reaching $40 billion by 2025. With an annual growth rate of 20%, Vietnam has been ranked among the top five countries globally for e-commerce growth by eMarketer. Furthermore, this growth trajectory is anticipated to continue, with the number of e-commerce users projected to grow at a Compound Annual Growth Rate (CAGR) of 9.93%, increasing from 17.3 million in 2018 to 44.6 million by 2028 (Group M, 2024b). This trend highlights substantial opportunities for Vietnam's e-commerce sector. Additionally, numerous studies indicate that digital innovation has altered consumer purchasing decisions. According to Deloitte's 2021 Vietnam Consumer Survey report, while traditional marketing channels like word of mouth and TV still hold significant sway over consumer buying decisions, digital and social media channels are rapidly gaining traction, influencing around 55% of purchases across all product categories. Similarly, Adtima's 2023 Rural Playbook (2023) confirms that social platforms are the second most influential source of information affecting purchasing decisions among rural consumers in Vietnam. Noticeably, in these rural areas, the role of community dynamics in shaping trust and influencing digital adoption significantly impacts the purchasing decisions of customers. They tend to value personal recommendations more than corporate messages, with 79% of rural online shoppers making purchases based on influencer endorsements.

Consequently, word-of-mouth, local influencers, and community approval are particularly impactful, offering trusted and relatable information that resonates with rural consumers (Group M, 2024a & 2024b) Faced with these changing customer behaviors, Vietnamese businesses feel a pressing need to embrace digital transformation. This shift aims to enhance customer experiences through improved understanding of customer information, innovation in business models, and the integration of advanced technologies (VA Ta & CY Lin, 2023). Small and Medium Enterprises (SMEs), which constitute approximately 98% of all enterprises in Vietnam, play a pivotal role in the national economy. They contribute around 48% of the country’s GDP, 20% of export value, and provide employment for 77% of the labor force (Thi Nhung, Gan & Hu, 2015). For SMEs, prioritizing the customer journey is essential. By delivering a positive and impactful experience, they can foster customer loyalty, thereby achieving their broader objective of improving business efficiency and competitiveness (Setia et al., 2013).

Understanding the essential role of digital transformation in sustaining economic growth and prosperity, the Vietnamese government has made significant efforts to promote and regulate various aspects of the digital economy (Cameron et al, 2019). However, a report by IDC in 2020 “Asia Pacific SMB Digital Maturity Study” found that Vietnam was still in the very early stages of digital transformation maturity, ranking last out of 14 APAC countries. This disappointing result shows that while awareness and promotion of Industry 4.0 within Vietnam are encouraging, technology adoption remains low, underscoring the need for a better approach to support the national transformation.

Hence, this study aims to address two primary questions: (1) "What are the key factors influencing digital adoption at both individual and organizational levels, particularly for small and medium-sized enterprises (SMEs) in Vietnam?"

and (2) "What are the barriers to digital adoption for SMEs in Vietnam, especially in rural contexts?". This focus is informed by the acknowledgment of significant differences between rural and urban areas, including disparities in cultural contexts, infrastructure, digital skills, educational access, and levels of investment (Asia Foundation, 2021; Nguyen et al., 2023b; Vietnam Economic Impact Report, 2023). These substantial gaps may lead to variations in digital transformation readiness between rural and urban enterprises, highlighting the need for tailored and effective strategies to facilitate digital transformation across the entire nation.

To understand and address these challenges, theoretical models provide valuable frameworks for analyzing digital adoption behaviors. Models such as the Theory of Reasoned Action (TRA), Technology Acceptance Model (TAM), Unified Theory of Acceptance and Use of Technology (UTAUT), Theory of Planned Behavior (TPB), and Technology-Organization-Environment (TOE) framework offer insights into the interplay of individual, organizational, and environmental factors. The study will then explore how factors beyond perceived usefulness and effort expectancy influence digital transformation in underdeveloped areas. This approach aims to deepen the theoretical understanding of digital transformation in rural settings. The findings indicate that conventional models, which mainly emphasize usefulness and effort expectancy, might miss crucial influences relevant to underdeveloped areas. It highlights the need to incorporate trust-based variables into models evaluating technology adoption in these regions and suggests that future models should broaden to include trust elements, offering a more comprehensive framework for analyzing digital adoption in rural environments. Additionally, this study will also preveal barriers to digital adoption, providing actionable recommendations for policymakers, SMEs, and researchers to advance equitable digital transformation across Vietnam.

## II. MATERIAL AND METHOD

This study employs a systematic literature review methodology, guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework (Moher et al., 2009). The review focuses on understanding technology adoption among Vietnamese SMEs, especially in Rural areas, by synthesizing key theoretical frameworks, identifying adoption barriers and enablers, and providing insights. The conceptual model is derived from the Unified Theory of Acceptance and Use of Technology (UTAUT), which explains user behavior through constructs like performance expectancy, effort expectancy, social influence, and facilitating conditions (Venkatesh et al., 2003). Complementary frameworks, including TAM, TPB, TRA, and TOE, are also considered to provide a comprehensive understanding of adoption behaviors at individual and organizational levels.

The PRISMA framework ensures rigor and transparency through its four stages: identification, screening, eligibility, and inclusion. In the identification stage, 450 records were retrieved from databases such as Scopus, Web of Science, and Google Scholar as well as reports from the World Bank, organizational white papers, and Vietnamese government authorities. After removing duplicates and screening for relevance, 220 studies were retained based on criteria such as their focus on rural SMEs and their alignment with key theoretical frameworks. Following eligibility evaluations, 95 studies (80 peer-reviewed articles and 15 reports) were included in the final review were included, synthesizing theoretical insights, contextual factors, and practical applications for SMEs.

The review highlights significant findings: UTAUT is particularly relevant for addressing rural adoption challenges, emphasizing facilitating conditions and social influence. Key barriers include infrastructure limitations, low digital literacy, and skepticism toward digital platforms, while enablers such as trust-building strategies, community-driven initiatives, and localized digital content promote adoption. These findings provide actionable recommendations for policymakers to improve infrastructure and digital literacy, for SMEs to adopt community-centric strategies, and for researchers to explore longitudinal studies on adoption behaviors in rural contexts.

## III. RESULT AND DISCUSSION

### 3.1 Models and Frameworks of Determinants Affecting Digital Adoption at Individual and Corporation Levels.

Research on technology acceptance and usage spans individual, group, and organizational levels, representing a mature domain within information systems (IS) research (Venkatesh et al., 2016; Venkatesh, Davis, & Morris, 2007; Sarker & Valacich, 2010). Technology adoption in rural Vietnamese SMEs requires a holistic analysis of individual and organizational behaviors. Models like the Theory of Reasoned Action (TRA), Technology Acceptance Model (TAM),

and Theory of Planned Behavior (TPB) emphasize attitudes, perceived ease of use, behavioral intentions, and control (Fishbein & Ajzen, 1975; Ajzen, 1991). Broader frameworks like the Technology-Organization-Environment (TOE) and Unified Theory of Acceptance and Use of Technology (UTAUT) address environmental and organizational factors (Tornatzky & Fleischer, 1990; Venkatesh et al., 2003).

Contextual challenges, including limited infrastructure, policy inconsistencies, and regional disparities, significantly affect adoption behaviors (World Bank, 2021; Walsh et al., 2023). Individual adoption hinges on perceived benefits, social influences, and facilitating conditions, while organizational adoption focuses on productivity, system integration, and strategic alignment (Ajzen, 1991; Fishbein & Ajzen, 1975). Quantitative methods dominate this field, but mixed-methods approaches are recommended to address nuanced realities and translate theoretical insights into practical strategies for rural contexts (Kumar & Ayedee, 2021). Integrating TRA, TAM, TPB, TOE, and UTAUT frameworks provides a cohesive pathway for advancing technology adoption and sustainable growth in under-resourced settings.

### 3.2 Technology Adoption in Individual Perspective

#### 3.2.1 Theory of Reasoned Action (TRA)

The Theory of Reasoned Action (TRA), developed by Fishbein and Ajzen (1975), is one of the foundational models in adoption research. TRA emphasizes that behavioral intentions are shaped by attitudes and subjective norms that significantly predict intentions to act (Bagozzi et al., 2000). TRA provides a foundation for understanding individual decision-making processes, particularly in Vietnam rural contexts where social norms heavily influence technology adoption (Ng, 2020; Albarracín et al., 2001; Armitage & Conner, 2001). Attitude toward behavior refers to an individual's positive or negative evaluation of performing the targeted behavior, shaped by their salient beliefs regarding its outcomes and the evaluation of those outcomes (Hewavitharana et al., 2021, Fishbein & Ajzen, 1975; Bagozzi et al., 2000). Subjective norms, on the other hand, reflect the influence of external social pressures, shaped by nominative beliefs and motivation to comply with these pressures (Hale, J., 2002, Bagozzi et al., 2000). These factors combine to predict behavioral intention, which in turn influences actual behavior, assuming minimal external constraints. However, TRA does not account for external conditions such as opportunities, skills, or resources, which are critical for technology adoption (Fishbein & Ajzen, 1975).

#### 3.2.2 Technology Acceptance Model (TAM): An Enhanced Perspective

Building on the Theory of Reasoned Action (TRA), the Technology Acceptance Model (TAM), proposed by Davis (1989), simplifies the conceptualization of technology adoption by introducing two key constructs: perceived usefulness (PU) and perceived ease of use (PEOU). PU represents the extent to which technology improves performance, while PEOU reflects the effort required to use it (Surendran, 2012; Hewavitharana et al., 2021). These constructs are influenced by external factors, including social, cultural, and political dimensions. Social factors encompass language, skills, and facilitating conditions, whereas political influences include governmental policies and political stability (Khan, Saleh, & Quazi, 2021).

User attitudes, as defined in TAM, refer to the evaluation of employing a specific technology, while behavioral intention measures the likelihood of adopting the technology (Chen et al., 2017). This model has been extensively applied in customer adoption studies, particularly in rural contexts where simplicity and perceived utility are pivotal for technology acceptance (Taylor & Todd, 1995; Pathak et al., 2019).

Despite its wide application, TAM has limitations in addressing external influences such as cultural and environmental factors. To overcome these gaps, recent studies have integrated additional dimensions into the model. For instance, Jan, Alshare, and Lane (2022) incorporated Hofstede's cultural dimensions to examine the role of societal norms in technology adoption. Similarly, Granić (2022) demonstrated the value of combining TAM with models like the Unified Theory of Acceptance and Use of Technology (UTAUT) to enhance its explanatory power. Research by Javier et al. (2023) and Pathak et al. (2019) in rural settings underscored the importance of including cultural and environmental factors, emphasizing their critical role in shaping adoption behaviors.

By addressing these limitations, TAM has evolved into a more comprehensive framework for analyzing technology adoption, particularly in diverse contexts such as rural areas. This expanded approach enables researchers and

practitioners to better understand the interplay between individual, cultural, and environmental factors, ensuring a more holistic analysis of adoption behaviors.

### 3.2.3 Theory of Planned Behavior (TPB)

The Theory of Planned Behavior (TPB), introduced by Ajzen (1991), extends the Theory of Reasoned Action (TRA) by incorporating perceived behavioral control, addressing the role of external barriers and internal resources in shaping adoption intentions. TPB posits that an individual's behavior is influenced by three key components: behavioral beliefs, normative beliefs, and control beliefs. These components reflect attitudes toward behavior, the influence of external parties, and the degree of control over performing the behavior, respectively (Ajzen, 1991).

TPB has proven particularly effective in understanding technology adoption in rural and resource-limited environments, where infrastructure challenges and digital literacy often serve as barriers (Aubert et al., 2012; Salemink et al., 2017). Alam et al. (2020) have shown that psychological factors and socio-psychological norms significantly influence technology adoption behaviors. In such settings, perceived behavioral control is critical, as individuals' intentions are shaped by both internal capabilities and external constraints (Sniehotta, Presseau, & Araújo-Soares, 2014; Thomas, Singh, & Gaffar, 2013). Similarly, institutional trust has been shown to influence adoption intentions by affecting attitudes and perceived behavioral control, validating TPB's applicability in rural contexts (Li et al., 2022).

Recognizing the limitations of standalone models, researchers have combined TPB with the Technology Acceptance Model (TAM) to create the C-TAM-TPB framework. This integrated model incorporates subjective norms and perceived behavioral control, allowing a more nuanced understanding of the variation between intention and actual behavior. This flexibility makes the model applicable to both technologically experienced individuals and novices, offering better insights into technology acceptance (Taylor & Todd, 1995; Kammani et al., 2014).

While TPB offers a more comprehensive framework than TRA by addressing external barriers and internal resources, it has limitations. A significant critique is its lack of consideration for human emotions, which can influence behavioral intentions and actions (Ajzen, I.,2011; Thomas, Singh, & Gaffar, 2013). Moreover, the model's reliance on rational decision-making processes may not fully capture the complexity of behavioral dynamics in diverse contexts. The Theory of Planned Behavior extends TRA by adding perceived behavioral control, making it a robust framework for analyzing behavior in technology adoption, particularly in rural and resource-constrained environments. Its integration into models like C-TAM-TPB enhances its explanatory power, providing a comprehensive lens for understanding the interplay of individual, social, and environmental factors. However, addressing its limitations, such as omitting emotional influences, could further refine its application in diverse adoption contexts.

## 3.3 Technology Adoption in Organizational Perspective

While TRA, TAM, and TPB focus on individual adoption behaviors, the Technology-Organization-Environment (TOE) framework, developed by Tornatzky and Fleischer (1990), shifts the focus to organizational adoption by analyzing the interplay of technological, organizational, and environmental factors. The TOE framework is particularly relevant for SMEs in rural Vietnam, where limited infrastructure, resource constraints, and external policy environments present unique challenges and opportunities for digital transformation (Tornatzky & Fleischer, 1990; Lutfi et al., 2022). Recent studies have emphasized the adaptability of the TOE framework across various contexts, particularly in developing economies. For example, Loo et al. (2024) highlighted that leadership support, resource availability, and external pressures such as government policies and market dynamics play pivotal roles in shaping SMEs' readiness for digital transformation. Similarly, Lutfi et al. (2022) underscored the importance of technological compatibility and infrastructure, noting that these factors significantly influence the adoption of advanced digital solutions like big data analytics in resource-constrained environments.

These findings highlight the necessity of tailoring the TOE framework to account for the unique structural and cultural challenges faced by SMEs in rural settings. However, the applicability of the TOE framework is not without limitations. Studies reveal that SMEs' limited resources and less developed technological infrastructures differentiate them significantly from larger firms, requiring a nuanced understanding of how TOE factors interact in smaller organizational contexts (Sun et al., 2020; Wahab et al., 2021). Furthermore, environmental factors, including governmental support, regulatory frameworks, and competitive pressures, are particularly impactful in rural Vietnam,

where businesses often lack the capacity to independently drive digital adoption initiatives (Yoon & George, 2013; Alharbi et al., 2022). Critically, the framework must integrate external cultural and environmental factors, such as community trust, societal norms, and region-specific infrastructure challenges, to provide a comprehensive analysis of SME adoption behaviors. This holistic perspective is especially pertinent in rural Vietnam, where evolving customer demands for digital adaptation necessitate innovations not just in technology but also in organizational processes and leadership approaches (Nguyen et al.,2023a). By leveraging the TOE framework, policymakers and SME leaders can develop targeted strategies that address the structural, cultural, and policy-related challenges unique to rural Vietnam. Such strategies should align organizational innovation with shifting market trends, ensuring that SMEs can meet the demands of digital adaptation while fostering sustainable growth.

**3.4 Synthesizing using Unified Theory of Acceptance and Use of Technology (UTAUT): A Comprehensive Model**

The Unified Theory of Acceptance and Use of Technology (UTAUT), proposed by Venkatesh et al. (2003), integrates elements from prior models such as TRA, TAM, TPB, and TOE, providing a comprehensive framework for understanding technology adoption. UTAUT identifies performance expectancy, effort expectancy, social influence, and facilitating conditions as primary determinants of behavioral intention and technology usage. While extensively validated in developed economies, UTAUT's application in resource-constrained settings, such as rural Vietnam, remains under-explored (Hewavitharana et al., 2021; Venkatesh et al., 2016). This gap presents a significant opportunity for adapting UTAUT's constructs to address the unique challenges faced by SMEs, such as limited digital infrastructure, socio-cultural influences, and policy inconsistencies.

UTAUT has been applied to study technology acceptance across various user groups, including employees, consumers, and citizens (Hong et al., 2011; Zhou, Lu, & Wang, 2010; Chang et al., 2007). For instance, studies have focused on specific types of users, such as teachers (Pynoo et al., 2011) and physicians (Chang et al., 2007), as well as diverse organizational types like hospitals, government agencies, and schools (Pynoo et al., 2011; Gupta et al., 2008). Additionally, UTAUT has been employed to analyze a variety of technologies ranging from general tools, such as the Internet (Gupta et al., 2008), to specific applications like mobile banking, e-government services, and digital-learning contexts (Hong et al., 2011; Zhou et al., 2010). These studies demonstrate UTAUT's versatility in evaluating technology adoption across different tasks, including medical diagnosing, income tax filing, and decision-making in technology design (Brown et al., 2010; Chang et al., 2007).

One of UTAUT's strengths lies in its ability to incorporate moderating factors, such as age, gender, experience, and voluntariness. However, many studies have primarily focused on the main effects, with limited exploration of these moderating factors, particularly in non-Western settings like Vietnam (Gupta et al., 2008; Al-Shafi et al., 2009). This lack of empirical evidence restricts the generalizability of UTAUT's constructs and their applicability to rural SMEs (Venkatesh & Zhang, 2010; Im, Hong, & Kang, 2011).

Researchers have extended UTAUT to integrate additional mechanisms and constructs to address contextual and theoretical gaps. For instance, new exogenous mechanisms, such as charismatic leadership, have been shown to enhance performance expectancy and social influence (Nguyen et al.,2023a; Neufeld et al., 2007). Similarly, endogenous mechanisms, like behavioral expectation, have enriched the explanatory power of UTAUT (Venkatesh et al., 2008). Furthermore, moderating mechanisms, including cultural differences (e.g., Korea vs. USA), and organizational-level factors (e.g., facilitating conditions) have been added to account for specific contexts (Park, Lee, & Yi, 2011; Im et al., 2011). These extensions highlight the need to adapt UTAUT to diverse environments, particularly in resource-constrained regions like rural Vietnam.

To summarize the theoretical contributions, Table 1 outlines the focus areas, key constructs, and major studies associated with each model and framework.

| Theory | Focus | Key Constructs | Key Studies |
|---|---|---|---|
| **TRA** | Individual/Customer behavior | Attitude, Subjective Norms | Fishbein & Ajzen (1975); Adrian et al. (2005); Ng (2020); Bagozzi et al. (2000) |
| **TAM** | Individual/Customer | Perceived Usefulness, Perceived | Davis (1989); Taylor & Todd (1995); Pathak et |

| | | | |
|---|---|---|---|
| | behavior | Ease of Use | al. (2019); Surendran (2012); Hewavitharana et al. (2021);Jan, Alshare, & Lane (2022); |
| **TPB** | Individual/Customer behavior | Attitude, Subjective Norms, Perceived Behavioral Control | Ajzen (1991); Salemink et al. (2017); Alam et al. (2020); Li et al. (2022); Sniehotta et al. (2014) |
| **TOE** | Organizational behavior | Technological, Organizational, Environmental Factors | Tornatzky & Fleischer (1990); Lutfi et al. (2022); Sun et al. (2020); Wahab et al. (2021) |
| **UTAUT** | Integrated (Individual & Organizational) | Performance Expectancy, Effort Expectancy, Social Influence, Facilitating Conditions; Behavioral Expectation (endogenous mechanism), Cultural Contexts (moderating mechanisms) | Venkatesh et al. (2003); Alharthi et al. (2024); Hewavitharana et al. (2021);Neufeld et al. (2007); Venkatesh et al. (2008); Park, Lee, & Yi (2011); Gupta et al. (2008); Zhou et al. (2010); Hong et al. (2011); Al-Shafi et al. (2009); Im, Hong, & Kang (2011); Al-Gahtani et al. (2007); Brown et al. (2010); |

Synthesizing TRA, TAM, and TPB insights, UTAUT bridges individual and organizational adoption behaviors, making it particularly relevant for rural SMEs striving for digital transformation. Facilitating conditions, such as resource availability and infrastructure, are particularly impactful in aligning UTAUT with TOE's organizational and environmental dimensions (Tornatzky & Fleischer, 1990). However, researchers have noted UTAUT's limitations in addressing higher-level contextual factors, such as socio-cultural dynamics and regional disparities, which are pivotal in shaping adoption behaviors (Paul & Rosado-Serrano, 2019).

Future research should focus on extending UTAUT through a contextualization approach. This includes exploring new constructs, such as community trust and regional infrastructure challenges, better to understand the interplay between technology adoption and local conditions. Additionally, incorporating cross-level associations and cultural dimensions could further enhance UTAUT's applicability in rural settings (Al-Gahtani et al., 2007; Venkatesh & Zhang, 2010). For example, research on mobile banking and e-government services in rural Vietnam could benefit from examining user behavior across adoption stages (i.e., initial use vs. post-adoptive use) (Zhou et al., 2010; Venkatesh et al., 2008).By adapting UTAUT to these specific contexts, it is possible to create a robust framework that explains adoption behaviors and guides practical interventions. This synthesis underscores the importance of localized research and the need for UTAUT adaptations that align with rural Vietnamese SMEs' socio-economic and cultural realities, fostering both technological integration and sustainable growth.

### 3.5 How These Models Be Reflected in Vietnam's Rural Context?

The adoption and effectiveness of technological frameworks such as TRA, TAM, TPB, TOE, and UTAUT in rural Vietnam depend on addressing the socio-cultural, infrastructural, and behavioral dynamics unique to these regions. These models, developed in predominantly urban or developed contexts, require adaptations to align with rural consumers' preferences, SMEs' capabilities, and the broader community-driven culture of Vietnam's rural areas.

#### 3.5.1 Community-Driven Adoption

In Vietnam, rural consumers' purchasing decisions are heavily influenced by community norms, word-of-mouth (WOM), and social validation. Studies highlight that 58% of rural consumers rely on recommendations from friends, family, and community leaders rather than traditional advertising (Adtima, 2023; Kantar, 2023). This underscores the critical role of trust-building strategies, such as partnerships with local influencers and WOM campaigns, in driving digital adoption. 43% of rural consumers prefer reputable online sellers, and 58% opt for familiar brands, reflecting strong brand loyalty and community-driven trust (Adtima, 2023). Furthermore, 82% express reluctance toward unknown brands, emphasizing the importance of trust-based decision-making (Deloitte, 2023).

Frameworks like TRA and TAM, which emphasize attitudes and subjective norms, can be adapted to include community validation as a key construct. Facilitating conditions from UTAUT ensures that SMEs have access to resources, digital infrastructure, and training to address local demands. Localized content—such as ads in rural dialects or featuring cultural references—has been shown to boost engagement by up to 25% (Asia Foundation, 2021).

Policymakers and SMEs can amplify digital adoption by leveraging community structures, including local leaders and cooperatives. Collaborations with trusted community influencers to endorse digital platforms have proven effective in establishing trust networks and increasing e-commerce adoption (Nguyen et al., 2023a).

Vietnam's reliance on WOM and community recommendations contrasts with urban areas where direct advertising is more impactful. Similar community-based initiatives, such as training programs and cooperatives promoting digital tools, have succeeded in countries like India and Indonesia, adapted to their unique social contexts (Cameron et al., 2019; Deloitte, 2023).

### 3.5.2 Behavioral and Trust Factors

Trust plays a pivotal role in rural Vietnam, where skepticism toward digital platforms often slows adoption. Surveys reveal that 70% of rural consumers prioritize payment security, and 65% value responsive customer service, highlighting concerns such as product authenticity and secure payment systems (Nguyen et al., 2023b). These preferences align with the social influence construct in the UTAUT model, which emphasizes the importance of peer validation and facilitating conditions.

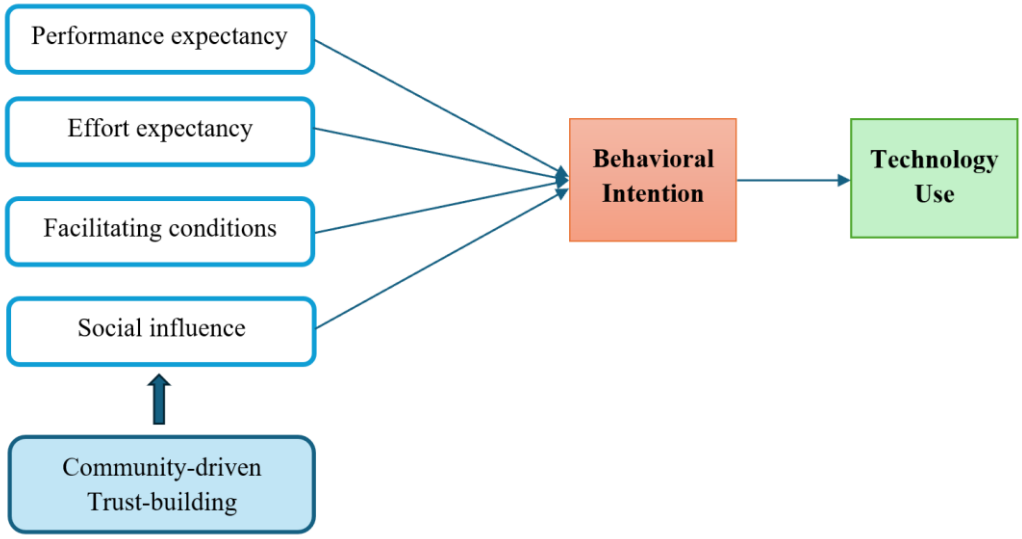
Rural SMEs can leverage UTAUT's facilitating conditions by implementing secure, localized digital tools and creating customer-centric experiences. Leveraging trusted community influencers and local leaders to endorse digital platforms enhances credibility and addresses consumer skepticism (Nguyen et al., 2023b). For example, SMEs using localized advertisements in rural dialects or featuring cultural references have reported increased customer engagement and reduced barriers to digital adoption (Asia Foundation, 2021).Vietnam's e-commerce market, projected to reach USD 40 billion by 2025, presents opportunities for SMEs to integrate trust-centric strategies. By focusing on behavioral and trust-building measures, SMEs can overcome digital hesitancy and foster sustainable digital adoption (Group M, 2024; Statista, 2025).

### 3.5.3 Infrastructure and Digital Literacy

Infrastructure limitations and low digital literacy are significant barriers in rural Vietnam. Studies reveal that 53% of SMEs lack the necessary skills to effectively adopt digital tools, while 45% face connectivity issues (Vietnam Economic Impact Report, 2023). To overcome these barriers, the TOE framework, which addresses technological, organizational, and environmental factors, can guide targeted interventions. This includes investments in community Wi-Fi programs, digital literacy initiatives, and training tailored for rural SMEs. By addressing infrastructure gaps and enhancing technical skills, SMEs can better leverage digital transformation to expand their market reach and operational efficiency.

### 3.5.4 Localized Adaptations of UTAUT

The Unified Theory of Acceptance and Use of Technology (UTAUT) offers a robust framework for understanding technology adoption, particularly through constructs like social influence and facilitating conditions. However, rural Vietnam presents unique socio-cultural dynamics, requiring contextual adaptations to enhance UTAUT's applicability.



In rural contexts, community-driven trust emerges as a critical factor in technology adoption, complementing UTAUT's social influence construct. Recommendations from local leaders, family, and peers significantly shape perceptions, with word-of-mouth (WOM) and community endorsement outweighing direct advertising. Strategies include:

- Leveraging Local Influencers: Engaging respected community figures to promote digital platforms.
- Peer Validation Mechanisms: Building trust through shared community experiences and endorsements.
- Localized Campaigns: Creating culturally relevant content in regional dialects to foster familiarity and credibility.

These adaptations emphasize community trust as essential for building collective acceptance, aligning with rural Vietnam's reliance on social validation.

For facilitating conditions, trust networks, such as cooperatives, serve as infrastructure. Embedding training within community groups and aligning customer support with local expectations further enhances adoption. Community trust could be a new construct or a moderating factor in UTAUT, amplifying the impact of existing constructs like social influence and facilitating conditions. Tailored strategies ensure UTAUT's relevance in addressing rural adoption

barriers, and fostering sustainable digital transformation. Tailored adaptations, such as localized mobile banking and e-government services, can address distinct adoption stages (initial use vs. sustained engagement), ensuring long-term trust and usability. By embedding community trust into UTAUT, the framework becomes more relevant for rural Vietnam, bridging adoption barriers and promoting sustainable digital transformation.

### 3.5.5 Government Support

According to Nguyen et al, (2023b)A successful digital transformation necessitates significant investment, coordinated efforts, and strategic direction across society. Firstly, at the national level, a unified strategy is crucial to align government agencies, businesses, and individuals under a shared vision. This involves setting objectives, defining responsibilities, and ensuring synchronized implementation, with government support providing infrastructure, policies, and resources for thriving in the digital economy. Secondly, while data sharing and integration are fundamental to advancing digital transformation, the development and utilization of national and private-sector databases in Vietnam remain slow, limiting the potential of digital technologies. Hence, the government should promote the intergration and digitalisation of information system facilitating seamless data exchange to optimize decision-making and drive innovation at both national and private-sector. Thirdly, digital literacy initiatives and tailored training programs for SMEs should also be prioritized to bridge the skills gap and enhance digital adoption. Since education and vocational training reforms are crucial for developing a digitally competent workforce, the government should facilitate the transition from a theory-based education system to practical, technology-driven training that aligns with industry demands. Strengthening digital literacy programs, expanding vocational training opportunities, and promoting university autonomy will equip young people with the essential skills needed to actively participate in and contribute to the digital economy.

### 3.5.6 Vietnam’s rural digital transformation in global context

The study explores the impact of digital transformation on rural SMEs, with a focus on Vietnam, offering insights into the global digital transformation landscape. Vietnam faces challenges common to many developing nations, such as infrastructure limitations and low digital literacy. In response, the Vietnamese government has implemented various initiatives to promote digital transformation, focusing on infrastructure development and digital literacy enhancement, similar to India's Digital India program (G. Narsimulu, 2024). Similarly, in China, the digital divide and skill gaps remain significant obstacles to rural digital adoption. To address these barriers, scholars suggest investing in digital infrastructure, implementing targeted training programs, and fostering technological awareness to encourage positive attitudes toward digital adoption (Hou, 2024). In developed countries, such as the United Kingdom, a survey of 189 rural companies identified broadband capacity constraints, a lack of digital skills within the workforce, and internal resistance to change as the most significant challenges in the digitalization process (Wishart & Roper, 2021). In response, the UK government has undertaken substantial efforts to accelerate digital adoption. By comparing Vietnam's strategies with those of other countries, best practices and innovative solutions can be identified and adapted to diverse contexts, contributing to the sustainable growth of SMEs in rural areas worldwide.

## IV. CONCLUSION AND FUTURE OUTLOOK

This study highlights the pivotal role of digital transformation in fostering sustainable growth for Vietnamese SMEs, with a particular focus on rural areas. It underscores the importance of integrating theoretical frameworks, especially the Unified Theory of Acceptance and Use of Technology (UTAUT), to analyze and address the key factors influencing digital adoption. While UTAUT constructs such as performance expectancy, effort expectancy, social influence, and facilitating conditions provide a strong foundation, this research identifies community-driven trust-building as a critical dimension of digital transformation. This dimension emphasizes leveraging local trust networks, such as community leaders and cooperatives, to mitigate skepticism and foster digital engagement.

Significant barriers remain, including infrastructure limitations, low digital literacy, and cultural resistance, which require targeted interventions. Policymakers should prioritize investments in digital infrastructure and literacy programs tailored to rural SMEs. SME leaders are encouraged to adopt trust-building strategies that resonate with local cultural contexts, such as community-driven endorsements and localized campaigns. These approaches align with rural socio-cultural dynamics and have the potential to significantly enhance digital adoption.

Moreover, the scalability of community-driven trust-building strategies offers significant potential for adaptation in other developing countries with similar socio-cultural dynamics. By addressing these localized and systemic challenges, Vietnam can bridge the digital divide, unlock the transformative potential of digital innovation, and drive equitable, sustainable growth in the digital economy.

This study acknowledges certain limitations that require further research. As a literature review, this research does not incorporate primary quantitative data. Instead, it synthesizes a diverse range of secondary data from reputable academic and industry sources to enhance the reliability of its findings. While every effort has been made to ensure objectivity and rigor in data selection and analysis, future studies should incorporate empirical research to validate confirm the interaction between community-driven trust variables and their significance in different contexts. We would explicitly focus on operationalizing community-driven trust-building as either a new construct or a moderating factor within the UTAUT framework. Longitudinal and comparative studies are essential to examine adoption behaviors across rural and urban SMEs, identify disparities in digital readiness, and explore how constructs like community trust can be scaled or adapted for other resource-constrained settings. Investigating emerging technologies, such as artificial intelligence and blockchain, within this localized framework could provide innovative pathways for adoption.

**ABSTRACT**

Social sustainability is one of the critical pillars of the global sustainable development framework, ensuring quality of life while promoting equality and social justice. Poverty alleviation and human development require more concern in a VUCA world (Volatile, Uncertain, Complex, and Ambiguous), as a high Human Development Index (HDI) partially reflects the achievement of economic development aimed at advancing human well-being. This study focuses on whether poverty and economic growth affect the human development index (HDI) in Viet Nam during Covid-19 and post Covid-19. By using the panel data from 63 provinces of Viet Nam in the 2019-2021 period., the results documented that poverty has a negative impact on provincial human development index. Moreover, during COVID-19, the higher the economic growth rate of the province the lower is the level of the human development index. Furthermore, there was no causal relationship among the three economic growth, poverty and human development index at the provincial level. These novel findings would help policymakers of sustainable development better understand the role of poverty and economic growth on human development. In addition, the study provided some recommendations to increase provincial human development and improve the human development index of Viet Nam in general.

*Keywords*: "economic growth", "poverty", "HDI", "Vietnam"

## I. INTRODUCTION

Human beings are the center of social sustainability, which means that all of a country's activities must be made for the goal of enhancing their achievements, freedoms, and capabilities. It is the life quality people have that is of intrinsic importance, not the commodities or income that they happen to possess. In the past, economic development traditionally measured by GDP per capita was considered to be of utmost importance to the development of a country. However, this was a poor predictor of social achievements as GDP takes into account material well-being but provides no information on how a country's wealth is converted into basic needs. Thus, based on Amartya Sen's idea of functioning and capabilities (Sen, 1985), in 1990, the United Nations (UN) proposed a protocol to measure a country's overall degree of development. The 1990 UNDP Human Development Report (UNDP,1990) was the first major attempt to rank the levels of human development of nations. It emphasized that development is about freedom, both human choice and participatory process, underscoring the fact that human development, because of its breadth and generality, pertains to all countries. Therefore, the Human Development Index (HDI) constructed of three dimensions including a long and healthy life, knowledge and a decent standard of living was composited by UNDP to reorient the assessment of development levels away from income to more broadly based measures.

In 1990, Viet Nam was categorized in the group of low human development countries with the HDI of only 0.483 (UNDP,1991). In an eight-year time from 1990 to 1998, Vietnam's HDI has continuously increased to reach medium development group with 0.567 in 1998. The upward trend continued despite the outbreak of COVID-19 pandemic. In 2020, the HDI of Viet Nam has increased steadily and recently moved to high development group with a level of 0.706 point (UNDP, 2021). This indicates that human development has always been one of the main concern of Viet Nam government. It has been claimed that the economy of Vietnam is associated with social development, implying that economic growth must be accompanied by social progress with human development as the premise (Nguyen, 2021). The government's spending on human development areas such as health, education and science and technology has been prioritized in recent years, reflected in the increasing trend of investment expenditure (Hoang, 2018). Constantly improving the life quality of people and ensuring social justice are the long-lasting goals of our government even during

the period of the COVID-19 global epidemic.

However, the HDI ranking of Viet Nam still low with 7th place in the region, 119th place in the world. In addition, the growth in the HDI has shown signs of slowing down over the past few years. Meanwhile, during this period, the economic growth rate has decreased significantly along with the growing poverty rate. A question was raised about the link among raising the human development index and other development goals such as economic growth or poverty reduction. The purpose of this paper is to examine the effects of economic growth and poverty in Viet Nam in the context of the COVID-19 pandemic, thereby making policy recommendations to promote economic growth and poverty reduction in order to increase human development index, contributing to the sustainable growth of the country.

The structure of the paper is organized as follows. Section 2 presents the literature review. Section 3 describes the theoretical framework and hypothesis development. Section 4 explains the methodology. Section 5 presents the research results and discussion and section 6 concludes the paper.

## II. LITERATURE REVIEW

### 2.1. Human development and Economic growth

The relationship between human development and economic growth was indicated through the significant correlation between social expenditure ratios and income distribution (Suri et al., 2011). Various studies show that increases in the national income level resulting from economic growth contribute to better human development outcomes. According to Strauss & Thomas (1995), Case et al. (2002), and Haddad et al. (2003), improvements in income result in higher health and educational achievements. At the household level, an increase in income enables families to spend more on food consumption, access to clean water and good hygiene, effective health care and child care arrangements. Whereas greater income, at the community level, will eventually lead to higher quality of health care centers, water and sanitation systems. Meanwhile, Cutler et al. (2005) argue that advances in technology, which results from higher income and education level, contribute to reductions in mortality and improvements in life expectancy. As the flow of health-enhancing knowledge and technology continues to thrive, there are enormous incentives for the development of new drugs and medical treatments. Moreover, people with higher income are prepared to pay more for longer lives and people who live longer are willing to pay more to cure diseases. Empirical research has been conducted to testify the relationship between economic growth and HDI as a measurement of human development with data from Pakistan, Zambia, Indonesia and India by Khan et al. (2018), Chikalipah & Makina (2019), Syofya (2018) and Tilak (1992) respectively. Their results indicate that, in these countries, economic growth patterns and HDI share a correlation.

Although economic growth does affect human development, it is not the only causal factor (Aturupane et al.,1994). This statement was also advocated by Ranis et al. (2000), there is an iterative process between the ultimate objective improvements in human development and economic growth as necessary but not sufficient conditions for achieving such improvements. The research also claimed that economic and social policy tend to focus on achieving favorable preconditions for economic growth and human development must await such economic growth. However, human development is considered to be not only an end-product of the development process but also a means to future economic growth. Therefore, the relationship between economic growth and human development should not be misspecified through the unidirectional view that economic growth simply results in human development improvements as the ultimate goal.

Interestingly, there is an opposite view from the literature of the endogenous theory, with education enhancing incomes and growth, but having no utility value per se with the exceptions of studies by Aghion & Howitt (1998), Blackburn & Cipriani (1998) and Grossman (1972). That education is both a consumer good produced by economic growth and an investment good that enhances future growth has been recognized in an earlier generation of development economists including Bowman & Anderson (1963) and Lewis (1955). As education can substitute for other inputs into economic growth, investments in education are vital to economic growth, but not essential for sustaining economic growth (Lucas, 1988). Each of the components of human development has a distinct impact on economic growth (Ulas & Keskin, 2017; Zhang,2019). The interactive relationship between human development and economic growth was also advocated by Ranis (2004). He further concluded that human development affects growth

when greater freedom and capabilities improve economic performance, while economic growth enhances human development as increased incomes will increase the range of choices and capabilities enjoyed by households and governments.

Aside from this, the two-way causality between human development and economic growth has also been discussed by Morand (2005) who focuses on health and growth, and Baldacci et al. (2008) who take into account the role of education and health spending on education, health, investment, and growth. The result of the latter study indicates that the complete impact of expenditure on education only became apparent after a period of 10 to 15 years whereas the effects of health spending are more immediate. In summary, while human development has long been viewed both as an input into and as an outcome of the development process, the feedback and dual causality between human development and economic growth have not yet been fully taken into account. In Vietnam, little research has been made on the relationship between human development and economic growth specifying its pattern during the period of COVID-19 pandemic.

**2.2. Human Development and Poverty**

Poverty was one of the biggest social problems in the twentieth century and has continued to be so in the twenty-first century (Wagle, 2018). The proportion of the population not able to attain the specified level of expenditure is segregated as poor (Bhagawati, 1988). These basic needs commonly include clean and fresh water, nutrition, health care, education, clothing and shelter. According to Laderchi et al. (2003), several approaches may be taken to poverty measurement such as the monetary approach, capability approach, social exclusion and participatory methods, which will suggest different policy implications for the government. In Viet Nam, there are two parallel approaches to poverty measurement using the national poverty line. The first approach, developed and led by the Ministry of Labor, Invalids, and Social Affairs (MOLISA), is based on income and is used primarily for targeting social programs. The second was developed by the General Statistical Office and the World Bank, is based on consumption and is used chiefly for monitoring poverty over time (Demombynes & Hoang Vu, 2015).

The relationship between poverty and human development has been the main topic of various studies. According to Celemín & Velázquez (2018), deficiencies in access to education, healthcare services, sanitation and quality of housing decrease the level of well-being. Living in such substandard conditions, most of the poor are undernourished, with poor disease resistance, physical and intellectual development. This research also indicates a negative correlation among HDI and poverty (associated with unsatisfied basic needs) with intermediary data collected in Buenos Aires, Argentina. This is also the conclusion of Sen (1995), Singh (2012) and Syofya (2018) who studied the cases of America, India and Indonesia respectively. Singh (2012) also clearly revealed the profound influence of HDI and per capita income on poverty reduction. Furthermore, Arief & Pratiwi (2017) concluded that HDI's indicators have negative relationships and significant effect on poverty reduction statistically.

Poverty prevails everywhere and poverty alleviation has been the main concern of human development. Although eliminating poverty is just one aspect of human progress, poverty and development remain interrelated; one presupposes and challenges the other (Madan, 2012). Hence, it is important to assess the impact and significance of human development on poverty, which has been attempted in a large number of studies in the past in terms of decomposition exercise (Tendulkar & Jain, 1990, Kakwani, 2000, Jain et. al., 2003). According to Kakwani et al. (2000), the development process does not benefit the poor directly, rather the fruits of development received by them remain proportionately less than that of the rich section of the society. This underlines the need for the expansion of economic activities and educational facilities along with their equitable distribution. It can be concluded that to raise the level of human development efforts at a foundational level, not only towards raising economic resources and developmental opportunities but also to ensure their equal distribution should be made (Klugman et al., 2011). Thus, the human development approach has also been considered to contribute significantly to the measurement of poverty and inequality.

**2.3. Economic growth, poverty and HDI in the context of COVID-19**

While it is difficult to tell exactly the economic damage from the global COVID-19 pandemic, it has had severe negative impacts on the global economy. During 2020, the world's collective gross domestic product (GDP) fell by 3.4

percent. To put this number in perspective, global GDP reached 84.54 trillion U.S. dollars in 2020 – meaning that a 3.4 percent drop in economic growth results in over two trillion U.S. dollars of lost economic output (Statista, 2022). Global growth is expected to slump from 5.7 percent in 2021 to 2.9 percent in 2022— significantly lower than 4.1% that was anticipated in January (World Bank, 2022). It is expected to hover around that pace over 2023-24, as the war in Ukraine disrupts activity, investment, and trade in the near term, pent-up demand fades, and fiscal and monetary policy accommodation is withdrawn. As a result of the damage from the pandemic and the war, the level of per capita income in developing economies this year will be nearly 5 percent below its pre-pandemic trend (IMF, 2022).

The result is that the impact of the COVID-19 pandemic is largest for the world's poorest. The COVID-19 pandemic has caused a human development crisis worldwide. It struck in all aspects of human's lives including in health, education and income with the largest contraction of economic activity since the Great Depression. Drops in HDI values were widespread during the Covid-19 pandemic, with over 90 percent of countries suffering a decline in either 2020 or 2021 far exceeding the number that experienced reversals in the wake of the global financial crisis (UNDP, 2021). While most very high Human HDI countries did not suffer declines on the HDI in 2021, the majority of countries in low and medium HDI and high HDI countries did (UNDP, 2022).

Vietnam is included in the medium HDI countries with the rank of 117 in 2019. The HDI of Viet Nam has increased slightly over the years from 0.682 to 0.703 in the period of 2016 - 2019 and remained at that stable rate even in the middle of the COVID-19 pandemic until now (UNDP, 2022). The poverty rate decreased within the same period while there was a decrease in economic growth with the GDP growth rate falling from 7.15% in 2019 to 2.94% in 2020 and 2.58% in 2021. In 2022, Vietnam's economy is expected to grow 8% this year, beating an official target for an expansion of 6.0%-6.5%.

## III. THEORETICAL FRAMEWORK AND HYPOTHESIS DEVELOPMENT

### 3.1. Theoretical framework

#### Neoclassical growth theories

The consumption of goods and services is frequently seen in neoclassical economics as a function of a person's well-being. Furthermore, it is a widely held belief that the sum of individual levels of welfare can be used to calculate the social welfare function that maximizes "the greatest good for the greatest number." Gross domestic product (GDP), which measures all economic activity, takes into account both current consumption and investments that enable future consumption.

However, contemporary neoclassical economics' utilitarian viewpoint has frequently come under harsh criticism for philosophical, empirical, and conceptual reasons. First, on normative grounds, Rawls (1971) contends that people would choose a social welfare function that maximizes the circumstances of the least fortunate member of society if they hide their abilities, wealth, and social standing. Therefore, maximizing an overall utilitarian welfare function may result in unjust outcomes. This adjustment to the welfare function, among other reasons, can help rule out perverse situations where a traditional utilitarian approach would mandate imposing substantial harm on some members of society significantly if this harm results in larger welfare increases for others, even if these are already better off (Kymlicka, 2001). Second, it has been argued that concentrating on just one indicator, such as aggregated consumption, implies incorrectly perfect substitutability between consumption types with normatively different weights. In this view, the attainment of minimal threshold levels in numerous imperfectly substitutable indicators, such as access to food, shelter, democratic rights, and other factors, for all members of society, is the only way to accurately measure well-being (Doyal & Gough, 1991).

#### Endogenous growth theories

Until now, it has been more than a decade that economic theory has acknowledged the effect of education on economic growth. Lucas (1988), in his pioneering endogenous growth model, emphasizes the crucial significance of human capital formation for growth and development in a relatively straightforward manner. However, it is paradoxically ignored in this and subsequent growth models that human capital formation as a source of growth is very literally embodied in people. However, only alive and healthy people can offer effective human capital services. As a result, given the widespread acceptance of human capital formation as a source of growth, it is also necessary to take a

closer look at how changes in population health may affect growth and, by extension, overall welfare.

Grossman (1972) claimed that health has a variety of effects on well-being and economic performance. The positive impact of "good health" on labor productivity is particularly significant from the standpoint of growth. However, resources are needed to provide health care. The expansion of the health sector may promote growth through improved population health, and the contraction of the health sector may also free up resources to promote growth through an increase in human capital accumulation activities. As a result, it appears that there is a direct trade-off between health and human capital accumulation. The asymmetries in the productivity traits of health generation and the accumulation of human capital further complicate this trade-off.

In contrast to human capital accumulation activities, which give rise to technologically advanced activities in which innovations, capital accumulation, and economies of scale result in a cumulative rise in output per man hour, Baumol (1967) uses the health sector as an example of a sector that only permits sporadic increases in productivity because there is no substitute for the personal attention of a physician. This implies that, in terms of the growth model, the production of health services was assumed to be characterized by decreasing returns, whereas the accumulation of human capital is typically modeled using increasing returns. Health directly affects welfare, so it should be included in the utility function next to consumption — at least in Western economies — which is another asymmetry between health and human capital that should be acknowledged in the analysis. Thus, there is a direct trade-off between the resources used in the health sector and the sector producing finished goods.

**New growth theories**

According to new theories of growth, economic development and growth will not reach their full potential and improve without the development of human resources (Barro et al., 1996; Benhabib & Spiegel, 1994; Lucas et al., 1992; Romer, 1994; Stiglitz et al., 2009). Both education and training enhance people's skills and capabilities, placing them at the center of a nation's economic development (Agarwal, 2006)

Economic growth can be coordinated with human development, which is essential. In this way, conventional political measures that argue that advancing human development should wait until economic growth picks up seem to be a mistake. Ramirez et al. (1997) examined the connections between economic growth and human development and identified two implications. Spending on social services and education are important associations that determine the relationship between economic growth and human development. One of those is the relationship between economic growth and human development, and the other is the relationship from human development toward economic growth.

### 3.2. Hypothesis development

**A two-way causal chain of economic growth and human development**

Human development was viewed as the central objective of human activity and economic growth was an important instrument for advancing it (Ranis et al. 2000). Simultaneously, achievements in human development can make a critical contribution to economic growth. This model was then adapted by Suri et al. (2011) with several changes. The biggest change was the replacement of GNP to GDP at one end of the chain. In Suri’s model, foreign and domestic investment, technology and openness were also considered to be important inputs into economic growth. Similarly, the private and public allocation of GDP, the distribution of income, and the effectiveness of human development spending decides how economic growth is converted into human development. In each country, the production function relationship and the strength of these links varies depending on its initial conditions, the policy setting and the changing environment.

**From economic growth to human development**

In the chain from economic growth to human development, the different level of income across households and the allocation of expenditure within households affects their propensity to spend the after-tax income on items that directly promote human development in poor countries. This means that, generally, poor households spend a higher proportion of their incomes on human development items than higher-income ones (Apergis et al., 2022). If a country’s level of poverty is high, it is because either per capita income is low or low expenditure of households on human development. Meanwhile, the spending of households on human development items is strongly affected by the rate of poverty reduction. Additionally, an increase in family income is believed to have positive effects on child schooling,

particularly the enrollment rate of schools (Holme, 2022)

Concerning the government, the distribution of resources to improve human development is a function of overall public sector expenditure, how much of this flows to human development sectors, and how it is allocated within these sectors. This is expressed in three ratios: the public expenditure ratio, the human development allocation ratio, and the human development priority ratio, which is defined as the proportion of total human development-sector expenditure that goes to priority sectors. Some human development expenditures are much more productive in terms of achieving advances in human development than others. For example, basic education, particularly at an early stage of development, is widely acknowledged to have a greater impact on human development than tertiary education (Swanson, 2022). Each of these ratios varies greatly among countries, implying that the same level of GDP may be associated with extremely diverse levels of government spending on human development priorities. The degree of government decentralization influences these three ratios: true decentralization tends to enhance total revenue available (Sohail et al., 2021). It frequently boosts the human development allocation ratio; and almost always improves the human development priority ratios.

**From human development to economic growth**

The second chain starting from human development to economic growth implies that higher levels of human development affects the economy by enhancing people's capabilities and consequently their creativity and productivity. People contribute more to economic growth as they become healthier, better nourished, and educated, while certain key aspects of human development, such as making the lives of the terminally sick tolerable, do not immediately result in greater productivity (Cohen & Flood, 2022). Thus, the health and education of a population are among the key determinants of the composition and growth of output and exports, and form a crucial factor in a system's capacity to borrow foreign technology efficiently (Ma et al., 2022). Greater income equality influenced by improvement in education is also likely to favor higher growth rate (Wienk et al., 2022). Low-income people, as education becomes more broadly based, can be able to seek out economic opportunities. In addition, education may impact per capita income growth via its impact on population growth.

Although high levels of sustained growth can not be guaranteed solely by high rates of saving and investment, there is still a positive relationship between investment and growth, with its strength depending on environmental policies, the quantity and quality of human resources, the availability of technology choices and the flexibility of the institutional framework (Liu et al., 2021). Domestic investment and direct foreign investment are both influenced by a country's degree of human development, notably the workforce's education and skill levels. However, inequalities in economic growth across societies are caused not only by the amount of inputs but also their purpose and effectiveness. Economic policy incentives have a significant impact. Another originates from people's goals and behavioral patterns.

Accordingly, the first hypothesis is:

**Hypothesis H1:** Economic growth has a positive effect on the human development index

According to Angelsen & Wunder (2003), the definition of poverty alleviation is the process by which individuals move above a notional poverty line and reducing poverty results in greater human development. The statement "poverty is both a cause and a consequence of deficiencies in human development" has captured the connection between human development and the reduction of poverty (UNDP, 1991). A serious effort to alleviate poverty, which remains at the top of the development agenda for most countries, will undoubtedly highlight human beings as the main beneficiaries of development.

Adnan et al. (1996) claimed that poverty has given several causes that are related to human development. Firstly, there is a lack of intrinsic human development, which includes poor health, inadequate nutrition, a lack of intellectual and practical skills, and a lack of drive to improve oneself. Secondly, there is a people-resource imbalance, or increased access of the poor to productive assets like land, credit, and other natural resources, which is exacerbated by population growth and natural or man-made disasters. Finally, there are factors that prevent the poor from participating in development, such as structural adjustments. These elements place restrictions on the poor's capacity to develop their skills and market their labor. These lessen the poor's ability to participate in the development process even more. Human development will undoubtedly be enhanced by poverty alleviation that removes restrictions and corrects

imbalances caused by any unintentional negative effects on the poor.

**Hypothesis H2:** Poverty has a negative effect on human development index

## IV. METHODOLOGY

### 4.1. Data

This research used panel data of gross regional domestic product growth rate, poverty rate and the HDI of 63 provinces in Viet Nam from 2019 to 2021 with a total of 189 observations. These are secondary data archived from legitimate sources including the General Statistics Office of Vietnam (GSO), the Ministry of Planning and Investment (MPI), The Ministry of Labor - Invalids and Social Affairs (MOLISA).

Panel data (also known as longitudinal or cross-sectional time-series data) is a dataset in which the behavior of entities is observed across time. There are at least three factors contributing to the geometric growth of panel data studies: (i) data availability, (ii) greater capacity for modeling the complexity of human behavior than a single cross-section or time series data, and (iii) challenging methodology (Hsiao, 2007).

Panel data give the advantage of more accurate inference of model parameters. Panel data usually contain more degrees of freedom and more sample variability than cross-sectional data which may be viewed as a panel with T = 1, or time series data which is a panel with N = 1, hence improving the efficiency of econometric estimates (Hsiao, 1995). Panel data allows control for variables that cannot be observed or measured; or variables that change over time but not across entities. With panel data variables at different levels of analysis can be included which is suitable for multilevel or hierarchical modeling.

From the official websites and publicized documents of the abovementioned sources, the authors used MS Excel software to synthesize observations, then process and classify the collected data. After that, STATA 15 was utilized to process and analyze the data used in solving the research problem.

### 4.2. Model

From the collected datasets, the authors proposed the research model for the research as follow:

$$PHDI = f(GRDP, PPVR)$$

To analyze the dependent relationship of human development index on the economic growth and poverty in 63 provinces of Vietnam, the author uses three econometric models to process panel data including: pooled regression model (Pooled OLS), random effects model (REM) and the fixed effects model (FEM).

With PHDI as the dependent variable, PPVR and GRDP as two independent variables, the general formula for this model is presented as follow:

$$PHDI_{it} = \beta_0 + \beta_1 GRDP_{it} + \beta_2 PPVR_{it} zz + v_{it}$$

(i = 1, 2, …, N and t = 1, 2, …, T)

$$v_{it} = a_i + u_t$$

Where:

$\beta_0$: The unknown intercept for each entity (n entity-specific intercepts);

$\beta_1$, $\beta_2$: The coefficients of GRDP and PPVR;

it: The indices that varies in both space and time;

i: The indices that varies in time, not in space;

$u_t$: An unobservable factor that affects the dependent variable but does not affect the independent variables, satisfying the OLS hypothesis.;

$a_i$:An unobservable factor that does not change over time but can have an impact on the independent variables, thereby affecting the dependent variable.

## V. RESEARCH RESULTS AND DISCUSSION

The panel data consisting of 189 observations of human development index by province, gross regional domestic product and provincial poverty rate were processed by STATA 15. Table 1 shows the regression results of Pooled OLS

model, FEM and REM.

**Table 1. POLS, FEM, REM results**

| Variable | POLS | | FEM | | REM | |
|---|---|---|---|---|---|---|
| | **Coef.** | **P>t** | **Coef.** | **P>t** | **Coef.** | **P>z** |
| GRDP | 0.00007 | 0.912 | -0.0002 | 0.003 | -0.00023 | 0.008 |
| PPVR | -0.00528 | 0.0000 | -0.00043 | 0.000 | -0.0005 | 0.000 |
| _cons | 0.7185 | 0.0000 | 0.69510 | 0.000 | 0.6954 | 0.000 |
| Prob > F | 0.000 | | 0.000 | | 0.000 | |
| R-Squared | 0.4002 | | 0.2352 | | 0.3579 | |
| Obs | 189 | | 189 | | 189 | |

*Source: Authors' calculation with Stata 15*

As can be seen from the results, all of the models have (Prob > F) = 0.000< 0.05, indicating that these models are significant as there is at least one independent variable having an impact on the dependent variable. In the POLS model, only provincial poverty rate (PPVR) has significant influence on HDI as its p-value (0.000) is lower than 0.05. In contrast, despite having positive coefficient, gross regional domestic product (GRDP) with a p-value (0.912) greater than 0.05 shows no effect on HDI.

In the FEM and REM, both of the independent variables (GRDP, PPVR) were proved to have significant impacts on the dependent variable (HDI) with p-values lower than 0.05. Interestingly, in both models, gross regional domestic products (GRDP) was found to be negatively correlated with HDI. The provincial poverty rate (PPVR), as expected, shares a negative correlation with HDI. In all three models, PROV is proven to not have statistical significance on the dependent variable, meaning that it does not have any effect on the provincial human development index. The r-squared of the FEM is the smallest (0.2352) indicating that in this model, GRDP and PPVR can explain 23.52% of the variation in the HDI. Meanwhile, in the POLS model and REM, variance in the HDI is explained at the rate of 40.02% and 35.79% respectively. To select the most appropriate model for the research data, three tests were adapted including the F-test to choose between POLS and FEM, Breusch–Pagan Test to compare POLS and REM and Hausman Test to decide between FEM and REM.

**5.1. Negative impact of economic growth on the human development index**

Interestingly, the result of the model does not comply with hypothesis *H1: Economic growth has a positive effect on the human development index.* Instead, the growth rate of gross regional domestic product (GRDP) was shown to have a negative effect on the HDI with the regression coefficient of -0.0002353. This negative impact was also found in a study by Wang et al. (2018). They further explained that this was due to the fact that this research was conducted using data from Pakistan. Although, in the last few years, this country experienced a rising economic growth, it was among the lowest in access to education and rate of primary schooling completion. Other reasons for this peculiar correlation were believed to be the lack of investment in health and education as well as the shift of production structure from agriculture. Another research conducted with data from Nigeria by Abraham & Ahmed (2011) also presented similar results. The study's findings suggest that while growth-promoting policies might short-term harm human development, long-term equilibrium will be restored by HDI adjusting to correct the equilibrium error. This suggests that macroeconomic policies aimed at achieving sustainable economic growth should be continued because it is believed that it promotes human development.

With reference to the two previous studies, it can be concluded that the negative impact of provincial economic growth on the HDI in Viet Nam in the period of 2019-2021 was due to the COVID-19 pandemic's effect on the economic growth pattern. Due to the heavy impact of the COVID-19 epidemic, industrial production nationwide and most localities decreased rapidly, greatly affecting the ability to fulfill development targets of industry and the whole economy nationwide and locally. The prolonged situation of COVID-19 caused many businesses to go bankrupt, some others have to temporarily suspend their businesses or conduct businesses in moderation due to inefficient business or loss in very difficult business conditions, many of them cannot develop due to the production of non-essential items, and circulation is restricted during the implementation of social distancing. This led to the decrease in economic growth

of almost all provinces of Viet Nam during this period. Meanwhile, the provincial HDI in the majority of provinces continues to rise steadily. Another reason for this negative result might be the lack of investment on human development despite a positive trend in economic growth at provincial level. The below tables list ten provinces with the highest GRDP growth rate in 2019, 2020, 2021 and their HDI rankings from highest to lowest.

Although economic growth was shown to have a negative impact on human development at provincial level, its influence is relatively small with the coefficient of only -0.0002. This is due to the fact that despite decreases in economic growth rate and insufficient investment on human development in some provinces, Viet Nam is still making progress in various aspects of human development. According to the United Nations Development Programme (UNDP), in Viet Nam, all three dimensions of the HDI have been improved significantly since the 1990s. This rate of increase in the HDI has slowed down over the past decade, mainly because Vietnam has become a richer country with life expectancy and education level is relatively high compared to income level. Improvement has also been seen in Vietnam's Gender Inequality Index (GII), which measures the decline in human development due to inequality between men and women.

Moreover, Viet Nam also does well in terms of reducing maternal mortality, increasing girls' schooling, and women's labor force participation, but women's representation in parliament remains low. Therefore, the negative impact of economic growth on the HDI is expected to be short-term due to the disturbances caused by COVID-19. In the long term, economic growth is still believed to have a positive influence, which is a premise for human development and raising the HDI in Vietnam. The long-term positive impact of economic growth on HDI was proven in various previous studies by Tilak (1992), Syofa (2018), Khan et al. (2018) and Chikalipah & Makina (2019). The unexpected results of this research suggest that there may be some other hidden factors that affect the HDI such as political stability, corruption, and governance which can be potential areas that need to be investigated in future studies.

### 5.2. Negative impact of poverty on the human development index

In the case of poverty, the result of the model supported for hypothesis *H2: Poverty has a negative impact on the human development index.* The regression coefficient of the provincial poverty rate (PPVR) is -0.0005 at the significant level of 5% implying a negative influence of poverty on the HDI in Viet Nam from 2019 to 2021. In general, at the province level, poverty has a negative impact on the HDI. These results are compatible with previous studies by Sen (1995), Singh (2012), Pratiwi (2017), Celemín & Velázquez (2018).

Poverty will make people's quality of life uncertain. The poor cannot afford meals with adequate nutrients leading to lack of energy and malnutrition (FRAC, 2017). Moreover, poor people and poor households often take advantage of all that they can exploit to serve the needs of life. As a result, because of immediate needs, they can kill rare animals and directly destroy the environment (Le, 2001). Poverty is also one of the main causes of the increasing crime rate. The poor and unemployed will try to find ways to make a living by engaging in illegal activities such as drug trafficking, fraud and theft. On the other hand, the poor are also the weak ones whose desire to escape poverty has been used by human traffickers to lead them to commit crimes or sell them across the border. In particular, illegal human trafficking is a major problem not only in Vietnam but also in other Southeast Asian countries.

## V. CONCLUSION

Economic growth, poverty and human development are three major development goals of all countries worldwide. Therefore, research on the relationship among these factors is extremely essential, especially during the time that countries are facing heavy losses in all aspects due to the COVID-19 pandemic. The study has provided an overview of research on the effect of economic growth and poverty on the human development index. At the same time, a theoretical framework along with a research model were conducted in order to examine the dependent relationship among these three factors.

During the period of COVID-19 and post COVID-19, the provincial economic growth has a negative effect on the human development index. This was due to the fact that the economic growth rate by province has been seriously influenced by the consequences of the epidemic. Meanwhile, the provincial human development index still continued to rise as progress has been made in all aspects of human development. However, the negative impact of economic growth on human development is considered to be temporary and in the long-term, economic growth will still positively

influence the human development index as proven in various previous studies. Therefore, social development indicators must be used to regularly and strictly regulate the economic growth process. Moreover, it is essential to associate the goals of economic growth and increasing human development index in governmental policies in order to promote the comprehensive development of the country

Poverty has a negative impact on the human development index, which is in line with the conclusions of previous research. The emergence of COVID-19 has slowed down economic development, causing a sharp increase in re-impoverished households in many provinces of Viet Nam. Additionally, COVID-19 has made the gap between the rich and the poor become wider, causing greater disparity among regions. The remote mountainous and ethnic minority areas have to suffer the most from the consequences of the pandemic. This shows that urgent measurements should be taken to enhance socio-economic development in remote areas and ethnic minority areas. At the same time, it is necessary to have policies and plans to financially support and create jobs for the poor, giving them a chance to escape poverty and have a better life.

# LEGAL AND ECONOMIC IMPLICATIONS OF AI-DRIVEN LABOR MARKET TRANSFORMATIONS: BALANCING DIGITAL INNOVATION AND SUSTAINABILITY IN VIETNAM

**Nguyen Nam Trung**[1*]

[1]Faculty of Law, University of Economic and Finance

* Corresponding: trungnn@uef.edu.vn;

**ABSTRACT**

This study focuses on assessing the rapid and explosive development of Artificial Intelligence (AI) and its impact on Vietnam's labor market, particularly concerning unskilled workers and traditional, low-skilled sectors. To clarify these issues, the author employs documentary research, comparative legal analysis, and policy evaluation. The findings indicate that AI significantly elevates the risk of unemployment in labor-intensive industries characterized by repetitive tasks, while simultaneously exerting pressure to enhance workers' digital competencies. The current legal framework lacks explicit regulations regarding AI-induced labor substitution, which has led to various shortcomings in retraining programs, financial support, and oversight of corporate labor planning and employee welfare.

Drawing on the experiences of several leading countries in AI application, such as Germany, Japan, the United States, South Korea, and Singapore—the study proposes improving relevant legislation, establishing a career-transition support fund, mandating retraining prior to workforce reductions, and enhancing regulatory supervision. These measures aim to safeguard the right to employment, while fostering sustainable and equitable economic development amid the rapid expansion of AI.

*Keywords*: "Artificial Intelligence (AI)", "Labor Market Transformation", "Legal Gaps in Labor Policy", "Retraining and Transition Support", "Sustainable and Equitable Workforce".

## I. INTRODUCTION

### 1.1. Research context

Rapid advances in the Fourth Industrial Revolution (Industry 4.0) and digital transformation have led to substantial negative repercussions for global labor markets, heightening the risk of contract termination due to AI-driven job displacement. According to McKinsey (2021), nearly 400 million workers could be replaced by automation and AI worldwide by 2030, particularly in sectors with repetitive tasks such as manufacturing, logistics, and finance. In Vietnam—a socialist-oriented market economy experiencing rapid growth and deep international integration—the increasing adoption of AI has already resulted in 50,000 job losses in 2022, and forecasts indicate that 1.8 million current positions may vanish by 2028 (JobTest, n.d.).

Despite the urgency of this situation, Vietnam's labor legislation remains imprecise regarding the protection of workers' rights when AI-driven job displacement leads to contract termination. Existing regulations neither define nor address dismissals arising specifically from AI-related technological changes, leaving employer obligations—such as mandatory retraining, severance, or workforce reallocation—unclear. Furthermore, enforcement mechanisms fall short of ensuring effective safeguards, as they lack explicit provisions to mitigate risks before layoffs occur or to guarantee that employers provide adequate support to affected workers. Although Article 35 of the 2013 Constitution of Vietnam reaffirms the right to work as a fundamental right of citizens (National Assembly of the Socialist Republic of Vietnam, 2013), it does not fully account for the unprecedented challenges posed by AI's disruptive capacity. Consequently, current legal frameworks require significant revision and stronger enforcement to protect workers' rights in a rapidly evolving technological landscape.

By contrast, advanced AI-adopting countries such as Japan, Germany, Singapore, and South Korea have introduced comprehensive policies to safeguard workers facing job losses or imminent risks of termination due to automation. These jurisdictions have also adapted their legal frameworks, accordingly, setting practical precedents for Vietnam to

consider. In this context, Vietnam remains in need of more robust legislative reforms and enforcement mechanisms to ensure a balanced approach that both promotes sustainable economic development and preserves workers' rights in the AI era.

### 1.2. Research Questions and Objectives

**Research Objectives**

**RO1**: Critically examine the escalating threat of AI-induced labor replacement in Vietnam, giving particular attention to vulnerable worker groups most at risk of sudden job loss.

**RO2**: Pinpoint and scrutinize urgent legislative gaps in Vietnam's labor laws concerning contract termination due to technological shifts—especially AI—and determine the extent to which these gaps undermine workers' rights.

**RO3**: Draw on actionable insights from nations at the forefront of AI adoption (e.g., Japan, Germany, Singapore, South Korea) to identify decisive policy strategies that protect workers against AI-driven displacement.

**RO4**: Propose robust legal reforms and rigorous enforcement mechanisms to safeguard labor rights, mandate effective retraining, and bolster sustainable economic progress in Vietnam's rapidly evolving AI era.

**Research Questions**

**RQ1**: How does AI intensify the risk of large-scale labor displacement in Vietnam, particularly for low-skilled and unskilled workers, and what are the far-reaching repercussions for the labor market?

**RQ2**: To what degree do Vietnam's current labor regulations address dismissals prompted by AI-driven technological changes, and which policy and legal shortcomings remain unresolved?

**RQ3**: What concrete lessons can Vietnam derive from countries with advanced AI ecosystems to fortify workers' rights and foster comprehensive retraining programs?

**RQ4**: Which legal and policy interventions can most effectively counter AI's adverse impacts, preserve fundamental labor rights, and sustain Vietnam's economic vitality amid accelerating AI adoption?

## II. Material and Methodology

### 2.1. Theoretical foundation

In order to address the aforementioned research questions, this study draws on the following theoretical frameworks to clarify the ways in which artificial intelligence (AI) reshapes labor-market structures and to identify policy interventions that align with both sustainable development and Vietnam's economic competitiveness in the AI era.

**Segmented Labor Market Theory**

This theory maintains that labor markets are composed of distinct segments defined by skill levels, occupations, or social status (Doeringer & Piore, 1971). Positions in higher-tier segments typically require more advanced qualifications, offer higher wages, and provide greater job stability. In contrast, lower-tier segments often involve low-skilled or unskilled labor and are therefore more susceptible to displacement by automation and AI technologies. This theoretical perspective closely aligns with RO1, which seeks to evaluate AI's impact on Vietnam's labor market, by illustrating how AI disproportionately jeopardizes the lower-tier workforce. It also informs RO2, which investigates gaps in existing labor legislation, as such gaps may fail to protect these vulnerable worker segments. In terms of the research questions, RQ1's focus on the effects of AI on low-skilled workers relates directly to the segmentation principle, while RQ2's inquiry into the sufficiency of Vietnam's legal framework draws upon the theory's emphasis on structural labor-market inequalities.

**Equity Theory**

This theory proposes that workers evaluate the fairness of their employment conditions by comparing their inputs, such as effort or expertise, with the outcomes they receive, including wages, benefits, or professional development (Adams, 1965). Within the context of AI-driven labor displacement, this theory helps explain how workers perceive and respond to potential job losses or changes in working conditions, particularly when such changes appear inequitable. This focus on fairness relates strongly to RO3, which examines lessons from developed nations on managing AI-related

job displacement, and to RO4, which involves formulating equitable policy solutions that address the grievances of displaced workers. Equity Theory is similarly pertinent to RQ3, which investigates how various national policies uphold fair labor practices amid AI adoption, and RQ4, which seeks to identify methods for balancing technological advancement with the protection of workers' rights.

**Sustainable Development Theory**

This theory maintains that economic progress should be harmonized with the protection of social rights, including employment (WCED, 1987; United Nations, 2015). In an AI-driven labor context, this principle demands that the pursuit of innovation not undermine job security or workers' welfare. The theory directly relates to RO1 and RO2 by emphasizing the significance of evaluating AI's labor-market repercussions in conjunction with existing legal frameworks, ensuring that worker protections are not sacrificed in the name of economic growth. In accordance with RO4's objective of proposing comprehensive solutions, Sustainable Development Theory supports the formulation of policies that combine AI-driven innovation with robust labor protections. In addressing RQ1 and RQ2, the theory highlights the necessity of reconciling economic imperatives with the social imperative of safeguarding fundamental labor rights. RQ4 also draws on this perspective in exploring how Vietnam might balance AI adoption with sustainable labor practices that ensure both productivity and worker well-being.

**Corporate Social Responsibility (CSR)**

This theory posits that firms have duties beyond profit generation, including ethical obligations toward their workforce (Adams, 1965; Doeringer & Piore, 1971). In an environment where AI threatens to displace workers, CSR calls for businesses to provide retraining, placement assistance, or fair compensation. This theoretical lens helps address RO3, which seeks to derive actionable insights from international best practices, and RO4, which requires the development of policy measures that incentivize corporate accountability in mitigating the adverse social impacts of AI. From a research-question standpoint, RQ3 looks to CSR-oriented models in advanced AI-adopting countries to discern effective ways of safeguarding labor rights, while RQ4 underscores the importance of aligning technological progress with ethical business conduct that maintains worker protections.

In synthesizing these four theoretical perspectives—Segmented Labor Market Theory, Equity Theory, Sustainable Development Theory, and CSR Theory—the study creates a comprehensive framework to examine RO1 through RO4 and RQ1 through RQ4. The interplay of these theories facilitates a deeper understanding of how AI disrupts labor market structures, how workers perceive fairness amid potential job loss, how sustainability principles must guide legislation, and how corporate entities share responsibility for safeguarding workers' rights. By drawing on these intersecting viewpoints, the research provides a nuanced foundation for assessing current legal shortcomings and for developing strategies to ensure that AI adoption in Vietnam promotes economic advancement without undermining the welfare and rights of the labor force.

### 2.2. Research Methodology

To address the study's research objectives (RO1–RO4) and research questions (RQ1–RQ4), this research adopts a multi-method approach comprising documentary research, qualitative inquiry, policy analysis, and comparative legal analysis. These methods collectively facilitate an in-depth understanding of AI's influence on Vietnam's labor market and the formulation of policy interventions that uphold sustainable development and protect workers' rights.

**Documentary Research Method**

This component underpins RO1 (evaluating AI's impact on Vietnam's labor market) and RO2 (identifying legal gaps) by systematically gathering and examining secondary data from authoritative sources, including academic publications, legal documents, and governmental or international organization reports. Principal data were drawn from the Ministry of Labor, War Invalids, and Social Affairs (MOLISA), the General Statistics Office of Vietnam, and the International Labour Organization (ILO). Through this documentation, the study addresses RQ1 (assessing AI's effect on vulnerable workers) and RQ2 (analyzing the efficacy of current legal frameworks) by elucidating the ways AI reshapes job structures and highlights areas in which existing regulations may be inadequate. In addition, the study references policy insights from jurisdictions such as Japan, Germany, and Singapore, which directly inform RO3 (drawing lessons from developed nations) and RQ3 (identifying international best practices for safeguarding

employment).

**Qualitative Research Method**

In-depth interviews and content analysis were employed to gain expert perspectives on AI-driven changes in the workforce, thus reinforcing RO1 (evaluating labor-market implications) and offering practical insights toward RO3 (drawing international lessons). This approach clarifies the specific legal challenges confronting Vietnamese workers (RQ1) and illuminates deficiencies in the labor policy framework (RQ2). By investigating expert recommendations, the study also addresses RQ4 (balancing AI adoption and labor rights) and supplies preliminary input for RO4 (proposing policy solutions) by identifying how targeted legal or institutional adjustments could better protect workers while maintaining economic competitiveness.

**Policy Analysis Method**

Policy analysis plays a vital role in assessing RO2 (determining legal gaps) and RO4 (developing policy remedies to limit AI's adverse outcomes). By systematically examining existing labor legislation, particularly regarding job security and the right to retraining when faced with AI-induced changes, the research aligns with RQ2 (evaluating the sufficiency of current laws) and pinpoints areas for revision or expansion. The method further responds to RQ4 (balancing AI-based innovation with labor rights) by formulating evidence-based proposals that integrate international best practices with Vietnam's specific legal context, ultimately contributing to sustainable economic development.

**Comparative Legal Analysis**

A comparative legal lens strengthens RO3 (extracting lessons from other jurisdictions) by examining how countries such as Japan, Germany, and Singapore approach AI-related labor issues. This cross-national perspective informs RQ3 (learning from advanced AI-adopting nations) and clarifies which legal mechanisms effectively mitigate job displacement risks or hold employers accountable for retraining obligations. By comparing these frameworks, the study refines policy proposals aimed at addressing RQ4 (balancing economic development with worker protections) and thereby provides insights tailored to Vietnam's socio-legal context.

Through this integrated methodology—encompassing documentary research, qualitative inquiry, policy analysis, and comparative legal analysis—the study synthesizes robust data sources, expert perspectives, and cross-jurisdictional policy lessons. The resultant findings not only illuminate AI's immediate labor-market impacts but also facilitate the development of targeted legal reforms and institutional strategies that protect workers' rights while bolstering Vietnam's economic resilience.

## III. RESULTS AND DISCUSSION

### 3.1 The Impact of Artificial Intelligence (AI) on Vietnam's Labor Market

Artificial Intelligence (AI) is exerting a profound influence on Vietnam's labor market, particularly within the ongoing process of digital transformation and the broadening application of technological innovations. Industries that rely heavily on low-skilled labor—such as textiles, processing, transportation, and assembly manufacturing—are among the most exposed to AI-driven automation. According to a report by the International Labour Organization (ILO, 2021), approximately 70% of workers in these industries in Vietnam may be replaced by automated systems and AI within the next ten years. Repetitive, low-complexity, or low-creativity tasks are especially vulnerable.

For instance, a study by THT Textile (2021) indicates that the textile industry, which contributes 15% of Vietnam's GDP and employs nearly 3 million workers, has experienced workforce reductions of up to 30% in several large factories located in Bình Dương and Đồng Nai due to automation. Automated systems have taken over repetitive tasks such as sewing and fabric cutting, while also performing more precise quality checks. Although these technological advances enhance productivity and lower production costs for enterprises, they simultaneously force substantial numbers of low-skilled laborers into unemployment.

AI's impact also extends beyond immediate job losses; it reshapes the skill profiles required by future labor markets. Specifically, prospective jobs demand workers capable of operating and managing automated systems, equipped with digital competencies, and adaptable to rapid technological evolutions. This shift imposes considerable pressure on low-skilled laborers, who frequently lack access to training programs focused on digital or technical skills.

Furthermore, the proliferation of AI in the workforce has induced clear labor-market segmentation. Highly skilled workers, those specializing in AI programming, big data analytics, or automated system design, reap significant benefits from heightened industry demand. Conversely, low-skilled employees and individuals without specialized capabilities face the greatest likelihood of adverse outcomes, exacerbating income disparities and limiting career progression.

### 3.2. Legal Gaps in Vietnam's Labor Code Regarding AI-Induced Workforce Reductions

The 2019 Labor Code provides overarching guidance on terminating labor contracts in cases of structural or technological change (Articles 42 and 44). However, it lacks specificity concerning circumstances under which AI replaces human workers, thereby creating significant legal voids.

**Ambiguities Surrounding "Technological Changes"**

Although the Labor Code classifies "technological changes" as including new production processes, machinery, equipment, and technologies, it does not clarify whether the substitution of human labor by AI or automation constitutes such a change. This omission leaves room for employers to reduce their workforce without adequate safeguards. According to a 2022 report by the Vietnam Chamber of Commerce and Industry (VCCI), more than 60,000 manufacturing workers lost their jobs due to the adoption of robots and AI. One electronics assembly firm in Bắc Ninh replaced over 1,500 employees with automated production lines in 2021, yet did not introduce a labor reallocation plan or any career transition support.

**Lack of Retraining and Skill-Development Provisions**

While the Labor Code requires employers to provide severance compensation (Article 44), it does not impose any obligation for retraining or upskilling. This regulatory gap disproportionately impacts low-skilled workers, who lack the qualifications needed to thrive in an evolving labor market. In the textile sector alone, data from the Vietnam Textile and Apparel Association (VITAS, 2022) show that approximately 38,000 workers lost their jobs due to automation. Only 10% benefitted from retraining support, while the remainder faced protracted unemployment due to insufficient technical skills.

**Inadequate Enforcement and Oversight Mechanisms**

The Labor Code mandates that enterprises develop labor utilization plans when implementing technological changes (Article 42), yet compliance remains superficial. Many businesses merely issue formalized layoff announcements without offering any tangible support for affected workers. A 2022 report by the Vietnam General Confederation of Labor notes that only 20% of surveyed enterprises met the requirement to submit labor utilization plans; the rest either ignored the provision or fulfilled it in a perfunctory manner, leaving workers unprotected.

**Absence of a Labor Transition Fund for Displaced Workers**

Vietnam's legal framework lacks any provision for establishing a labor transition fund to assist workers displaced by AI and automation. In the absence of financial aid or retraining opportunities, these workers often endure prolonged joblessness and economic instability. By contrast, countries such as Germany and Japan maintain robust labor transition funds. In Germany, a Labor Transition Fund—financed by corporate and government contributions—enables laid-off employees to pursue vocational training free of charge. Consequently, approximately 65% of displaced workers successfully transitioned into new roles within 12 months. According to a 2022 report by the International Labour Organization (ILO), without similar retraining initiatives, 40% of employees in Vietnam's manufacturing and service sectors risk being pushed out of the labor market over the next five years as AI's capabilities expand.

In summary, Vietnam's labor laws lack clarity on defining AI-driven workforce reductions as "technological changes," do not mandate retraining or skill development, exhibit weak oversight mechanisms, and fail to provide a transition fund for displaced employees. These legal omissions render many workers vulnerable to adverse labor-market shifts, highlighting the need for targeted reforms to protect workers' rights and ensure an equitable, resilient labor market under ongoing AI-driven advancements.

### 3.3. International Experiences in Safeguarding Employment Amid AI Development

**Germany: Establishing and Operating Labor Transition Funds**

Germany has pioneered a mandatory "Labor Transition Fund" to support workers affected by automation and AI.

This fund obliges businesses to contribute alongside government financial assistance, thereby funding retraining programs and facilitating the transition of displaced workers into new roles. When companies introduce AI or automated systems resulting in workforce reductions, they must submit labor utilization plans and make contributions to the training fund. The German government, acting as a mediator, collaborates with vocational institutions to offer free or subsidized courses focused on digital skills, system maintenance, and high-tech operations.

According to a report by the Federal Ministry of Labour and Social Affairs (BMAS, 2022), over 65% of workers displaced by automation found new employment within 12 months through this initiative. A salient example is Germany's automotive industry—its most automated sector—where thousands of workers successfully transitioned into maintenance technician and AI operations supervisor positions.

**Japan: Implementing New Skill Training Programs**

Japan enforces a policy under which enterprises must offer skill training programs to workers prior to downsizing for technological reasons, grounded in the principle of "human development." Employers are required to draw up training plans and promptly inform employees of skill-development opportunities. To support this initiative, the Japanese government has introduced programs such as "Skills for the Future," emphasizing information technology, AI system management, and automated machinery operation. The HelloWork system, a public employment agency, matches retrained workers with companies seeking specialized personnel. For instance, in electronics manufacturing, large entities like Toyota and Panasonic combine production-line automation with in-house training initiatives, enabling employees to transition into roles such as maintenance technicians or automated system supervisors. This proactive approach has kept the unemployment rate for workers replaced by AI below 3% (Ministry of Health, Labour and Welfare, n.d.).

**United States: Implementing the Trade Adjustment Assistance Program (TAA)**

The United States employs the "Trade Adjustment Assistance" (TAA) program to assist workers adversely affected by globalization and automation. TAA integrates financial assistance, vocational training, and job search services. Displaced workers receive unemployment benefits during enrollment in training programs tailored to high-demand fields such as information technology, digital engineering, and automated system maintenance. Local employment service centers then provide counseling and connect these workers with prospective employers. According to a 2020 report by the U.S. Department of Labor, 75% of TAA participants found new jobs, and over 50% secured wages equal to or exceeding their previous earnings. Detroit, where the automotive sector has seen significant AI-driven changes, illustrates TAA's effectiveness: it has retrained thousands of workers, enabling them to assume roles as industrial robot operators and technicians.

**South Korea: Early Notification and Digital Skill Training**

South Korea has enacted legal provisions compelling businesses to inform workers in advance of planned technological adjustments and associated staff cuts. Additionally, companies must provide appropriate compensation and introduce measures to support affected employees. Concurrently, the government has rolled out digital skill training programs, notably "K-Digital Training," which target programming, data analytics, AI management, and system operations. These courses receive governmental subsidies, and collaboration between enterprises and educational institutions is strongly encouraged to ensure the relevance of short-term training. In shipbuilding and steel, for example, many workers have been retrained to serve as automated systems engineers or maintenance specialists, allowing them to adapt to newly introduced production technologies (MOEL, 2021).

**Singapore: Implementing the SkillsFuture Initiative**

Singapore's national "SkillsFuture" initiative advances the objectives of lifelong learning and workforce skill enhancement, particularly in response to rapid AI and automation developments. The policy encompasses two major components: financial support for workers and the design of training programs aligned with industry needs. The government provides SGD 500 to SGD 1,000 in credits to citizens aged 25 and older, enabling them to enroll in vocational courses focusing on data analytics, AI operations, and digital transformation. To ensure program relevance, Singapore also fosters partnerships between businesses and educational institutions. In the hospitality and finance sectors, for example, employees replaced by AI systems can retrain for positions involving smart systems management

or higher-value customer service (SkillsFuture Singapore, 2022).

**Lessons and Implications**

Countries such as Germany, Japan, the United States, South Korea, and Singapore exemplify how coordinated efforts between the corporate sector and government agencies can effectively safeguard workers in the face of AI-induced disruptions. Policies like labor transition funds, skill-development initiatives, and financial support systems not only enable displaced workers to shift into new professions but also foster labor-market stability and sustainable economic development in the context of rapid technological progress.

### 3.4 Recommendations for Improving Vietnam's Labor Law and Enhancing Implementation Effectiveness

**Amend and Supplement Labor Law Provisions on Termination Due to AI Replacement**

Articles 42 and 44 of the 2019 Labor Code reference structural or technological changes as legitimate grounds for contract termination, yet they omit explicit guidance on cases in which AI directly displaces human workers. This omission risks leaving workers unprotected against abrupt job loss. To address this deficiency, the Labor Code should explicitly define AI-induced labor substitution as a technological change, for instance:

"*Technological changes include replacing workers with artificial intelligence (AI), automated systems, or other emerging technologies that result in reduced labor demand.*"

A phased approach to implementation is recommended:

Short-Term Phase (2024–2025). The Ministry of Labor, Invalids, and Social Affairs (MOLISA) conducts a comprehensive review of relevant legal provisions, identifies specific gaps related to AI-induced workforce reductions, and consults stakeholders—ranging from labor unions to industry experts—prior to drafting amendments.

Medium-Term Phase (2025–2026). Revised or supplemental legal instruments explicitly delineate employer obligations when adopting AI, mandating labor utilization plans, retraining initiatives, and appropriate compensation. Pilot projects within AI-intensive sectors (e.g., textiles, electronics, logistics) will inform final policy designs.

Long-Term Phase (Post-2026). Once formally adopted nationwide, local labor authorities are charged with monitoring and reporting on policy compliance. For example, an electronics firm reducing its workforce due to automation would be legally required to submit a justification, outlining retraining or reallocation plans, as well as compensation packages, for thorough review and approval.

**Establish a Mandatory Retraining and Reskilling Mechanism**

Protecting the right to work in an AI-centric labor market necessitates a legal mandate for businesses to provide retraining prior to terminating contracts. Article 44 should thus be refined to stipulate:

*"Businesses must organize retraining or career-transition programs for workers at least six months before terminating labor contracts due to technological changes."*

Implementation should proceed incrementally:

Phase One: Regulatory Development (2024). The government issues detailed guidance on the content, duration, and desired outcomes of retraining initiatives, while encouraging collaboration with vocational training institutions and industry professionals.

Phase Two: Pilot Implementation (2025–2026). Pilot retraining programs in AI-intensive industries receive partial financial support from a state vocational fund. Rigorous monitoring and evaluation identify best practices and areas requiring improvement.

Phase Three: Nationwide Rollout (Post-2026). The requirement becomes mandatory nationwide, accompanied by industry-specific training centers co-managed by government agencies and private enterprises. As an illustration, logistics workers displaced by AI could transition to roles operating or maintaining automated warehouse systems.

**Establish a Vocational Transition Fund**

A vocational transition fund is crucial to buffering workers against AI-driven job displacement. Three principal funding sources are envisioned: (i) mandatory business contributions (e.g., 1–2% of annual revenue when workforce reductions stem from AI), (ii) seed capital from the state budget, and (iii) voluntary donations from NGOs or

international programs. The fund would finance both retraining opportunities and financial assistance:

(2024–2025). Legal foundations and governance structures are developed, informed by proven models (e.g., Germany, Japan).

(2025–2026). Initial implementation targets high-displacement industries, providing subsidized retraining for displaced workers.

(Post-2026). Comprehensive nationwide enforcement begins, managed by MOLISA and local labor agencies. For instance, an automobile firm automating production would allocate contributions to the fund, which would then support retraining in AI operations for affected employees.

**Strengthen Monitoring and Impose Rigorous Sanctions on Non-Compliant Businesses**

Effective worker protection hinges on proactive monitoring and decisive penalties for businesses failing to meet statutory obligations, such as notification requirements, retraining mandates, or adequate compensation. Firms committing significant violations could face fines ranging from 50–100 million VND or 5–10% of annual revenue. This approach relies on a two-phase timeline:

Phase One: Regulatory Amendments (2024). Updated decrees clarify specific violations, establish fines, and outline enforcement procedures, thus deterring non-compliance.

Phase Two: Enhanced Labor Inspections (2025). Labor inspection agencies receive increased resources, authority, and specialized training. In practice, a company in Bình Dương found to have dismissed 500 workers without a retraining plan would be compelled to implement corrective measures and could be subject to a fine proportional to its annual revenue.

**Develop a National Strategy for Lifelong Learning and Digital Skills Development**

Finally, Vietnam must adopt a national framework for lifelong learning that endows workers with the digital and technological competencies essential in an AI-driven economy. Training credits can encourage workers to enroll in short-term programs—delivered online or face to face—in areas such as AI operations, digital analytics, or automated system maintenance.

(2024–2025). Government bodies collaborate with educational institutions to devise relevant curricula addressing digital skills, AI system administration, and broader automation technologies.

(Post-2026). Implementation scales up across the country, supported by both public and private funding. For example, hospitality workers could receive partial government sponsorship to undertake short courses in AI-based customer service applications.

Taken collectively, these five initiatives form a coordinated policy framework designed to uphold workers' rights amid AI-induced transformations. By strengthening legislation, mandating retraining, offering financial safety nets, deploying robust enforcement, and fostering continuous skill development, Vietnam can advance an equitable and resilient labor market in the face of rapid technological change.

## IV. CONCLUSION

Amid rapid advancements in artificial intelligence, Vietnam faces not only significant economic prospects but also profound labor-market challenges, particularly for low-skilled and unskilled workers. The existing legal framework lacks the specificity and comprehensiveness required to secure the right to employment in an era of swift AI adoption. Examining international experiences—such as creating labor transition funds and implementing systematic retraining policies—can inform the development of a more flexible and equitable labor system. Measures including legislative reform, rigorous sanctions against noncompliant businesses, and the promotion of lifelong learning strategies not only enhance worker protection but also foster sustainable development and bolster Vietnam's competitive edge in an AI-driven global economy.

# AN APPROACH TO BALANCE THE INTERESTS OF COPYRIGHT HOLDERS AND ARTIFICIAL INTELLIGENCE DEVELOPERS

**Nguyen Thi Lam Nghi**[1*]

[1]University of Economics and Law, Vietnam National University of Ho Chi Minh City

* Corresponding: nghintl@uel.edu.vn

**ABSTRACT**

Artificial Intelligence (AI) has been emerging as a unique phenomenon in society. Today, AI has been penetrated into many fields: natural and social science, academic studies and daily activities. While it is undeniable that AI technology brings several benefits to society, one of the concerns it creates is copyright issues. AI developers use machine learning algorithms to train AI models, which exploit an enormous amount of input datasets. In the case that such data are copyrighted works, the question is whether AI developers are responsible for paying for that use. There are two kinds of arguments: for and against imposing copyright liability on AI providers. The point is that both reveal shortcomings that would result in unjustified effects. This article's purpose is to look for a balancing approach to solve this copyright dilemma, which can help rightsholders remain their legitimate interests on the one hand and still encourage the development of AI technology for the public benefit on the other.

*Keywords*: "AI", "Artificial intelligence", "balancing interests", "copyright"

## I. INTRODUCTION

Artificial Intelligence (AI) is currently developing rapidly and bringing great benefits to many fields, from natural to social sciences, from academic research to practical activities. However, copyright issues are emerging as one of the most controversial topics in the field of AI development. Specifically, AI applies machine learning techniques that require enormous datasets to train AI models. Several documents in these datasets are copyrighted works. The question is whether AI developers are required to ask permission from and pay royalties to copyright holders for this use. This is a puzzle for policy makers. It creates a dilemma in the field of copyright and AI, which is not easy to solve. In principle, using works must comply with copyright provisions. However, given the characteristic of machine learning techniques that demand innumerable amount of datasets to train AI, imposing copyright liability will create a big challenge for AI developers to overcome. This approach would be detrimental to the advancement of novel technologies.

Recently, a series of lawsuits against the use of AI training data filed in the US further reflects this challenge. [1] AI developers have lamented that imposing copyright liability on AI development would be a fatal blow to this field, thereby threatening the development of AI (Blake Brittain, 2023). This comment is not an exaggeration because, as in the Complaint filed by The New York Times, billions of parameters have been used to train AI (The New York Times's Complaint, paragraph 2). Of course, not all documents in datasets are copyrighted. But imagine, even if only 10-20% of the billions of documents used are copyrighted, for which AI developers are required to pay, it would be a huge financial burden for them. Even if the AI developer finds a way to minimize costs somehow, for example negotiating to buy access to the entire package of documents from each copyright holder, the scenario could not be much better. It is because the required data sources are not only in a handful of content providers but can be scattered everywhere. Furthermore, because copyright is automatically protected, regardless of registration, copyright holders can be any ordinary internet user. As a result, package licenses are not feasible. In addition, the mechanism for requesting permission to use copyrighted works is cumbersome and inefficient.

However, if AI developers are freed from copyright responsibility for the data they use, it would not be justified because AI can now create products that directly compete with authors' works. AI painters might be competitors to artists. AI writers would be a threat to screenwriters. AI news aggregators could directly take jobs from traditional

[1] For example, Authors Guild et al v. OpenAI Inc. et al (September 19, 2023), Chabon v. OpenAI, Inc. (September 8, 2023), Walters v. OpenAI LLC (July 14, 2023), Silverman, et al v. OpenAI Inc. (July 7, 2023), Tremblay v. OpenAI Inc. (June 28, 2023), Getty Images (US), Inc. v. Stability AI, Inc. (October 7, 2023), and The New York Times v. Microsoft et al (December 27, 2023).

journalism. Therefore, it is unfair for copyright owners whose works are freely exploited by AI developers to create works that directly compete with them. In fact, AI providers are currently making a fortune from the AI models they develop.

In short, the traditional copyright regime is in a crisis due to the emergence of AI. This dilemma needs to be resolved by a mechanism that ensures the harmonious interests of all parties. Copyright policies need to have an approach that maintains the interests of copyright owners on the one hand, while still encouraging the development of science and technology, specifically the field of AI, on the other. This also reflects the principle of balancing interests in copyright: balancing the interests of the right holder and the public interest.

## II. LITERATURE REVIEW, THEORETICAL FOUNDATION, AND METHODOLOGY

### 2.1. Literature review

There are currently two arguments, for and against, on the issue of imposing copyright liability on AI training data.

The opposing argument is represented by Sag (2012). Sag (2012) proposes the concept of non-expressive use and argues that the use of AI training data is the use of non-expressive elements, namely, elements that are not protected by copyright. Sag's argument comes from the idea/expression dichotomy, according to which copyright protection only applies to expressions and does not extend to ideas. Sag argues that the way to use data to train AI is only to use ideas, not expressions. Because machine learning is the process that trainers provide input data to AI models, these models will find common patterns in the data and learn from them, then produce human-styled works. Patterns are ideas, not expressions. Sag therefore insists that the use of this data falls within the scope of fair use under Section 107 of the Copyright Act of the US. Further developing Sag's view are the studies of Jenny Quang (2021) and Thomas Margoni & Martin Kretschmer (2022). Both studies argue that because the elements used by AI are ideas but not expressions, this use does not fall within the scope of copyright protection. In other words, the use of AI training works is not subject to copyright. This approach is essentially to eliminate all risks of copyright liability for AI training. It is because the fair use doctrine is full of uncertainties. Courts observing this issue has arrived at contradictory findings. By arguing that AI training should be excluded from copyright, such risks would also be eliminated.

Conversely, some commentators argue that excluding copyright liability for the use of AI training data is unjustified. Grimmelmann (2016) notes that US judicial history has always treated robotic reading as non-expressive use, thus machinery reading is viewed fair use while human reading is subject to copyright. However, Grimmelmann (2016, p. 674-681) opposes this view in the field of AI because he worries that the bias towards AI could lead to consequences that are not beneficial to the future of humanity. Sobel (2017) argues that viewing the use of AI training data as fair use could result in a crisis in copyright. In his view, the purpose of fair use is to secure the public interest. In other words, fair use is only for the majority of readers to encourage learning. However, applying fair use to machine learning could urge the opposite result: the beneficiaries of fair use are a few big techs while the majority of creators are harmed. The reason is that giant companies like Google and Microsoft are the main AI developers, and they exploit big data on their platforms on the internet where each user can be a creator whose copyrighted works are exploited by AI providers without asking for permission or paying a single penny. The approach that grants fair use to the AI provider would reverse the familiar narrative of the fair use doctrine.

The above studies have revealed that both the support and opposition to imposing copyright liability on AI training could create adverse consequences. Prioitizing AI will be unfair to the author. Conversely, supporting the author is a threat to the development of AI, therefore the community cannot enjoy the benefits brought by novel technology. Hence, a fair approach for both is necessary.

### 2.2. Theoretical foundation for research

#### 2.2.1 Theory of public goods

Gordon (1982) makes an insight analysis of intellectual property's nature to insist that creations bear public goods' characteristics including non-rivalry and non-excludability. First, non-rivalry of works is shown in the perspective in which one person's use of the work is not a barrier for other people's exploiting this work simultaneously. In other words, the number of people who can access the same work is unlimited at the same time. Especially, unlike tangible goods, the more people use the work, the more value increases. Non-excludability of works makes it very difficult to

exclude someone from using the work. The cost for this exclusion would be very expensive. Both characteristics raise the free-rider problem in the copyright field, which is a big challenge to copyright policymakers.

The public good nature of works has a great influence on the design of copyright. An effective copyright regime must take into account the social attribute of intellectual goods. Specifically, the scope and level of copyright protection should not be limited because of the impossibility of eliminating social access to works. Further, from the economic perspective, given that the marginal cost of copying an additional unit of intellectual goods is almost zero, together the fact that the work's value do not decrease in spite of how many people use it, imposing an excessive level of copyright protection would make the copyright regime unreasonable and ineffective. Indeed, in a copyright regime that is too strict, people will tend to free-rider the work, thereby making copyright enforcement more difficult.

#### 2.2.2. Principle of balancing copyright holders' interest and the public good

The principle of balancing interests in copyright law is official acknowledged in the preamble to the World Intellectual Property Organization (WIPO) Copyright Treaty*:*

"Recognizing the need to maintain a balance between the rights of authors and the larger public interest, particularly education, research and access to Information, as reflected in the Berne Convention."

The principle holds that the copyright mechanism must secure both individual interest and social benefit. This comes from the duality of intellectual property. Because creative activities are inherited. That is, any creative work is based on previously existing ideas. Therefore, the work always contains two characteristics: social cumulation and individual creativity. The copyright protection mechanism should reflect this duality. The two popular copyright systems in the world are the Civil law, typically France, and the Common law represented by England and the US. The copyright laws of France and continental European countries adopt the natural rights approach. Specifically, the French copyright philosophy is the personality theory, developed from John Locke's labor desert doctrine. Accordingly, the purpose of copyright law is to protect the rights of the author himself because the work is the creator's brainchild. In contrast, the Anglo-American copyright law system, from the Statute of Anne in England to the Copyright Clause in the US Constitution, demonstrates a utilitarian approach. The ultimate purpose of the copyright laws in these countries is not primarily for the author's interest but to promote the public good. In other words, if the French copyright model prioritizes personal interests, in the American copyright model, the social value holds a central stage.

However, according to Carla Hess (2002), both these systems demonstrate a hybrid approach. French and Anglo-American copyright regimes are restricted within a limited time and scope of protection. It is not to mention the exceptions provided by both. Evidentially, any system must take into account the dualistic nature of intellectual property. An effective copyright regime needs to balance individual interests and social benefits.

### 2.3. Methodology

The study applies the following research methods:

First is the theoretical research method. The article conducts research on copyright theories and scientific research of scholars to draw out reasonable factors to support and develop the thesis and research results.

The second method is to analyze and compare legal provisions and case law. The article analyzes legal regulations and precedents of two systems of Civil law, represented by France and the European Union, and Common law, represented by England and the US to clarify the similarities and differences of these systems as a basis for proposals.

## III. RESULT AND DISCUSSION

### 3.1. AI and machine learning

Stryker and Kavlakoglu (2024) define AI as "technology that enables computers and machines to simulate human learning, comprehension, problem solving, decision making, creativity and autonomy." Thus, AI is considered an entity created to simulate human creative activities with the purpose of generating human-styled products. Just like a child, AI needs to be "taught" to be able to perform creativity. AI training is done through machine learning techniques. Machine learning simulates the way humans learn. Particularly, a vast number of datasets are needed to train AI models. AI models will search for common points and patterns among data, then remember them, thereby producing new information and content. There are many types of machine learning algorithms, among which the neural network is the

most popular, which is "modeled after the human brain's structure and function." (Stryker and Kavlakoglu, 2024).

Thus, there are two notable things related to AI. First, AI simulates human creative activities to generate results similar to works created by humans. Second, to do this, AI uses machine learning algorithms which use an enormous amount of data to train the AI. These datasets may contain copyrighted works. The question arises whether AI developers should be held liable for copyright infringement for use without permission and payment of royalties.

### 3.2. Arguments for and against fair use for machine learning

#### 3.2.1. Rationales for exemption AI training data use from copyright liability

Sag (2012) exploits the non-expressive use rationale to argue that training AI falls into the fair use zone under Section 107 of the US Copyright Act. This Section provides four factors to be considered for a fair use case:

"1. The purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes;

2. The nature of the copyrighted work;

3. The amount and substantiality of the portion used in relation to the copyrighted work as a whole; and

4. The effect of the use upon the potential market for or value of the copyrighted work."

Sag's argument focuses on the first factor that plays a significant role in determining whether exploitation of works falls within the fair use border. This factor is regularly satisfied in the case of transformative use. Transformativeness is uses that "add something new, with a further purpose or different character, and do not substitute for the original use of the work (The US Copyright Office, 2023). Two landmark cases, Authors Guild v. HathiTrust (2014) and Authors Guild, Inc. v. Google Inc (2015), well demonstrate that robot reading is viewed as transformation. In these cases, the judges held that digitalizing works for searching purposes satisfies the first factor, thereby the defendant, Google, did not infringe copyright. The findings are based on the reasoning that no evidence proves that the author's purpose in writing is to serve searching purposes, therefore machinery uses of works for searching online is transformation (Author Guild Inc. v. Google Inc., p.97).

However, fair use is a doctrine of uncertainties. It is because sometimes the findings do not arrive at the same result despite that their similarities. In Associated Press v. Meltwater U.S. Holdings, Inc. (2013), the defendant used search engines to supply searching online services to customers, like Google in Author Guild (2015) and HathiTrust (2014). However, it is surprising that this use was held to be copyright infringement because the court did not view such use as transformative. Hence, Jenny Quang (2021) and Thomas Margoni & Martin Kretschmer (2022) adjust this approach of supporting AI training by developing the rationale of exemplifying AI training datasets from copyright scope. Specifically, these commentators argue that robots use only patterns lied in works. Patterns are ideas while ideas are not subject to copyright, so training AI should be outside of copyright scope.

Advocates of AI training reason that imposing copyright responsibilities on AI developers in training AI tools would be detrimental to the progress of novel technologies. This argument is not totally baseless. As mentioned above, the scenario in which AI providers are required to pay for their exploitation of AI training datasets would be a huge financial burden. This scenario may threaten the development of AI field. Also, it is undeniable that AI is useful for society. Hindering the progress of novel technologies is incompatible to copyright policies set forth in the Copyright Clause of the US Constitution. Likewise, the Directive on Copyright in the Digital Single Market (CDSM) enacted by the EU in 2019 requires that "relevant legislation needs to be future-proof so as not to restrict technological development." (CDSM, Recital 3)

#### 3.2.2. Arguments for securing copyright holders' interest

While advocates' arguments have some merits, opponents well develop the rationales that insist on the copyright owners' benefits.

Commentators suppose that not all robotic reading is non-expressive use. Sobel (2017) and Opderbeck (2024) point out that machine learning algorithms require reproduction of input datasets, which could amount to copyright issues. Therefore, the non-expressive argument is not justified in all cases. Besides, Sobel (2017, p.88-89) discovers that if machine learning enjoys fair use that would inverse the traditional fair use scenario. He argues that the fair use doctrine

is adopted to secure the public interest, that is, to serve the majority of readers at the expense of the rightsholders' interest. However, given machine learning requires a vast amount of input datasets many of which can be copyrighted. This is meant to be that an unnumerable quantity of authors would be affected by the view that machine learning is fair use. Meanwhile, AI technologies are almost in a handful of big techs such as Google and Microsoft. Consequently, the scenario in which the fair use doctrine is applied to AI training data would reverse the fair use provision's purpose. This would result in an unjustified approach that prioritizes the minority of giant businesses at the cost of the majority of creators' benefits.

In fact, the CDSM of 2019 and the Artificial Intelligence Act of 2024 demonstrate an author-centered approach. The CDSM provides that commercial AI providers can use copyrighted works for training data in the case that they "has not been expressly reserved by their rightsholders in an appropriate manner, such as machine-readable means in the case of content made publicly available online." (Article 4). This is an "opt-out" mechanism that mandates that AI developers have to ask permission from works' authors if these authors expressly reserve their rights. Meanwhile, Article 53.1.d of the AI Act demands AI providers reveal AI training datasets. This is a requirement of transparency, which facilitates authors to carry out their rights.

The CDSM has been criticized by commentators. Karathanasis (2023) supposes that the CDSM approach in favor of authors might be detrimental to the development of AI in EU. Margoni and Kretschmer (2022, p.700) express their concern that this approach may urge AI developers to prioritize outdated data to save costs, thereby to provide biased and low quality AI models. Furthermore, Senftleben (2023, p. 1548) argues that the EU approach discourages AI developers in EU, therefore, they might move to the opponent markets such as the US or Japan. Consequently, the CDSM would create a lose-lose situation in which copyright owners could not only obtain royalties, and AI technology might not also be advanced in EU market.

In sum, commentators are inclined to lament that the approach of favoring authors would hinder the AI development, thus humans could not enjoy huge advantages AI tools brings.

### 3.3. Compulsory licensing: a balancing approach

The analysis of AI pro and cons arguments reveals a copyright dilemma. Neither supporting or nor opposing arguments are justified. Besides, the history of copyright has shown that traditional doctrines are prone to crisis whenever a new technology emerges, then the current laws turn out outdated (Patterson, 1987, p. 10). The era of the recording, broadcasting industry, and the internet has proven that. The phenomenon of AI is now creating a similar challenge. A new technical context of society requires a corresponding legal approach (Rooks, 1995, p. 267). One of the solutions chosen by countries to respond new technologies was to issue a compulsory licensing regime which can be construed to be a compromise approach responsive to new technologies that "has created new uses for which the author's exclusive rights have not been clearly established" (Lee, 1982, p. 209), and "has made old licensing methods for established rights ponderous or inefficient." (Lee, 1982, p. 209). Applying this regime in copyright has been now pervasive globally. A compulsory license for AI training data has recently been suggested by commentators (Opderbeck, 2024, p. 1000-1002). This approach may be a more balancing and rational alternative than the fair use doctrine. Rooks (1995, p. 267-291) cited scholars to point out that there are generally three reasons for adopting compulsory licensing scheme, including "(1) ensur[ing] public dissemination and authors' compensation; (2) market failure-high transaction costs; and (3) enforcement problems due to free riders." Three rationales should not be considered independently but intertwined together to achieve a comprehensive understanding. This subsequent analysis will illustrate that applying compulsory licensing mechanism for AI can meet all these reasons.

#### 3.3.1. Balancing interest issue

The first reason is to strike a balance between the interests of the community and the rights owners (Shapiro, Bernstein, & Co. v. Remington Records, 1959). This equation has two variables that must be satisfied: public goods and private interests of copyright holders. The scope of the exclusive rights that copyright law grants to the right owner entails two aspects: the right to allow use of works and the right to collect royalties for that use. Compulsory licensing is a partly concession, in comparison with fair use doctrine where copyright is completely eliminated, by the rights holder for the common good. When applying the compulsory licensing regime, the user's obligations are reduced by

half: they are obliged to pay for use without needing permission from the copyright owner.

The rationale of the interest balance should be only justified where a three-step test is taken: (1) the use of works essentially facilitate a special industry's operation; (2) that industry is beneficial for social development; and (3) absolutely eliminating copyright liability would be unreasonably detrimental to the right owner's legitimate benefits. While steps 1 and 2 demonstrate social needs that justify the use of works, step 3 prevents that use from falling into the fair use zone.

Step 1 dictates that an industry could be subject to copyright compulsory licenses if use of works is necessary to perform its function. In other words, there is almost no other (feasible or effective) choice for the industry. This step should be taken because if a number of alternatives are ready for their operation, it is unjustifiable to circumvent the rightsholder's interests. Take the recording industry as an example. A broad variety of copyrightable subject matter is frequently needed for making a recording. A full copyright liability scheme can limit accessing works, therefore, bar this industry's development. Likewise, in the context of AI training that vitally needs using a large volume of works, allowing copyright owners to reserve the right to prohibit AI developers from accessing their works would severely threaten the survival of this technology.

Step 2 requires that the industry could be eligible for compulsory licensing regime if it brings great benefits to society. Compulsory licensing regime, in addition to fair use doctrine, establishes an exception for copyright, which aims to satisfy public needs for the cost of individual interests. The social benefits as the industry's outcome must outweigh this cost. The compulsory licenses are granted for cable television industry because it can enhance people's capacity of access knowledge and information to people.[2] In the contemporary digital world, AI has been applied to a wide range of social, art, and technical fields to meet needs of a variety of occupations, from office staff, artists to scientific professionals. People could save time, effort, and money when simple creative tasks are done by robots, such as translation for a meeting, information synthesis or empirical analysis for a report. In addition, Sobel argues that machine learning has an impact on academic research, then restraining it would "impoverish research efforts." (Sobel, 2017, p. 80-81)

While the first two steps point out the benefits of AI and thus the legitimate need for access to AI's work, step 3 demonstrates that a blanket copyright exemption for AI is unjustified. The indefensibleness comes from both theoretical and practical backgrounds, as analyzed above. AI models could operate as "competitors" to the authors whose copyrighted works is used for training these models. From a competition law perspective, absolute exemption from copyright obligations for AI developers is probably unfair for copyright holders.

### 3.3.2. Market failure issue

The concept of market failure can be traced to Gordon (Gordon, 1982). Gordon (1982, p. 1612-1613) argues that copyright law can facilitate a Smithian competitive market where the transaction cost is low. In this market, transferring copyrights between parties is voluntary. However, in case the market does not function adequately, namely, market failure, the Government need adopt such special public policy as compulsory licensing to avoid monopolistic control over certain economic fields or high transaction costs (Gordon, 1982, p. 1613). Giving the need and vastness of input data for machine learning, transaction costs are probably exceedingly expensive. Not to mention the time-consuming process of dealing with a large number of rights holders, thus "private ordering is intractable." From the perspective of competition law, copyright owners act as both the party holding the market dominant position of input data resources and the competitor of outputs in the relevant market. Therefore, rightsholders could abuse their monopolistic position to impose adverse conditions for bargaining or even reserve their rights to refuse copyright transfer. These scenarios can constitute a market failure issue.

### 3.3.3. Free rider issue

The emergence of disruptive technologies helps thrive dissemination of works. However, it also makes copyrighted

[2] This is cited from the testimony of Rex Bradley, Chairman, National Cable Television Association in Hearings on H.R. 2223 before the Subcommittee on Courts, Civil Liberties and the Administration of Justice of the House Comm. on the Judiciary (94th Cong., 1st Sess. 503 (1975).

works more accessible to users through new effective and anonymous use, thus the free rider problem escalates. AI is not an exception case for this. In reality, exactly identifying what data an AI model has used and to what extent they have been exploited is nearly impossible unless the developer publicizes such information. To avoid the free-rider problem, the rights owner can, through compulsory licensing mechanism, seek more effective protection than fair use doctrine (Rooks, 1995, p. 271).

The compulsory licensing regime attracts some criticism, especially concerns about the license fee (Opderbeck, 2024, p. 1002). Outlining a comprehensive legal framework for a compulsory licensing mechanism to fix its inherent flaws is beyond the scope and objectives of this study. However, some points should be kept in mind for designing such a legal scheme. Given the sophisticated nature of the AI training mechanism, which requires an uncountable number of data, the licensing fee should be considered with great care. There are two approaches: (1) a license fee agreed upon by the parties, and (2) a license fee that is prescribed by law. The advantage of the first approach is that it ensures the parties' freedom to agree. However, it probably takes time to reach an agreement, making the mechanism cumbersome and ineffective. Not to mention that in some cases, rights holders who are not willing might "circumvent the law" by imposing an excessively high fee, which would make the compulsory licensing impossible. Therefore, a more feasible approach is to set a statutory fee. This approach may overcome the disadvantage of the first one. Conversely, its shortcoming is that the fee would be fixed, so it is not always reasonable, especially where market conditions change. Therefore, a statutory fee should be designed to achieve the following goals: (1) ensuring the legitimate economic interests of the rights holders but not imposing an undue cost burden on AI providers; (2) the fee must take into account the characteristics of each type of work and the level and extent of use; and (3) the fee frame should be periodically reviewed to be compatible with the new market conditions.

In sum, applying compulsory licensing regime to AI training data seems to be a more balanced approach, and therefore more likely to be accepted by all parties, than the fair use doctrine. However, given the collective nature of intellectual property, any exceptional approach to AI needs to be considered in relation to traditional copyright policies for humans. Otherwise, these policies will lack theoretical basis and fail to ensure their original goals. This issue will be analyzed in the next section.

## IV. CONCLUSION

Given the duality of creative works, that is, any creation bears two characteristics: the private and cumulative attributes, an effective copyright policy is not only to protect authors' interest but also serve social development. In the context of AI training data, therefore, that the approaches prioritize one of the parties, namely, authors and AI developers, might not be justified. Indeed, preference of one side at the expense of the other probably results in bad effects. In favor of copyright holders may disadvantage the progress of AI, a novel useful technology for human life. In contrast, viewing AI training as a fair use could create unfair situations in which AI developers freely use authors' works to create AI tools that would compete with these authors. Hence, compulsory licensing may be an approach balancing interests of two parties. On the one hand, compulsory licensing secures copyright owners' benefits and encourages the development of AI on the other because AI providers are not inhibited from exploiting copyrighted works for training AI models.

# ENHANCE FOREIGN INVESTMENT ATTRACTION IN SCIENCE, TECHNOLOGY AND INNOVATION DEVELOPMENT IN VIETNAM IN THE CONTEXT OF THE DIGITAL AGE

**Pham Thi Hong My[1] ***

[1] Faculty of Law, Saigon University

*Corresponding: pthmy@sgu.edu.vn

**ABSTRACT**

The 2013 Constitution affirmed that: "Developing science and technology is the top national policy, playing a key role in the country's socioeconomic development". Especially in the context of taking advantage of the 4.0 industrial revolutions, Vietnam has identified science, technology and innovation (S&I) as the golden key, the most important strategic breakthrough. To develop S&I, the solution to increase capital attraction is given top priority.Therefore, the article will focus on analyzing (i) The situation of attracting foreign investment in developing S&I in the period of 2020 - 2024; (ii) Solutions to increase foreign investment attraction in developing S&I in Vietnam towards the goal of sustainable development in the context of the digital age.

*Keywords:* "foreign investment", "science", "technology", "innovation", "digital age"

## I. INTRODUCTION

The socioeconomic development strategy for the period 2021-2030 has identified science, technology and innovation as an important content in implementing the strategy. On the other hand, the context of the 4.0 industrial revolution has placed science, technology and innovation at the center. Therefore, Vietnam, as well as other countries in the world, focus on solutions to develop science, technology and innovation, including solutions to increase foreign investment attraction in science, technology and innovation development in Vietnam towards the goal of sustainable development. According to the General Statistics Office (2025), foreign direct investment licensed an economic sector (Accumulated projects valid as of December 31, 2023) for professional activities, science and technology, the number of projects is 4,488.0; total registered capital (tr. USD) is 5,433.3. The number of projects and total registered capital of science and technology activities are ranked 3rd out of 18 sectors receiving foreign direct investment (Statistical Yearbook, 2023). Also, according to the Statistical Yearbook (2023), if only foreign direct investment licensed in science and technology in 2023 is counted, not cumulatively, science and technology activities also attract 414 projects and total registered capital (tr. USD) is 1,437.8. According to the Numbers and Events Magazine (2025), the government is proactively promoting emerging high-tech industries that are in line with world trends. In the semiconductor industry, in a short time, Vietnam has made impressive steps in semiconductor cooperation with countries and economies such as the United States, South Korea, Japan, Taiwan, Europe... and large technology corporations such as Cadence, Intel, Qovor, Apple, Marvell, Samsung, Synopsys. Vietnam was also selected by the United States as one of 6 countries participating in the Chips Act to develop the global semiconductor supply chain. In the field of artificial intelligence (AI), many corporations such as Microsoft, Google, Qualcomm, Meta have increased cooperation in research and application of AI in Vietnam. Domestic corporations such as Viettel, VinGroup, FPT, CMC... have also proactively and actively implemented synchronous projects and research and development activities on AI. Regarding the development of the innovation and startup ecosystem, Vietnam has strongly developed the connection between ecosystem subjects with the leading role of the National Innovation Center, which is considered a strong ecosystem in the region. In 2024, a series of large corporations invested in Vietnam such as Amkor Technology Group invested 1.07 billion USD, LG Group invested 1 billion USD, Hyosung Group invested 700 million USD in the Bio-BDO (Butanediol) bio-fiber factory project, Talway Group invested 700 million USD, Capital Land invested 661 million USD, Foxconn invested 551 million USD in the project on smart entertainment products and smart system equipment... NVIDIA Corporation (USA) officially signed a cooperation agreement with the Vietnamese Government on the establishment of the Artificial Intelligence Research and Development Center (VRDC) and the Artificial Intelligence Data Center in Vietnam (Thu Huong, 2025).

However, the current situation of attracting foreign investment in science, technology and innovation development in the period 2020-2024, besides the results achieved with an impressive number of projects and total investment capital, still has some limitations and shortcomings. For example, the total registered investment capital for science, technology and innovation are still low compared to some other industries, proving that investment attraction is not very effective; few FDI projects have high technology, low technology spillover (Vo Thanh Thu and Tran Thi Trang, 2023); investment attraction is uneven among localities; investment partners are mainly investment partners in Asia, in the top 08 countries investing the most in Vietnam from 2020 to 2024, only the Netherlands is a European country, the remaining 07 partners are in Asia. That means Vietnam's foreign direct investment partners mainly do not come from countries holding source technology such as the United States, EU, Japan but mainly from Asia such as China, Korea (Bui Kieu Anh, 2023); orientation to attract foreign investment by industry and partner are still limited; Although it has attracted many good technologies, it has not achieved the goal of attracting technology and transferring technology (Hoang Anh Minh, 2024). On the other hand, there are still many limitations such as the quality of high-quality human resources, infrastructure, policy mechanisms or management, supervision, inspection, and implementation in management are not yet highly effective.

Research on the topic of attracting foreign investment in science, technology, and innovation development from 2020 to 2024, it can be seen that in Vietnam there are many research works related to attracting foreign investment, such as Vo Thanh Thu and Tran Thi Trang (2023), Recommendations to attract foreign direct investment in Vietnam in the Journal of Development and Integration; Pham Thi Hong My (2023), Current policy mechanism for developing national science, technology, and innovation. Proceedings of the national scientific conference: Developing national science, technology, and innovation: perspectives from stakeholders. National Economics University; Le Nhu Quynh (2022), Policy to attract foreign direct investment in Vietnam to 2030, PhD thesis; Bui Kieu Anh (2023), Foreign direct investment in Vietnam in the new context, PhD thesis... The above research works only study foreign direct investment in general, not focusing on foreign direct investment in the science and technology sector. And this work will focus on foreign investment in science, technology and innovation in the context of the digital age.

Science, technology, and innovation play an important role in economic growth, GDP, enhancing Vietnam's competitiveness and are an important driving force to enhance the overall strength in the fields of socio-economics, national defense and security, promoting dual transformation (digital transformation, green transformation), protecting the environment and responding to climate change, ensuring sustainable development. Therefore, attracting foreign investment in science, technology, and innovation development will create additional capital sources in addition to state budget capital and private capital. Capital is a prerequisite resource for science, technology and innovation development and increased foreign investment will help reduce pressure on investment capital from the state budget. Increasing foreign investment attraction in science, technology and innovation development will help Vietnam narrow the gap with other countries. Foreign-funded R&D centers have made positive contributions to the introduction of international advanced technologies and high-level talents, improving the technological level and scientific and technological innovation capacity. Through attracting foreign investment, Vietnam has the opportunity to access the world's advanced technology to develop economic sectors using modern technology such as precision mechanics, electronics, software industry, post and telecommunications, biotechnology, etc. Attracting foreign investment also contributes to the rapid development of export processing zones and industrial parks with advanced technology levels, enterprises have produced and brought to market many products that we had to import in the past due to the backwardness of domestic technology. In the context of the digital age, digital transformation requires the use of data and digital technology to comprehensively and comprehensively change all aspects of economic and social life. Therefore, science, technology and innovation and digital transformation will have a close relationship with each other. Developing science, technology and innovation will create modern technology that contributes to digital transformation in specific fields. To have many applications of modern digital technology, capital is required, which means attracting foreign investment in science, technology and innovation will help make digital transformation faster and more modern. Because for Vietnam - a developing country, the fastest and shortest way to narrow the gap with developed countries is to attract modern technology from abroad, including through foreign direct investment projects in science, technology and innovation activities.

Therefore, it is very necessary to study the situation of attracting foreign investment in science, technology, and innovation development in Vietnam in the period of 2020 - 2024 in the context of the digital age to propose policies and solutions in the coming time.

## II. MATERIAL AND METHOD

The article uses the research method of analysis, synthesis and comparison based on secondary documents such as legal documents, data reports of the Foreign Investment Agency, articles of domestic experts to clarify the situation of attracting foreign investment in the field of science, technology and innovation, thereby proposing solutions to increase foreign investment attraction.

## III. RESULT AND DISCUSSION

### 3.1. Situation of attracting foreign investment in science, technology and innovation development in the period 2020 - 2024

Attracting capital for science, technology and innovation development is an important solution, so attracting foreign investment is also determined to be implemented. In the period of 2020 - 2024, the situation of attracting foreign investment also achieved positive signs.

**Achievements**: By participating in signing many new-generation free trade agreements, clear and transparent legal regulations, simplified administrative procedures, applying digital transformation and especially implementing many policies to attract foreign investment in national economic sectors such as Vietnam's Human Resources Development Strategy for the period 2011-2020; Science and Technology Development Strategy for the period 2011-2020; Resolution No. 50-NQ/TW dated August 20, 2019, of the Politburo on orientations for perfecting institutions and policies, improving the quality and effectiveness of foreign investment cooperation until 2030 and the Foreign Investment Cooperation Strategy issued by the Government, aiming to focus on attracting quality foreign investment flows, contributing more effectively to economic growth and having a spillover effect on domestic enterprises; Directive No. 01/CT-TTg of the Prime Minister dated January 14, 2020, on promoting the development of digital technology enterprises in Vietnam, Law on Technology Transfer 2017, Law on Investment 2020, Law on Environmental Protection 2020 ; Law on Tax Administration 2019, Law on Intellectual Property 2005, amended and supplemented in 2009, 2019, 2022, Law on Enterprises 2020; Decision No. 29/2021/QD-TTg dated October 6, 2021, of the Prime Minister regulating special investment incentives; Decision No. 667/QD-TTg dated June 2, 2022, of the Prime Minister approving the Foreign Investment Cooperation Strategy for the period 2021-2030; Decree 182/2024/ND-CP regulating the establishment, management and use of the Investment Support Fund ... The State also participates in becoming a member of a series of bilateral and multilateral free trade agreements, creating a boost for attracting a wave of foreign direct investment into the country such as the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP), Vietnam - European Union Free Trade Agreement (EVFTA), Investment Protection Agreement (EVIPA). For example, the Vietnam - EU Free Trade Agreement (EVFTA) has been signed and entered into force. This will further promote the activities of foreign enterprises in Vietnam.

On the other hand, the rapid and strong economic growth of Vietnam is also an opportunity to welcome the wave of foreign investment attraction. In order to grow the economy and attract foreign investment in a sustainable and effective manner, the State has focused on investing in digital transformation and applying green technology to production and business activities to help manage the impact and adapt to climate change. The orientation to shift to green economic development is expected to bring many opportunities and is an important factor for Vietnam to compete to attract investment.

Therefore, in the period of 2020-2024, Vietnam has achieved many achievements compared to the fluctuating international context. Localities have also been proactive and prepared conditions to attract foreign investment in science, technology and innovation development such as completing transport infrastructure, building high-tech zones, etc. For example, Nghe An is a province has promoted administrative reform and improved the provincial competitiveness index; promoting the construction of e-government, digital government, improving the quality of cadres, civil servants and public employees and strengthening coordination between agencies and units are important factors. The province has also actively mobilized resources to develop transport infrastructure, connecting western

Nghe An with the lowlands and promoting the development of high-tech agriculture.

Some typical results in attracting foreign investment capital can be mentioned as

Firstly, attracting foreign investment capital into professional, scientific and technological activities are always in the Top 5 sectors attracting foreign investors out of a total of 21 national economic sectors (manufacturing and processing industry, real estate business, wholesale and retail, electricity production and distribution and professional, scientific and technological activities). Specifically, professional activities, science and technology ranked 5th in the Top 18 sectors receiving foreign direct investment in 2023, in terms of total registered capital. Also in 2023, there were 111 countries and territories investing in Vietnam. There were 114 countries and territories investing in Vietnam in 2024. Bac Ninh took the lead with a total registered investment capital of nearly 5.12 billion USD, accounting for 13.4% of the total investment capital of the country, more than 2.8 times higher than the same period. Hai Phong ranked second with more than 4.94 billion USD, accounting for 12.9% of total registered investment capital, up 42.4% compared to 2023. Ho Chi Minh City ranked third with a total registered investment capital of more than 3.04 billion USD, accounting for nearly 8% of total investment capital nationwide, down 49.4% compared to 2023. Next in line are Quang Ninh, Hanoi, Binh Duong, ... (Ministry of Planning and Investment, 2024). According to the Statistical Yearbook (2023):

**Table 01: Licensed foreign direct investment attraction in the period 2020 - 2023**

| Year | Project Number | Total registered capital (million USD) | Total implemented capital (tr.USD) |
|---|---|---|---|
| 2020 | 2610 | 31045.3 | 19980.0 |
| 2021 | 1818 | 38854.3 | 19740.0 |
| 2022 | 2169 | 29288.2 | 22396.0 |
| 2023 | 3314 | 39390.3 | 23183.0 |

*Source: Statistical Yearbook 2023*

**Table 02: Ranking of licensed foreign direct investment by economic sector in 2023**

| Rank order | Industry |
|---|---|
| 1 | Processing and manufacturing industry |
| 2 | Real estate business |
| 3 | Production and distribution of electricity, gas, hot water, steam and air conditioning |
| 4 | Finance, banking and insurance activities |
| 5 | Professional, scientific and technological activities |

Second, the total registered foreign investment capital in science and technology in recent years has always been above 1 million USD (Table 04). Total newly registered capital, increased capital and contributed capital in 2024 also increased month by month during the year (Table 05).

**Table 04: Attracting foreign investment in professional, scientific and technological activities in the period 2020 - 2023**

| Year | Number of new projects | New registered capital (*tr.USD)* | Number of project adjustments | Adjusted registered capital (*tr.USD)* | Number of capital contributions to buy shares | Value of capital contribution to buy shares *(million USD)* | Total registered capital *(million USD)* |
|---|---|---|---|---|---|---|---|
| 2020 | 376 | 169.30 | 87 | 114.30 | 825 | 1,062.96 | 1,346.56 |
| 2021 | 291 | 143.31 | 87 | 276.55 | 620 | 604.12 | 1,023.98 |
| 2022 | 331 | 249 | 106 | 172.43 | 603 | 867.90 | 1,289.31 |
| 2023 | 403 | 179.64 | 103 | 332.62 | 531 | 772.73 | 1,285.00 |

| 12 | 1268,798 |
| Total | 6.675,083 |

*(Source: Ministry of Planning and Investment, 2024).*

Locally, we can mention the case of Luxshare - ICT Vietnam Company, a member of the Chinese multinational corporation Luxshare - ICT, in November 2023 invested an additional 330 million USD to expand its factory in Bac Giang, bringing the total capital of this company in Bac Giang province to 504 million USD. Luxshare - ICT is a manufacturer of Airpods and many other devices for Apple. Luxshare - ICT also invested 290 million USD in Nghe An with two projects, Luxshare ICT 1 worth 140 million USD and Luxshare 2 worth 150 million USD in VSIP Nghe An Industrial Park (Hung Nguyen), to produce electronic components (Yen Anh, 2024). In Ho Chi Minh City, according to the report of the General Statistics Office, the bright spot in attracting foreign investment to this locality in 2023 is that out of 194 projects with adjusted registered capital, 50 projects were in the field of science and technology, with registered capital increasing by 290 million USD, accounting for nearly 50% of the adjusted registered capital. In addition, out of the total 996 million USD attracted through capital contribution and share purchase, professional, science and technology activities attracted 278 million USD, accounting for 28%, ranking first among the sectors with capital contribution and share purchase (Le Quan, 2023). According to the Management Board of Ho Chi Minh City High-Tech Park, in 2024, 7 projects were started here, including 3 foreign -invested projects with an investment capital of 696 million USD and 4 domestic projects with an investment capital of 4.077 billion VND. The newly started projects all have high technology content, using high-quality human resources such as the Nipro Vietnam Factory Expansion Project; HCMC1 Data Center. The project that is receiving the most attention in Ho Chi Minh City today is the Data Center at Lot T4-3 with an area of 3 hectares in the High-Tech Park. Up to now, there are 7 investors wanting to invest in this project, including 6 famous foreign investors such as Eaton (USA); Evolution under the Warburg Pincus Investment Fund (USA); Hyosung (Korea); NTT Data (Japan) ... (Le Quan, 2024).

Third, according to the Global Innovation Index (GII) Report 2023 (GII 2023) published by the World Intellectual Property Organization (WIPO), Vietnam increased by 2 places compared to 2022, ranking 46/132 countries and economies in global innovation, at the same time, ranking 4th in the ASEAN region and among the top developing economies. Also, according to the Vietnam Innovation and Technology Investment Report 2021 published by NIC, the total amount of venture capital in 2021, in Vietnamese innovative startups reached 1.4 billion USD. Of which, according to the estimate of ThinkZone Ventures Fund, about 90% of this capital is capital from foreign venture capital funds. In 2023, 1.5 billion USD is the capital committed to Vietnamese startups from 41 investment funds from Korea, Japan, Singapore, Indonesia, USA, and Vietnam in the period 2023-2025. According to the GII 2024 Report, Vietnam's innovation index is ranked 44/133 countries and economies, up 2 places compared to 2023. Of which, innovation input increased 4 places compared to 2023, from 57th to 53rd; innovation output increased 4 places compared to 2023, from 40th to 36th (General Statistics Office, 2024).

**Limitations and shortcomings** : After 10 years of implementing Resolution No. 20-NQ/TW dated November 1, 2012, of the 11th Party Central Committee on the development of science and technology to serve the cause of industrialization and modernization in the context of a socialist-oriented market economy and international integration, it has been shown that: The implementation of the Resolution still has some limitations and weaknesses, some aspects are slow to be overcome, and have not met the requirements of industrialization and modernization of the country. The institutionalization is not complete and synchronous; the state management work is slow to innovate, and has not strongly promoted the development of science, technology, and innovation. The capacity of a number of science and technology officials are still limited; the potential and level of national science, technology and innovation are still far behind the group of leading countries in the region. Science, technology and innovation have not really played the role of a leading national policy, a strategic breakthrough, or an important driving force for renewing the growth model and developing the country quickly and sustainably. To clarify this statement, we can see:

Firstly, the total registered foreign investment capital in science and technology is still low compared to other sectors, typically the processing and manufacturing industry and real estate business (Table 02).

**Table 06: Comparison of total registered foreign investment capital in science and technology compared to other sectors in the period 2020 - 2023 (unit: million USD)**

| Year | Professional, scientific and technological activities | Processing and manufacturing industry | Real estate business |
|---|---|---|---|
| 2020 | 1,346.56 | 13,601.09 | 4,184.95 |
| 2021 | 1,023.98 | 18,120.89 | 2,637.42 |
| 2022 | 1,289.31 | 16,801.53 | 4,451.44 |
| 2023 | 1,285.00 | 23,504.98 | 4,665.76 |

*Source: author compiled from annual reports of the Foreign Investment Agency*

Second, according to the Global Innovation Index Report 2023, the aspect of capital investment in science, technology and innovation activities in Vietnam has not improved. The level of investment in research and development (R&D) compared to the GDP of the Vietnamese Ecosystem is still low and tends to decrease. In 2023, the recorded figure for R&D investment compared to Vietnam's GDP was 0.4%, lower than the average of Southeast Asia, ranked 66th globally, down 7 places compared to last year, ranked lower than the ranking in 2021. Meanwhile, countries in the same region have increased capital investment in this activity, and quickly rose in the 2023 rankings such as Thailand: 1.3% (up 4 places), Singapore 2.2% (up 3 places), Malaysia: 1%. The report shows that Vietnamese enterprises still face many obstacles when innovating. 75% of businesses surveyed in the report affirmed that the lack of full awareness of the role of open innovation leads to unclear motivation for realization (Hieu Phuong, 2024).

Third, the situation of attracting foreign investment in science, technology and innovation are not uniform in Vietnam. That is, in terms of investment location criteria, it is clear that foreign investment is concentrated in localities with favorable infrastructure, stable human resources, administrative reform, digital transformation application, high-class services and dynamism in investment promotion such as centrally-run cities such as Hanoi, Ho Chi Minh City, Da Nang, Hai Phong and Can Tho. Can Tho as well as the provinces of Binh Duong, Dong Nai, Long An, Quang Ninh,

Bac Ninh, Bac Giang, Thai Nguyen. For example, Hanoi is a bright spot in the field of science, technology and innovation in the country (leading the country in the local innovation index). In 2023, attracting foreign investment capital to Ho Chi Minh City in professional, scientific and technological activities increased. Of the 194 projects with adjusted registered capital, 50 projects were in professional, scientific and technological activities, with registered capital increasing by 290 million USD, accounting for nearly 50% of the adjusted registered capital. In addition, of the total 996 million USD attracted through capital contribution and share purchase, professional, scientific and technological activities attracted 278 million USD, accounting for 28%, ranking first in the sectors of capital contribution and share purchase (Le Quan, 2023). Meanwhile, it is also attracts foreign investment in science, technology and innovation in the province. In Ha Tinh and Phu Yen, the number of projects and registered capital is too low or non-existent. Specifically, according to the Ha Tinh Provincial Statistical Yearbook (2023), there are no foreign direct investment projects licensed by economic sectors and professional activities in science and technology in 2023. If based on the cumulative number of projects still in effect as of December 31, 2023, the number of licensed projects is 03 and the total registered capital is 13 million USD. According to the Phu Yen Provincial Statistical Yearbook (2023), there are no foreign direct investment projects licensed by professional activities in science and technology in 2023. If based on the cumulative number of projects still in effect as of December 31, 2023, there are no projects in the field of science and technology.

Fourthly, although the activities to support science, technology and innovation have been promoted by localities, statistics show that 32/63 provinces/cities nationwide have established science and technology development funds, contributing to practical support for enterprises in technological innovation. 60/63 localities have issued plans to implement the National Program to support enterprises in improving productivity and quality of products and goods in the period of 2021-2030 (Xuan Dien and Minh Hieu, 2024). This means that the number of localities with development funds is still low and has not been focused on implementation.

Fifth, if we consider the criteria of investment partners, foreign investment partners in developing science, technology and innovation activities in Vietnam are all traditional partners such as Korea, Japan, Singapore, China, etc. This means that they are still not diversified and have not attracted investors from other countries.

### 3.2. Solutions to increase foreign investment attraction in developing science, technology and innovation in Vietnam towards the goal of sustainable development

**For state agencies:**

Perfecting the legal framework to create a foundation for attracting foreign investment: First of all, it is necessary to study and promulgate the Law on Science, Technology and Innovation to replace the current Law on Science and Technology to properly reflect the nature of creating a legal basis for the development of science, technology and innovation as well as unifying the content of innovation that is currently stipulated in many legal documents. The Law on Science, Technology, and Innovation needs to stipulate specifically the concept of scientific research; fully stipulate the legal framework for innovation; state policies on science, technology, and innovation; rights and obligations of organizations and individuals performing science and technology activities, science, technology, and innovation activities in higher education institutions... Perfecting the legal framework is also the basis for creating motivation to attract foreign investors to invest in science, technology, and innovation. It is necessary to perfect legal documents related to investment and transfer of high technology. Intellectual property laws need to be strengthened because intellectual property protection will promote innovation through patents, trademarks, copyrights and geographical indications (Bui Kieu Anh, 2023). Completing the legal corridor on science, technology, and innovation will contribute to promoting the development of this industry, implementing digital transformation, and creating conditions for national socioeconomic development.

Promote foreign investment attraction: Promoting foreign investment attraction will have more and more investment partners in the fields of science, technology, and innovation. Practice has proven that if the state agencies of each province and city is proactive in investment promotion, they will attract more and more foreign investment capital. The experience of the Bac Ninh provincial government has shown that clearly. Therefore, in the coming time, it is necessary to promote investment promotion. Each locality needs to be proactive in communication to attract foreign

investors to invest in science, technology and innovation by preparing infrastructure, factories, high-tech zones, and having clean land funds for foreign investors to learn about. In particular, there should be a specialized working group working with foreign investors to promptly remove difficulties for investors such as administrative procedures... Strengthen learning from the experiences of some countries in the world on policies to attract foreign investment in science, technology and innovation development for flexible application in Vietnam. Strengthen reform of the science and technology management system, improve the efficiency of allocating science and technology factors. Good implementation will contribute to increasing foreign investment attraction. Strengthen propaganda using communication to highlight the role of innovation in the development of enterprises of the national socio-economy. For localities with low foreign investment in science, technology and innovation development, local authorities need to actively prepare infrastructure to create conditions to attract investment capital. Send working delegations to countries to learn about and seek foreign investors to invest in science, technology and innovation in their localities.

High-quality human resource training: High-quality human resources are the golden force for developing science, technology, and innovation. Therefore, when attracting foreign investment capital, it is necessary to have a force that understands the market, the business, the technology... to contribute to the implementation of the investment project. Review and develop training programs that adapt to international standards to create high-quality human resources as a foundation to welcome foreign investment waves. As well as increase contact with foreign investors to understand their needs and desires before investing in science, technology and innovation development, thereby building and adjusting appropriate policies. Clearly define the allocation of foreign investment capital to focus on investment in human development, including investment in developing the scientific and scientific management team, promoting basic research, potential research, technology incubation; investment in basic industries, key fields and strong industries and professions; investment in building and developing an innovation ecosystem...

**For businesses and educational institutions**

Focus on developing human resources as experts for businesses to have a high-quality workforce by "placing orders" with educational institutions and cooperating with educational institutions to train human resources. Be proactive in seeking foreign investors, have close ties with state agencies and associations in investment promotion, such as coordinating with diplomatic agencies or business associations. Improve local marketing activities: create good videos (in different languages), professionally introduce potential investment opportunities in the locality, local strengths, local incentives for high-quality projects: support for land rental, tax exemption and reduction policies (Vo Thanh Thu and Tran Thi Trang, 2023).

It is necessary to develop a mechanism to promote investment in the form of public-private partnership between higher education institutions and businesses. There needs to be coordination, experience sharing and learning between domestic enterprises and universities, academies, research institutes and experts to improve the capacity of science, technology and innovation of domestic enterprises ((Bui Kieu Anh, 2023)..

## IV. CONCLUSION

Developing science, technology and innovation in the context of the digital age is the focus of each country's socioeconomic development strategy, so increasing foreign investment attraction plays a role in contributing to the implementation of that strategy. Opening up to attract foreign investment is one thing, retaining foreign investors for long-term investment in science, technology and innovation are another, as well as ensuring equal investment in localities. Therefore, in the coming time, it is necessary to synchronously implement solutions to further promote the attraction of foreign investment capital into the development of national science, technology, and innovation.

# INFORMATION TECHNOLOGY PRODUCTION IN THE NORTHERN SUB-REGIONAL PROVINCES AND CITIES, THE RED RIVER DELTA AND POLICY IMPLICATIONS

**Nguyen Thi Le Thuy [1*]**

[1] Faculty of Management Science, College of Economics and Public Management, National Economics University.
*Corresponding: thuykhoahocquanly@neu.edu.vn

**ABSTRACT**

The paper analyzes the current status of the information technology industry in the provinces and cities of the Northern sub-region and the Red River Delta based on data on "readiness to apply information technology" from the Ministry of Information and Communications (MIC) (MIC, 2023), focusing on analyzing the general index of the information technology industry and three component indexes of information technology production, information technology services, and information technology business and distribution of 7 provinces and cities of the Northern sub-region. The article proposes three policy implications for the development of the information technology industry of this sub-region to achieve the economic growth target according to the Socio-economic Development Plan of the Red River Delta for the period 2021-2030 with a vision to 2050.

*Keywords:* "Information technology", "Information technology industry", "Information technology services", "Information technology production".

## I. INTRODUCTION

The information technology industry has been an important economic sector in Vietnam since the Prime Minister issued Decision No. 1755/2010/QD-TTg on the project "Making Vietnam soon become a strong country in information technology and communications" (Prime Minister, 2010); Decision No. 2289/QD-TTg on the "National Strategy on the Fourth Industrial Revolution to 2030" (Prime Minister, 2020); and Decision No. 411/QD-TTg on "Approving the National Strategy for Digital Economy and Digital Society Development to 2025, with a vision to 2030" (Prime Minister, 2022).

The northern sub-region of the Red River Delta, also known as the Northern Key Economic Zone, includes 8 provinces and cities, including the former Ha Tay, according to Decision 148/2004/QD-TTg (Prime Minister, 2004). The Northern sub-region currently includes 07 provinces and cities: Hanoi, Hai Phong, Quang Ninh, Hai Duong, Hung Yen, Bac Ninh, and Vinh Phuc, according to the Socio-Economic Development Plan of the Red River Delta for the period 2021-2030, with a vision to 2050. According to this plan, the Northern sub-region will strongly develop the information technology industry in the direction of developing the high-tech industry, processing, and manufacturing industry with high added value (Prime Minister, 2024). Therefore, the issue of the current status of the information technology industry is raised in this study to clarify the strengths and limitations of the Northern sub-regions information technology industry in contributing to the implementation of the economic growth targets of the Red River Delta according to the Socio-Economic Development Plan of the Region for the period 2021-2030, with a vision to 2050.

The objective of this article is to analyze the current status of the Northern sub-region's information technology industry. The Red River Delta aims to assess the strengths and limitations of the information technology industry of the provinces in the sub-region. From there, the article proposes implications for the policy development of the information technology industry of the sub-region to contribute to the implementation of the economic growth goals of the Red River Delta according to the Development Plan for the period 2021-2030, vision 2050.

## II. MATERIAL AND METHOD

### 2.1. Digital economy and the information technology industry production index

**Digital economy**

The digital economy includes the entire network of economic and social activities built on a digital platform (To Trung Thanh et al., 2020). In Bui Trinh's study, the digital economy is considered an industry; along with industry, agriculture, trade, and services, the digital economy is included in the input-output (I-O) table analysis and the research results show the level of diffusion of the final products of the two groups of industries and the digital economy to the remaining industries of the economy. Bui Trinh's study considers the digital economy, including the core digital economy, the basic digital economy, and the digital economy. In this study, the digital economy includes the ICT digital economy (information technology industry and telecommunications services), the platform digital economy, and the industry digital economy. Bukht & Heeks (2017) consider the digital economy to include a core digital economy, a narrow digital economy, and a broad economy.

In Vietnam, the digital economy includes 1) the ICT digital economy, which is the information technology industry and telecommunications services; 2) the platform economy, which is the economic activity of digital platforms, online systems connecting supply and demand, and online services on the network; 3) the sectoral digital economy, which is digital economic activity in industries and fields (Prime Minister, 2022).

**Information Technology Industry Production Index**

According to the concepts of digital economy, the information technology industry or core digital economy is an important component of the digital economy, contributing to the development of the digital economy in general and spreading to the development of the remaining sectors of the economy. According to the Ministry of Information and Communications (2022), Vietnam's information technology industry index includes three component indicators: information technology production index; IT service index; IT business and distribution index (trade index). The IT production index is the production of hardware, software, and digital content products, including three sub-indicators: IT production revenue, IT product export value, and tax payment from IT production. The IT service index includes three sub-indicators: IT service revenue, IT service export value, and tax payment from IT services. The IT business and distribution index includes two sub-indicators: IT service revenue and distribution and tax payment from IT products and service business and distribution.

### 2.2. Research Methodology

The article uses secondary data sources on the information technology industry index (IT index) of provinces and cities in Vietnam published by the Ministry of Information and Communications in the Report on the Information Technology Readiness Index in Vietnam (ICT Index - Information and Communication Technologies). This data is available in 2019, 2020 and 2022. The data for 2021 is missing due to the impact of the Covid epidemic. At the time of writing this article, the data for 2024 has not been published by the Ministry of Information and Communications.

The information technology industry index is a weighted component index value that is presented as the information technology production index: information technology service index: information technology trade index is 2: 2: 1. This weight is determined to encourage the promotion of information technology production and service activities (Ministry of Information and Communications, 2022). Each component index is the average value of each group of indicators that has been standardized by the Z-score calculation method. The component indexes are then standardized by the Min-Max method to bring them to the value range |0-1| (Ministry of Information and Communications, 2022).

The article uses the method of comparison over time, cross-comparison of provinces and cities in the Northern sub-region and the Red River Delta. The compared indexes are the general index of the information technology industry and three component indexes. The article relies on the synthesis method to determine the strengths and limitations of the information technology industry index in 7 provinces and cities in the sub-region, thereby implying some policies for developing the information technology industry in the Northern sub-region and the Red River Delta.

## III. RESULT AND DISCUSSION

### 3.1. The role of the information technology industry in Vietnam and the Red River Delta

In Vietnam, the National Strategy for Digital Economy and Digital Society Development to 2025, with a vision to 2030 states: “Developing the digital economy helps people become richer, contributing to Vietnam surpassing the low-middle income level by 2025, reaching the high-middle income level by 2030, and reaching the high-income level by

2045" (Prime Minister, 2022). Also, according to the Strategy, the goal by 2030 is that Vietnam will achieve a digital economy ratio of 30% of GDP; in addition, the digital economy ratio in each industry and field will reach at least 20%. Thus, the information technology industry is a constituent element of the digital economy and plays an important role in contributing to the development of the digital economy in Vietnam.

The Red River Delta is planned into two sub-regions: 1) The Northern sub-region includes 07 provinces and cities: Hanoi, Hai Phong, Quang Ninh, Hai Duong, Hung Yen, Bac Ninh, and Vinh Phuc. The development of the Northern sub-region is closely linked to the development of the Hanoi Capital region; 2) The Southern sub-region includes 04 provinces: Thai Binh, Nam Dinh, Ha Nam, and Ninh Binh (Prime Minister, 2024). In particular, the Socio-Economic Development Plan for the Red River Delta region has determined the orientation of the Northern Sub-region to "focus on developing high-tech industry, processing and manufacturing industries with high added value, especially mechatronics, semiconductors, digital technology products, artificial intelligence, robot manufacturing, etc. Developing the dynamic region, including Hanoi city and district-level areas along National Highway 5 and National Highway 18 through the provinces of Bac Ninh, Hung Yen, Hai Duong, Hai Phong city, and Quang Ninh province, in which Hanoi capital is the growth pole" (Prime Minister, 2024). In addition, Hanoi capital, Bac Ninh, Quang Ninh, and Hai Phong are also the 4 growth poles of the Red River Delta region and the whole country. The planning orientation of the Red River Delta region shows that the information technology industry is increasingly playing a key role in the socio-economic development of the region and the whole country.

### 3.2. Status of information technology industry index in the Northern sub-region and Red River Delta provinces

**General index of the information technology industry**

Hanoi is one of the leading localities in the country and the Northern sub-region and Red River Delta in terms of the information technology industry. In 2022, Hanoi rose to first place after two years of being second in the country in terms of the information technology industry index. Bac Ninh is also a strong locality in this field, continuously holding the third position in the three years 2019, 2020, and 2022. Next, Vinh Phuc was ranked third in the Northern sub-region, Red River Delta, and ranked 8th in the country. Vinh Phuc province has achieved a three-rank improvement in 2022 compared to 2020. Ranked fourth in the sub-region and tenth in the country is Hai Phong city; however, in 2022, this locality dropped 5 ranks compared to 2020. Hung Yen is also a locality that is quite developed in the information technology industry, ranked 5th in the Northern sub-region, the Red River Delta region, and 13th out of 63 provinces and cities. In 2022, Hung Yen rose 5 ranks compared to 2019. Ranked 6th in the Northern sub-region and 17th out of 63 provinces and cities is Hai Duong province. Hai Duong's ranking in the 2019-2022 period shows the instability of the development of the information technology industry in this locality. Ranked last in the sub-region is Quang Ninh province with a ranking of 21st out of 63 provinces and cities. Like Hai Duong, Quang Ninh province has not shown stability in the IT industry. In 2019, the province ranked 7/63 provinces and cities, ranked 30 in 2020, and ranked 21 in 2022.

**Table 1: Information technology industry index of the Northern sub-region provinces, Red River Delta region**

| No. | Province/city name | Production index | Service index | Business index | IT industry index | Ranking by year | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | | 2022 | 2020 | 2019 |
| 1 | Ha Noi | 0.2480 | 1.0000 | 0.9542 | 0,6900 | 1 | 2 | 2 |
| 2 | Bac Ninh | 1.0000 | 0.0424 | 0.0107 | 0,4191 | 3 | 3 | 3 |
| 3 | Vinh Phuc | 0.1452 | 0.0000 | 0.0000 | 0,0581 | 8 | 11 | 12 |
| 4 | Hai Phong | 0.0670 | 0.0122 | 0.0445 | 0,0406 | 10 | 5 | 6 |
| 5 | Hung Yen | 0.0229 | 0.0035 | 0.0379 | 0,0182 | 13 | 14 | 18 |
| 6 | Hai Duong | 0.0065 | 0.0011 | 0.0168 | 0,0155 | 17 | 12 | 21 |
| 7 | Quang Ninh | 0.0006 | 0.0060 | 0.0299 | 0,0086 | 21 | 30 | 7 |

*Source: Mic, 2023*

Analyzing the three components of the IT industry index shows a better picture of the strengths and weaknesses of each locality. Hanoi achieved an absolute score in the IT service index and a near-absolute score in the business index (IT trade), in which the IT service index is a strength in line with the orientation of encouraging the promotion of IT

production and services in Vietnam in the current period. Meanwhile, Bac Ninh is quite different, with its strength being IT production, while its IT services and business are much lower than Hanoi's. Although Vinh Phuc ranks 8th out of 63 provinces and cities in terms of the information technology industry, its information technology production index only reaches 0.1452/1,0000 points, while the other two indexes are both 0. The remaining provinces of Hai Phong, Hung Yen, Hai Duong, and Quang Ninh do not have clear strengths in the component indexes of the information technology industry.

**Information Technology Production Index**

Information technology production is an important component of the information technology industry, which is being encouraged to develop in Vietnam. This index is calculated through three indicators: Production revenue; Production value; State budget contribution. Bac Ninh leads in the production index and continuously holds the top position in this index. Hanoi ranks 4th in the country in terms of production index, but this index score is only ¼ of Bac Ninh's score. More specifically: Hanoi's production revenue and production value are only 11% of Bac Ninh's; Hanoi's state budget contribution from information technology production is only 55% of Bac Ninh's.

Some other provinces and cities in the Northern sub-region have production revenue and production value larger or similar to Hanoi, such as Vinh Phuc and Hai Phong, but have not yet generated state budget contributions from information technology production. Some other localities have also generated revenue from information technology production and paid to the state budget, but the scale is not large, although these provinces are also ranked at a fairly good level compared to the whole country.

**Table 2: Information technology production index of the Northern sub-region provinces, Red River Delta region**

| No. | Province/city name | Production revenue (Million VND) | Production value (Million USD) | State budget contribution (Million VND) | Information technology production index | Ranking by year | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | | 2022 | 2020 | 2019 |
| 1 | Ha Noi | 151.825.087 | 3.860 | 3.566.766 | 0,2480 | 4 | 4 | 4 |
| 2 | Bac Ninh | 1.369.230.952 | 34.960 | 6.430.008 | 1,0000 | 1 | 1 | 1 |
| 3 | Vinh Phuc | 286.252.000 | 7.399 | 0 | 0,1452 | 5 | 8 | 8 |
| 4 | Hai Phong | 139.299.560 | 3.192 | 0 | 0,0670 | 9 | 5 | 5 |
| 5 | Hung Yen | 15.324.612 | 31 | 383.115 | 0,0229 | 12 | 10 | 9 |
| 6 | Hai Duong | 52.455.288 | 1.571 | 14.834 | 0,0293 | 11 | 9 | 10 |
| 7 | Quang Ninh | 109.781 | 0 | 10.979 | 0,0006 | 25 | 37 | 28 |

*Source: Mic, 2023*

**Information Technology Service index**

**Table 3: Information technology service index of the Northern sub-region provinces, Red River Delta region**

| No. | Province/city name | Service revenue (million VND) | Export value (million USD) | State budget contribution (million VND) | IT service index | Ranking by year | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | | 2022 | 2020 | 2019 |
| 1 | Ha Noi | 39,591,970 | 0 | 1,524,249 | 1.0000 | 1 | 2 | 2 |
| 2 | Bac Ninh | 925,698 | 0 | 95,879 | 0.424 | 5 | 5 | 15 |
| 3 | Vinh Phuc | 0 | 0 | 0 | 0.0000 | 44 | 44 | 45 |
| 4 | Hai Phong | 934,687 | 0 | 0 | 0.0122 | 13 | 10 | 13 |
| 5 | Hung Yen | 32,555 | 1 | 814 | 0.035 | 22 | 28 | 33 |
| 6 | Hai Duong | 32,003 | 0 | 2,190 | 0.0011 | 27 | 34 | 17 |
| 7 | Quang Ninh | 133,171 | 0 | 13,317 | 0.0060 | 19 | 19 | 4 |

*Source: Mic, 2023*

Same as the information technology production index, information technology services are an important component of the information technology industry, which is being encouraged to develop in Vietnam. Hanoi is the

leading locality in the subregion and the whole country in information technology services with service revenue reaching 39,591,970 million VND and state budget contribution reaching 1,524,249 million VND. However, an easily noticeable weakness of Hanoi, which is also a weakness of all the provinces in the Northern Sub-region and the Red River Delta, is that it has not exported information technology services. Although Vinh Phuc ranks 8th out of 63 provinces and cities in terms of the information technology industry, information technology services are ranked last because they have not generated service revenue, export value, or contributed to the state budget. Hai Duong and Hung Yen provinces are ranked average in terms of information technology services with modest service revenue and state budget contributions, while export value is very low or has not yet arisen.

**Information Technology business and distribution index**

The IT business and distribution index is less important than the IT production and IT service index. Hanoi is still the locality with the highest ranking in this index with business and distribution revenue reaching 109,086,107 million VND; and state budget contribution reaching 1,718,339 million VND. Bac Ninh has quite an advantage in the IT production index but IT business and distribution are not yet developed, ranking 21/63 provinces and cities. Some provinces and cities in the Sub-region are in the top 10 localities in this index such as Hai Phong, Hung Yen, and Quang Ninh, although the score difference is very large compared to Hanoi: in 2022, Hanoi ranked 2nd with 0.9542/1,000 points, while Hai Phong ranked 6th with 0.0445/1,000 points, Quang Ninh ranked 9th with 0.0299/1,000 points; the large difference in scores is also more clearly shown in the large difference in business revenue, distribution and state budget payment of these provinces and cities compared to Hanoi. Vinh Phuc ranked last, 61st in the country in the information technology business due to no business revenue, distribution, and state budget payment.

**Table 4: Information technology business index of the Northern sub-region provinces, Red River Delta**

| No. | Province/city name | Business and distribution revenue (million VND) | State budget contribution (million VND) | Business and distribution index (million VND) | Ranking by year | | |
|---|---|---|---|---|---|---|---|
| | | | | | 2022 | 2020 | 2019 |
| 1 | Ha Noi | 109,086,107 | 1,718,339 | 0.9542 | 2 | 1 | 1 |
| 2 | Bac Ninh | 1,169,870 | 20,141 | 0.0107 | 21 | 11 | 26 |
| 3 | Vinh Phuc | 0 | 0 | 0.0000 | 61 | 50 | 33 |
| 4 | Hai Phong | 10,052,798 | 0 | 0.0445 | 6 | 5 | 11 |
| 5 | Hung Yen | 3,357,454 | 83,936 | 0.0379 | 7 | 19 | 31 |
| 6 | Hai Duong | 3,250,460 | 8,691 | 0.0168 | 14 | 26 | 52 |
| 7 | Quang Ninh | 936,980 | 93,698 | 0.0299 | 9 | 17 | 8 |

*Source: Mic, 2023*

## IV. CONCLUSION

### 4.1. Conclusion of strengths and weaknesses of the information technology industry

**Strengths of the information technology industry**

Analysis of the current status of the information technology industry in 7 provinces and cities in the Northern sub-region and the Red River Delta shows that Hanoi and Bac Ninh are the leading localities in the information technology industry. The index of these two localities is quite stable over the years, showing a sustainable development.

Some provinces and cities in the Sub-region hold lower rankings but have been quite steadily promoted since 2019, such as Vinh Phuc and Hung Yen, showing the right development trend of the information technology industry; ensuring that these localities follow the orientation of the Development Plan of the Northern Sub-region and the Red River Delta, which is to "focus on developing high-tech industry, processing and manufacturing industry with high added value, especially mechatronics, semiconductors, digital technology products, artificial intelligence, and robot manufacturing" (Prime Minister, 2024).

**Weaknesses of the information technology industry**

Hai Duong and Quang Ninh are low-ranking localities in the Sub-region and have not yet confirmed the development trend of the information technology industry according to the orientation of the Northern Sub-region

Development Plan.

Although Hanoi and Bac Ninh are localities with clear strengths in the information technology industry, both localities have not yet had comprehensive development in both information technology production and information technology services. Hanoi is a leader in information technology services and information technology business and distribution but is quite limited in information technology production while Hanoi has high-tech industrial parks, promising potential for developing information technology production. Bac Ninh has great strengths in information technology production but is not strong in information technology services and information technology business and distribution.

Another limitation is that except for Hung Yen province, which exported 1 million USD of IT services in 2022, 6/7 provinces and cities of the Northern Sub-region had an export value of 0. This shows that IT service exports are not yet a strength of the localities.

Finally, the IT industry index of 7 provinces and cities of the Northern Sub-region shows a huge differentiation or gap between Hanoi, Bac Ninh, and the remaining 5 localities in terms of the current status of the IT industry in general, IT production, IT services, IT business and distribution in particular. Moreover, apart from Bac Ninh and Hanoi, other provinces and cities have not yet affirmed their strengths in the IT industry. These findings are a big problem for state management agencies in developing the Northern Sub-region according to the identified socioeconomic development planning orientation.

**4.2. Policy implications**

Firstly, from the perspective of regional and sub-regional development, the 7 provinces and cities of the Northern Sub-region and the Red River Delta share a common strategic perspective and design and implement a policy of cooperation in developing the information technology industry of the Sub-region. In which, Bac Ninh and Hanoi are the two locomotives with core strengths in information technology production and information technology services, which will act as a driving force for the remaining localities. In terms of developing information technology production, Bac Ninh focuses on developing information technology industrial zones, with a focus on policies supporting the construction of research and development centers for information technology products; policies supporting the establishment of infrastructure for the application and development of information technology; policies supporting the incubation of information technology production enterprises, supporting technology transfer, and providing information technology training. Hanoi will combine the model of developing information technology production and information technology services in the near future, focusing on creating an environment that encourages and supports enterprises to participate in the information technology service supply chain.

Secondly, the policy of cooperation in developing the information technology industry of the Northern Sub-region should be built on the existing strengths of the localities in information technology production and services and, at the same time, based on the foundation of the information technology industry supply chain: identifying provinces focusing on information technology industry production; provinces focusing on information technology industry services; provinces focusing on business and distribution of information technology services. With its position as a leader in information technology development, Hanoi serves as the coordinating unit in collaboration with localities within and across regions in the policy for developing the information technology service supply chain, encouraging and supporting enterprises to link up within the supply chain.

Third, in the short and medium term, information technology exports have yet to be a priority in the development of the information technology industry. While Thailand has the potential to participate in the global supply chain with its strength in expanding information technology production facilities across international markets, Vietnam in general, and the Red River Delta sub-region in particular, should focus on the domestic supply chain in the short term, serving the local market. As of now, Hung Yen remains the only province to have recorded an information technology export value of $1 million, while other provinces have yet to demonstrate significant potential in this sector. Consequently, from now until 2030, policy efforts should center on fostering information technology business growth and distribution, with a strategic emphasis on domestic markets. Strengthening the local information technology industry's competitiveness against imported products and services is imperative, ultimately paving the way for the substitution of

select foreign technologies. Until local information technology products and services attain the capability to replace imports, information technology exports should not be considered a primary policy focus for provinces in the Red River Delta region.

# EVALUATING THE QUALITY OF HEALTHCARE SERVICES IN HANOI: A COMPARATIVE ANALYSIS OF PUBLIC AND PRIVATE HOSPITALS

**Duong Thi Tra My[1*], Le Ngoc Mai[1], Nguyen Thi Hang Nga[1], Phuong Diem Quynh[1], Nguyen Linh Nhi[1], Luong Minh Nghia[1]**

[1]VNU University of Economics and Business, Vietnam National University, Hanoi, Vietnam
* Corresponding author: tramy.311@gmail.com

**ABTRACT**

This study aims to evaluate and compare the quality of healthcare services between public and private hospitals in Hanoi, Vietnam. The research focuses on four hospitals: Thanh Nhan Hospital and Xanh Pôn Hospital (public); Thu Cúc International Hospital and Hanoi French Hospital (private). A survey was conducted among 302 respondents, selected from patients and their families visiting these hospitals between October 2023 and March 2024. Using Cronbach's Alpha, Exploratory Factor Analysis (EFA), and Linear Regression Analysis, the study identified key factors influencing service quality, including empathy, information, tangibility, administrative procedures, and responsiveness. The findings reveal that private hospitals generally provide higher-quality services, particularly in areas such as empathy, information provision, and responsiveness, while public hospitals excel in administrative procedures. The study concludes that while both public and private hospitals have their strengths, there is a need for continuous improvement, especially in enhancing service delivery and patient satisfaction across both sectors.

*Keywords*: "healthcare service quality", "public hospitals", "private hospitals"

## I. INTRODUCTION

The quality of healthcare services plays a crucial role in national development, serving as a key indicator of a country's socio-economic progress and overall quality of life. As globalization accelerates, the demand for healthcare services continues to rise, placing significant strain on healthcare systems, particularly in low- and middle-income countries where financial constraints and infrastructural limitations hinder service delivery. According to the World Health Organization (WHO, 2019), healthcare expenditures in these countries are rapidly rising, consuming a significant portion of their GDP. This imbalance between public demand and healthcare capacity results in overcrowding and declining service quality.

Even in developed countries, healthcare systems face considerable challenges, particularly with aging populations and shortages of medical professionals. These factors have necessitated healthcare reforms aimed at enhancing service quality and fostering private sector involvement. Research suggests that the expansion of private healthcare services not only eases the burden on public healthcare systems but also stimulates competition, ultimately improving overall service quality (**Xu & Wang, 2021)**.

Vietnam has embarked on healthcare reforms to improve service accessibility and quality, responding to the increasing complexity of healthcare demands. Despite significant progress, public healthcare institutions still struggle with persistent challenges such as overcrowding and resource shortages (Hau et al., 2021; Khong, 2020). Conversely, the private sector has expanded significantly, particularly in urban areas like Hanoi, attracting those with higher financial means despite increased costs.

Given these dynamics, an in-depth evaluation of healthcare service quality in both public and private hospitals in Hanoi is necessary. Such an assessment will provide valuable insights into existing gaps, inform policy recommendations, and contribute to the broader discourse on healthcare system improvements in Vietnam.

## II. MATERIAL AND METHODOLOGY

### 2.1 Conceptual Foundation

#### Healthcare Service Quality

Healthcare service quality plays a crucial role in patient satisfaction and healthcare facility selection. Numerous studies have compared public and private hospital services, highlighting factors affecting service quality and patient

perceptions. Most findings suggest private hospitals excel in infrastructure, service attitude, and waiting times (Jasvinder & Dharna, 2023; Abdul et al., 2022; Awinaba et al., 2021; Albert & Jain, 2018). However, some studies report no significant differences (Mustika et al., 2023) or indicate that public hospitals outperform private ones in treatment procedures, outcomes, and reliability (Swain et al., 2019), demonstrating that service quality varies by region and healthcare system.

In Vietnam, Phan Quoc Tan (2016) found that private hospitals offer superior service attitudes and shorter waiting times, while public hospitals, despite advanced facilities, struggle with overcrowding. Conversely, Hiep et al. (2020) argued that ongoing improvements in public hospitals have minimized quality gaps between the two systems.

**Factors Influencing Healthcare Service Quality**

Healthcare service quality is shaped by multiple factors, including infrastructure, staff competence, treatment procedures, costs, and administrative processes (Le, 2019; Eun Kim et al., 2017). Among these, human factors—such as professional skills, communication, and patient care—are key determinants (Mustika et al., 2023; Francis et al., 2016). Enhancing infrastructure, medical equipment, and reducing waiting times are also critical for service improvement (Anh et al., 2023).

Additionally, efficient management processes and transparent information access contribute to better healthcare delivery (Anh et al., 2023). Technological advancements, such as electronic medical record systems, have further improved hospital operations. Beyond institutional factors, patient perceptions play a crucial role in service evaluation (Arwa, 2020), as gaps between expectations and actual experiences influence overall satisfaction, particularly in comparisons between public and private hospitals (Lal, 2021).

**Patient Satisfaction**

Patient satisfaction is a key indicator in evaluating healthcare service quality, and studies have shown that it is influenced by various aspects. Shorter waiting times and swift treatment procedures are the main factors enhancing patient satisfaction in private hospitals. Additionally, the dedication of healthcare staff plays a significant role in building patient trust and satisfaction. Conversely, research by Nguyen (2013) indicates that patient satisfaction in public hospitals primarily stems from reasonable treatment costs and easy access to basic healthcare services. However, Anh et al. (2023) also point out that overcrowding and complex administrative procedures in public hospitals remain major obstacles reducing patient satisfaction.

**Factors Influencing Hospital Choice**

The decision between public and private hospitals is influenced by financial capacity, infrastructure, and service quality. A study by Gil et al. (2019) in South Korea found that individuals with higher incomes and private insurance prefer private hospitals, aligning with findings from Swain et al. (2019) in India, where private hospitals excel in infrastructure and staff attitudes, while public hospitals serve low-income patients seeking essential healthcare. Similarly, studies by Ajwinder & Ajay (2019) and Eun Kim et al. (2017) indicate that people with chronic illnesses, disabilities, and lower incomes often prefer public hospitals. Service availability and flexibility also play a role, with private hospitals attracting financially capable patients (Awinaba et al., 2021; Gil et al., 2019), while public hospitals struggle with resource constraints (Shumba et al., 2017).

In Vietnam, factors beyond service quality influence hospital choice (Hiep et al., 2020). Nguyen (2013) highlights that private hospitals attract patients seeking premium services, while public hospitals are preferred for their stability in treatment

## 2.2 Research method

### 2.2.1 Method and Data

This study aims to evaluate and compare the quality of healthcare services between public and private hospitals in Hanoi. The target population comprises patients and their families seeking medical care at these hospitals between October 2023 and March 2024. The study focuses on four hospitals: Thanh Nhan Hospital, Xanh Pôn Hospital (public), Thu Cúc International Hospital and Hanoi French Hospital (private), all chosen for their high patient volume and comprehensive healthcare services.

This study employs primary data collected through direct surveys of patients and their families using questionnaires. A total of 336 questionnaires were distributed, with 302 valid responses analyzed after excluding 24 incomplete questionnaires. Data analysis was conducted using SPSS 20 and Excel software, employing Cronbach's Alpha for scale reliability testing, Exploratory Factor Analysis (EFA), and Linear Regression Analysis.

### 2.2.2 Research model

In assessing the quality of healthcare services at medical facilities, numerous studies have been conducted, yielding various results. International studies by Byju (2014) and Sumathi K (2012) conducted in the cities of Pondicherry and Madurai indicate that the elements of "responsiveness" and "empathy" from healthcare staff are the most critical factors in healthcare service quality and have a strong, significant impact on customer satisfaction. In Vietnam, the Ministry of Health in 2016 has updated and proposed criteria based on the hospital quality assessment framework to guide and promote quality improvement activities in hospitals, with the primary perspective of "patient-centered care and treatment." Building on these research models, the author has developed a research framework with five factors influencing the evaluation of healthcare service quality in both public and private hospitals: empathy, information, tangibility, administrative procedures, and responsiveness.

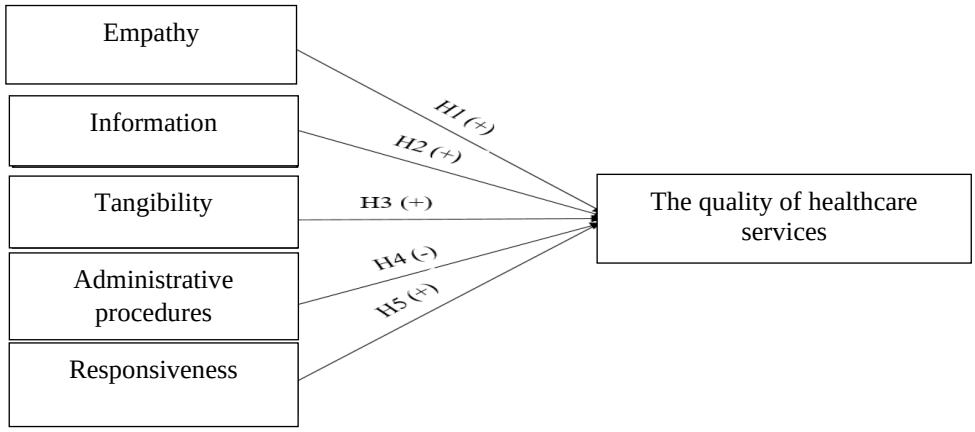

**Figure 1:** Research Framework

Private hospitals are hypothesized to have better quality than public hospitals (+)

Public hospitals are hypothesized to have better quality than private hospitals (-)

**Hypotheses:**

- **H1 (+):** Private hospitals will be perceived as having higher quality healthcare services regarding empathy than public hospitals.
- **H2 (+):** Private hospitals will be perceived as having higher quality healthcare services regarding information provision than public hospitals.
- **H3 (+):** Private hospitals will be perceived as having higher quality healthcare services regarding tangibility than public hospitals.
- **H4 (-):** Public hospitals will be perceived as having higher quality healthcare services regarding administrative procedures than private hospitals.
- **H5 (+):** Private hospitals will be perceived as having higher quality healthcare services regarding responsiveness than public hospitals.

## III. RESULTS AND DISSCUSION

### 3.1. Result

#### 3.1.1 Cronbach's Alpha reliability coefficient

The internal consistency of the research scales was assessed using Cronbach's Alpha. Table 1 presents the results for the five measured constructs: Empathy, Information, Tangibility, Administrative Procedures, and Responsiveness.

**Table 1: Scale Reliability Results**

| Observed Variable | Scale Mean if Item Deleted | Scale Variance if Item Deleted | Corrected Item-Total Correlation | Cronbach's Alpha if items deleted |
|---|---|---|---|---|
| Empathy Scale - Cronbach' Alpha = 0.873 | | | | |
| DC1 | 10.447 | 3.404 | 0.690 | 0.853 |
| DC2 | 10.440 | 3.483 | 0.718 | 0.845 |
| DC3 | 10.374 | 3.139 | 0.800 | 0.810 |
| DC4 | 10.500 | 2.782 | 0.742 | 0.842 |
| Information Scale - Cronbach's Alpha = 0.846 | | | | |
| TT1 | 15.411 | 5.100 | 0.584 | 0.833 |
| TT2 | 15.553 | 4.746 | 0.644 | 0.817 |
| TT3 | 15.536 | 4.834 | 0.606 | 0.828 |
| TT4 | 15.517 | 4.636 | 0.686 | 0.806 |
| TT5 | 15.387 | 4.318 | 0.752 | 0.787 |
| Tangibility Scale - Cronbach's Alpha = 0.764 | | | | |
| HH1 | 22.391 | 3.289 | 0.456 | 0.743 |
| HH2 | 22.407 | 3.219 | 0.501 | 0.731 |
| HH3 | 22.457 | 3.113 | 0.579 | 0.711 |
| HH4 | 22.351 | 3.179 | 0.496 | 0.733 |
| HH5 | 22.318 | 3.041 | 0.556 | 0.716 |
| HH6 | 22.464 | 3.213 | 0.456 | 0.743 |
| Administrative Procedure Scale - Cronbach's Alpha = 0.856 | | | | |
| HC1 | 16.937 | 2.405 | 0.677 | 0.824 |
| HC2 | 16.947 | 2.402 | 0.692 | 0.821 |
| HC3 | 16.927 | 2.447 | 0.630 | 0.836 |
| HC4 | 16.914 | 2.292 | 0.659 | 0.830 |
| HC5 | 16.897 | 2.325 | 0.697 | 0.819 |
| Responsiveness Scale - Cronbach's Alpha = 0.75 | | | | |
| DA1 | 12.791 | 1.063 | 0.574 | 0.677 |
| DA2 | 12.748 | 1.039 | 0.547 | 0.691 |
| DA3 | 12.719 | 1.020 | 0.540 | 0.695 |
| DA4 | 12.772 | 1.081 | 0.520 | 0.705 |

The Empathy Scale achieved the highest reliability ($\alpha = 0.873$), indicating excellent internal consistency, while the Responsiveness Scale had the lowest reliability ($\alpha = 0.750$), suggesting room for improvement. The Information and Administrative Procedure scales also demonstrated strong reliability ($\alpha > 0.84$), confirming that the items within these constructs are cohesive and well-aligned.

### 3.1.2 Exploratory factor analysis (EFA)

To assess the construct validity, Exploratory Factor Analysis (EFA) was performed for both dependent and independent variables. The Kaiser-Meyer-Olkin (KMO) test and Bartlett's test of sphericity were conducted to verify sampling adequacy and data suitability for factor extraction.

**Factor analysis (EFA) for the dependent variable**

**Table 2: KMO and Bartlett's Test for Dependent Variable**

| | | |
|---|---|---|
| Kaiser-Meyer-Olkin Measure of Sampling Adequancy | | 0,798 |
| Bartlett's Test of Sphericity | Approx. Chi-Square | 2722,314 |
| | Df | 253 |
| | Sig. | 0,000 |

The KMO value of 0.798 indicates that the sample size is adequate for factor analysis. The Bartlett's test significance ($p < 0.05$) confirms that the observed variables are sufficiently correlated to proceed with Exploratory Factor Analysis (EFA).

| | **Rotated Component Matrix** | | | | |
|---|---|---|---|---|---|
| | 1 | 2 | 3 | 4 | 5 |
| **HC1** | 0.821 | | | | |
| **HC5** | 0.796 | | | | |
| **HC2** | 0.772 | | | | |
| **HC4** | 0.762 | | | | |
| **HC3** | 0.719 | | | | |
| **TT5** | | 0.862 | | | |
| **TT4** | | 0.810 | | | |
| **TT2** | | 0.765 | | | |
| **TT1** | | 0.727 | | | |
| **TT3** | | 0.720 | | | |
| **DC3** | | | 0.892 | | |
| **DC4** | | | 0.858 | | |
| **DC2** | | | 0.840 | | |
| **DC1** | | | 0.825 | | |
| **HH3** | | | | 0.743 | |
| **HH5** | | | | 0.723 | |
| **HH2** | | | | 0.674 | |
| **HH4** | | | | 0.671 | |
| **HH6** | | | | 0.623 | |
| **HH1** | | | | 0.623 | |
| **DA3** | | | | | 0.762 |
| **DA1** | | | | | 0.691 |
| **DA4** | .318 | | | | 0.668 |

**Factor analysis (EFA) for the independent variables**

**Table 3: KMO and Bartlett's Test for Independent Variables**

| | | |
|---|---|---|
| **Kaiser-Meyer-Olkin Measure of Sampling Adequancy** | | 0.512 |
| **Bartlett's Test of Sphericity** | Approx. Chi-Square | 185.108 |
| | df | 10 |
| | Sig. | 0.000 |

The Bartlett's test of sphericity yielded a significance value of 0.000 ($p < 0.05$), confirming that the observed

variables are significantly correlated. The KMO coefficient (0.512) meets the minimum threshold, indicating that EFA is marginally appropriate for this study.

| | Component Matrix |
|---|---|
| | 1 |
| CLDV2 | 0.904 |
| CLDV5 | 0.902 |
| CLDV1 | 0.732 |
| CLDV3 | 0.598 |
| CLDV4 | 0.585 |

The findings confirm that the independent variables exhibit strong internal consistency and can be retained for subsequent regression analysis.

### 3.1.3 Multiple Regression Analysis

To test the research hypotheses, multiple regression analysis was conducted to examine the relationship between healthcare service quality (CLDV) and its influencing factors.

**Table 4: Pearson Correlation Matrix**

| | | CLDV | DC | TT | HH | HC | DA |
|---|---|---|---|---|---|---|---|
| CLDV | Pearson Correlation | 1 | .378** | .721** | .200** | .337** | .292** |
| | Sig. (2-tailed) | | .000 | .000 | .000 | .000 | .000 |
| | N | 302 | 302 | 302 | 302 | 302 | 302 |
| DC | Pearson Correlation | .378** | 1 | -.001 | -.018 | .062 | .067 |
| | Sig. (2-tailed) | .000 | | .981 | .751 | .282 | .247 |
| | N | 302 | 302 | 302 | 302 | 302 | 302 |
| TT | Pearson Correlation | .721** | -.001 | 1 | .067 | .176** | .305** |
| | Sig. (2-tailed) | .000 | .981 | | .247 | .002 | .000 |
| | N | 302 | 302 | 302 | 302 | 302 | 302 |
| HH | Pearson Correlation | .200** | -.018 | .067 | 1 | .072 | .084 |
| | Sig. (2-tailed) | .000 | .751 | .247 | | .212 | .147 |
| | N | 302 | 302 | 302 | 302 | 302 | 302 |
| HC | Pearson Correlation | .337** | .062 | .176** | .072 | 1 | .503** |
| | Sig. (2-tailed) | .000 | .282 | .002 | .212 | | .000 |
| | N | 302 | 302 | 302 | 302 | 302 | 302 |
| DA | Pearson Correlation | .292** | .067 | .305** | .084 | .503** | 1 |
| | Sig. (2-tailed) | .000 | .247 | .000 | .147 | .000 | |
| | N | 302 | 302 | 302 | 302 | 302 | 302 |

Table 4 presents the Pearson correlation coefficients between the dependent and independent variables, indicating significant relationships ($p < 0.05$ for all variables).

**Regression Model**

**Table 5: Anova test**

| ANOVA | | | | | | |
|---|---|---|---|---|---|---|
| Model | | Sum of Squares | df | Mean Square | F | Sig. |
| 1 | Regression | 26.658 | 5 | 5.332 | 155.351 | .000[b] |
| | Residual | 10.159 | 296 | .034 | | |
| | Total | 36.817 | 301 | | | |
| a. Dependent Variable: CLDV | | | | | | |
| b. Inependent Variable: (Constant), DA, DC, HH, TT, HC | | | | | | |

**Table 6: Model Statistics**

| Model | R | $R^2$ | Adjusted $R^2$ | Std. Error of the Estimate | Durbin-Watson |
|---|---|---|---|---|---|
| 1 | 0.851[a] | 0.724 | 0.719 | 0.18526 | 1.854 |
| a. Independent Variables: (Constant), DA, DC, HH, TT, HC | | | | | |
| b. Dependent Variable: CLDV | | | | | |

The adjusted $R^2$of 0.719 indicates that with 95% confidence, the independent variables explain 71.9% of the variance in the dependent variable (CLDV), reflecting a strong correlation. The remaining 28.1% is attributed to factors outside the model and random error. The Durbin-Watson statistic of 1.854 suggests that the model does not violate the assumption of first-order autocorrelation.

**Checking the Normal Distribution of Residuals**

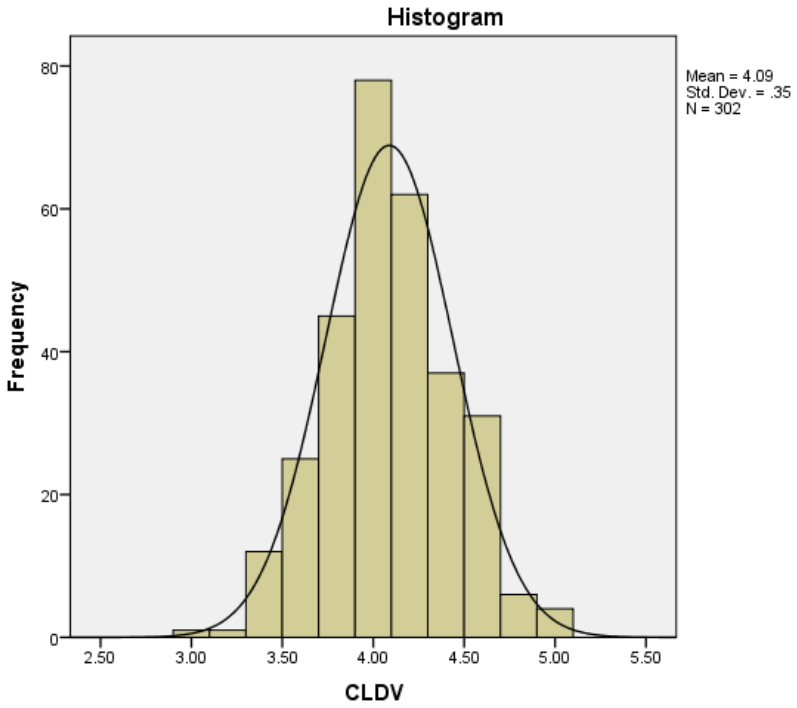

**Figure 2:** Residuals' Normal Distribution Plot

In regression analysis, showing a mean of 4.09 and a standard deviation of 0.35, indicating an approximately normal distribution. This confirms that the normality assumption is satisfied.

**Regression Model Equation**

The final multiple regression equation for predicting healthcare service quality (CLDV) is as follows:

CLDV = 0.323 + 0.223*DC + 0.455*TT + 0.151*HH + 0.197* HC - 0,067*DA (1)

The "Information" factor has the highest standardized Beta coefficient of 0.455, making it the most significant

determinant of healthcare service quality in the studied hospitals. Other factors in decreasing order of impact include "Empathy" (0.223), "Administrative Procedures" (0.197), "Tangibility" (0.151), and "Responsiveness" (0.067). Therefore, the factors of Empathy, Administrative Procedures, Information, and Tangibility contribute to higher perceived service quality in private hospitals, while Responsiveness is perceived as better in public hospitals.

### 3.2 Discussion

The analysis indicates that five factors—Empathy, Information, Tangibility, Administrative Procedures, and Responsiveness—significantly influence perceived healthcare service quality. Notably, Information emerged as the most impactful factor, with private hospitals providing superior access compared to public institutions. This finding aligns with previous research emphasizing that accessible medical records enhance patient recall and understanding, thereby improving satisfaction (Walsh et al., 2019).

Empathy was the second most influential factor, with private hospitals receiving higher patient ratings. Patients reported feeling more understood and cared for in private settings, likely due to enhanced communication skills among healthcare professionals. This observation is consistent with studies demonstrating that physician empathy significantly boosts patient satisfaction and compliance (Kirby et al., 2021).

Administrative Procedures also played a crucial role, with private hospitals outperforming public ones through streamlined processes. Patients experienced quicker, more efficient services in private hospitals, often facilitated by online platforms that reduce wait times. In contrast, public hospitals were noted for cumbersome procedures leading to delays and dissatisfaction.

Regarding Tangibility, private hospitals excelled due to modern equipment and well-maintained facilities, positively influencing patient perceptions. Public hospitals, however, faced challenges such as overcrowding and outdated infrastructure, likely due to budget constraints.

Interestingly, Responsiveness was the only factor where public hospitals slightly outperformed private ones, though the difference was minimal. Public hospitals, especially those with financial autonomy, have made strides in improving service delivery, evidenced by timely support and accurate diagnoses (Kashkoli et al., 2017). Despite these efforts, the overall advantage in service quality still leans toward private hospitals across most evaluated factors.

## IV. Conclusion

This study aimed to evaluate and compare the quality of healthcare services between public and private hospitals in Hanoi, using a sample of 302 patients surveyed across four hospitals. The investigation focused on key factors influencing service quality, including empathy, information, tangibility, administrative procedures, and responsiveness. Data analysis revealed that private hospitals generally offer higher quality services than public ones, particularly in terms of information access, empathy, and administrative efficiency. The findings indicated that the "Information" factor was the most significant in determining patient satisfaction, highlighting the importance of clear communication in healthcare settings. While public hospitals demonstrated competitive responsiveness, they were often hindered by overcrowding and inefficient procedures. Overall, this research underscores the need for ongoing improvements in both sectors to enhance healthcare quality and ensure equitable access for all socio-economic groups in Hanoi. Recommendations for policy enhancements and service quality improvements are essential for meeting the evolving healthcare demands of the population.

# THE INFLUENCE OF BIG FIVE PERSONALITY TRAITS ON GEN Z'S ONLINE IMPULSIVE BUYING BEHAVIOUR IN VIETNAM: PATHWAYS TO SUSTAINABLE CONSUMPTION

**Nguyen Quynh Hoa[1], Bui Thi Nhu Quynh[2], Nguyen Ngoc Linh[2], Bui Thi Khanh Ly[3*], Tran Thuy Trang[3]**

**ABSTRACT**

E-commerce has emerged as a global phenomenon, revolutionizing shopping behaviors and redefining traditional market boundaries. Once focused on straightforward transactions, it has evolved into a multifaceted ecosystem that reshapes consumer behavior. In Vietnam, its rapid growth, driven by convenience and accessibility, has significantly contributed to the rise of impulsive shopping behavior. However, the surge in impulsive buying, influenced by psychological triggers and marketing strategies, poses financial and social challenges, particularly among Gen Z consumers. Addressing these complexities requires in-depth research to enhance financial literacy and promote responsible consumer practices. This paper investigates the influence of the Big Five personality traits on impulsive shopping behavior among Gen Z in Vietnam. It explores how personality dimensions such as openness to experience, conscientiousness, extraversion, agreeableness, and neuroticism shape impulsive purchasing behavior by applying The FFF Model of online consumer behavior to analyze the relationship between psychological factors and consumer behavior. Therefore, this research aims to benefit consumers by promoting thoughtful purchasing while helping businesses reduce consumers' post-purchase regret that can harm customer's long-term loyalty and lasting profitability for businesses.

*Key words:* "Big Five personality trait", "e-commerce", "FFF Model", "online impulsive buying", "sustainable consumption"

## I. INTRODUCTION

### 1.1 Background of the study

Over the past decade, e-commerce has increasingly played its role as an indispensable part of the global retail sector, driven by the widespread proliferation of internet connectivity and the rapid evolution of digital technologies. These advancements have not only revolutionized traditional retail dynamics but also enabled online platforms to deliver unparalleled convenience, extensive and diverse products, and competitive pricing structures, thereby altering consumer behavior on a global scale. According to The Statista, the number of individuals purchasing online is continuously climbing, with over five billion. In 2024, retail e-commerce sales are projected to surpass 4.1 trillion U.S dollars. This upward trend reflects the growing consumer reliance on online shopping. This shift has not only reshaped traditional retail models but it has also created new opportunities for businesses to expand their market and more goods options for customers in innovative ways. According to the report of the Ministry of Industry and Trade of the socialist republic of Vietnam, the Vietnam e-commerce sector continues to undergo impressive growth, approximately increasing 18-25% annually. By 2024, the market size is forecasted to exceed 2025 billion USD, reflecting a 20% rise compared to 2023 and accounting for nearly 9% of total domestic retail sales and service revenue. Moreover, the latest report from Metric, a data analytics platform specializing in e-commerce, the total retail sales across Vietnam's five major e-commerce platforms - Shopee, Lazada, Tiki, Sendo, and TikTok Shop - have reached 71.2 trillion VND. This represents a significant growth of 78.69% compared to the first quarter of 2023. This upward trend has enabled the increase of people purchasing impulsively, roughly 64% of global consumers engaged in spontaneous online shopping over 2022. This behavior is characterized by spontaneous buying decisions made without prior planning or consideration.

Scholars have shown interest in impulsive shopping behavior for more than six decades, with early studies focusing on defining the concept (Li & Jing, 2014). Applebaum (1951) characterized impulsive shopping behavior as unplanned purchasing triggered by promotional stimuli in stores or supermarkets. Stern (1962) further elaborated that this behavior encompasses any unplanned purchase transactions. Importantly, impulsive buying behavior is not confined to brick-and-mortar stores; it is equally prevalent in online shopping environments. Notably, online shoppers are often perceived to be more impulsive than their offline counterparts (Liu et al., 2013). Evidence suggests that impulsive purchases can account for approximately 40% of customers' total spending on online platforms, underscoring the necessity for online retailers to comprehend consumer behavior in the context of digital transactions (Verhagen & Dolen, 2011).

In general, existing research highlights diverse factors influencing impulsive purchasing decisions across websites, social media platforms, and e-commerce marketplaces. Trung et al. (2017) categorized the determinants of online impulsive buying into two primary groups. The first includes direct drivers such as impulsivity, immediate gratification, perceived rationality, and trust. The second encompasses indirect motivators like product availability, user-friendly website interfaces, and visual appeal. Meanwhile, Trang et al. (2021) demonstrated that immediate gratification is not the most influential determinant of impulsive purchasing. Instead, when ranked by impact, factors such as trust, supermarket advertisements, and impulsivity overshadow immediate gratification. Additionally, website usability has been recognized as a critical characteristic that attracts consumers to purchase unplanned items (Trang, 2023).

Furthermore, the factors influencing impulsive shopping tendencies vary not only across shopping formats but also across cultural contexts. Kacen & Lee (2002) applied Hofstede's cultural dimension theory to reveal that culture significantly shapes impulsive buying behavior. Compared to Western consumers, Asian shoppers exhibit lower levels of impulsive purchasing. Moreover, cultural independence - an individual-level cultural metric was not found to significantly affect impulsive buying among Asians, despite its influence on Western consumers' impulsive shopping behaviors. Lee & Kacen (2008) have suggested that consumers from collectivist cultures tend to engage in impulsive purchases when shopping with individuals who hold significance to them. Meanwhile, individualism has been observed to positively influence impulsive shopping in specific cultures, such as Vietnam, though its impact remains negligible in other cultural settings (Miao et al., 2019).

Impulsive buying behavior also varies by product category. For fashion and apparel, key factors include web design, product display, promotions, search functionality, and pricing, while product interest has minimal impact (Rhee, 2006). Wadera and Sharma (2018) found product variety most influential, followed by discounts, marketing, navigation, display content, and web design, with price having the least effect. In contrast, website quality does not significantly impact impulsive book purchases (Ravi, 2013).

With the rapid advancement of e-commerce, consumers' agency in their shopping journey has been markedly enhanced. Consequently, research into the determinants of impulsive buying behavior has increasingly shifted its focus toward the intrinsic characteristics of consumers. Given that consumers are exposed to similar information within the online shopping environment, variations in individual traits are more likely to catalyze impulsive purchasing behaviors. Therefore, examining the factors influencing impulsive buying from the perspective of consumers' internal characteristics in the context of e-commerce becomes imperative. In recent years, a growing body of literature has emerged on this topic, with prominent studies employing the Big Five personality model to better understand these behavioral dynamics.

Although many international studies have analyzed the relationship between the Big Five Model (BFM) and impulsive buying behavior (IP), most have not specifically focused on Gen Z, especially in the context of e-commerce. Research by Badgaiyan and Verma (2014), Mathai and Haridas (2014), and Thompson and Prendergast (2015) highlights how traits like extraversion and conscientiousness influence impulsive purchasing in traditional retail settings. In online environments, studies by Turkyilmaz et al. (2015) and Bosnjak et al. (2007) demonstrate that traits such as openness and emotional sensitivity also play a role in shaping online impulsive buying behavior. However, in Vietnam, studies largely concentrate on external factors like website usability, promotions, and eWOM, with minimal attention to the internal psychological factors, particularly personality traits.

Therefore, there is a significant research gap in understanding Gen Z's impulsive buying behavior in Vietnam,

especially in the context of the Big Five personality model. Currently, no studies have applied this model to explain impulsive purchasing in this group. Most existing research focuses on external factors like product images, website quality, and promotions, without exploring how personality traits influence buying decisions. This leaves a void in understanding the deeper psychological drivers of consumer behavior, particularly as e-commerce continues to expand. To fill this gap, this research aims to integrate the Big Five model and explore its impact on Gen Z's shopping behaviors in the digital age.

### 1.2 Research Questions and objectives

The research aims to investigate the impact of personality traits within the Big Five Model on impulsive buying behavior among Gen Z. The study aspires to provide a comprehensive understanding of the underlying motivations and consequences of impulsive purchases, thereby proposing strategies for personal financial management and enhancing spending efficiency in modern society. There are several main objectives of the research:

- RO1: To systematize the theoretical foundation of the Big Five Model and develop a research framework and measurement scales to examine the influence of the Big Five Model on online impulsive buying behavior among Gen Z.
- RO2: To ascertain the interactions of personality factors within the Big Five influencing online impulsive buying behavior among Gen Z
- RO3: To help Gen Z optimize financial management, foster sustainable consumption, and guide businesses in crafting sustainable marketing for long-term profitability
- To accomplish the above-mentioned goals, the following are some of the most important questions that will be answered:
- RQ1: What are the key personality traits from the Big Five Model that influence Gen Z's impulsive buying behavior on e-commerce platforms?
- RQ2: How do personality traits influence impulsive buying behavior among Gen Z on e-commerce platforms?
- RQ3: How can Gen Z improve financial management and adopt sustainable consumption, and how can businesses support this through sustainable marketing?

## II. MATERIAL AND METHODOLOGY

### 2.1. Conceptual Foundation

#### Big Five Model

The Five-Factor Model of Personality (FFM), commonly known as the "Big Five," consists of five key personality traits: Extraversion, Agreeableness, Conscientiousness, Neuroticism (sometimes referred to as Emotional Stability), and Openness to Experience. This model emerged from the psycholexical approach, which argues that personality differences are encoded in language and reflected in the vocabulary people use (De Raad, 2000). The foundation of the Big Five was laid by Norman (1963) and Goldberg (1981), whose research identified core dimensions of personality. Costa and McCrae (1992) expanded the model by adding agreeableness and conscientiousness, resulting in the development of the NEO-PI tool to assess these traits. Further research by Costa and McCrae (2008) confirmed the causal relationships between the five factors, solidifying the Big Five as a comprehensive framework for understanding personality. For a long time, personality psychology struggled due to the absence of a common model or theoretical framework. The emergence of the Big Five model in the early 1990s provided a key solution to this issue (Costa & McCrae, 1992), though it faced strong opposition, especially from Eysenck (1992). This is evident not only in the growing body of research but also in the model's significant role in predicting various life outcomes (Roberts et al., 2007). Despite ongoing debates, personality psychology has evolved from fragmentation to a comprehensive classification system, a promising theory in just two decades.

#### Impulsive buying

Impulse buying is a spontaneous, emotionally driven purchase behavior where decisions are made quickly without careful consideration of alternatives or consequences (Beatty & Ferrel, 1998; Kacen & Lee, 2002). It is widely studied

due to its complexity and prevalence across various product categories (Baumeister, 2002; Ramanathan & Menon, 2006). Defined as an unplanned purchase driven by a desire for immediate ownership (Rook & Gardner, 1993), impulse buying is strongly linked to consumer impulsiveness (Puri, 1996). This behavior primarily fulfills hedonic desires (Hausman, 2000) and is triggered by strong emotional reactions to stimuli. Han et al. (1991) classify impulse buying into four types: planned, reminded, fashion-oriented, and pure impulse buying. Key characteristics of this behavior include spontaneity, strong desire, post-purchase satisfaction, and a lack of pre-planned intent (Virvilaite et al., 2009). Impulse buying behavior first emerged in retail stores (Sun & Wu, 2011), but the rise of e-commerce has fostered this behavior (Xiang, 2016). Researchers argue that online shopping encourages impulsive buying behavior more than physical stores (Liu et al., 2013) by eliminating constraints like location, operating hours, and social pressures from staff and other shoppers (Chan, 2017). Therefore, studying online impulsive buying behavior is essential in the digital economy, as it helps assess its impact on sustainable consumption, enabling businesses and policymakers to develop strategies that promote responsible shopping in an increasingly digitalized marketplace.

**The FFF Model of Online Consumer Behavior**

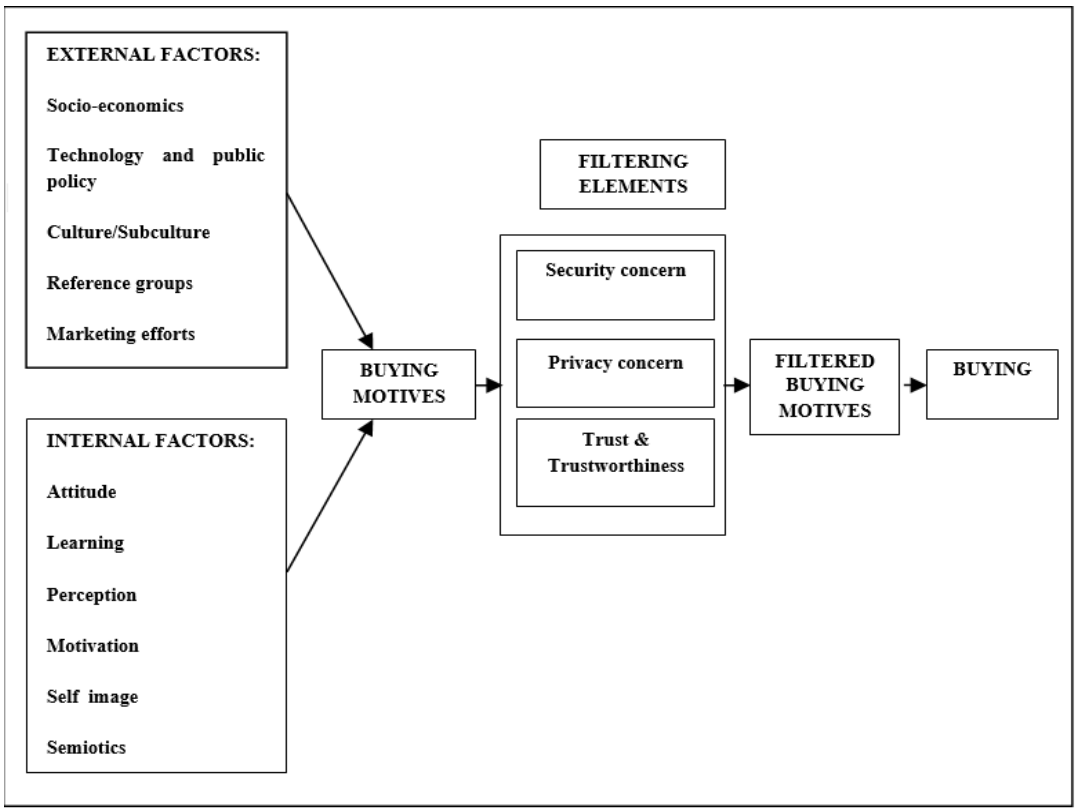

**Fig 2. 1 - The FFF Model of online consumer behavior**

*Source: Duralia, 2016*

Proposed in 2012 by management scholars Ujwala Dange and Vinay Kumar from Priyadarshini Engineering College and S. B. Patil Institute of Management, the FFF Model (Factors, Filtering elements and Filtered buying motive) offers a comprehensive framework for understanding online consumer behavior. This model delineates the interplay of internal and external factors that collectively shape consumers' purchasing decisions in the digital realm. Internal factors are personal traits or behaviors that encompass attitudes, learning, perception, motivation, self-image, and semiotics, all of which play a pivotal role in influencing how consumers approach e-commerce. External factors, on the other hand, include environmental stimuli such as social economics, technology and public policy, culture/subculture, reference groups and marketing efforts, which often guide consumer choices in the virtual marketplace. Furthermore, the FFF Model introduces the concept of filtering mechanisms - cognitive processes through which consumers evaluate and prioritize specific attributes like product variety, ease of navigation, perceived security, and trustworthiness of the platform. These filtering mechanisms not only narrow down the options available but also refine the consumer's final purchasing behavior. By synthesizing these factors, the FFF Model provides a nuanced

understanding of the complexities underlying online consumer behavior, offering valuable insights into how contemporary digital shoppers, particularly Gen Z, navigate e-commerce platforms. This model thus helps researchers explore the multifaceted drivers of impulsive shopping behavior in the ever-evolving landscape of online commerce. In the context of this study, the FFF Model serves as a theoretical foundation to understand how these factors interact with personality traits, specifically the Big Five personality traits, to influence impulsive shopping behavior.

This study aims to expand the applicability of the FFF Model by integrating it with the Big Five personality traits, providing a more personalized lens through which to analyze impulsive shopping behavior. Hence, the research seeks to uncover how Gen Z consumers in Vietnam's e-commerce environment navigate their online shopping experiences.

### 2.2 Research method

#### Hypotheses Development based on Past Studies

The factors underlying impulsive buying behavior can generally be categorized into two main types: external factors and internal factors. Turkyilmaz et al. (2014) highlighted external influences, including website usability, utility, and entertainment. Marketing cues also play a critical role in driving such behavior (Youn, 2000). As e-commerce evolves, consumer proactivity in shopping decisions has grown, shifting the research focus toward internal traits. Personality has been shown to influence impulsive buying significantly (Wang et al., 2022; Aquino & Lins, 2023). Besides, FFM is widely acknowledged in personality psychology and has been used in numerous studies on consumer behavior (Costa & McCrae, 1992; John et al., 2008). Unlike other personality frameworks such as MBTI or HEXACO, FFM provides a more comprehensive and detailed approach. Each factor of FFM encompasses six facets, which enhance FFM's ability to predict behaviors (Paunonen & Ashton, 2001). For instance, Neuroticism consists of anxiety, hostility, depression, self-consciousness, impulsiveness and vulnerability (Furnham, 2022), each capturing distinct nuances of personality (Speer et al., 2022). Moreover, findings from McCrae & Costa (1988) demonstrated that the MBTI categorizes personality into 16 types based on four dichotomous pairs that align closely with four of the five major dimensions of normal personality. Given its empirical rigor and extensive validation, the FFM is regarded as a more robust tool for personality assessment. Previous studies have demonstrated that each personality trait within the Big Five is strongly associated with impulsive buying behavior in an online environment (Turkyilmaz et al., 2015; Bosnjak et al., 2007). In Vietnam, Gen Z exhibits unique consumption behaviors, frequently engaging with e-commerce platforms and being highly susceptible to psychological factors such as emotions and impulsiveness. Thus, applying this model to examine the relationship between personality and impulsive shopping provides deeper insights into this group's behavior.

#### Big Five personality traits

The Big Five personality traits provide a conceptual framework for understanding personality traits through five core dimensions: Openness to Experience, Conscientiousness, Extraversion, Agreeableness and Neuroticism. Since the late 1990s, the Big Five model has established itself as the prevailing framework for understanding personality (DeYoung et al., 2007; John et al., 2008). Furthermore, personality traits play a crucial role in shaping consumer buying behavior (Otero-López et al., 2021). Previous research has extensively examined consumer impulse buying behavior in e-commerce, particularly investigating the impact of Big Five personality traits on such behaviors (Turkyilmaz et al., 2015; Ming et al., 2021).

The first factor, Openness to experience, is characterized by creativity, imagination, and receptivity to novelty (Zhao & Seibert, 2006). According to Wang et al. (2022) and Badgaiyan et al. (2016), individuals with high openness to experience are more drawn to novel ideas and innovative product offerings, making them more influenced by persuasive marketing and prone to impulsive buying decisions. In contrast, those with low openness tend to adhere to traditional preferences, exhibiting lower susceptibility to impulsivity and a preference for familiar products (Miao et al.,2019).

Conscientiousness is exemplified by being organized, self-disciplined, resilient, responsible, reliable and goal-oriented (Costa & McCrae, 1992). Consumers characterized by high conscientiousness are typically less impulsive in their buying behavior (Wang et al., 2022), as they carefully evaluate purchases and make more thoughtful decisions, which reduces their susceptibility to impulsive buying behavior (Miao et al., 2020).

Extraversion is marked by sociability, assertiveness, and a preference for engaging social interactions (Itani et al., 2020). Regarding extraversion, Wang et al. (2022) suggest that those with higher levels of extraversion may be more prone to impulsive purchases, as their sociability and receptiveness to external influences make them vulnerable to persuasive marketing tactics. Their tendency to engage with sellers and extend their shopping experience increases exposure to impulsive buying temptations.

Agreeableness is a personality trait defined by characteristics such as altruism, tolerance, empathy, and a propensity for nurturing and forgiving others (Barrick & Mount, 1991). Findings from Chen and Lee (2015) suggest that individuals with high agreeableness are more likely to trust others and make impulsive purchases compared to those with low agreeableness. Turkyilmaz et al. (2015) also argued that agreeableness plays a significant role in explaining online impulsive buying behavior, finding a positive association between agreeableness and impulsive buying.

Lastly, neuroticism pertains to one's ability to manage emotional stress and maintain psychological stability (Chen & Roberts, 2020). Concerning neuroticism, Miao et al. (2020) concluded that varying levels of neuroticism significantly influence the emotional pressure experienced by consumers, which can trigger impulsive purchases. When facing negative emotions, highly neurotic individuals may resort to impulsive buying behavior to seek temporary relief or instant gratification.

Although numerous international studies have explored the relationship between the Big Five Personality Model and impulsive buying behavior, few have specifically focused on Generation Z. Therefore, this study aims to fill this gap by examining the impact of Big Five personality traits on Gen Z's impulsive buying behavior in the e-commerce environment, offering insights into their unique consumer habits.

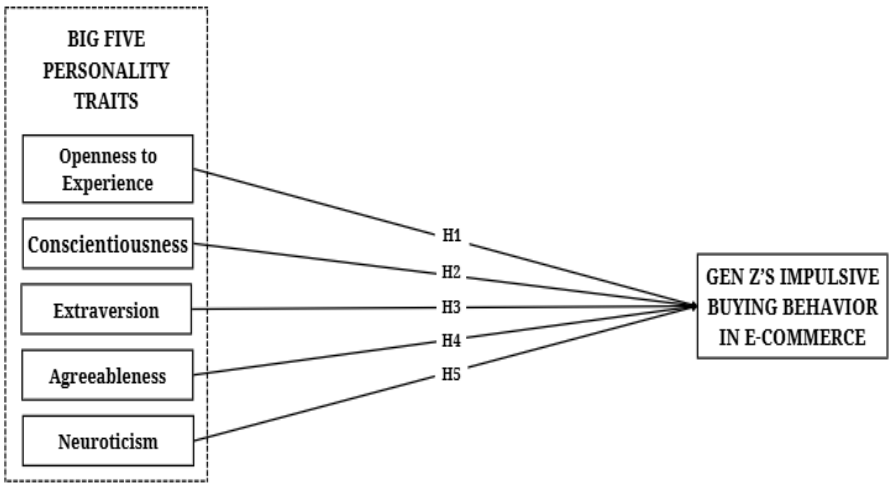
Therefore, the following hypothesis is derived.

- H1: Openness to experience has a positive relationship with online impulsive buying behavior among Gen Z
- H2: Conscientiousness has a negative relationship with online impulsive buying behavior among Gen Z
- H3: Extraversion has a positive relationship with online impulsive buying behavior among Gen Z
- H4: Agreeableness has a positive relationship with online impulsive buying behavior among Gen Z
- H5: Neuroticism has a positive relationship with online impulsive buying behavior among Gen Z

**Data collection and analysis**

The study was conducted using purposive and non-probability sampling methods. To collect data, a questionnaire specifically designed for the research context was developed and randomly shared across social media sites. 408 responses were collected, and the data was then analyzed using Structural Equation Modeling (SEM) techniques with Smart-PLS 4.0 software.

### 2.3. Research model



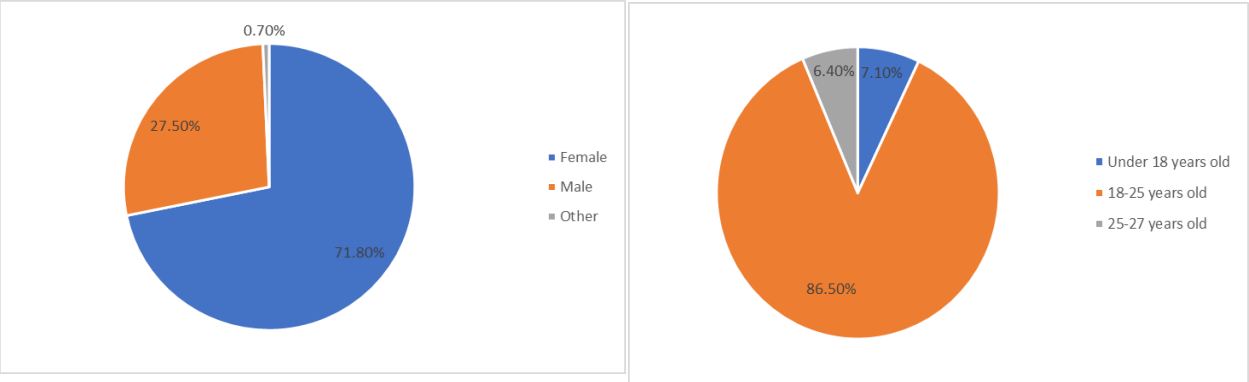


**Fig 2. 2 - Proposed Conceptual Model**

## III. RESULT AND DISCUSSION

### 3.1 Research subjects

According to the survey results on the Big Five personality traits and levels of impulsive shopping behavior among

Gen Z in Vietnam's e-commerce environment, following the total number of samples collected, the majority of participants are females which account for 71.8%, meanwhile the male participants make up 27.5% of the total numbers (Figure 3.1a).

**Fig 3. 1 - Results of demographic profile (N=408)**

The age distribution of the study group is illustrated in Figure 3.1b. The 18-25 age group represents the largest proportion of survey participants, accounting for 86.5%. This is followed by the 25-27 year-old age group, which comprises 7.1%. The under-18-year-old age group makes up the remaining percentage of the total sample. Most respondents engage in online shopping less than five times per month..

### 3.2. Model results

The results of the model analysis indicate that hypotheses potentially affect Gen Z's impulsive buying behavior in Vietnam's e-commerce environment (Figure 3.2)

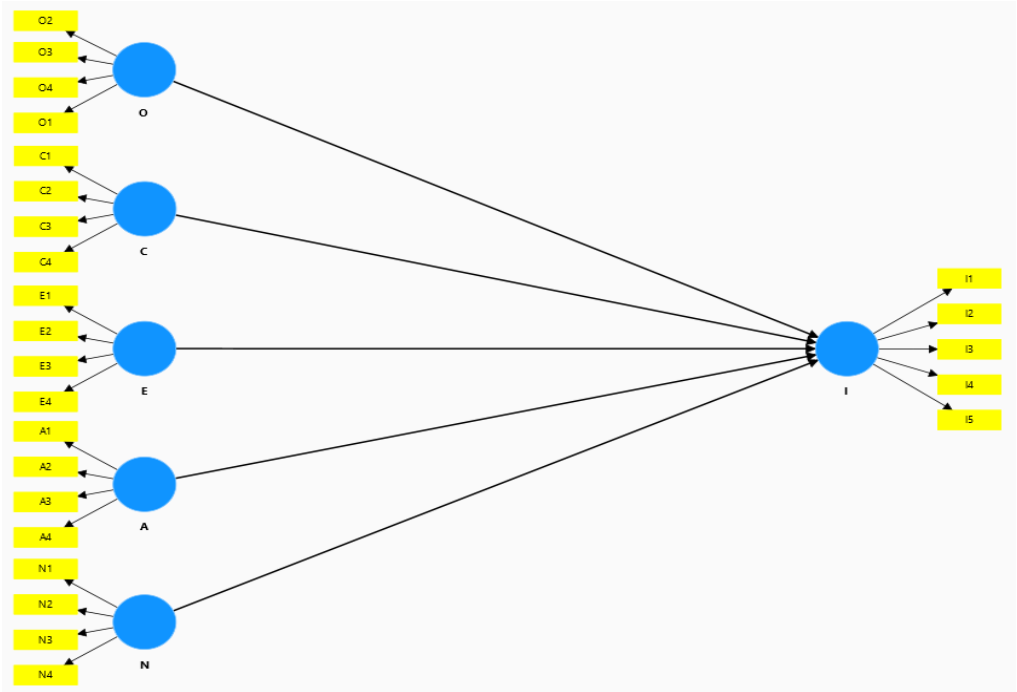

**Fig 3. 2 - Research model**

Table 3.1 shows the correlation results between variables and Online impulsive buying behavior . β = 0.423 indicates that individuals with higher levels of Openness to experience are significantly more inclined to engage in impulsive shopping behavior on e-commerce platforms. These individuals are naturally drawn to novelty and innovation, making them more receptive to new and creative products introduced by sellers, which can often result in

spontaneous purchases.

Similarly, β = 0.309 and β = 0.337, corresponding to Extraversion and Neuroticism respectively, reveal that individuals exhibiting higher levels of these traits are more prone to impulsive online shopping. Highly extroverted individuals are driven by their spontaneous interactions and heightened responsiveness to stimuli, leading them to make unplanned purchases. On the other hand, individuals with high neuroticism often experience negative emotions such as anxiety or distress, which can prompt them to indulge in impulsive buying as a coping mechanism to ease emotional instability.

Agreeableness, with β = 0.066, also influences impulsive shopping behavior, though its impact is notably minimal, as reflected in the model and survey findings.

Lastly, β = -0.340 for Conscientiousness underscores that individuals who score high in this personality trait are significantly less likely to engage in impulsive online shopping. Their strong sense of self-discipline and preference for structure enables them to exercise greater self-control, favoring planned and deliberate purchasing decisions over impulsive ones.

**Table 3. 1 – Results of β coefficient**

| Beta coefficient | |
|---|---|
| | **Online impulsive buying behavior** |
| Agreeableness | 0.066 |
| Conscientiousness | -0.340 |
| Extraversion | 0.309 |
| Neuroticism | 0.337 |
| Openness to experience | 0.423 |
| Online impulsive buying behavior | |

Table 3.2 evaluates the reliability and validity of variables using Cronbach's alpha, Composite reliability (rho_a), Composite reliability (rho_c) and Average variance extracted (AVE). The test results indicate that all variables have a Cronbach's Alpha coefficient ≥ 0.7 and Composite Reliability (CR) ≥ 0.7, demonstrating that the representative variables meet the required criteria and exhibit high reliability.

**Table 3. 2 - Reliability and validity of variables**

| | **Cronbach's alpha** | **Composite Reliability (rho_a)** | **Composite Reliability (rho_c)** | **Average Variance Extracted (AVE)** | **STANDARD** |
|---|---|---|---|---|---|
| **Agreeableness** | 0.885 | 0.904 | 0.920 | 0.742 | >0.7 |
| **Conscientiousness** | 0.888 | 0.920 | 0.921 | 0.746 | >0.7 |
| **Extraversion** | 0.872 | 0.875 | 0.912 | 0.722 | >0.7 |
| **Online impulsive buying behavior** | 0.922 | 0.924 | 0.941 | 0.763 | >0.7 |
| **Neuroticism** | 0.887 | 0.887 | 0.922 | 0.748 | >0.7 |
| **Openness to experience** | 0.890 | 0.897 | 0.923 | 0.751 | >0.7 |

**Table 3. 3 – The discrimination of the variables**

| | **Agreeableness** | **Conscientiousness** | **Extraversion** | **Online impulsive buying behavior** | **Neuroticism** | **Openness to experience** |
|---|---|---|---|---|---|---|
| **Agreeableness** | 0.861 | | | | | |
| **Conscientiousness** | 0.081 | 0.864 | | | | |
| **Extraversion** | 0.005 | 0.066 | 0.850 | | | |
| **Online impulsive buying behavior** | 0.103 | -0.202 | 0.341 | 0.873 | | |

| | | | | | | |
|---|---|---|---|---|---|---|
| **Neuroticism** | 0.057 | 0.110 | 0.135 | 0.365 | 0.865 | |
| **Openness to experience** | 0.103 | 0.177 | 0.020 | 0.391 | 0.046 | 0.867 |

Additionally, Table 3.3 assesses the discriminant validity of the variables, revealing that the highest values between variables are consistent. Therefore, the reliability of the variables and the authenticity discrimination of the variables are validated.

**Table 3. 4 - Results of the structural model**

| | **Original Sample (O)** | **Sample Mean (M)** | **Standard deviation (STDEV)** | **T statistics (\|O/STDEV\|)** | **P values** | |
|---|---|---|---|---|---|---|
| **Agreeableness -> Online impulsive buying behavior** | 0.066 | 0.074 | 0.038 | 1.747 | 0.081 | Non-support |
| **Conscientiousness -> Online impulsive buying behavior** | -0.340 | -0.345 | 0.040 | 8.481 | 0.000 | **Support** |
| **Extraversion -> Online impulsive buying behavior** | 0.309 | 0.310 | 0.048 | 6.513 | 0.000 | **Support** |
| **Neuroticism -> Online impulsive buying behavior** | 0.337 | 0.338 | 0.035 | 9.586 | 0.000 | **Support** |
| **Openness to experience -> Online impulsive buying behavior** | 0.423 | 0.421 | 0.039 | 10.737 | 0.000 | **Support** |

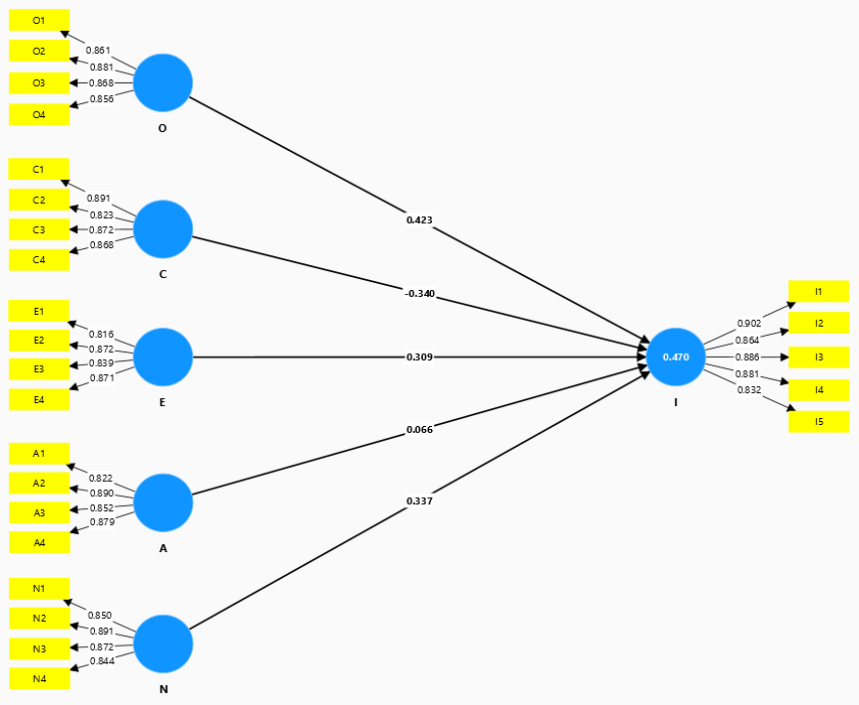

**Fig 3. 3 – The result of research model**

The analysis results depicted in Figure 3.2 reveal a strong correlation between most of the Big Five personality traits and Gen Z's impulsive buying behavior within Vietnam's e-commerce landscape. As presented in Table 3.4, the research findings highlight a significant interaction of Openness to Experience in influencing online impulsive buying behavior ($\beta = 0.423$). Furthermore, the p-values for Conscientiousness, Extraversion, Neuroticism, and Openness to Experience are all less than 0.05, indicating that hypotheses 2, 3, 4, and 5 are accepted. In contrast, the first hypothesis regarding the relationship between Agreeableness and online impulsive buying behavior has a p-value of 0.081, leading to the rejection of hypothesis 1.

## IV. CONCLUSION

### 4.1 Research Findings

The swift growth of e-commerce has significantly transformed customer behaviors, enabling greater accessibility to diverse products, competitive pricing and unparalleled convenience. In Vietnam, the adoption of online shopping has surged because of its ability to overcome geographical limitations and provide a purchasing experience. However, this convenience has also led to a notable rise in impulsive buying behavior, especially among Generation Z, which emphasizes the need to raise awareness of responsible consumption in the digital age. This study will analyze the influence of Big Five personality traits including Openness to Experience, Conscientiousness, Extraversion, Agreeableness, and Neuroticism on Gen Z's impulsive buying behavior in online shopping by surveying in Vietnam. The results indicate that four out of five personality traits correlate with impulsive buying behavior in online platforms among Gen Z. Specifically, Conscientiousness, Extraversion, Open to Experience, and Neuroticism have significantly impacted on impulsive buying behaviors while there is a relationship between Agreeableness and impulsive buying behaviors. The primary purpose of this paper is to examine the correlations among these variables influencing Gen Z's impulsive buying behavior, particularly in the context of online shopping. Such behavior is identified as a significant driver of overconsumption - unplanned purchases driven by emotional and psychological factors, which trigger challenges for sustainability efforts and environmental protection. If younger individuals take control of their impulsivity and consume more cautiously; it can lead to avoiding wastefulness. Such behavioral shifts can contribute positively to environmentally sustainability, fostering a more responsible approach to resource usage and conservation. Addressing this issue requires fostering a culture of mindful consumption, particularly among younger individuals who are key drivers of consumer trends recently. This study will also help university students and younger people orientating investment deeply understand the necessity of budgeting apps, and automated savings platforms, which can educate them on topics like debt management, credit building, and long-term wealth creation. Therefore, it emphasizes the importance of fostering customer awareness and financial management as approaches to mitigate impulsive unsustainable consumption behaviors, which may promote more responsible and environmentally conscious purchasing decisions.

### 4.2 Limitations and Future Research Directions

This study has some limitations that should be considered. First, this research is restricted by its selective sampling and focuses only on Gen Z in Hanoi, primarily focusing on university students. These constraints may restrict the generalizability of the findings to broader. Future research will address these limitations by expanding other geographical samples and the scope of research. Such efforts will strengthen the reliability and practical relevance of the findings. Moreover, this research focuses on Big Five personality traits, while other factors such as self-discipline or narcissism may also play a significant role in defining impulsive shopping behavior in e-commerce. Therefore, future research should integrate additional personality dimensions to provide deeper insights into impulse buying motivations. Additionally, this study highlights the role of intrinsic traits in impulsive shopping behavior. However, intrinsic factors can be influenced or moderated by external factors such as marketing stimuli or cultural differences among countries. Future studies should adopt an integrated approach that considers both intrinsic and extrinsic factors in the online shopping environment. Furthermore, the impact of the Big Five on impulse buying behavior may not remain consistent across different contexts, different product categories or over time. Future studies could employ longitudinal studies to track change in this influence over time or conduct comparative studies across different groups and products to determine the stability of the relationship between personality traits and impulse buying behavior.

**ABSTRACT**

This research examines the temporal changes of household-level energy poverty during the period 2012-2020 in Vietnam. Energy poverty is measured by multidimensional energy poverty, which comprises various types of energy access through cooking, electricity usage, service and entertainment appliances, and communication. The paper employs the Vietnam Household Living Standard survey in five consecutive datasets. The results indicate that the Vietnamese households have increasingly better quality of life as households have wide access to more various types of energy; thus, the MEPI index decreases steadily over the period. Research also shows that although the gap in energy poverty in urban and rural areas and among six regions has decreased, it still shows certain differences. This needs to be discussed in the government's inequality reduction policies in the coming time.

*Key words:* energy poverty, MEPI, regional disparity, households, Multidimensional Energy

## I. INTRODUCTION

Energy poverty is a key driver of socio-economic development and improves the quality of life (Valcic & Markuz, 2024; Zhang, 2024). Differences in infrastructure, economic conditions, consumption habits, and local policies create stark gaps in energy access across various regions (Pramanik et al., 2020; Tien & Quang, 2019). On an individual level, this impacts the livelihoods of energy-poor households, while on a broader scale, it hinders sustainable development, particularly poverty alleviation and energy sustainability.

Although there has been considerable research on energy access and energy poverty, these studies employ various methods to measure energy poverty (Katoch et al., 2023) or focus on a single factor like access to clean cooking energy (Domguia et al., 2024) or access to clean fuels and technologies (Sikdar et al., 2024). Another study in China uses two indicators, energy supply and energy consumption, to examine energy poverty (Zhang et al., 2024). This variation arises because energy poverty lacks a widely accepted definition, complicating its measurement (Guevara et al., 2023; Jones & Reyes, 2023).

Despite Vietnam's shift from traditional to modern energy sources, energy poverty has increased, particularly among poor households and ethnic minorities (Nguyen et al., 2019). Many households report dissatisfaction with their energy supply despite over 96% of households having access to electricity. Approximately 25% of households consume less than 50 kWh per month, indicating a gap between energy access and actual energy needs (Duong & Nguyen, 2021). Furthermore, energy poverty is exacerbated by regional disparities, with rural households and those in the northern and central coastal regions being most affected by temperature shocks, which reduce agricultural output and energy access (Feeny et al., 2021).

However, this paper identifies a significant research gap in the field of energy poverty. First, most existing studies focus on singular aspects such as electricity access or energy usage, while a multidimensional approach to comprehensively assess energy poverty remains limited. Second, in Vietnam, there is a notable lack of detailed analysis regarding disparities in energy access across key economic regions and between rural and urban areas over an extended period. Specifically, most prior studies have been limited to one or a few years, failing to capture the long-term trends and changes during the 2012-2020 period. This gap restricts a comprehensive understanding of the shifts and inequalities in energy access between different regions and sectors. Based on these findings, the research proposes solutions to narrow the energy access gap between regions, aiming to reduce energy poverty and ensure sustainable development.

## II. MEASURING MULTIDIMENSIONAL ENERGY POVERTY INDEX (MEPI)

We applied a multidimensional measurement based on the framework by Nussbaumer et al. (2012) to assess the Multidimensional Energy Poverty Index (MEPI), capturing energy consumption intensity across five categories: cooking facilities, electronic items, services, entertainment, and communications. Each category is assigned a weight of 0.2. From these categories, criteria are chosen due to the availability of data and based on Phung &Le (2024). As Cedano et al. (2021) mentioned, highlighted television usage—comparing color TVs and black-and-white TVs—to show energy consumption levels and household affordability. If a household cannot afford a color TV, it may reflect energy shortages or limited access to stable and sufficient electricity, offering deeper insights into their energy poverty status. As shown in table 1, these criteria include the use of eco-friendly cooking materials, air quality, access to electrical energy, using electric goods, heating or cooling, ownership of entertainment devices, and access to telecommunication technologies. Each criterion is coded as a binary variable with values '0' or '1,' where '0' indicates that the household is not energy poor, and '1' indicates energy poverty. Then, MEPI is calculated by adding a weighted average of these seven criteria. MEPI represents deprivation score, showing energy poverty level of households. The higher MEPI, the higher households are expected to be energy poor. Sabina Alkire (2014) mentioned that in developing countries, a threshold MEPI of 0.33 is defined as energy poverty. Thus, in our analysis, if a household's score exceeds the threshold of 0.33, its members are considered energy poor.

**Table 1. Measure Multidimensional Energy Poverty Index (MEPI)**

| Category | Variables | Weight | Households are considered to be poor energy if |
|---|---|---|---|
| **Cooking** | Eco-cook: Eco-friendly cooking materials | 0.1 | They cook with coal/coal briquettes/firewood/ farming products |
| | Air-quality: Air circulation quality in the house | 0.1 | They do not have gas stove or induction stove or electric stove |
| **Electricity usage** | Electricity: Access to electrical energy | 0.2 | They use electricity below 100 kW per year |
| **Luxury appliances** | Electric – device: Household use electric items for their convenient lives. | 0.1 | They do not own a refrigerator |
| | Thermal-device: Heating or cooling | 0.1 | They do not own heaters, air, conditioners, or fans |
| **Entertainment** | Entertainment: Ownership of leisure devices | 0.2 | They do not have a television (any type). |
| **Communication** | Communication: Access to telecommunication technologies | 0.2 | They do not have a landline or mobile phone. |

Furthermore, to evaluate regional poverty disparities, we calculate deprivation scores between rural and urban areas as well as among six regions. The regional codes range from 1 to 6, corresponding to the Northern Midlands and Mountainous Region (14 provinces), Red River Delta (11 provinces), North Central and Central Coastal Region (14 provinces), Central Highlands (5 provinces), and Southeast Region (6 provinces).

## III. DATA

The energy poverty data, encompassing cooking, electricity usage, luxury appliances, entertainment, and communications, were sourced from the Vietnam Household Living Standards Survey (VHLSS) for the period 2012-2020, provided by the General Statistics Office of Vietnam. This dataset is highly valuable and serves as a legally representative source of household data nationwide. For this study, the surveyed households were required to specify their average monthly energy consumption across different types of energy.

Of which five datasets ranging from 2012 to 2020, the observations are quite dispersed. Surveys on household consumption over the years have different sample sizes. In 2012, the number of households with data was 4,647, followed by 9,399 households for 2014 and 2016, and 9,398 households in 2020. In particular, in 2018, consumption data was conducted with a relatively large sample of 70,428 households.

## IV. RESEARCH RESULTS

### 4.1. Sample of households' energy poverty

A summary of households' energy poverty during the period 2012-2020 is provided in table 2. From that, the proportion of households inaccessible to energy criteria has mostly decreased over time.

Air-quality has shown a steady decline, decreasing from 10.76% in 2012 to 6.39% in 2020. This can be attributed to increased awareness among households regarding the use of cleaner, eco-friendly cooking materials like gas, induction, and electric stoves. The households with electrical energy poverty have decreased from 12.22% in 2012 to 4.24% in 2020. The most significant improvement has been observed in household electric goods, with the poverty rate decreasing from 24.42% in 2012 to 17.08% in 2020. However, this rate remains relatively high compared to other aspects, reflecting that many households, especially those in need of modern goods like refrigerators, still have limited access. The poverty rate regarding heating equipment has decreased from 14.03% in 2012 to 6.59% in 2020. Improved access to heating equipment has contributed to an enhanced quality of life, particularly in regions with harsh weather conditions such as the northern mountainous areas and the Central Highlands. The poverty rate in terms of telecommunications has decreased significantly from 17.67% in 2012 to 4.26% in 2020. The rapid development of information and communication technology (mobile phones, internet) has enhanced accessibility to these devices.

**Table 2. Number of poor households in each energy indicator, 2012-2020**

| Indicator \Year | 2012 | 2014 | 2016 | 2018 | 2020 |
|---|---|---|---|---|---|
| **Eco-cook** | 912 | 4671 | 3742 | 9100 | 2140 |
| | 19,63 (%) | 49,7 (%) | 39,81 (%) | 12,92 (%) | 22,79 (%) |
| **Air-quality** | 898 | 1325 | 1060 | 6166 | 600 |
| | 19,32 (%) | 14,1 (%) | 11,28 (%) | 8,76 (%) | 6,39 (%) |
| **Electricity** | 567 | 1007 | 767 | 2663 | 398 |
| | 12,2 (%) | 10,71 (%) | 8,16 (%) | 3,78 (%) | 4,24 (%) |
| **Electric – device** | 2549 | 3,868 | 3019 | 17201 | 1604 |
| | 54,85 (%) | 41,15 (%) | 32,12 (%) | 24,42 (%) | 17,08 (%) |
| **Thermal-device** | 652 | 1018 | 849 | 6383 | 619 |
| | 14,03 (%) | 10,83 (%) | 9,03 (%) | 9,06 (%) | 6,59 (%) |
| **Entertainment** | 467 | 720 | 709 | 6679 | 1145 |
| | 10,05 (%) | 7,66 (%) | 7,54 (%) | 9,48 (%) | 12,2 (%) |
| **Communication** | 821 | 951 | 682 | 5473 | 400 |
| | 17,67 (%) | 10,12 (%) | 9,03 (%) | 7,77 (%) | 4,26 (%) |

The following analysis will focus on clarifying the changes in energy poverty index according to different groups such as urban - rural and between regions. For the robustness of the analysis , table 3 shows ANOVA test for the differnces in the means of various groups and dependent variables. As shown, the P-value of all the tests are 0.00, showing that urban and rural group, or regional group have different means of MEPI and all components of MEPI at 95% confidence interval. These results confirm there exist mean gap among these groups that need to be futher analyzed.

**Table 3. ANOVA test on the differences between the means, by groups and dependent variables**

| Goup | MS | F | P-value |
|---|---|---|---|
| Dependent variable: MEPI | | | |
| Urban-Rural | 12.139 | 171.06 | 0.0000 |
| Regions | 8.0260 | 118.01 | 0.0000 |

**4.2. The dynamics in household-level energy access by areas in Vietnam during the period 2012-2020.**

The household energy poverty level in both rural and urban areas shows a decreasing trend across all seven criteria during the 2012-2020 period, except for the entertainment devices, which tend to increase. In general, rural households have higher levels of energy poverty than urban households. It is understandable that poor households and ethnic minorities mostly live in rural areas, heavily relying on traditional energy sources like coal and biomass to meet their energy needs. Another contributing factor was the rise in prices of modern fuels (e.g., LPG), which rural areas could not afford, leading to an increased use of cheaper fuels (such as coal, firewood, and wood).

Among the types of energy-related access, rural households face the greatest difficulty in accessing electronic goods. The poverty score for electronic goods is higher than 0.6 in 2012, three times larger than urban households. By 2020, the gap in the use of electronic goods between urban and rural areas has been smaller. Rural households have more conditions to buy refrigerators at home than before, therefore, poverty in electronic devices of rural households has decreased significantly and is only slightly higher than that of urban households.

In other poverty indicators, rural households have higher poverty reduction growth rates than urban households in environmental quality, electricity and mobile technology. It can be observed that the decline in eco-friendly cooking materials usage was more effective in rural areas due to increasing modernization, which gradually reduced the need for eco-friendly cooking materials. In urban areas, although the decrease was small, it still reflected a shift in cooking practices, as people stopped using harmful fuels to reduce negative impacts on the environment and health. This change resulted from greater environmental awareness among the population, along with the recognition of the harmful effects of emissions (e.g., CO, CO2) from cooking fuels on health.

For criteria electrical energy, household electric goods, and heating or cooling, both rural and urban areas experienced a decline in the rate of non-access. In rural areas, the decline was more pronounced: electrical energy dropped from 0.155676 in 2012 to 0.058339 in 2020, household appliances decreased from 0.651912 in 2012 to 0.202283 in 2020, and heating and cooling devices fell from 0.168624 in 2012 to 0.084179 in 2020. These improvements were facilitated by government policies, with local authorities and communities working together to address multidimensional energy poverty. Rising and more stable incomes allowed people to access more devices. In urban areas, where living standards were already higher than in rural areas, the changes were less significant. Electricity decreased from 0.037707 in 2012 to 0.009737 in 2020, household electric goods dropped from 0.289593 in 2012 to 0.106459 in 2020, and heating and cooling devices fell from 0.069382 in 2012 to 0.028562 in 2020. Urban areas, with

initially low energy non-access levels, saw improvements in infrastructure and living standards, reflecting effective policies and improved quality of life.

**Figure 2. Temporal trends in energy access inequalities across urban-rural areas.**

*Source: Calculation of authors based on VHLSS 2012-2020*

Regarding leisure, our study examined access to color or black-and-white television. Both rural and urban areas showed a slight increase in non-access levels during this period. In rural areas, non-access rose from 0.121048 in 2012 to 0.133006 in 2020, while in urban areas it increased from 0.049019 in 2012 to 0.099318 in 2020. This increase can be explained by the growing demand for satellite TV, as traditional terrestrial TV is no longer widely available. Some low-

income households could not afford the necessary services, leading to a rise in ownership of entertainment devices issues. For the access to telecom technologies criterion, with the ongoing development of technology and the widespread availability of the internet, information is increasingly accessible through mobile phones. As a result, non-access to communication energy decreased in both rural and urban areas, with rural areas dropping from 0.2162 in 2012 to 0.050571 in 2020 and urban areas decreasing from 0.077677 in 2012 to 0.02629 in 2020.

**4.3. The dynamics in household-level energy access by regions in Vietnam during the period 2012-2020**

Figure 3 shows that the Northern Midlands and Mountains and the Central Highlands are the two regions with the highest energy poverty levels in all indicators. In contrast, the Red River Delta and the Southeast are two regions with developed economic conditions, rapid urbanization, high average income and access to modern tools, and people here have the lowest poverty indicators.

Especially, in the indoor air quality criterion, the Northern Midlands and Mountains saw a considerable decline (plummeted from 0.471 in 2012 to 0.183 in 2020). Households have used more gas stoves and electric stoves than traditional cooking methods compared to the past. However, households in this area still use a lot of environmentally unfriendly cooking materials, resulting in an increasing trend in this kind of environmental energy poverty in the period 2012-2020. Higher levels of non-access to cooking energy are seen in those areas as a result of inadequate infrastructure, low income, and the ongoing reliance on traditional energy sources. On the other hand, clean energy sources are easier to access in urban or more developed areas.

As telecom technologies criterion, non-access levels decreased significantly across all six regions. However, it is worth noting that in the period 2012-2022, the regional differences in information technology began to narrow. Preferential policies for the development of technology infrastructure in mountainous and disadvantaged areas have created many opportunities for households in disadvantaged areas to access information technology, wireless and mobile phones. Table 3 also shows that a very small proportion (4.26%) of households do not have a telephone nationwide. This makes the gap in the use of communication devices in the regions increasingly narrow. Figure 3 shows that the mountainous and midland regions in the North or the Central Highlands all have access to communication devices almost equal to other regions in the country in 2020.

In the electricity criterion, all six regions saw a decline in the trend of not having access to power. Households also switched from using biomass energy (such as coal or firewood) to electricity, which enhanced their standard of living and decreased their dependency on non-sustainable energy sources. In the heating and cooling devices criterion, the non-access levels remained relatively unchanged across the regions over the years. Depending on the climate and the lifestyle needs of households in different regions, some households may not perceive the necessity of using heating or cooling devices. In cases where there is a demand, high electricity costs may limit the ability to access such devices.

The MEPI is calculated as weighted average of energy indicators as mentioned in table 1. This index shows that households are considered poor when the weighted average of the above criteria is greater than 0.33. Figure 4 shows the differences over time by region and area.

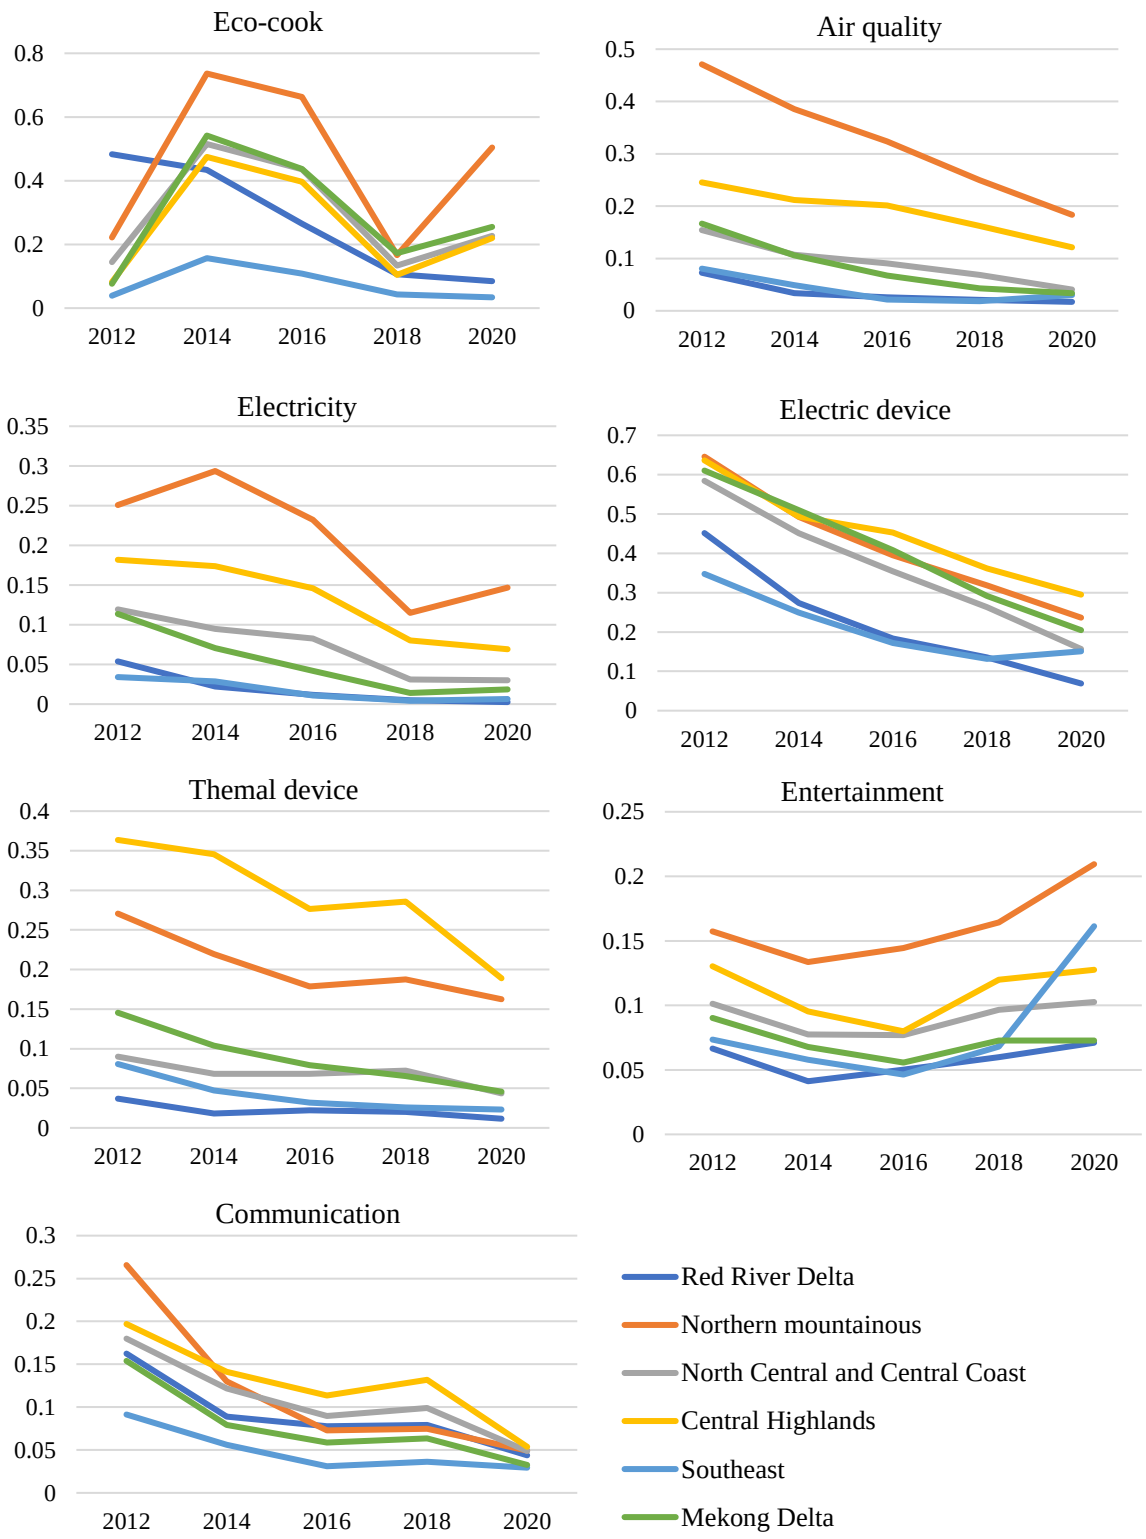

**Figure 3. Temporal trends in energy access inequalities across region gradients**

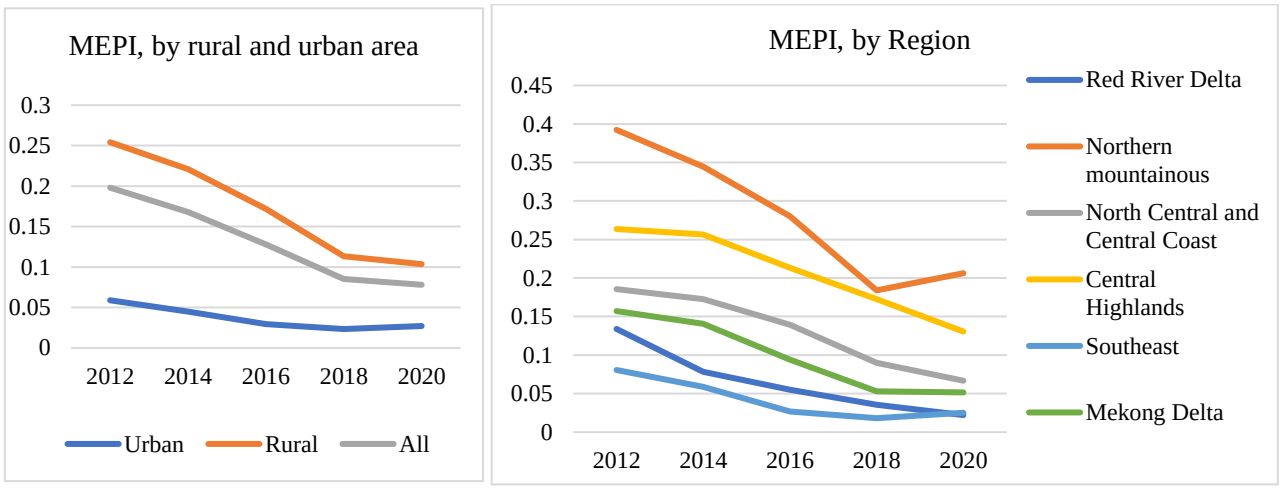
*Source: Calculation of authors based on VHLSS 2012-2020*

**4.4. The trend of changes in the Energy Poverty Index (MEPI) categorized in Viet Nam during the period 2012-2020.**



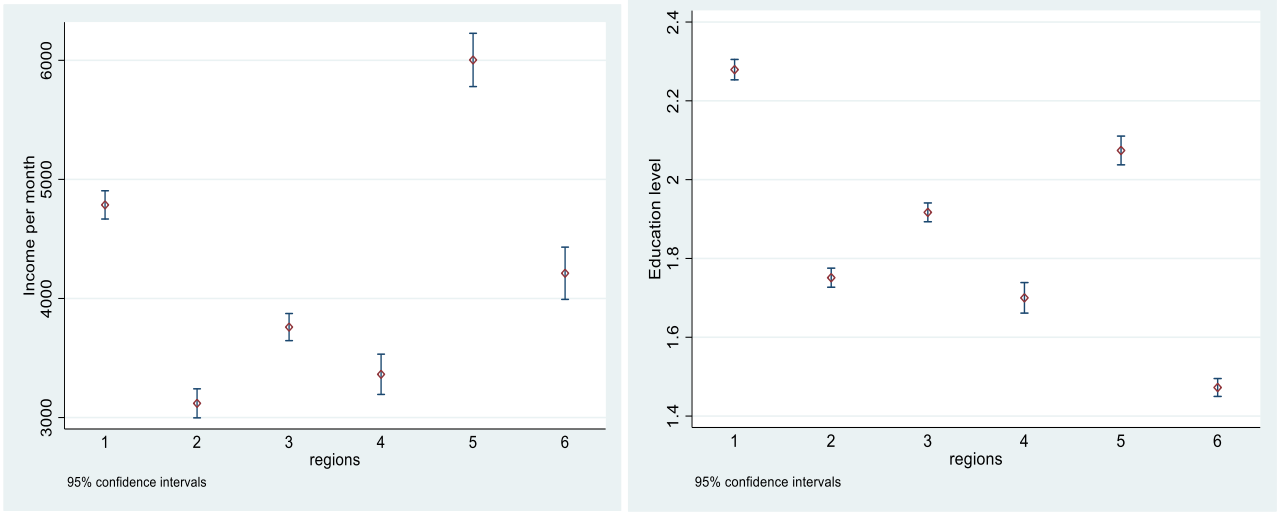


**Figure 1. Temporal trends in the Energy Poverty Index (MEPI), 2012-2020**

*Source: Calculation of authors based on VHLSS 2012-2020*

It can be seen that energy poverty level in Vietnam tends to decrease during 2012-2020. In 2020, the rate of energy poverty reduction slowed down compared to the previous period. In particular, poverty gap between urban and rural areas was very large at the beginning of the period, but the gap has gradually narrowed to half of what it was before. The difference between the two areas decreased from 0.1953 in 2012 to 0.0766 in 2020. This change reflects rural households' living conditions beginning to improve, reducing the wealth disparity between rural and urban areas.

However, energy poverty disparity among regions is still significant. The Southeast region captures the highest levels of energy access, so the energy poverty index is the lowest, ranging from 0.081 (2012) to 0.025 (2020). The Red River Delta and the Southeastern Region are both economic hubs with advanced industrial and urbanization development and state-of-the-art energy infrastructure, making them regions with favorable energy access circumstances. These advantageous circumstances enable energy sources to swiftly reach the populace, assisting in the fulfillment and enhancement of their energy requirements.

(4a) (4b)

**Figure 2. Confidences Interval Plot of income among regions and education level among regions, 2020.**

(4a): Unit of income; 1,000VND; (4b): Educational level ranges from 0 (no school) to 8 (Doctoral degree)

(4a), (4b): 1: The Red River Delta; 2: Northern midland and mountainous; 3:North Central and Central Coast; 4: Central Highlands; 5: Southeast; 6:Mekong Delta.

*Source: Calculation of authors based on VHLSS 2020*

The rate of energy poverty reduction is strongest in the Northern midland and mountainous region and the Central Highlands. These regions have challenging terrains, mainly mountainous areas, and limited energy infrastructure,

making modern energy access more difficult. The gradual reduction in the MEPI index reflects efforts to improve modern energy access nationwide. However, the substantial disparities between regions indicate that there are still inequalities in energy access. More priority should be given to regions with high MEPI, such as mountainous and midland regions of the North and the Central Highlands.

Factors affecting regional differences in energy poverty may come from income or education levels. Figure 4 shows that regions with high average income or high education levels have correspondingly low energy poverty. Therefore, economic and cognitive factors affect the quality of life of people in different regions.

## V. CONCLUSION

This research analyzes the dynamics of household-level energy poverty during the period 2012-2020 in Vietnam. The results indicate that the degree of energy deprivation tends to decline over time. The growth rate of energy poverty reduction slow down at the end of the period. The results also show that energy access is quite dispersed between rural and urban areas as well as among six regions in the country. The disparity between urban and rural households narrows down, although both regions exhibit a declining trend in the Energy Poverty Index (MEPI). Regarding economic regions, there is a significant disparity between the Northern and mountainous region and the Southeast. This makes for an uneven level of energy poverty among the six regions, although the MEPI tends to be downward for all.

Local measures have been largely explanatory for the MEPI index's recent improvement. Although the gap still exists, these improvements have been somewhat successful. Focus must be placed on creating all-encompassing instruments, expanding national regulations, and increasing public knowledge of this problem. First, in order to increase access to electricity, especially in mountainous areas, infrastructure should be upgraded through investments in the national power grid. Second, in order to decrease the usage of agricultural waste and enhance indoor air quality, social welfare policies and public awareness campaigns regarding environmental pollution should be created. Third, it is essential to promote the use of renewable energy sources and provide financial assistance programs to lessen the financial strain on households' energy access. Since energy poverty has many facets and is very difficult to properly reduce, this is not a problem that can be solved quickly.

# FLOODING IN RURAL SOUTHEAST ASIA: HEALTH IMPACTS

**Le Thi Ngoc Tu [1*]**

[1]Business School, University of Management and Technology, Ho Chi Minh City
* Corresponding: tu.le@umt.edu.vn

**ABSTRACT**

This research combines flood data extracted from satellite images with a rich panel data set of household surveys to examine the effects of floods on human health in six provinces of Vietnam and Thailand. We examine three health outcomes covering nutritional status and disease exposure as well as the effectiveness of different coping mechanisms. An increase in the share of village areas covered totally by water is associated with an average increase of around 13% in the likelihood of being underweight varying by gender and age groups. While experience of suffering from serious diseases and negative health status is a story composed of many factors, in which adaptation plays a significant role. We investigate several coping strategies commonly used by rural households in Southeast Asia. However, we only find a significant degree of success in assets strategy to deal with flood-related health impacts.

## I. INTRODUCTION

Floods have long been considered one of the most common and destructive natural disasters globally, with severe impacts on human health and well-being. According to the Intergovernmental Panel on Climate Change (IPCC), the frequency and intensity of climate-related extremes, including floods, have been increasing in many regions due to climate change (IPCC, 2021). The World Bank has also highlighted weather shocks as a significant poverty risk factor, especially for countries in the Global South (Bangalore et al., 2016).

Asia remains the region most affected by floods, accounting for nearly 50% of global flood-related fatalities (UNDRR, 2022). A historical review of flood events from 1980 to 2019 across multiple databases reported approximately 539,811 deaths, 361,974 injuries, and 2,821,895,005 people affected by floods worldwide (Doocy et al., 2013; EM-DAT, 2022). The primary cause of flood-related mortality is drowning, but the true scale of the impact is likely underestimated due to inconsistent reporting, particularly for the injured and affected populations (Doocy et al., 2013).

Flood impacts on human health are widespread and complex, affecting communities unequally and differing in both the short and long term, as well as direct and indirect consequences (Alderman et al., 2012). Understanding the multifaceted nature of flood-related health risks is crucial for developing effective disaster risk reduction and climate change adaptation strategies, especially in vulnerable regions like rural Southeast Asia.

Despite the comprehensive insights provided by the existing literature, several research gaps remain. One key gap is the need to utilize more objective data sources, such as satellite imagery, to assess the associations between flood burden and health outcomes. This could provide a more comprehensive and quantitative understanding of the linkages between flooding and various health impacts, moving beyond the reliance on epidemiological studies and self-reported data. Additionally, more research is needed to examine the heterogeneity of flood-related health impacts based on socioeconomic factors and the availability of health services and insurance coverage within rural Southeast Asian communities. This would help uncover any disparities in vulnerability and access to healthcare, which could inform the development of more equitable disaster risk reduction and flood management strategies. Furthermore, the existing literature has tended to focus on a relatively limited number of urban areas. Expanding the research to encompass a broader range of rural communities across the region could provide valuable insights into the context-specific drivers and manifestations of flood-related health impacts. Finally, the long-term health impacts of flooding remain an area that requires further investigation, as more longitudinal studies are needed to better understand the trajectories of recovery and the factors that influence long-term health outcomes among flood-affected communities in rural Southeast Asia.

Addressing these research gaps through rigorous, multidisciplinary investigations could contribute to a more

comprehensive and nuanced understanding of the health consequences of flooding in rural Southeast Asia. This knowledge could then inform the development of evidence-based, context-sensitive policies and interventions to enhance community resilience and safeguard public health in the face of increasing flood risks.

This research aims to provide an understanding of the evidence on the human health impacts of flooding in rural Southeast Asia, a region highly susceptible to these disasters due to its geography, climate, and socioeconomic conditions. This study will contribute to a deeper understanding of the complex pathways through which floods affect the health and well-being of rural communities in the region, informing policy and practice to enhance resilience and improve health outcomes.

**Literature review and research gaps**

A systematic review of 212 epidemiological studies (Ahern et al., 2005) indicates that flood-related deaths typically occur acutely due to drowning or trauma, such as being struck by objects in fast-moving waters. Flood events can also lead to a range of injuries, as individuals attempt to evacuate themselves, their families, or valued possessions. Furthermore, the clean-up process after floodwaters recede may pose additional injury risks. Flooding can also facilitate the spread of waterborne diseases, especially in areas with limited access to clean water and sanitation. Rodent-borne diseases may also increase due to altered contact patterns during heavy rainfall and inundation. The relationship between flooding and vector-borne diseases is complex, as floodwaters may both create breeding grounds for mosquitoes and flush away existing sites.

Building on this foundational understanding, the literature further explores the diverse health implications of flooding in South Asia. For instance, studies have examined the factors influencing vulnerability to diarrheal diseases during and after severe floods in Bangladesh (Hashizume et al., 2008; Kunii et al., 2002). Expanding the geographic focus, researchers have investigated the water-energy-food nexus and its climate risk implications, including flooding, in Southeast Africa (Mabhaudhi et al., 2019), and the vulnerability of Da Nang, Vietnam, to floods and strategies for enhancing resilience, which hold relevance for rural Southeast Asia (An et al., 2022). At the local level, understanding farmers' perceptions and addressing context-specific constraints are critical for effective climate change adaptation in agriculture (Le Dang et al., 2014). Flood risk assessment and coping capacity have emerged as crucial factors in developing targeted flood risk management strategies and adaptation measures (Vu & Ranzi, 2017). Moreover, the transformation of household livelihoods in response to flood control schemes requires participatory and holistic approaches to flood management that consider the diverse needs and vulnerabilities of local communities (Tran & James, 2017). Projections of future flood dynamics in the Vietnamese Mekong Delta further highlight the need for long-term flood risk management and adaptation planning in the region (Triet et al., 2020). A comprehensive and context-sensitive approach to flood damage evaluation is essential for informing robust and equitable disaster risk reduction strategies (Molinari et al., 2014).

The literature also suggests that floods can increase the global burden of disease, morbidity, mortality, and social and economic disruptions, placing ongoing stress on health services, particularly in low-resource countries (Du et all., 2010). Qualitative research indicates that symptoms of stress and mental disorders can persist for years after a flood event (Tapsell & Tunstall, 2008). However, studies have shown that psychological distress can be reduced through coordinated awareness of flood risks, flood protection, and prevention behavior, the development of simple insurance procedures and protocols for fast recovery, and learning from previous experiences (Correa et al., 2017). Disruptions to transportation and essential services during flood events may also contribute to psychological distress among affected populations (Yoda et al., 2017), and even small-scale floods can significantly disrupt communities and have substantial physical and mental impacts (Tapsell & Penning-Rowsell, 2002).

According to a systematic review of 35 published articles over the period 2004-2011 (Alderman et al., 2012), floods are estimated to have caused almost 53,000 deaths globally, with the majority occurring in resource-poor countries and communities due to their greater vulnerability and weaker disaster management systems. Non-fatal injuries and the exacerbation of chronic illnesses are the leading causes of morbidity, occurring before, during, and after flood events, including during the clean-up phase and repopulation. Floods can also trigger the release of chemicals, leading to toxic exposure-related health impacts. Additionally, floods are associated with increased risks of

communicable diseases, including waterborne illnesses, hepatitis, respiratory and skin infections, leptospirosis, and vector-borne diseases transmitted by mosquitoes. The long-term health impacts of flooding remain complex and not well understood.

Building on these insights, recent studies have examined the urban development and landscape characteristics of Can Tho City (CTC), a strategic center in Vietnam's Mekong Delta, and explored strategies for enhancing the city's resilience to climate change-induced flooding (Van Long & Cheng, 2018). Additionally, researchers have used a Flood Vulnerability Index (FVI) to assess the flood vulnerability of Chilmari upazila in Bangladesh, identifying highly vulnerable areas and informing targeted mitigation efforts (Islam & Hasan, 2023). In Bangkok, a study investigated residents' perceptions of the causes of persistent flooding, highlighting the need for a multi-stakeholder approach to address the physical and institutional barriers to effective flood mitigation (Thanvisitthpon et al., 2018).

Most studies on the effects of floods on human health are based on the subjective responses of people living in the affected area. In this study, we aim to provide evidence-based on objective satellite floodwater images from NASA's MODIS Near Real Time Global Flood Water (MFW) database.

## II. MATERIAL AND METHODOLOGY

We use a panel dataset of rural households in Thailand and Vietnam collected by the "DFG-FOR 756: Vulnerability to Poverty in Southeast Asia" project (TVSEP, n.d.). This data source is combined with flood data retrieved from daily satellite MODIS Flood Water images (MFW) version 4.9 provided by NASA and processed with Geographical Information Systems (GIS). Merging these two data sources allows us to estimate the impact of varying flooding intensities on an array of health outcomes in a panel regression.

### 2.1. Household dataset

The household surveys were targeted at rural households in six provinces of Vietnam and Thailand. These include three provinces in Northeast Thailand and three provinces from the northern central coast and western highlands in Vietnam. In total, 4400 rural households were interviewed following a three-stage cluster sampling design. In Vietnam, the sampling design further included strata for different agroecological zones. (Hardeweg et al., 2007). In this paper, we use the data from the first four waves conducted in 2007, 2008, 2010, and 2013. Attrition over the four-year panel is relatively small and leaves us with a full sample of around 4000 households. The household data contains information about the demographics, health, educational achievements, economic activities, agricultural activities, shocks and risks, employment, financial activities, assets, and housing conditions of the sampled households. The surveys also include fundamental information on the villages based on the responses of the village heads.

The main outcomes of interest are self-reported health, disease prevalence, and anthropometric measures. In order to measure nutritional outcomes, we use Body Mass Index (BMI) for adults and WHO z-scores for children, to calculate binary indicators for "underweight" following the standard WHO classification. The binary variables of "sickness" and "serious disease" take a value of one if the respondents report "experiencing general sick health" or "having suffered serious disease or injury". In the surveys, health expenditures are recorded at the household level; they are the aggregate of all health-related expenditures including doctor fees, medical expenses, and other health care expenses.

### 2.2 Flood data

This study uses the same method in (Tu Le, 2020) to create flood indicators, in which we retrieved flood areas from daily satellite MODIS Flood Water Image (MFW). With the support of Geographic Information System (GIS) and Google Earth tools, we created the main indicators for this research as follow;

First, we download the daily satellite MFW product version 4.9, which produces daily surface and floodwater maps at approximately 250m resolution, in 10x10 degree tiles for location 100E020N-South Indochina. This location covers six provinces in the study. MFW images are used for the period between 2003 and 2013. Second, in GIS the MFW image was processed and coded for the day that image was taken, for example. The principle of MFW is that MFW removes from the MODIS Surface Water image as a reference or expected water layer, such that the remaining water is likely to show flooding. MFW only indicates where water has been detected, but not how deep the water was. We unify all daily MFW into yearly flood measures. Third, the images were merged into village boundaries in GIS. We use the proportion of the village area that has been flooded during the year as the main exposure for our analysis.

### 2.3 Research method

Pooled OLS and fixed effect regression models are used to estimate the effect of flooding on individual health outcomes, using the following regression specification:

$$H_{it} = \gamma_i + \alpha_1 F_{vt} + \beta X_{it} + \gamma_i + \rho_t + \varepsilon_{it} \quad (1)$$

Where $H_{it}$ are health outcomes of individual I at time t. $H_{it}$ is measured in three ways: (a) a binary underweight indicator based on WHO classification, (b) a binary disease variable that takes the value of one if respondents report having suffered from a "serious disease or injury", and (c) a binary sickness variable takes the value of one if respondents report their general health status to be "sick". $X_{it}$ a matrix of covariates observed for each individual i at time t, and $\gamma_i$ are the individual-level fixed effects capturing time-invariant features of each individual. In the pooled OLS regression, the fixed effects are removed. Finally, $\rho_t$ is the wave fixed-effects to account for the unobserved difference between survey years, and $\varepsilon_{it}$ is the error term with standard errors clustered at the village level. The explanatory variable of interest is $F_{vt}$, which is the average proportion of a village's area that has been covered by floodwater in the previous year of the survey, thus ranging from 0 to 1. The parameter estimate $\alpha_1$ will give the average marginal effect at the mean of an increase in water coverage from 0 to 1.

To examine the role of coping strategies in reducing the effects of floods on individual health conditions, we use the model (1) and interact our flood measure with a set of coping mechanisms including possession of public or private health insurance, assets value, off-farm income, and income from saving accounts.

## III. RESULT AND DISCUSSION

### 3.1 Descriptive statistics

Table 1 below provides summary statistics of the main variables used in the analysis. The sample is pooled across all four waves. The sample is split equally between males and females with an average age of around 33. Roughly 19.3% of the individuals are underweight, which is about 12.5% for Vietnam and 6.8% for Thailand; about half of them are children and the elderly. The share of the respondents indicating that they have suffered from serious diseases is 16%, as compared to 10% reporting experiencing generally sick health. Albeit the survey covers rural areas, health coverage is quite high: 80% of the respondents have a free health card, and another 9% are covered by private health insurance. On average, the households in the surveys have four people in each house. Approximately, 14% of the heads of households have completed their secondary school. The dependency ratio in the sample is quite high; this phenomenon demonstrates that in households in rural Southeast Asia, grandparents in the villages take care of grandchildren while people of working ages work beyond their villages. The average annual total consumption per capita is 1740 USD; this is approximately 90% of their income per capita (2112 USD). It can be seen that the distribution of the consumption is mainly for food and rice, which is about 65% of the total, while the expenditure on health is only 3%. The rural people seem to have a close bond with the surrounding community. To get health care, the average time from home to the nearest hospital (or clinic) is about 30 to 45 minutes.

**Table 1: Descriptive Statistics of the Studied Sample**

| | Mean | SD | Min | Max |
|---|---|---|---|---|
| **Individuals** (N = 78,472) | | | | |

*Notes: consumption and income variables have been converted to 2005 USD.*

Figure 1 displays the number of days of villages in the samples that had been flooded over 10 years, from 2004 to 2014. Half of the villages in the sample had never been affected by floods, and half of the other villages had flood water at least one day in a year. In the sample, there are 3 provinces less affected including Buriram, Daklak, Nakhom-Phanom, and 3 other provinces are more affected including Thua-Thien-Hue, Ha-Tinh, and Ubon-Rathathani. Among the 6 provinces of the sample, Buriram is the least affected province, and Thua-Thien-Hue is the most affected province. In Buriram, there is only about 5% of villages have been flooded for more than 10 days in a year, the most affected village in Buriram was flooded for about 100 days with coverage of about 35% of its area. Meanwhile, Thua-Thien-Hue has up to 10% of villages in the sample exposed to flood water for more than 100 days per year, those villages were covered by flood water over 50% to 100% of their area.

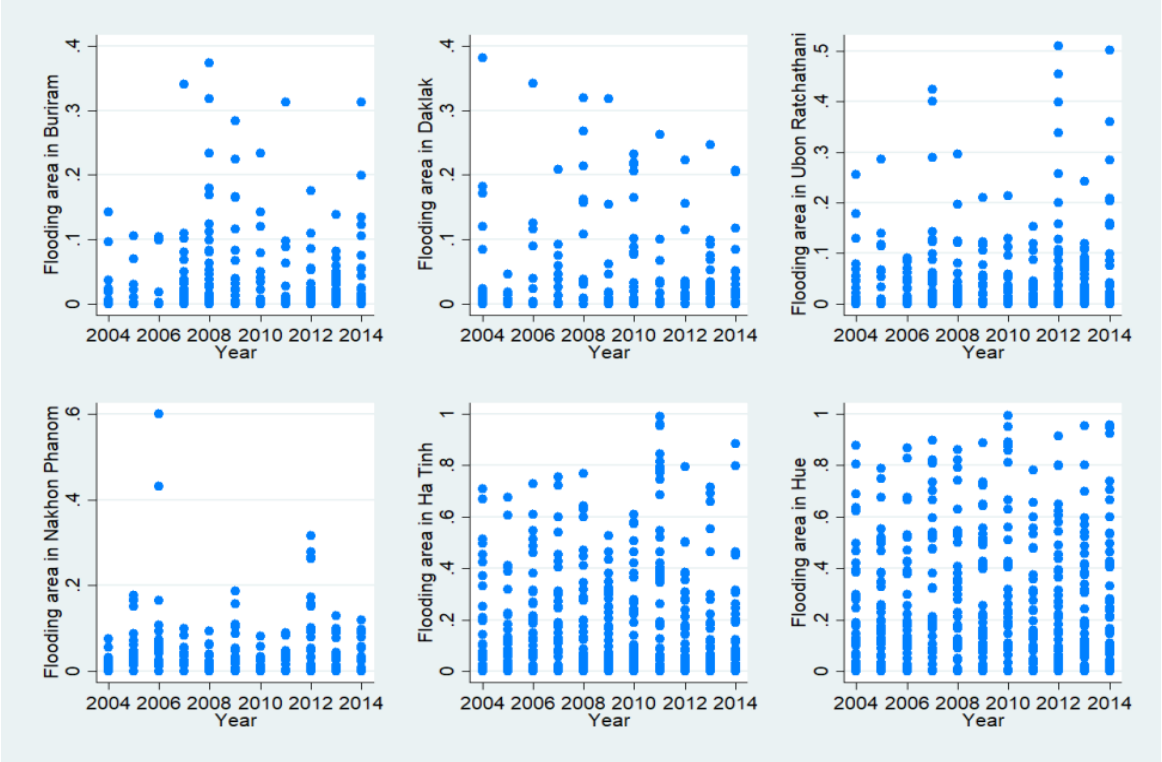

**Figure 1: Flooding area of villages in 6 Provinces, from 2004 to 2014**

*Source: Authors use GIS to create flooding map, and Stata to draw graphs*

**3.2 research results**

This section of the paper presents the results of our empirical analysis. First, we examine the effects of floods on health at the individual level, and then we assess the importance of coping strategies through formal and informal insurance mechanisms. All results use heteroscedasticity robust standard errors clustered at the village level.

*Source: Author's calculation. All standard errors are clustered at the village level. Dependent variables: (1) the individual is underweight (1/0); Other controls: Household variables, Village variables. Significance levels * $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$*

Table 2 presents the results on the effect of floods on the likelihood of being underweight for individuals living in the villages. Column (1) indicates a person living in a village covered by floodwater has a 12.3% higher likelihood of being underweight, while the effect of flood on the probability of being underweight for men is about 8.3%, women have roughly 7.5% higher likelihood than men (column (2)). The results in column (3) show the effect of flood on different age groups, the effect of flood on adults (aged 20-60) is around 14.3%, while the effects of flood on the likelihood of being underweight for children and adolescents (aged 0-5, and 5-19) is 8% lower than that of adults, and the elderly (aged over 60) is about 12% higher compared with adults, however, these differences are not statically significant. These results might be explained partly as that in the family, adults are the subjects who have responsibilities to participate in activities such as traveling, searching for food, trading, and exchanging goods, those activities need to be directly exposure to the floods, moreover, in family, likely adults would share their own foods for children, so in terms of flood impacts by age groups, adults are likely more affected than children. This should not be confused with the possibility of being underweight by age group in general, in which infants and elderly people are 3% and 15% more likely to be underweight than adults.

The impact of floods on the likelihood of being underweight might be through the relationship between flood and nutrition that individuals consume inadequately due to the damage in agricultural production or disruption of food supplies (Paterson et al., 2018). So, it is likely that this effect might be long-lasting, meaning that a village that has been flooded every year might have a greater impact on people living in that area in the likelihood of being underweight. To examine this hypothesis, we use data from floods over many years to calculate 5-year and 10-year flood indicators. The MODIS flood images were provided by NASA since 2002 (NASA, n.d.), therefore we use only 2013 household data to examine the impact of the 10-year flood indicator. Table 3 presents the effects of floods on the probability of being underweight, the results show that individuals living in the villages that are covered by floodwater every year are more likely to be underweight, the propabilities are increased respectively, 12.3% for within 1-year flood before the survey, 13.1% for within 5-years flood before the survey, and 13.7% for within 10 -years flood before the survey.

Next, we investigate how floods affect the likelihood of individuals contracting serious diseases, In Table 4, the results show, the average effect of flood on the likelihood of contracting serious diseases in the six provinces of the sample is not significant, and the impacts of the flood are not statically different for age groups or gender. We further tested with a subjective indicator, the feelings of general sickness, the results are similar to the likelihood of contracting serious diseases, except that the impact of flood on the elder group, which is 15.1% significantly higher than that for the adult group.

The results in Table 4 and Table 5, raise the question of whether it is a matter of omitted variables in the model. Observational health studies frequently deal with grouped or clustered data. When observations are clustered into groups, common group-level characteristics can affect outcomes. If all of these unique characteristics are observed and measured, it would be possible to include them in a model (1), although in most cases this is unrealistic. Some examples of the unobserved such as quality of diet, exercise, generic, predisposition, and culture … may or may not influence the predictor variables. Therefore, to check the concern of omitted variables, we add $\gamma_i$ as the individual level fixed effects to capture time-invariant features of each individual that may impact or bias the health outcome variables, however, we are aware the fixed effect model will give the estimate of the change of an individual's health condition with the average overtime of his/her health condition, and the fixed effect model cannot estimate the coefficients of time-constant variables such as gender or age groups, and still cannot capture the unobserved time-varying heterogeneity such as living habits may change partly with the seasons, in this case, the omitted variables still be concerned (Collischon & Eberl, 2020). The results in Table 6 indicate that the impact of the flood on individuals (after controlling for all individual time-constant factors) is positive, with a magnitude of about 4% for contracting serious diseases and 4.4% for feeling sickness, however, the effects are not statistically significant.

The results from the fixed effects model analysis further raise questions of whether individuals living in frequently flooded areas have adapted to flood environments, which could overshadow the impacts of floods on contracting serious diseases and feeling sick. To investigate this concern, we examine the impact of floods on the health conditions of people living in two different provinces, Thua-Thien-Hue which is the most affected province, and Buriram which is the least affected province. The results in Table 7 show that if a village in Buriram province is covered by flood water, it is associated with the likelihood of individuals living in that village contracting serious disease by about 28% and also increases the likelihood of feeling sick for people living in that village by 23%, while there is no significant impact for those living in flood-covered villages in Thua-Thien-Hue province. These results show that floods will have a strong impact on human health if floods occur irregularly in places that are not often flooded.

Giving attention to the other factors that are also closely related to the health conditions of local people such as family backgrounds and facilities in the community, we realize the fact that the story of the impact of the flood on human health is not only sole factor of nature but that is a combination of human copings and nature. Tables 4 and Table 5 present the correlations between household background with contracting serious diseases and feeling sick, including, household size, dependency ratio, assets (present value of assets lagged by one year), household head education, types of cooking fuel, and having private toilets. The results reveal a very clear message about these correlations is that families have richer assets, higher head education, less dependency ration, better cooking fuel (households use gas or electricity for cooking), having private toilets, and people living in such families have significantly lower the likelihood of contracting serious diseases, as well as the significant lower the likelihood of feeling sickness. Similarly, when we consider the correlations between the village background with contracting serious diseases and feeling sick, including, the time from village to town, the village infrastructure index, and the village having public water. These correlations are significant, people living in villages with better facilities, not only have a lower likelihood of suffering from serious diseases, but they are also less likely to feel sick. Villages that have epidemics might increase the likelihood of individuals getting serious diseases by 3%.

The findings above demonstrate that human health is influenced by nature as well as the relationship between nature and human coping. The results in Table 7 contend village infrastructure index in Hue played a significant role in reducing the likelihood of contracting serious diseases among villagers, while this factor played a negligible role in the probability of contracting serious diseases in villages in Buriram instead, the effects of floods play a significant role.

*Source: Author's calculation. All standard errors are clustered at the village level. Dependent variables: (1) individual suffers from serious diseases (1/0); (2) individual feels sickness (1/0); Other controls: Household variables and village variables.*

Whether a household suffers a health shock is likely to be related to both its shock prevention strategies toward such a shock ex-ante, as well as its ability to cope with the shock ex-post (Javier Esparcia*, 2016; Paul et al., 2014; Wiesinger & Georg, 2007). Besides, (Thennakoon et al., 2020) suggest that local residents' adaptive behaviors in response to extreme weather events are significantly different from time to time due to climate changes. A study of the households' resilience to flooding in Bangladesh (Smith & Frankenberger, 2018) has provided evidence that the social and human capital, as well as asset holdings, reduced the negative impact of flooding on household food security. This raises the question of whether any of these factors mitigate the negative impact of flooding on health. In order to examine the role of coping strategies in reducing the effects of floods on individual health conditions in our studied sample, we model the importance of coping strategies by estimating equation (1) for the outcome including interactions of our flood measure with a series of variables reflecting the various coping strategies. These are the possession of a free health card in column (1) and private health insurance in column (2), the present value of household assets in column (3), off-farm income per capita in column (4), and saving in the household in column (5). Negative coefficients on the interaction terms indicate that the coping strategy is associated with a reduced health vulnerability to flood.

*Source: Author's calculation. Dependent variables: Individual suffers from serious disease (1/0). Other controls: Household variables and village variables. Significance levels: * p < 0.1, ** p < 0.05, *** p < 0.01. All standard errors are clustered at the village level.*

Table 8, in column (1) presents the interaction term between individuals in possession of a free health card with the potential for serious disease and flood effects. Individuals who own free health cards are from poor households that fall below a certain income criterion, so it is not surprising to find that the likelihood for them to contract serious disease is about 1.8% higher than non-poor people, then combined with the impact of floods that likelihood increment by 5.4%, this finding reveals that the poor is the most vulnerable to flood impacts. Column (2) presents the relationship between individuals using private health insurance and the likelihood of serious diseases, the results demonstrate that owning private health insurance is not related to the effects of floods on getting serious diseases. However, again this coefficient should be interpreted as indicative rather than causal. Participation in private health insurance is influenced by considerable selection effects. While adverse selection theory would predict more sick people to invest in health insurance, we believe that in this case, participation effects could also lead to positive self-selection, whereby individuals with higher income (and thus presumably better health status) tend to participate more in private health insurance.

The informal insurance mechanisms investigated in columns (3-5) of Table 8 show all small effects on the probability of reporting serious disease for a given level of flood in the village the year before the survey. Again, this result is giving a signal that a household with more assets, and diversified income sources would be better able to cope with flood shocks. To sum up, we find few statistically significant reductions in the probability of contracting a serious disease for the investigated coping strategies, floods impact on contracting serious diseases varies in individuals with different family backgrounds, and in communities with different infrastructures.

Overview, Tables 4-8 show results for the impact of floods on human health in that the poor are at higher risk of contracting serious diseases, households with better backgrounds, and villages with better infrastructures have a lower probability of getting serious diseases for individuals living in those households and villages.

## IV. CONCLUSION

In this research, we studied the effects of floods, measured as the average share of village areas covered by water in a year, on health conditions in a large sample of households from six provinces in Vietnam and Thailand. This approach was implemented using a novel external dataset comprising satellite images, thereby allowing a highly precise and objective geographical measure of flood data. We assessed the association between floodwater and three self-reported health outcomes covering nutritional status and disease exposure. We find a positive association between our flood measure and the likelihood of being underweight and reporting a negative health status. However, the impact of floods is significant for being underweight, but the coefficients are rather small or reach statistical only for serious diseases as an outcome of interest with people living in the areas that are not usually flooded. We find some slight evidence that floods affect females and working-age individuals more strongly. The findings from an analysis of coping strategies show a fact that the effects of floods on human health are difficult to cope with; we only find a small effective of assets coping strategies dealing with flood-related health. These findings are useful for policymakers to identify which coping mechanisms might be better suited to reduce flood-related health vulnerability, and which ways might be effective to establish those coping strategies.

# THE MODERATING ROLE OF TRUST DEVELOPMENT AND FACTORS INFLUENCING PURCHASE INTENTION VIA LIVESTREAM AMONG GENERATION Z

**Ly Dan Thanh[1], Ngo Van Nhat[1]*, Dao Tra My[1], Phung Ngoc Bao Chau[1], Nguyen Pham Hong Ngoc[1]**

[1]Faculty of Business Administration, Ho Chi Minh City University of Economics and Finance, Vietnam
*Corresponding author: vannhat19062k4@gmail.com

**ABSTRACT**

In the era of "Industry 4.0" development, social media is becoming increasingly popular and serves as a method for people to access and explore rich sources of knowledge from various places. Through social media, individuals can be motivated to acquire and strengthen their limited knowledge and information. It is undeniable that social media has a significant impact on culture, economy, and vision in the digital age. The study employs a quantitative research method, utilizing a five-point Likert scale to measure the influencing factors, including the development of trust, subjective norms, streamer's credibility, perceived ease of use, platform design, perceived enjoyment, and social interaction.The research results indicated that the development of trust plays a moderating role in the relationship between influencing factors such as subjective norms and streamer's credibility with the purchase intention via livestream. Additionally, factors such as platform design, perceived ease of use, perceived enjoyment, and social interaction also had a significant impact on Gen Z's purchase intention.

*Keywords*: "development of trust"; "subjective norms"; "streamer's credibility"; "perceived ease of use"; "platform design"; "perceived enjoyment"; "social interaction", "purchase intention"

## I. INTRODUCTION

Online shopping has quickly become a popular global trend, growing rapidly and attracting a large number of consumers. Among the various forms, purchasing through livestreaming platforms is a new but extremely fast-growing method. According to a report by Coresight Research, global LIVE Commerce sales reached an impressive $171 billion in 2023, nearly tripling the $60 billion from 2019. Another study by Grand View Research predicts that the global LIVE Commerce market size will achieve a compound annual growth rate (CAGR) of 21.2% during the period 2024-2030. With a large population and high internet usage rate, Vietnam is a fertile market for the development of e-commerce. According to a report published by NIQ, approximately 95% of online shoppers purchased goods from livestream sessions during the first quarter of 2024. According to the statistical report published by Metric, the total output and revenue in the first half of 2024 compared to the same period in 2023 increased significantly, with the TikTok Shop platform rising from 150.54% to 242.15%. Known as a new era of e-commerce, livestreaming is the intersection of entertainment and commerce. One of the superior features of livestream commerce is the direct interaction, allowing the audience to ask questions and receive immediate feedback, creating a natural conversation and optimizing the way the audience engages through social media. Therefore, the paper is conducted with the aim of identifying the positive factors affecting consumers' purchase intentions through livestream. The research results will provide recommendations to contribute to improving product quality, sales systems, and optimizing the superior features of livestream commerce. Simultaneously, it will help businesses consider exploiting and enhancing the effectiveness of this form of e-commerce. The findings show the importance of user experience and social factors in driving online shopping behavior. Specifically, the level of interaction between customers, the credibility of the streamer, and the ease of use of the platform are key drivers in increasing purchase intentions.

## II. CONCEPTUAL BACKGROUND

### Consumer Purchase Intention

Consumer purchase intention seeks to systematically integrate knowledge from various fields (Mattila, 2004). It is an interdisciplinary field that studies how individuals and groups make decisions related to the purchase, use, and

disposal of products and services. Understanding consumer behavior is crucial for businesses and policymakers, as it provides insights into the factors influencing consumption patterns and choices (McFee, 2023).

Previous research has attempted to define customer intention as a study of how individuals, groups, and organizations select, purchase, use, and dispose of goods, services, ideas, or experiences to satisfy their needs and desires (Decrop & Woodside, 2017). Importantly, the Technology Acceptance Model (TAM) also provides a theoretical framework for understanding how users perceive and accept technology (Venkatesh & Davis, 1996). Besides the fields of information systems, marketing, and hospitality, TAM has been applied across various industries (Tung et al., 2008; Aghdaie et al., 2012). The Technology Acceptance Model (TAM) provides a theoretical framework for understanding how users perceive and adopt technology (Venkatesh & Davis, 1996). This model was developed based on the assumption that Perceived Ease of Use (PEOU) and Perceived Usefulness (PU) of a specific technology are the key determinants of the intention to use that technology.

**Subjective Norm**

According to Ajzen's (1991) Theory of Planned Behavior (TPB), which is currently a widely used theoretical framework for explaining human behavior, particularly in decision-making and intention formation, and is governed by three key factors: attitudes, subjective norms, and perceived behavioral control, subjective norm plays a crucial role in shaping consumers' behavioral intentions in various situations, including online shopping. Subjective norm is defined by Fishbein & Ajzen (1975) as an individual's perception of social expectations and pressures from those around them, such as family, friends, colleagues, or other influential people. Studies by Wang and Yu (2017), Pradhan (2018), and Hsu and Chang (2019) indicate that consumers' shopping intentions are significantly influenced by adherence to norms from important social groups, particularly in the context of online shopping via livestream. Livestream shopping creates a highly interactive environment where consumers can receive numerous opinions and suggestions. The influence of subjective norms in the context of online shopping is considered an important factor influencing consumers' purchase decisions and this level is greater when consumers perceive strong expectations and support from influential people in their social network. Therefore, the study proposes the hypothesis:

*H1: Subjective norm positively affects consumers' purchase intentions in livestream e-commerce.*

**Streamer's Credibility**

The credibility of streamers in e-commerce through livestream sessions reflects the degree to which consumers trust the information, recommendations, and endorsements provided by the streamer regarding the product (Ohanian, 1990). When the streamer is a celebrity, their endorsement becomes a crucial marketing strategy to enhance brand awareness and attract the right target audience. When implemented effectively, this strategy not only boosts current consumers' shopping behavior but also expands the reach to potential customers. Experimental studies have demonstrated that consumers' trust in the streamer's credibility can help mitigate perceived risks, enhance engagement, and positively influence purchase decisions (Song & Liu, 2021; Willemsen et al., 2012; Gong & Li, 2017). Additionally, a streamer's appeal helps attract consumers, making them more interested in the presented products and increasing the likelihood of consideration and purchase behavior (Xu et al., 2020). Based on this, the study suggests the hypothesis:

*H2: Streamer's credibility positively affects consumers' purchase intentions in livestream e-commerce.*

**The Moderating Role of Trust Development in Livestream E-commerce**

In livestream e-commerce, interactivity can foster close relationships between streamers and consumers, thereby enhancing trust (Wei et al., 2022). The entertainment aspect can pique consumers' curiosity about the streamer and the product, increasing their willingness to engage, leading to positive evaluations of both the product and the streamer (Wongkitrungrueng & Assarut, 2020). The element of "Trust Development" is fundamental to maintaining loyalty and supporting online shopping. It is formed through daily interactions between the streamer and viewers, the streamer's expertise, and other factors (Zhang et al., 2021). Liu et al. (2021) confirmed that social support directly and positively influences purchase intention in social commerce, with social trust partially mediating this relationship. This indicates that consumers develop trust when watching livestream sessions and form purchase intentions under the influence of that trust. Although the impact is not strong, in practice, customers' purchasing intention are still based on trust derived

from subjective norms (SN), streamer's credibility (SC), and previous theoretical foundations and studies continue to affirm this.

*H3: Trust development moderates the relationship between subjective norm and consumers' purchase intentions in livestream e-commerce.*

*H4: Trust development moderates the relationship between streamer's credibility and consumers' purchase intentions in livestream e-commerce.*

**Platform Design**

In livestreaming e-commerce, a user-friendly design of livestream platforms can provide consumers with an enjoyable shopping experience. This means that the design of livestream shopping platforms can influence consumers' sensory experiences, thereby affecting their shopping intentions and behaviors. A user-friendly and easy-to-use external design can inspire impulsive purchases and enhance self-efficacy. Lee and Chen (2021) found that the convenience of shopping has a positive impact on the perceived usefulness of products, encouraging consumers to make impulsive purchases.. The design of livestreaming e-commerce platforms directly impacts consumers' sensory experiences.

*H5: Platform design positively affects consumers' purchase intentions in livestream e-commerce.*

**Perceived Ease of Use**

For Wibowo (2013), perceived ease of use is the user's belief that technology will be easy to use. Conversely, Hartono (2013) defines perceived ease of use as the belief that using technology will be straightforward and without difficulty. The term "ease of use" can also be understood in various ways, generally referring to anything considered convenient and hassle-free. Customers often desire simplicity in using a system, especially when it involves payment or financial transactions. They want to use the system without trouble and without having to figure out how to use it. The ease of use of a product or technology significantly influences whether consumers can accept it. This is known as 'perceived ease of use' (PEU).

*H6: Perceived ease of use positively affects consumers' purchase intentions in livestream e-commerce.*

**Perceived Enjoyment**

Perceived enjoyment refers to the satisfaction or excitement consumers feel when interacting with their surroundings during the shopping process (Dwitya & Hartono, 2023). Livestream, with its high entertainment value, provides a fun, relaxing, and safe shopping medium, especially during the COVID-19 pandemic (Ducoffe, 1996; Chen & Lin, 2018). The motivation created by enjoyment and curiosity directly influences the intention to participate in livestream shopping (Gallego et al., 2016; Cai et al., 2018). According to Park and Lin (2020), perceived enjoyment and trust in digital celebrities can increase the likelihood of purchasing recommended products. Additionally, the entertainment experience from livestreaming positively impacts purchase decisions, improves customer attitudes, and increases loyalty towards livestream channels (Curras-Perez et al., 2014; Hsu et al., 2012).

*H7: Perceived* enjoyment *positively affects consumers' purchase intentions in livestream e-commerce.*

**Social Interaction**

In livestreaming e-commerce, content oriented towards social interaction conveyed through the streamer's speech when promoting products or services has a powerful impact on viewers' shopping behavior and gifting (Deng et al., 2016). Furthermore, intimate relationships between social network members play an important role in increasing information effectiveness. Additionally, social network structural factors such as relationship intensity, network density, and network centrality can enhance users' emotional and cognitive engagement, thereby increasing the likelihood of purchasing from the recommendations of close network friends (Park et al., 2018).

*H8: Social interaction positively affects consumers' purchase intentions in livestream e-commerce.*

**Development of Trust**

Trust, as defined by Sirdeshmukh et al. (2002), is the "consumer's expectation of the reliability of the service provider, as well as their ability to fulfill commitments." In e-commerce, trust in merchants plays a crucial role in reducing perceived risks in online transactions. Research by Hong and Cha (2013) indicates that when online merchants

take measures to mitigate certain risks, consumers' trust is enhanced, thereby increasing their online shopping intentions. Moreover, livestreaming e-commerce allows consumers to observe the streamer's behavior, including how they interact with other customer (Men et al., 2023). This observational capability helps consumers more accurately assess the streamer's reliability.

*H9: Development of consumer trust positively affects consumers' purchase intentions in livestream e-commerce.*

## III. METHODOLOGY

The data collected from the Likert scale will be used for quantitative analysis to determine the relationships between these influencing factors and purchase intentions. The five-point Likert scale will be applied with options ranging from "Strongly Disagree" to "Strongly Agree,". PLS-SEM enables the assessment of complex relationships between independent and dependent variables, including moderating effects, providing a more comprehensive perspective than linear regression. With its capability to handle non-normally distributed data and small sample sizes, PLS-SEM is particularly suitable for analyzing intricate structural models with interdependent relationships and enhancing predictive accuracy. Besides that, the PLS-SEM method is considered optimal for such studies, particularly when the sample size is small (Hair et al., 2014). The research model is constructed with a reflective structure. The most commonly used index for this purpose is CR, with acceptable values ranging from 0.70 to 0.95. Similarly, Cronbach's alpha is also used to evaluate internal reliability with similar threshold values but usually tends to be lower than CR (Hair et al., 2014). Additionally, Rho_A and Rho_C are analyzed as alternative measures of construct reliability. These indices provide a more accurate estimate of reliability, where Rho_A usually lies between Cronbach's alpha and CR, while Rho_C further refines reliability assessment by considering factor loadings and measurement errors. Threshold values from 0.70 to 0.90 are considered optimal when the factor model is correctly specified. Additionally, the Variance Inflation Factor (VIF) is calculated to check for multicollinearity issues among independent variables. VIF values below 5 are considered to indicate no serious multicollinearity.

## IV. DISCUSSION ANALYSIS

### Descriptive Statistics

After collecting and processing a total of 263 survey responses, the data was coded and analyzed. The mean values of the variables range from 3.31 to 3.92, while the standard deviations range from 0.918 to 1.165, reflecting the dispersion of the data.

### Measurement Model Evaluation

The CR ranges from 0.913 to 0.962, significantly higher than the 0.7 threshold proposed by Henseler & Sarstedt (2013. Notably, all factors have CR > 0.9, indicating very high reliability and stability of the theoretical model. DT has the highest AVE (0.885), while SC has the lowest AVE (0.702) but still meets the convergent validity requirement. This proves that the observed variables have strong interconnections and effectively explain the variance of the latent factor.

Specifically, the factor loadings for the observed variables under DT are 0.938 and 0.944, far exceeding the required threshold, reflecting well the latent concept and ensuring stability. Similarly, the PEU factor has loading coefficients ranging from 0.899 to 0.929, indicating a very high level. The PE factor also exceeds the 0.7 threshold, with loadings ranging from 0.885 to 0.922. These values not only indicate strong correlations but also ensure the stability and high reliability of the scale. The factors SI and SC are also highly rated with loadings from 0.904 to 0.918 and 0.754 to 0.893, respectively. Although some loadings for the SI factor are lower than for other factors (e.g., SC2 with a loading of 0.754), they still exceed the 0.7 threshold, indicating good reliability. Lastly, the factors SN and PD have loadings from 0.816 to 0.884 and 0.864 to 0.920, respectively, demonstrating that these scales meet the requirements for reliability and validity. For the factor PI, the observed variables have loadings from 0.847 to 0.929, with the lowest loading for PI4 at 0.867, still exceeding the 0.7 threshold. In general, all scales have high reliability. Overall, all observed variables have reasonable VIF values, allowing the model to continue without multicollinearity concerns.

**Table 4.1: Estimated measurement**

| Latent variable | Manifest variable | Outer Loading | VIF | rho_A | rho_C | Cronbach's anpha | AVE |
|---|---|---|---|---|---|---|---|

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| **DT** | DT2 | 0.938 | 2.454 | 0.871 | 0.939 | 0.870 | 0.885 |
| | DT3 | 0.944 | 2.454 | | | | |
| **PEU** | PEU1 | 0.929 | 4.685 | 0.952 | 0.962 | 0.951 | 0.836 |
| | PEU2 | 0.921 | 4.296 | | | | |
| | PEU3 | 0.899 | 3.444 | | | | |
| | PEU4 | 0.907 | 3.806 | | | | |
| | PEU5 | 0.915 | 4.131 | | | | |
| **PE** | PE1 | 0.900 | 3.472 | 0.946 | 0.957 | 0.944 | 0.817 |
| | PE2 | 0.905 | 3.981 | | | | |
| | PE3 | 0.922 | 4.244 | | | | |
| | PE4 | 0.885 | 3.167 | | | | |
| | PE5 | 0.906 | 3.928 | | | | |
| **SC** | SC1 | 0.805 | 2.216 | 0.929 | 0.943 | 0.929 | 0.702 |
| | SC2 | 0.754 | 2.182 | | | | |
| | SC3 | 0.884 | 3.638 | | | | |
| | SC4 | 0.893 | 3.936 | | | | |
| | SC5 | 0.819 | 2.619 | | | | |
| | SC6 | 0.829 | 2.940 | | | | |
| | SC7 | 0.871 | 3.267 | | | | |
| **SI** | SI1 | 0.916 | 3.765 | 0.933 | 0.951 | 0.932 | 0.83 |
| | SI2 | 0.918 | 3.655 | | | | |
| | SI3 | 0.904 | 3.421 | | | | |
| | SI5 | 0.907 | 3.336 | | | | |
| **SN** | SN1 | 0.884 | 2.623 | 0.874 | 0.913 | 0.873 | 0.725 |
| | SN2 | 0.829 | 1.974 | | | | |
| | SN3 | 0.875 | 2.428 | | | | |
| | SN5 | 0.816 | 1.881 | | | | |
| **PD** | PD1 | 0.874 | 3.089 | 0.934 | 0.949 | 0.932 | 0.788 |
| | PD2 | 0.871 | 2.788 | | | | |
| | PD3 | 0.920 | 4.326 | | | | |
| | PD4 | 0.864 | 2.653 | | | | |
| | PD5 | 0.907 | 3.713 | | | | |
| **PI** | PI1 | 0.904 | 3.569 | 0.937 | 0.951 | 0.935 | 0.795 |
| | PI2 | 0.847 | 2.458 | | | | |
| | PI3 | 0.911 | 4.050 | | | | |
| | PI4 | 0.867 | 2.745 | | | | |
| | PI5 | 0.929 | 4.684 | | | | |

**R-Square Analysis**

The results show that the $R^2$ value for DT is 0.662, indicating that the model explains 66.2% of the variation in DT, with two main factors being SN and SC. Similarly, the $R^2$ value for PI is 0.773, indicating that the model explains 77.3% of the variation in PI, with key influencing factors including DT, PU, PE, SI, and PD. The adjusted $R^2$ value slightly decreases to 0.769, showing that the model is stable and not overly complex.

**Table 4.2: R-squared coefficient analysis results (R-square)**

| | R-square | R-square adjusted |
|---|---|---|
| DT | 0.662 | 0.659 |
| PI | 0.773 | 0.769 |

**F-Square Analysis**

The f-square analysis results show that SC has a strong impact on DT with f-square = 0.377, indicating the important role of streamers in building consumer trust. In contrast, SN has a smaller impact with f-square = 0.078, suggesting that while cultural and social factors have an influence, they are not decisive in the model.

For PI, SI has a moderate effect with f-square = 0.125, reflecting that social connections between consumers and the community or streamer play a role in influencing purchase decisions, though not decisively. PU and PE have small effects (f-square = 0.064 and f-square = 0.018), indicating these factors have an influence but are not strong enough to create significant changes in the model.

Notably, PD also has a small effect on PI with f-square = 0.049, indicating that while platform design plays a role in the user experience, it needs to be combined with other factors such as ease of use and trust in the streamer to maximize its impact on purchase behavior.

**Table 4.3: F-squared impact factor analysis results (F-Square)**

| | f-square |
|---|---|
| DT -> PI | 0.001 |
| PEU -> PI | 0.064 |
| PE -> PI | 0.018 |
| SI -> PI | 0.125 |
| SC -> DT | 0.377 |
| SN -> DT | 0.078 |
| PD -> PI | 0.049 |

The analysis results indicate that all factors are significant; however, “Development of Trust” ($\beta = 0.028$, $P = 0.552$) and “Perceived Enjoyment” ($\beta = 0.147$, $P = 0.136$) do not reach statistical significance ($P > 0.05$), suggesting that these two factors have no substantial impact on “Purchase Intention.” Nevertheless, trust is still a key factor in maintaining long-term customer relationships and influencing purchase intention (Chen et al., 2021). This aligns with theoretical foundations and previous research, further reinforcing the crucial role of trust and enjoyment in consumer purchasing intention.

**Table 4.4: BOOTSTRAPPING analysis results**

| Relationship | Beta (Original Sample O) | P-value | T-statistics | Statistical significance |
|---|---|---|---|---|
| DT → PI | 0.028 | 0.552 | 0.595 | Not accepted |
| PEU → PI | 0.242 | 0.001 | 3.197 | accepted |
| PE → PI | 0.147 | 0.136 | 1.491 | Not accepted |
| SI → PI | 0.335 | 0.000 | 3.631 | accepted |
| SC → DT | 0.586 | 0.000 | 9.280 | accepted |
| SN → DT | 0.266 | 0.000 | 4.031 | accepted |
| PD → PI | 0.225 | 0.007 | 2.710 | Accepted |

**Variance Accounted For (VAF) Analysis**

The analysis of indirect effects shows that both "Streamer's Credibility" (SC) and "Subjective Norm" (SN) have full mediation effects on "Purchase Intention" (PI) through "Development of Trust" (DT).

**Table 4.5: VAF index analysis results**

| Relationship | Indirect Effect | Total Effect | VAF | Evaluate |
|---|---|---|---|---|
| SC -> PI | 0.016 | 0.016 | 1 (100%) | Full mediation |
| SN -> PI | 0.007 | 0.007 | 1 (100%) | Full mediation |

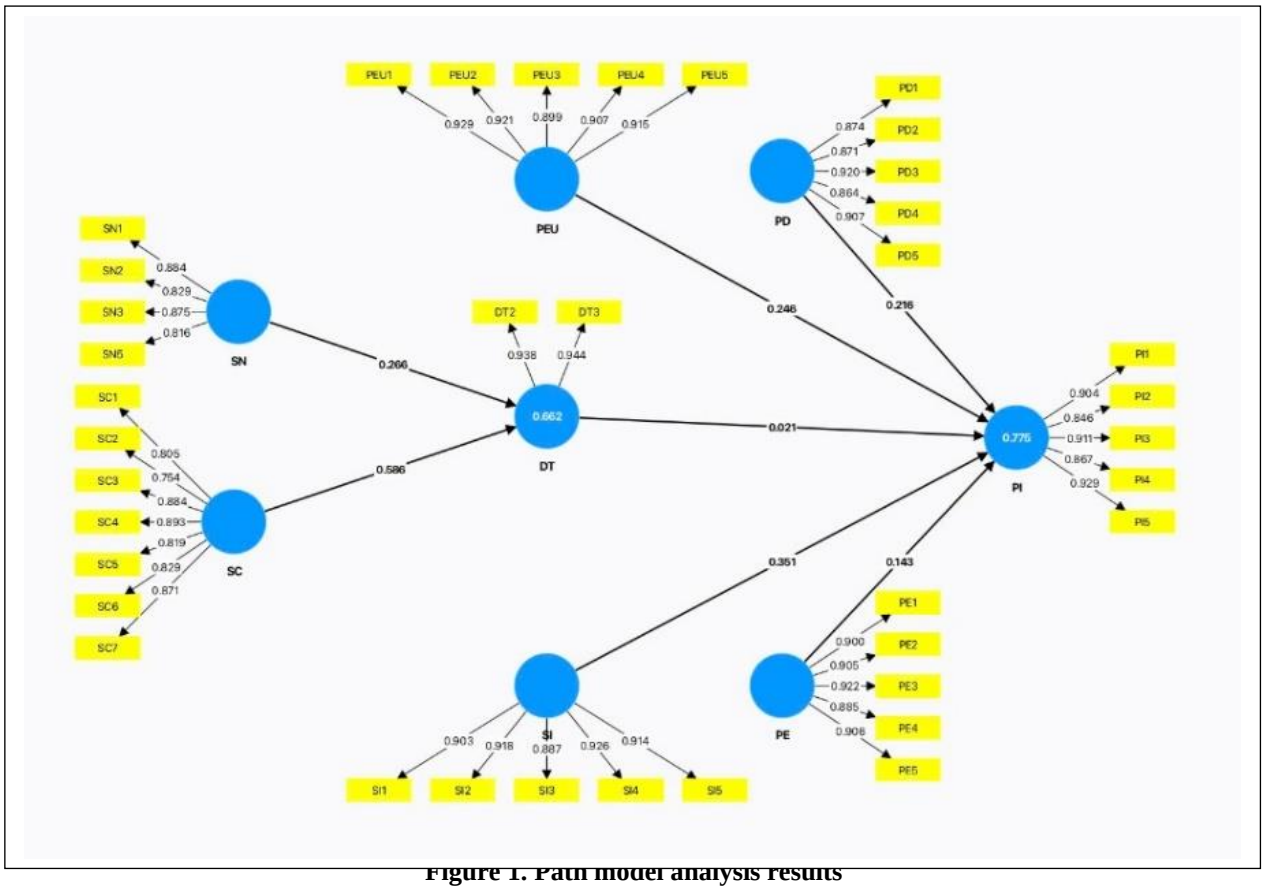

**Figure 1. Path model analysis results**

## V. CONCLUSION

The study reveals that three factors have a direct and significant impact on Purchase Intention through livestreaming, namely Social Interaction (β = 0.335), Perceived Ease of Use (β = 0.242), and Platform Design (β = 0.225). Additionally, Streamer's Credibility (β = 0.586) and Subjective Norm (β = 0.266) have indirect effects through the mediating role of Trust Development. Although Trust Development does not have a significant direct impact on Purchase Intention (β = 0.028, p = 0.552), it plays a crucial role in connecting other factors to consumers' shopping behavior.

These results underscore the importance of user experience and social factors in driving online shopping behavior. Specifically, the level of interaction between customers, the credibility of the streamer, and the ease of use of the platform are key drivers in increasing purchase intentions. This has significant implications for businesses and e-commerce platforms in optimizing marketing strategies, enhancing user experience, and building customer trust to boost sales through livestreaming.

# SESSION 2: MARKETING

# DEVELOPING A MODEL OF DIGITAL SOCIAL RESPONSIBILITY (DSR) IMPACT ON CUSTOMER BRAND SATISFACTION

**Le Hieu Nghia[1*], Phan Bao Giang[1], Nguyen Hoang Trieu Vy[1], Ngo Thanh Phuong Quynh[1], Nguyen Thi Minh Chau[1]**

[1] Faculty of Marketing, Ho Chi Minh City University of Economics and Finance.
* Corresponding: nghialh@uef.edu.vn

**ABSTRACT**

In the contemporary business landscape of Vietnam, enterprises are significantly emphasizing and focusing on Digital Social Responsibility (DSR). These are not only complementary factors but also important ones in brand establishment strategy by creating customer trust and satisfaction. The aim of this research is to measure the pivotal role played by various DSR factors in shaping customer satisfaction by elevating trust for a brand with eWOM as a moderator factor. To accomplish this, a qualitative method approach is deployed to do the empirical validation of research hypotheses and robust a theoretical framework for other DSR research later. In this research, the theoretical models related to DSR will be organized, and proposed a comprehensive research model to measure the impact of DSR on brand satisfaction by brand trust of customers as a cornerstone for future scholarly investigations. The findings of this research illustrated research design relating to DSR factors recently.

*Key words:* "model development", "digital social responsibility", "satisfaction", "customers"

## I. INTRODUCTION

Digital Social Responsibility (DSR) is a transformative extension of the conventional Corporate Social Responsibility (CSR) paradigm. They are emphasizing on the enterprises' ethical behavior and commitments in digital environments, with individuals, governments, and organizations. The connections between DSR, brand satisfaction, and brand trust are increasingly significant in the digital era, as consumers have placed greater focus on ethical behavior in online environments recently. Firstly, Puwirat and Tripopsakul (2019) indicated that DSR initiatives develop brand trust by creating transparency, ethical practices, and commitments to privacy in social commerce contexts. Additionally, trust also acts as the mediator between DSR and brand equity, indicating that effective DSR can lead to stronger brand relationships. Furthermore, several researchers have shown that brand trust positively affects brand satisfaction, with higher trust levels leading to increased customer satisfaction (Nugrahanta & Ariani, 2024). Secondly, DSR factors play an important role for brand satisfaction, such as enhanced customer experience, alignment with values or improve sustainability, and responsibility. In addition, DSR initiatives also boost brand image and consumer perceptions, which are essential for customer retention (Kim & Nilufar, 2024). In general, the high-level DSR brand will have greater credibility, resulting in increasing brand trust and brand satisfaction. However, Nugrahanta & Ariani (2024) highlighted the complex interplay between these factors and the need for a holistic approach to brand management. Therefore, this research aims to underscore the contentious nature of DSR, shedding light on the divergent viewpoints that shape discussions around this subject. By examining the foundational principles and practical applications of DSR, this study designs a new framework to explore how Digital Social Responsibility can cultivate enduring brand trust and bolster brand satisfaction, with eWOM as moderator factor, in an increasingly interconnected world.

## II. LITERATURE REVIEW

### 2.1. Concept

#### Digital Social Responsibility (DSR)

According to Okazaki et al. (2020), digital media gives enterprises the ability to create community responsibility programs that are both more relevant and engaging for consumers. Similarly, Puriwat and Tripopsakul (2021) explain that DSR uses social media platforms such as Facebook, Twitter, and Instagram to promote customer participation and collaboration in corporate social responsibility (CSR) activities. These platforms allow fast, low- cost, and interactive communication, enabling positive discussions between companies and consumers about DSR initiatives. Therefore,

DSR is the implementation of CSR through digital platforms like social networks or company websites. As social media and digital technologies develop quickly, this idea is essential for increasing customer satisfaction and brand engagement. Enterprises must prioritize DSR to meet customer expectations and build lasting value in a competitive market.

**Customer Satisfaction with the Brand**

**Customers**

Customers are the ones who make purchasing decisions and consume goods and services based on personal requirements and preferences, often regarded as the central point in a company's marketing strategies (Solomon, 2019). They are important stakeholders in a business's operations, enhancing the development and competitive advantages, as customer satisfaction significantly influences an organization's long-term success (Schiffman and Wisenblit, 2019). Customers play a crucial role in any organization, and managing customer relationships (CRM) has become a significant area of research and practice in marketing and management. Therefore, DSR activities are not only improve brand image but also create and maintain sustainably customer relationships. Additionally, DSR motivated customers engagement in society value creations (Phuong et al., 2021).

**Customer satisfaction**

Various theories and concepts regarding service quality and satisfaction have led to the development of models and metrics to assess the relationship between these two factors. Among these, the SERVQUAL model by Parasuraman and colleagues (1985, 1988) has received widespread acceptance and application in research. Cronin and Taylor (1992) have delineated differences between quality and satisfaction, such as: (1) quality pertains to specific aspects, whereas satisfaction can stem from any factor; (2) quality does not necessitate prior experience, while satisfaction requires a consumption experience; (3) quality focuses on a few product factors, while satisfaction encompasses multiple cognitive and emotional factors. Oliver (1997) emphasizes in the satisfaction theory that the level of satisfaction depends on the extent to which customer expectations are met, leading to loyalty when expectations are met or exceeded. According to Zeithaml and colleagues (2009), customer satisfaction does not necessarily reflect service quality; however, perceptions of quality influence their future intentions and behaviors, playing a significant role in impacting satisfaction. Survicate (2024) indicates that customer satisfaction is the degree to which a product or service meets or exceeds customer expectations, measured through their perception of value derived from the product or service. High satisfaction often predicts the likelihood of customers remaining loyal to a brand and their intention for repeat purchases.

**Brand**

The American Marketing Association defines a brand as "a name, symbol, sign, design, or a combination of these elements intended to identify the products or services of a manufacturer and differentiate them from competitors' products." From this traditional viewpoint, a brand is considered part of the product, with its primary function being to distinguish its products from similar offerings of competitors. However, this perspective fails to elucidate the role of brands in the context of the global economic shift towards globalization and intense competition, leading to a significant expansion of the components that constitute a brand (Nguyen Dinh Tho and colleagues, 2002). Kotler and Keller (2016) assert that a brand is not merely a name or symbol but encompasses the entirety of perceptions and experiences that consumers derive from that product or service. Kotler and Keller (2022) also argue that a brand is a promise to consumers, providing them with distinctive value compared to their competitors. This includes both tangible and intangible elements that influence customers' perceptions and emotional connections with the brand. This underscores the crucial role of a brand in fostering trust and satisfaction from customers.

**Customer Satisfaction with the Brand**

He and colleagues (2012) define brand satisfaction as an emotional response, emphasizing the emotional structure and the quality of the brand relationship. Satisfaction occurs when the brand's performance meets customer expectations. This holds true even in the case of digital news platforms, where audiences feel satisfied only when the content meets their expectations for accuracy, timeliness, and in-depth analysis. Additionally, Palla and colleagues (2014) have demonstrated that satisfaction derived from well-established brands is easier to achieve compared to newly

established brands. Solomon (2023) posits that brand satisfaction results from positive or negative experiences that customers have with the brand, evaluated based on the brand's commitment and consistency in delivering value. In the digital landscape, brand satisfaction extends to satisfaction with online interactions and customer service, creating a comprehensive experience for customers as they engage with the brand (Alfonso, 2024).

**Brand Trust**

According to Morgan and Hunt (1994), trust is considered as a critical factor in building and maintaining relationships between brands and consumers. Trust not only influences customer satisfaction with the brand but also helps to minimize the sense of risk when making purchases, thereby fostering a more positive interaction between the brand and the customer. In Aaker's study (1997), brand trust is established when customers are willing to use a brand's product because it can meet and satisfy the functions that customers desire when using it. Brand trust is a core factor in creating sustainable relationships between customers and providers, as highlighted in Bernarto's research (2020).

**Electronic Word of Mouth (eWOM)**

Litvin and colleagues (2008) define eWOM as the transmission of information about products, services, or sellers over the internet, targeting consumers. With the rise of social networks like Facebook, customers can easily share their personal experiences, making eWOM a popular tool in influencing consumer awareness and purchasing decisions. According to Huete-Alcocer (2017), WOM not only influences behavior but also shapes customers' attitudes toward a product or service. Jassim and colleagues (2020) clarify that eWOM allows consumers worldwide to freely share and post reviews about products, enabling other users to reference before making purchases. Al-Dmour and colleagues (2022) also emphasize that the diversity of eWOM, from reviews to sharing personal experiences, is a crucial factor in promoting and building trust for products and services. Alfandi and colleagues (2022) suggest that eWOM about budget services can establish a framework to guide businesses in improving not only service quality but also optimizing communication and marketing messages to potential customers (Barween and colleagues, 2022).

### 2.2. Relevant Research Works

**Model by Puwirat and Tripopsakul (2019)**

The objective of this study is to investigate the impact of Digital Social Responsibility (DSR) on customer trust and brand value in the context of social commerce. The results indicate that DSR initiatives significantly and positively influence customer trust and brand value. DSR also indirectly affects brand value through customer trust, playing an intermediary role in the realm of social commerce. This research provides a clearer understanding of the role of Digital Social Responsibility in shaping customer attitudes and brand value in the context of social commerce.

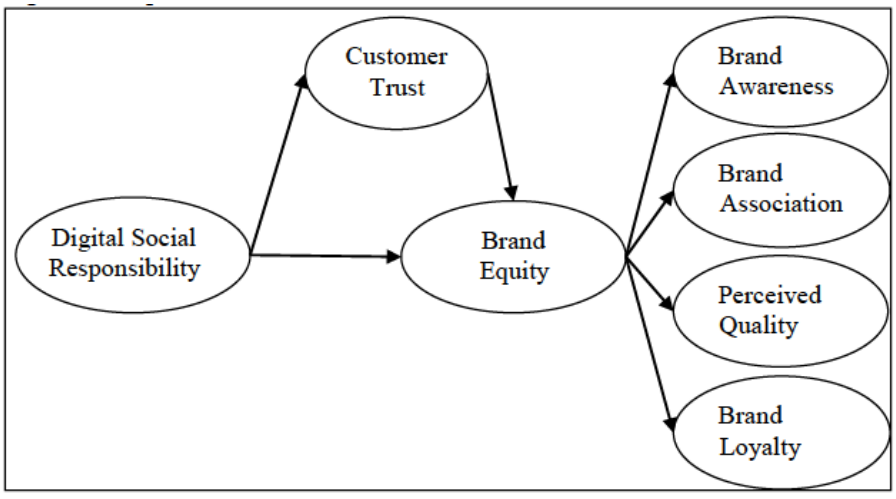

**Figure 1. Research model of Puwirat and Tripopsakul (2019)**

**Model by de Oliveira Santini and Colleagues (2020)**

This study examines customer engagement on social media (CESM). The results indicate that customer engagement is driven by satisfaction, positive emotions, and trust, but not by commitment. Satisfaction is a stronger predictor of customer engagement in high convenience situations (compared to low), B2B (compared to B2C), and

Twitter (compared to Facebook and Blogs). Twitter seems to enhance customer engagement through higher satisfaction and positive emotions compared to other social media platforms. The research also finds that customer engagement brings significant value to companies, directly impacting business performance, behavioral intentions, and word-of-mouth. Moreover, experiential consumption amplifies the impact of customer engagement on business performance nearly three times that of utilitarian consumption.

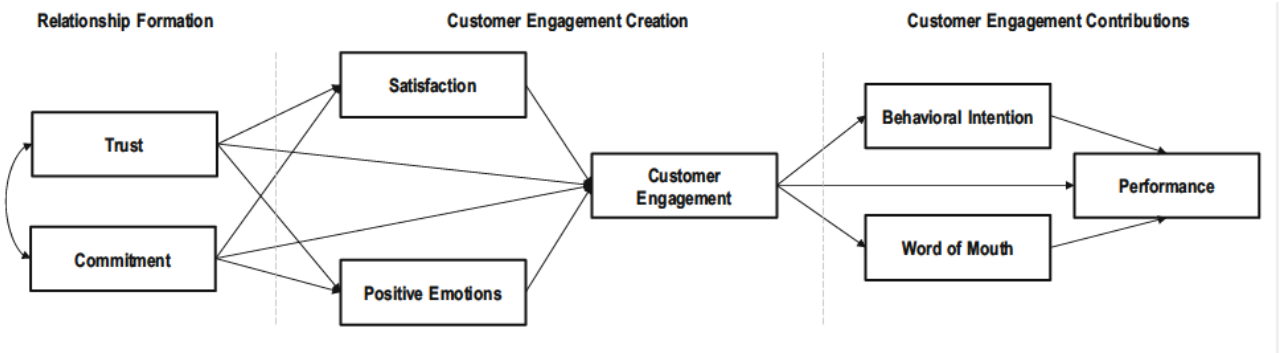

**Figure 2. Research model of de Oliveira Santini et al. (2020)**

**The model by Puwirat and Tripopsakul (2021)**

The purpose of this study is to investigate the impact of DSR on brand preference and purchase intention among consumers, comparing between product categories with high and low levels of involvement. The results indicate that DSR initiatives are significantly and positively related to consumers' brand preference and purchase intention. The moderating results show that the level of product involvement plays an important role in enhancing the relationship between DSR initiatives and brand preference. The impact of DSR on brand preference is stronger for respondents with low product involvement compared to those with high product involvement. The study emphasizes the importance of DSR and expands the current knowledge on DSR and its potential impact on customer perceptions.

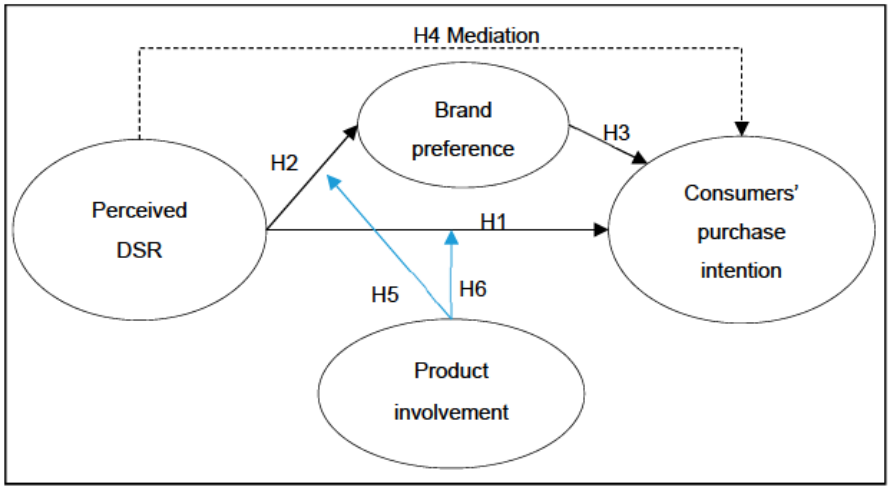

**Figure 3. Research model of Puwirat and Tripopsakul (2021)**

**Model by Puwirat and Tripopsakul (2022)**

Research on Digital Social Responsibility (DSR) and its impact on customer perception and behavior on social media remains limited. This study, based on a sample of 157 respondents from universities in Thailand, shows that DSR positively influences customer awareness and online word-of-mouth (WOM), supporting prior research by Fatma et al. (2020). DSR is a cost-effective and time-efficient platform for attracting stakeholders, enhancing customer sentiment, and generating positive WOM. Businesses should view DSR as a strategic approach tailored to different customer segments, recognizing that not everyone has access to digital platforms. DSR is considered a marketing activity, building brand advocacy through social media channels. User interactions (likes, comments, shares) on a company's DSR initiatives on social media contribute to this advocacy. DSR is an effective method to encourage positive emotions and WOM from customers, leveraging the convenience of digital channels over traditional ones. Companies need to

design comprehensive social responsibility programs both online and offline to meet stakeholders' needs and gain a competitive edge.

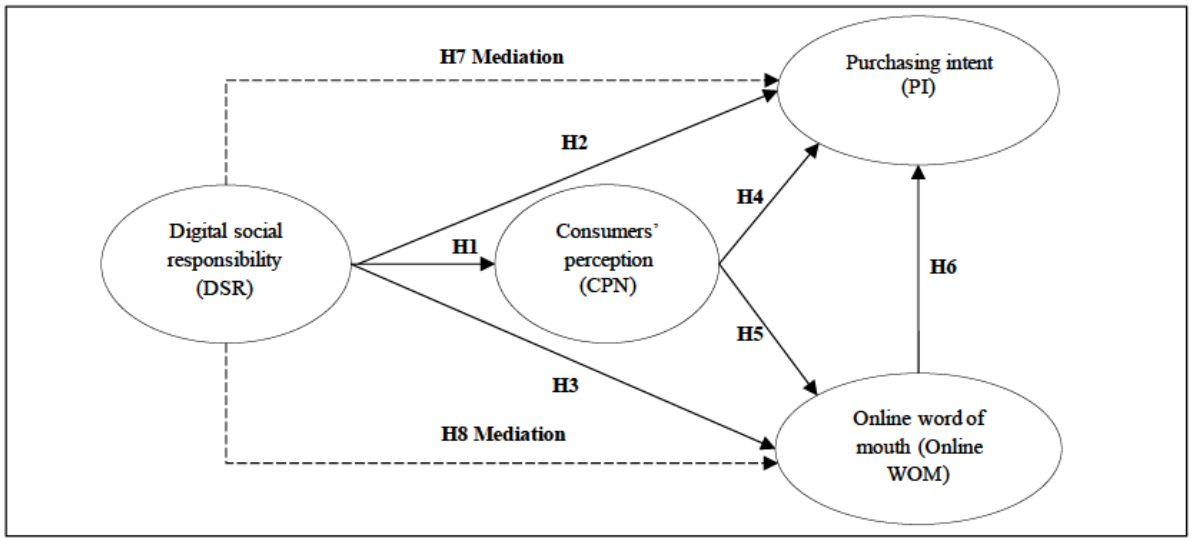

**Figure 4. Research model of Puwirat and Tripopsakul (2022)**

**Model by Zhang and Colleagues (2023)**

The integration of charity activities in the form of games into digital social responsibility (DSR) initiatives has spurred customers to engage in socially and environmentally friendly behaviors in their daily lives. To maximize the benefits of DSR, this study analyzes how sustainable customer outcomes of DSR translate into external outcomes, such as customer citizenship behaviors, and internal outcomes, like customer continuance intentions. Furthermore, the study examines the roles of emotional commitment and gamification within a singular framework in shaping customer responses to DSR. Results from an experimental study conducted within DSR programs demonstrate that the underlying psychological mechanisms linking customer engagement in DSR to various customer outcomes are mediated by emotional commitment and moderated by gamification. This research contributes to the DSR literature on sustainable engagement outcomes by proposing a theoretical framework to understand the psychological mechanisms and boundary conditions influencing customer responses to DSR.

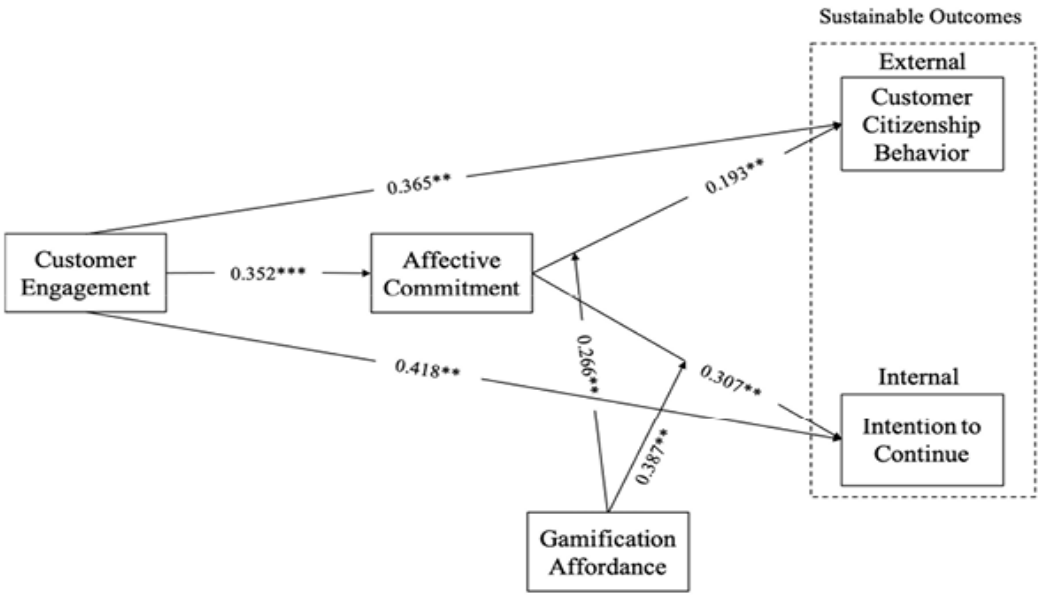

**Figure 5. Research model of Zhang et al. (2023)**

**Model by Amankona and Colleagues (2024)**

The research reveals a strong positive relationship between corporate social responsibility (DSR) and purchase intention, mediated by consumer engagement and brand loyalty. However, it does not show that the attitude of

Generation Y towards DSR moderates this relationship. The study underscores the importance of DSR for manufacturing businesses in Ghana. By exploring relatively uncharted territory regarding DSR and its impact on consumer behavior in developing countries, especially within the context of manufacturing businesses in Ghana, this research adds to the overall body of existing work. This study elucidates how DSR influences the purchase intention of Generation Y customers by considering the mediating roles of brand loyalty and consumer engagement.

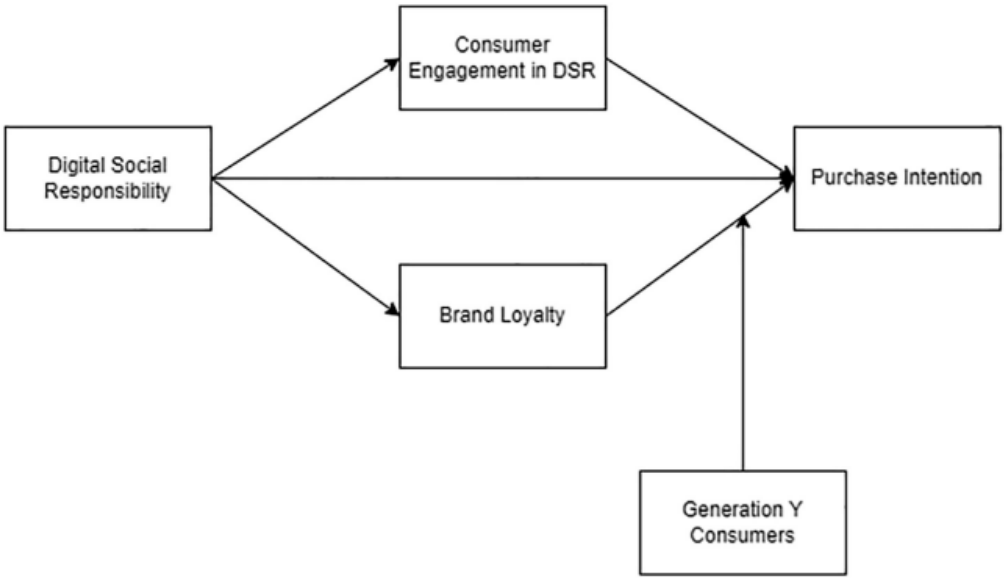

**Figure 6. Research model of Amankona et al. (2023)**

### 2.3. Proposed Model

Building on theoretical foundations and a review of relevant research topics by authors both domestically and internationally, this study inherits and advances previous research topics by authors such as Okazaki et al. (2020), Puriwat and Tripopsakul (2021), Solomon (2019), Schiffman and Wisenblit (2019), Phuong et al. (2021), Parasuraman et al. (1985, 1988), Cronin and Taylor (1992), Oliver (1997), Zeithaml et al. (2009), Survicate (2024), Nguyen Dinh Tho et al. (2002), Kotler and Keller (2016, 2022), He et al. (2012), Palla et al. (2014), Solomon (2023), HubSpot (2024), Morgan and Hunt (1994), Aaker (1997), Bernarto (2020), Litvin et al. (2008), Huete-Alcocer (2017), Jassim et al. (2020), Al-Dmour et al. (2022), Alfandi et al. (2022), Barween et al. (2022)... Additionally, the authors integrate previous related research models such as those by Puriwat and colleagues (2019, 2021, 2022), de Oliveira Santini and colleagues (2020), Zhang and colleagues (2023), Amankona and colleagues (2024)... and develop a model on "The Impact of Digital Social Responsibility (DSR) on Customer Brand Satisfaction" consisting of five factors including DSR - Digital Social Responsibility; Brand factor; Trust factor impacting the Satisfaction factor; meanwhile, the eWOM factor acts as a moderator between the Trust and Satisfaction factors; through intermediary variables directly influencing customer satisfaction with the Brand. The research model is based on the PLS analysis model where the Trust and Satisfaction factors are higher, the customer satisfaction with the Brand is higher.

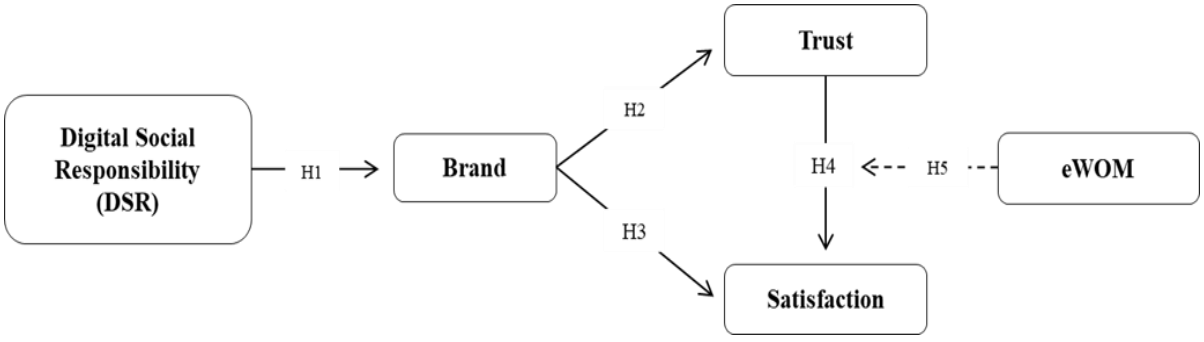

**Figure 7. Proposed research model**

### 2.4. Research Hypotheses

Hypothesis H1: Digital Social Responsibility (DSR) has a positive effect on Brand.

Hypothesis H2: Brand has a positive effect on Trust.

Hypothesis H3: Brand has a positive effect on Satisfaction.

Hypothesis H4: Trust has a positive effect on Satisfaction.

Hypothesis H5: eWOM has moderation between the Trust and the Satisfaction.

## III. CONCLUSION AND FUTURE RESEARCH DIRECTIONS

This study provides a comprehensive overview of the theoretical framework, inheriting and synthesizing numerous relevant studies to investigate the factors and research model of how DSR influences customer satisfaction with the brand—a novel emphasis of the author group. The theoretical foundation was constructed based on 38 referenced studies, culminating in the proposal of a research model consisting of 5 factors affecting customer satisfaction with the brand through the influence of DSR. Consequently, the authors suggest the research model "The Impact of Digital Social Responsibility (DSR) on Customer Brand Satisfaction" as illustrated in Figure 7. Exploring the impact of Digital Social Responsibility (DSR) on customer satisfaction with the brand is a promising field of significant importance in the context of an increasingly digital market. Building customer satisfaction with the brand now extends beyond product or service quality to encompass various aspects related to how a brand demonstrates its social responsibility in the digital space. Future research should focus on these 5 key factors to comprehensively assess the impact of DSR on customer satisfaction with the brand.

# IMPACT OF LUXRY BRAND AUTHENTICITY'S DIMENSIONS ON FUNCTIONAL VALUE, PERSONAL VALUE, AND SOCIAL VALUE

**Luc Phan Tan[1*]**
[1]Thu Dau Mot University
* Corresponding: lucpt@tdmu.edu.vn

**ABSTRACT**

In the context of consuming luxury brands, the purpose of this study was to investigate the effects of three aspects of brand authenticity—brand individuality, brand continuity, and brand consistency—on three aspects of perceived value—functional value, personal value, and social value. Information was gathered via a sample poll consisting of 485 customers. The research model was tested using the partial least squares structural equation modeling (PLS-SEM) using SmartPLS version 3.0. The findings demonstrated the influence of brand continuity, uniqueness, and consistency on the authenticity of premium brands. Furthermore, the findings demonstrated that although there was no significant correlation between brand authenticity and functional value, there was a favorable association between brand authenticity and both social and personal values. The results of this research provide credence to the notion that brand authenticity may and ought to be regarded as a critical component in the growth of perceived value and the prosperity of luxury businesses.

*Key words: "*brand authenticity", "brand consistency", "brand individuality", "brand continuity", "perceived value".

## I. INTRODUCTION

In a time when customers must deal with an increase in product marketing, brands that convey true meaning will gain an edge over their competitors. Consumers increasingly seek authenticity in brands, as authenticity has surpassed quality as a common purchasing criterion (Nayeem et al., 2019; Pine & Gilmore, 2007), especially in luxury brands. Brand authenticity is starting to receive much attention from marketers as they want to analyze consumer preference for authentic offerings to help improve the consumer experience of how they consume and relate to their experiences with others (Taheri et al., 2018). Brand authenticity is essential for luxury brands for several reasons. First, luxury brands must differentiate themselves from competitors to maintain their premium position. Authenticity helps luxury brands stand out in a market crowded with other competitors and fake brands (Bargoni et al., 2022). Second, authenticity creates trust between the brand and the consumer. Consumers are willing to pay a premium for luxury goods because they trust that the brand delivers a high-quality product that meets their expectations. Authenticity reinforces this trust by proving the brand's values and promises are genuine. Third, luxury brands are built to last; authenticity is essential for longevity. An authentic brand has a clear and consistent identity that transcends the latest trends and fads. This enables luxury brands to maintain relevance over time and build a loyal customer base that returns repeatedly. Finally, luxury brands are not just selling products but a lifestyle and a set of values (Ramadan et al., 2018). Authenticity helps luxury brands establish an emotional connection with their customers by evoking a sense of heritage, legacy, and tradition. This emotional connection creates a deeper bond between the brand and the consumer, leading to stronger brand loyalty. Therefore, it is necessary to bring authentic experiences to consumers (Kim & Bonn, 2016).

Although many researchers have delved deeply into broader ideas about brands, such as brand equity, brand personality, and brand loyalty (Abril & Rodriguez-Cánovas, 2016; Šeinauskienė et al., 2015), very few studies examining authentic brand structure have been conducted in the context of luxury brands (Hernandez-Fernandez & Lewis, 2019). Additionally, research on the effects of genuine brands or their numerous precursors on dimensions of perceived value, such as functional value, personal worth, and social value, is still notably lacking (Hernandez-Fernandez & Lewis, 2019). Authenticity may add perceived value to luxury products in the luxury brand market. Consumers perceive authentic luxury brands as having a higher intrinsic value because of their heritage, craftsmanship, and tradition. This perception of value allows luxury brands to command higher prices for their products, which, in turn, reinforces their premium positioning. Luxury companies, therefore, possess a natural foundation and opportunity to

foster authenticity in customers' minds.

However, it is essential to consider the unique characteristics of the Vietnamese market, which present distinct challenges and opportunities for luxury brands. As a rapidly developing economy with an expanding middle class, Vietnam offers a burgeoning market for luxury goods. Particularly in Ho Chi Minh City, home to some of the country's largest shopping malls, consumer behavior toward luxury brands reflects a blend of global trends and local cultural nuances. Vietnamese consumers are not only drawn to the exclusivity and prestige of luxury brands but also place significant value on authenticity due to their deep-rooted appreciation for heritage, tradition, and craftsmanship. The need for authenticity among Vietnamese luxury consumers differs markedly from international markets, as local socio-cultural and economic contexts shape it.

This study addresses these gaps by focusing on luxury brand authenticity in Vietnam, with data collected from surveys conducted in five of the largest shopping malls in Ho Chi Minh City. It offers a conceptual framework to examine how authentic brands influence perceived value in the Vietnamese luxury goods market. According to Aliyev et al. (2019), the luxury brand market is a segment of the retail industry that focuses on high-end products often associated with quality, exclusivity, and prestige. By understanding Vietnamese consumers' specific preferences and expectations, this study aims to guide managers and executives in creating greater consumer awareness of brand individuality, continuity, and consistency. Additionally, it seeks to enhance perceived value dimensions, including functional, personal, and social value. The findings will enable marketers to evaluate better and defend their marketing strategies, tailoring their efforts to resonate with the unique dynamics of the Vietnamese luxury market.

## II. LITERATURE REVIEW AND RESEARCH HYPOTHESES

### 2.1 Brand authenticity

The term "authenticity" is rooted in the Greek words "autos" and "hentes," meaning "self" and "doer" or "being," respectively, which suggests acting on one's authority (Södergren, 2021). Authenticity has long been an important ideal in Western thought, mainly since the Romantic era, and it has been linked to the notion of an innate, genuine self, exemplified by the works of Jean-Jacques Rousseau (Laermans, 2018). The term's original meaning suggested resistance to conformity and extrinsic motivations, but it has since evolved to include concepts like genuineness, sincerity, truthfulness, responsibility, and transparency.

The paradox of brand authenticity stems from the fact that while authenticity and personal autonomy were initially associated with rejecting societal norms and institutions, they were later co-opted by powerful economic forces (Thompson et al., 2013). As a result, brands now offer ways for consumers to enact their true selves and engage in self-actualization. This has led to iconic brands embodying authenticity by leveraging cultural and political authority as resources for self-expression, which can cause consumers to feel disconnected from their identity projects and aspirations (Arnould & Thompson, 2005).

The concept of brand authenticity has rapidly grown in terms of definition and conceptualization in recent times. Although this point of view is evident in many early definitions, it may be claimed that authenticity is far more complicated than being unique or authentic (Alexander, 2009). An item's authenticity is frequently used to indicate that it is accurate and not fake. Cory (2013) has defined brand authenticity simply as "genuineness in its product and its principles." O'Neill et al. (2014) define authenticity as what consumers want. Brand authenticity has been defined as "the extent to which consumers perceive a brand to be faithful and true towards itself and its consumers, and to support consumers being true to themselves" Morhart et al. (2015). The concept of authenticity has changed significantly, from a straightforward promise of genuine goods or services to a coherent and potent statement about non-commercial distinction and deeply ingrained company principles (Beverland et al., 2008).

In short, brand authenticity refers to the degree to which consumers perceive a brand as genuine, honest, and trustworthy. It reflects the extent to which a brand's identity and values align with its actions and behaviors and the degree to which consumers perceive the brand as delivering on its promises. Authenticity is an important aspect of brand identity, especially in the context of consumer preferences for transparency and ethical behavior (Safeer et al., 2021). Authentic brands are those that are perceived as accurate to their core values, delivering on their promises and acting in an ethical and socially responsible manner. In contrast, inauthentic brands may be perceived as dishonest or

misleading and may not align with consumer values or expectations. This can result in a loss of trust and credibility and decreased consumer loyalty and sales. Authenticity can be communicated through various brand elements, including messaging, design, and marketing campaigns. It is also reflected in the brand's behavior and actions, including product quality, customer service, and social responsibility initiatives. The relationship between brand authenticity and the personal value of luxury brands suggests important implications for marketers. By communicating a brand's authenticity and aligning its values with its target audience, marketers can enhance consumers' value associated with the brand. This can increase consumer loyalty and drive sales. Similarly, the relationship between brand authenticity and the social value of luxury brands suggests that marketers should focus on building trust, credibility, and transparency to enhance the brand's social value (Hamby et al., 2019). By acting ethically and socially responsible and communicating this effectively, luxury brands can build a strong and loyal customer base that values the brand's authenticity and commitment to its core values.

Bruhn et al. (2012) developed a scale to measure consumers' perception of brand authenticity. In the study of Bruhn et al. (2012), authenticity was discovered to consist of four dimensions. The antecedents were identified through literature review and qualitative research as reliability, originality, continuity, and naturalness. These four aspects differ significantly from those derived from the work of Napoli et al. (2014). According to Eggers et al. (2013), brand authenticity includes brand congruency, customer orientation, and consistency. This concept strongly resembles the model developed the following year by Schallehn et al. (2014). In both models, brand consistency is recognized as the antecedent of brand authenticity, providing a reliable complement. In the study of brand authenticity, Coary (2013) identified three main aspects: adherence to principles, maintaining product originality, and being a pioneer.

Moulard et al. (2016) created a conceptual framework for brand authenticity based on the self-determination theory, attribution theory, and current brand research to address the absence of empirical examination of the impacts and antecedents of brand authenticity. According to this model, there are four antecedents to brand authenticity, including two linked to steady brand behaviors and two to unusual brand behaviors (uniqueness and scarcity) (longevity and longitudinal consistency). The framework also suggests quality and anticipated trust as two impacts or results of brand authenticity. Schallehn et al. (2014) analyzed this model, and the structure is comparable. In the context of their research, these writers define originality as "the distinctive manner the brand delivers on its promise" (Schallehn et al., 2014). Comparatively speaking, their conception of individuality may be grouped under the uncommon brand behaviors suggested by Moulard et al. (2016). The ideas of continuity and consistency are thus considered solid brand behaviors. As a result, brand individuality, continuity, and consistency are three antecedents of brand authenticity that the author considers in this study.

**2.2 Relationship of brand individuality, brand consistency, brand continuity and brand authenticity**

Brand individuality refers to the ability of a brand to distinguish itself from competitors and create a unique identity and personality (Light, 2014). Consumers perceive a brand that can differentiate itself and create a unique identity as more authentic. Brands that maintain their individuality while maintaining their core values and fulfilling their promises are considered genuine, honest, and trustworthy (Hernandez-Fernandez & Lewis, 2019). Conversely, brands that lack personality and imitate their competitors are viewed as dishonest and profit-oriented. Therefore, brand individuality is important in enhancing brand authenticity by creating a unique identity and personality, differentiating itself from competitors, building a strong customer relationship, and increasing its perceived authenticity.

Brand consistency is a crucial factor in impacting brand authenticity. It refers to the degree to which a brand's visual identity, messaging, and actions are consistent across all channels and touchpoints (Bengtsson et al., 2010). Consistency in a brand's communication and behavior creates trust and reliability, which increases its perceived authenticity. Brands that consistently deliver on their promises, maintain a cohesive identity and message, and communicate consistently across channels are seen as genuine and trustworthy. In contrast, inconsistent brands can cause confusion and mistrust among consumers, leading them to view the brand as inauthentic (Eggers et al., 2013). Therefore, brand consistency is vital in enhancing brand authenticity by reinforcing its authenticity and building customer trust.

Brand continuity is another crucial factor that impacts brand authenticity (Schallehn et al., 2014). It refers to the

degree to which a brand's identity and message remain consistent over time. Brands that maintain continuity in their identity and message are perceived as genuine, honest, and trustworthy because they create a sense of stability and reliability. Brands that frequently or drastically change their identity and message are viewed as not genuine or trustworthy, leading to consumer confusion and mistrust (Eggers et al., 2013). Therefore, brand continuity is important in enhancing brand authenticity by maintaining a consistent identity and message over time, reinforcing its authenticity, building trust with customers, and leading to increased consumer loyalty and positive word-of-mouth.

H1. Brand individuality positively influences brand authenticity.

H2. Brand consistency positively influences brand authenticity.

H3. Brand continuity positively influences brand authenticity.

**2.3 Perceived value**

Perceived value is a consumer's overall assessment of a product's utility based on their perceptions of what they receive and give, as defined by Zeithaml (1988). Perceived value is a subjective measure based on an individual's personal beliefs, preferences, and experiences. From an economic point of view, consumers consider their perceived value as the price they are willing to pay for a good or service and the value they receive from the service. From a psychological perspective, perceived value helps solve cognitive and affective problems that affect purchase decisions and brand choices. Functional, personal, and social values are the main aspects of perceived product value (Wiedmann et al., 2009). A consumer's perception of value is a subjective concept that tends to influence their attitudes toward a product or service when it fulfills their wants and needs.

The functional value of buying a luxury brand refers to the practical benefits that the product provides beyond its perceived status or prestige (Salehzadeh & Pool, 2017). Although luxury brands are often associated with high prices and exclusivity, they may also offer superior quality, design, and functionality compared to other products. Luxury brands may use higher quality materials, more advanced technology, or more sophisticated design techniques, which can result in more durable, efficient, or comfortable products. Additionally, luxury brands may offer better customer service, warranties, and after-sales support, which can enhance the product's overall value and provide consumers with greater peace of mind. Luxury brands may also invest in research and development, innovation, and customization, which can result in products tailored to the consumer's specific needs and preferences.

Buying luxury brands may give individuals personal value regarding the perceived benefits they derive from owning and using these products (Zhang & Zhao, 2019). Luxury brands are often associated with high quality, superior craftsmanship, and exclusivity, providing individuals with status, prestige, or luxury (Nwankwo et al., 2014). Luxury brands often invest heavily in marketing and storytelling, which can create emotional connections with consumers and make them feel part of a particular lifestyle or community. For some individuals, buying luxury brands may also be a way to express their style or identity or to reward themselves for their achievements or hard work. Owning luxury brands is also a symbol of success, power, or influence, providing individuals with confidence and self-esteem.

The social value of buying a luxury brand refers to the social and cultural benefits that the product provides beyond its functional value (Ajitha & Sivakumar, 2017). Luxury brands are often associated with social status, prestige, and exclusivity, which can provide individuals with a sense of belonging, identity, or cultural capital (Prentice & Loureiro, 2018). Owning luxury brands may be seen as a symbol of success, power, or influence, which can enhance their social status and reputation. Owning luxury brands may also give individuals access to exclusive networks, events, and experiences, which can help them build social connections and enhance their cultural knowledge and appreciation. Additionally, luxury brands may significantly impact the wider society and culture, as they often serve as symbols of excellence, creativity, and innovation.

**2.4 Relationship of brand individuality, brand consistency, brand continuity and brand authenticity, functional value, personal value and social value**

When consumers perceive a brand as authentic, they are more likely to trust that its promises and claims about its products are true (Napoli et al., 2016). This, in turn, can increase the perceived quality and reliability of the product, leading to a higher functional value for the consumer. Additionally, authentic brands tend to have a more precise identity and a better understanding of their target audience, resulting in products that are better suited to meet the needs

and desires of their customers. This can further enhance the functional value of buying a luxury brand. Moreover, brand authenticity can influence the perceived prestige of owning a luxury brand product. Authentic brands are often perceived as more exclusive and prestigious, which can increase the perceived value of owning a luxury product, further enhancing its functional value. Brand authenticity can positively impact the functional value of buying a luxury brand by increasing the perceived quality and reliability of the product, better aligning the product with the needs and desires of its target audience, and enhancing the prestige associated with owning a luxury brand product.

H4. Brand authenticity positively influences functional value.

When consumers perceive a brand as authentic, they tend to develop a stronger emotional connection with it (Hamby et al., 2019). They may view the brand as more genuine, honest, and trustworthy and, therefore, feel more positive about owning and using products from the brand. Authentic brands often have a clear and consistent identity, which can resonate with consumers who share similar values and beliefs. This creates a sense of affiliation and belonging, increasing the personal value consumers attach to buying a luxury brand. Moreover, when consumers perceive a brand as authentic, they may feel that owning and using its products enhances their self-image, making them feel more confident and sophisticated. In addition, authentic luxury brands often have a rich history, heritage, and cultural significance, which can add to their perceived personal value. Consumers may feel a sense of pride and ownership when they own products from such brands, which can further enhance the personal value they derive from buying luxury brands. Brand authenticity can significantly impact the personal value of buying a luxury brand by creating emotional connections, enhancing self-image, creating a sense of affiliation and belonging, and providing a sense of pride and ownership.

H5. Brand authenticity positively influences personal value.

A brand perceived as authentic by consumers is likelier to be seen as prestigious and associated with high social status (Fritz et al., 2017). This can enhance the brand's social value, as owning and displaying such a brand can signal to others that the individual is sophisticated and successful. In addition, an authentic brand is likely to have a positive reputation among peers and society at large, further enhancing the social value of owning and using the brand. On the other hand, if a brand is perceived as lacking authenticity, it may be seen as a symbol of conformity or a lack of discernment, which can diminish its social value. Therefore, the authenticity of a luxury brand can play a crucial role in shaping its social value and desirability among consumers. In addition, an authentic brand can also enhance the social value of buying a luxury product by creating a sense of community and belonging among consumers. Consumers who share the same values and aspirations may feel a sense of connection and identity with the brand, leading to a more excellent social value associated with owning and using the brand's products. This can also lead to increased brand loyalty and advocacy, as consumers who feel a sense of community with the brand may be likelier to promote and defend it to others.

Furthermore, a brand's authenticity can also impact the social value of buying a luxury brand in terms of the brand's social responsibility and ethical practices. Consumers today are increasingly concerned about the social and environmental impact of their purchases, and brands that are perceived as authentic in their commitment to social responsibility and ethical practices may be more highly valued by consumers (Hasan et al., 2022). This can enhance the social value of buying a luxury brand, as consumers may feel that their purchase aligns with their values and contributes to a greater social or environmental good.

H6. Brand authenticity positively influences social value.

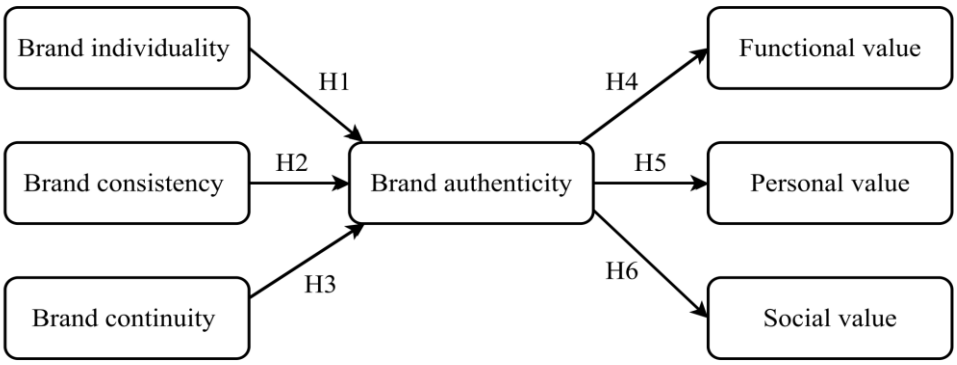

**Figure 1. Research model**

## III. RESEARCH METHODOLOGY

### *3.1 Sampling Procedures and Participants*

Based on the list of the 15 largest shopping centers in Ho Chi Minh City, Vietnam, the author randomly selected five shopping centers to collect data. Data was collected directly from shoppers at these five malls, including Takashimaya, Vincom Mega Mall, Van Hanh Mall, AEON Mall Tan Phu, and Bitexco. The author conducted a survey using a convenience sampling method of 100 participants at each shopping center. Convenience sampling allowed the author to select participants based on their accessibility, availability, geographic distance, and willingness to respond. Additionally, this sampling method has been applied in previous studies on the buying behavior of luxury brands. The first part of the questionnaire explained the purpose of the study and collected demographic information from respondents (see Table 1). The remaining questions related to brand authenticity, individuality, consistency, continuity, functional value, personal value, and social value. A total of 850 questionnaires were distributed, aiming for a broad and diverse sample to ensure the data was representative of shoppers in Ho Chi Minh City's luxury brand market. Out of the 850 distributed questionnaires, 485 valid responses were collected. The final sample size of 485 was determined after excluding incomplete and invalid responses to ensure the reliability and accuracy of the data for analysis. This response rate aligns with accepted norms in similar studies and provides a sufficiently large sample for meaningful statistical analysis and generalization of findings. The decision to work with the 485 valid responses was based on their completeness and relevance to the research objectives. Sample demographics are depicted in Table 1.

### 3.2 Measurement

Each construct in the current study is adopted from the previous research and measured using a five-point Likert scale (1 strongly disagree and five strongly agree). The measures of brand individuality, consistency, and continuity were adopted by Hernandez-Fernandez and Lewis (2019). These were measured using three items for each construct. The six-item scale of brand authenticity items is adopted from Schallehn et al. (2014). Finally, the functional, personal, and social value measures were adopted by Salehzadeh and Pool (2017).

### 3.3 Data analysis

This study employed the variance-based partial least square structural equation modeling (PLS-SEM) approach to analyze the data using the software SmartPLS version 3.0. The procedure for our data analysis consists of (1) the evaluation of the collinearity and standard method bias, (2) the assessment of the reliability and validity of the measurement model, and (3) the evaluation of the structural model.

## IV. RESULT

**Table 4. 1 – Demographic information of respondents**

| Variable | Frequency | Percentage (%) |
|---|---|---|
| Gender | | |
| Male | 214 | 44.12 |
| Female | 271 | 55.87 |

| | | |
|---|---|---|
| Age | | |
| 22-30 | 149 | 30.72 |
| 30-40 | 228 | 47.01 |
| 40+ | 108 | 22.26 |
| Working sector | | |
| Business | 241 | 49.69 |
| Education | 137 | 28.24 |
| Environment | 42 | 14.73 |
| Information technology | 38 | 7.83 |
| Hospitality | 14 | 2.88 |
| Others | 13 | 2.68 |

**4.1 Collinearity and common method bias**

Given that this research employs a self-reported survey approach, common method bias is a major risk factor for measurement errors (Podsakoff et al., 2003). As a result, the author ran two statistical analyses to assess the significance of CMB. First, the author conducted Harman's one-factor test by loading all items into an unrotated exploratory factor analysis, which was based on Podsakoff et al. (2003). Less than half, or 32.25 percent, of the total was accounted for by the first (biggest) factor that was obtained by principal components factor analysis. Consequently, no CMB evidence was detected. The second approach that was utilized to look for CMB further was the one that Liang et al. (2007) suggested. A common method factor including elements from every construct in the PLS model was included in this test. The average of the substantive factor loadings was 0.684, and the findings showed that all of them were statistically significant at $p<0.001$. In contrast, the majority of technique factor loadings were significantly less than their corresponding substantive factor loadings (average = 0.000, $p>0.05$). As a result, these results suggested that CMB did not pose a significant risk to the study's validity.

**4.2 Measurement model**

The convergent validity and discriminant validity of each model concept were assessed by the author in order to determine the quality of the measurement model (see Table 2). The variables' Cronbach's Alpha ranged from 0.802 to 0.888, indicating that all values were significantly higher than the 0.7 criterion. Similarly, the composite reliability (CR) values were also significantly higher than 0.7 (Fornell & Larcker, 1981). The construct dependability was supported when taken as a whole. Subsequently, all first-order variable AVEs fell between 0.514 and 0.756, above the suggested cut-off of 0.50. Accordingly, it showed that the study's convergent validity of measures was adequate.

**Table 4. 2 – Construct reliability and convergent validity**

| Construct | Cronbach's alpha | Composite reliability (CR) | Average variance extracted (AVE) |
|---|---|---|---|
| **1. Brand authenticity** | 0.881 | 0.905 | 0.514 |
| **2. Brand individuality** | 0.888 | 0.915 | 0.642 |
| **3. Brand consistency** | 0.856 | 0.893 | 0.584 |
| **4. Brand continuity** | 0.860 | 0.900 | 0.643 |
| **5. Functional value** | 0.838 | 0.908 | 0.756 |
| **6. Personal value** | 0.866 | 0.908 | 0.713 |
| **7. Social value** | 0.802 | 0.863 | 0.558 |

Next, HTMT.85 and the Fornell and Larcker (1981) criteria may be used to assess the discriminant validity. Each latent variable's square root of the AVE, as shown in Table 3, varied from 0.717 to 0.869, which was stronger than the correlations between latent variable pairings. It meets the requirement set forth by Fornell and Larcker (1981). Additionally, all components' HTMT correlation ratios are smaller than 0.85, which further supports discriminant validity. When combined, discriminant validity is adequate for the measuring model used in this investigation.

**Table 4. 3 – Correlation, AVE, and Heterotrait-Monotrait (HTMT) ratio value.**

| | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|---|
| **1. Brand authenticity** | **0.717** | 0.686 | 0.727 | 0.773 | 0.724 | 0.726 | 0.521 |
| **2. Brand individuality** | 0.609 | **0.801** | 0.485 | 0.608 | 0.524 | 0.6 | 0.279 |
| **3. Brand consistency** | 0.633 | 0.424 | **0.764** | 0.685 | 0.683 | 0.688 | 0.513 |
| **4. Brand continuity** | 0.673 | 0.534 | 0.588 | **0.808** | 0.704 | 0.633 | 0.527 |
| **5. Functional value** | 0.623 | 0.453 | 0.58 | 0.598 | **0.869** | 0.606 | 0.501 |
| **6. Personal value** | 0.635 | 0.528 | 0.593 | 0.546 | 0.518 | **0.844** | 0.369 |
| **7. Social value** | 0.44 | 0.236 | 0.426 | 0.439 | 0.412 | 0.31 | **0.747** |

***Note:*** *Correlations and Heterotrait-Monotrait ratio are at the lower and upper of the diagonal, respectively; the square roots of AVE are highlighted in bold.*

**4.3 Structural model.**

The PLS model's explanatory strength and predictive relevance were evaluated using R2 values and the Stone-Geisser Q2 metric, respectively (Hair et al., 2022). The findings reveal that the R2 varied from 0.253 (social value) to 0.602 (brand authenticity), beyond the 0.25 threshold value. This suggests that the variation accounted for by these endogenous factors was substantial and high. By contrast, the cross-validated redundancy $Q^2$ values of all endogenous components were more than zero, indicating the predictive usefulness of the model.

The direct effects were tested using a t-test and the bootstrapping procedure with 5,000 samples, as Table 4 illustrates. The findings supported H1, H2, and H3 since they showed a substantial direct influence on brand authenticity from originality, consistency, and continuity. Additionally, the findings showed that although there was no significant association between brand authenticity and functional value, it was favorably related to social and personal values. Consequently, H5 and H6 were supported, while H4 was not.

**Table 4. 4 –. Research results**

| | Hypotheses | Path | p-value | Supported |
|---|---|---|---|---|
| H1 | Brand individuality è Brand authenticity | 0.301 | 0.000 | Yes |
| H2 | Brand consistency è Brand authenticity | 0.312 | 0.021 | Yes |
| H3 | Brand continuity è Brand authenticity | 0.328 | 0.000 | Yes |
| H4 | Brand authenticity è Functional value | 0.623 | 0.432 | No |
| H5 | Brand authenticity è Personal value | 0.635 | 0.000 | Yes |
| H6 | Brand authenticity è Social value | 0.440 | 0.012 | Yes |

**V. DISCUSSION**

Today, the competitive landscape for luxury brands is increasingly fierce. Luxury brands not only face competition but also the dangers of counterfeit products. To win these competitions, luxury brands must focus on building deep connections with consumers. The findings of this study are similar to those of Alexander (2009) and Newman and Dhar (2014), suggesting that consumers will establish a strong emotional relationship with a brand compared to less authentic brands. More specifically, in the market for luxury products and the relationship between brand individuality and authenticity, the higher the degree to which a luxury brand delivers on its promise, the more likely consumers are to consider it authentic. Brand uniqueness is the capacity of a brand to forge distinctive linkages in a consumer's mind between the brand and the things that matter to them. By establishing a distinct identity, a brand can differentiate itself from its competitors and attract a specific target audience. This uniqueness helps the brand to position itself as a market leader in a specific industry or niche. This finding could be of particular importance in the luxury goods market. Given the wide range of competitors and the threat posed by counterfeit luxury goods, consumers may view brand individuality as an essential attribute influencing the potential consumption of these brands. If a luxury brand can differentiate itself, thereby increasing awareness of brand individuality, then that brand will be rewarded with the audience's perception of authenticity.

Regarding the relationship between brand consistency and authenticity, brand consistency refers to the brand's

ability to maintain a consistent image across all marketing channels, including visual elements such as logos, typography, color schemes, and messaging. By demonstrating that the brand's identity remains consistent, the brand can establish strong brand recall, which helps consumers recognize and identify with the brand. Consistency also helps to build brand trust, as consumers associate the brand with consistent quality and experience. Given the brand's positioning in the market, luxury brands should take actions consistent with their brand promise, making sure not to engage in any activities contrary to their nature. All luxury brands provide upscale and luxurious goods. Hence, attempting to boost the sense of brand consistency might result in a better perception of authenticity.

In terms of the connection between brand continuity and brand authenticity, it is crucial for increasing brand recognition and authenticity to successfully fulfill previous brand promises and link previous actions with current brand promises. Several well-known brands have existed in the luxury market for a very long time. These well-known companies have a compelling narrative to tell customers, solid value systems, and a rich history. The veracity of these qualities has been demonstrated. The connection between brand continuity and authenticity should not be disregarded, not even by newcomers to the market. Creating a captivating narrative and establishing key principles early on helps raise customer awareness of brand continuity and boost their impression of authenticity. This means that the brand's core values and personality remain consistent, even as the brand evolves and adapts to changing circumstances. This continuity helps to reinforce the brand's identity and establish it as a trusted and reliable player in the market.

Brand authenticity positively impacts personal value because it creates a sense of trust and emotional connection between the brand and the consumer. Authenticity reinforces the idea that a brand's values and promises are genuine, which makes consumers feel confident that they are investing in a product or service that meets their expectations. This confidence, in turn, leads to a higher perceived value for the product, as consumers are willing to pay a premium for luxury goods that they trust to deliver a high-quality experience. Additionally, personal authenticity can evoke a sense of heritage, legacy, and tradition that resonates with consumers on a deeper level, making them feel more connected to the brand and its values. This emotional connection and sense of belonging to the brand can also increase perceived value for consumers.

Brand authenticity can positively impact social value because it helps establish a brand's credibility and reputation. When a brand is seen as authentic, it is perceived as honest and trustworthy, and its values and promises are genuine. This can create a social identity for consumers who align with the brand's values and beliefs. This can lead to a sense of social belonging and a desire to share and promote the brand with others, which can increase its social value. Authenticity can also create a sense of heritage and tradition, which can help to establish a brand's cultural significance and increase its social value. Brand authenticity can create a sense of social status and belonging for consumers, positively impacting social value.

Finally, the research results show that brand authenticity does not directly impact function value. This result can be explained because function value refers to the functional benefits that a product or service provides, such as quality, efficiency, or effectiveness. On the other hand, authenticity is a non-functional attribute of a brand that pertains to the brand's identity, values, and heritage. While authenticity can enhance a brand's perceived quality or reliability, it is not directly related to the functional benefits of the product or service.

## VI. CONCLUSION, LIMITATIONS AND FUTURE RESEARCH

Brand authenticity may and should be considered a crucial component for the success of brands, according to the positive and significant associations discovered in this study. To establish and raise awareness of authenticity, personal, consistent, and ongoing brand promise fulfillment is necessary. This is an interesting outcome in the luxury goods market as countless brands use very similar marketing strategies, and some of the luxury brands have been around for a long time. This is very difficult for new brands to position themselves. In addition, this study shows that brand authenticity affects only personal and social value and has no impact on function value. This study provides deeper insights into aspects of perceived value that previous studies have not explored.

This study provides several actionable implications for luxury brand managers, particularly in markets like Vietnam. First, for consumers with high demands for authenticity who invest time verifying product legitimacy and avoiding counterfeits, brands should integrate transparency tools such as digital authentication (e.g., QR codes or

blockchain verification) to emphasize product origins, craftsmanship, and ethical practices. These tools can be incorporated into packaging, in-store displays, or promotional materials to create a seamless experience. Second, enhancing brand individuality, continuity, and personality can help brands differentiate in competitive markets. Managers should promote individuality by showcasing unique heritage and craftsmanship through storytelling campaigns or collaborations with local artisans. Ensuring brand continuity through consistent visual identity, messaging, and customer experience across touchpoints further reinforces authenticity. Third, building an emotional connection through immersive brand experiences and storytelling is essential. This can include pop-up exhibitions, virtual reality tours, or advertising campaigns highlighting the brand's legacy and tradition. Leveraging social value perception is another critical aspect; marketers can organize exclusive events, partner with cultural institutions, or highlight sustainability initiatives to foster a sense of exclusivity and social prestige. Finally, marketers must tailor strategies to cultural and demographic contexts. In Vietnam, where consumers highly value heritage and craftsmanship, luxury brands should emphasize these attributes in campaigns while researchingresearching to understand evolving perceptions of authenticity and adjust strategies accordingly. These targeted and context-specific approaches can strengthen brand authenticity and drive customer loyalty.

This study is also not without its limitations. First, this sample lacks a precise classification of luxury brands. Further studies may focus on a specific group of luxury brand categories. Second, this study was limited to mediators. Other potential mediators of the relationship between brand authenticity and perceived value exist, such as brand trust and perceived quality, which should be included in a future model. Finally, this study focused on outcomes as three dimensions of perceived value. Other positive outcomes can be considered about brand authenticity, such as brand trust, brand love, brand awareness, brand loyalty, and brand personality.

# THE EFFECTIVENESS OF CAUSE-RELATED MARKETING ON CUSTOMER LOYALTY UNDER CSR INITIATIVES: A CASE STUDY OF UPRACE – A VIETNAMESE ONLINE RUNNING EVENT

**Le Thi Huyen My[1*], Nguyen Hoang Phu[1]**

[1]International University, Vietnam National University, Ho Chi Minh City, Vietnam

* Corresponding: lethihuyenmy.06@gmail.com

**ABSTRACT**

Purpose – This research investigates the effects of sport-charity events under CSR initiatives on corporate image and customer loyalty, and examines the participant's perceptions to join the event, the involvement of customers with the social impacts, and the event sponsor's fit.

Design/methodology/approach – Survey questionnaire and quantitative approach are used to collect the data from participants who joined the UpRace running event. The survey received 255 responses in total and 237 valid responses. The data were analyzed by the partial least square-structural equation modeling (PLS-SEM) technique.

Findings – The data show that corporate image performs an important role as an indirect mediator in the relationship between the perception of joiners and customer loyalty. Besides, becoming a sponsor for a well-organized event can have positive effects on corporate image and customer loyalty.

Practical implications – The study proposed some recommendations for corporates to build brand image and customer loyalty through organizing or sponsoring charitable sports events.

Originality/value – This study is distinguished from past studies because it analyzes charitable sporting events from the perspective of people who attended the event. The research's results emphasize the relevance of CSR in corporate marketing and communicating with the community.

*Keywords:* corporate image, corporate social responsibility (CSR), sports sponsorship event

## I. INTRODUCTION

Recently, the concept of corporate social responsibility (CSR) has been applied widely in the marketing industry. Among many CSR initiatives implemented, firms have recognized the possibility of expanding the scope of CSR to collaborate with sports events as sponsors and support philanthropic causes to achieve their own social and economic goals (Trendafiova, Ziakas, and Sparvero, 2017). Therefore, the question of how sponsorships for sports charity events impact the business purposes of corporations has risen (Plewa et al., 2016). Although relevant scholarly research has lately expanded the topic (Woolf et al., 2013; Eagleman and Krohn, 2012), little is known regarding the possible effects of certain sponsorship components on participants, who are also the customers, in a non-profit participatory sports event (Silva, A., 2021).

Based on the growing trend of corporate sponsorship for philanthropic or charitable sports activities, the evaluation of how a charity program can impact stakeholders, particularly the participants in sports events, has become critical. According to research, involvement in the activity (Lardinoit & Derbaix, 2001), attitudes regarding the events (Quester & Thompson, 2001), and event sponsors (Olson & Thjomoe, 2011) are important variables influencing sponsorship success.

Therefore, this research analyzes UpRace - an online running event, as the context, and VNG Corporation as the event's primary sponsor, to investigate the relationships between those aspects and CSR effectiveness from a sponsored charity sport event. The research also investigates the effectiveness of those factors on the loyalty of customers to the products and services of corporations. UpRace is an online running event held annually in Vietnam, and it is technically supported by VNG Corporation. VNG Corporation and other sponsors committed to donating 1,000 VND for social organizations in every kilometer run of joiners recorded by the UpRace application (UpRace., n.d.). Four years after its launch, UpRace has attracted more than 230,000 joiners and gained around 20 billion VND donated to Vietnam and

international non-profit organizations, including Operation Smile Vietnam, Newborns Vietnam, Save Vietnam's Wildlife, etc.

The following parts of this research include three steps. First, this research reviewed previous literature in marketing and public relations for sports management. Second, primary data from participants were collected and analyzed. Finally, the results were discussed, and proposed suggestions for future CSR initiatives and further research in the marketing industry.

The results of this research will explore the relationship between corporate social responsibility (CSR) initiatives associated with charity sports events, and their impact on corporate image and customer loyalty. The first area of investigation focuses on how CSR activities undertaken during charity sports events influence how the public perceives the sponsoring corporation. The second area will analyze how corporate image, shaped by its CSR efforts, can translate into increased customer loyalty. Finally, the research examines the impact of cause-related events, particularly charity sports events, on the perception of participants towards the sponsoring companies. This exploration aims to shed light on the potential for these events to create positive associations and build trust between brands and consumers. By investigating these interconnected themes, this research seeks to provide valuable insights into the strategic use of CSR within the context of charity sports events and its potential to benefit both corporations and their customers.

## II. LITERATURE REVIEW

### 2.1 CSR in sport sponsorship activity

CSR consists of corporate charities for a social cause or to support the community's well-being (Kotler and Lee, 2005), which has a significant impact on sports sponsorship initiatives, particularly in charity sporting events (Walzel, 2018). Sponsorship for charitable issues has reached recorded levels, indicating how customers are willing to purchase enterprises that align with their own beliefs and values (Sung and Lee, 2016). The connection of corporate CSR to a sports organization could enhance brand image to the community and boost the company's reputation (Mahmood and Bashir, 2020). Furthermore, CSR efforts directly or indirectly promote customer loyalty to the brand (García de Leaniz and del Bosque Rodríguez, 2015), while helping create a favorable business image (Gürlek et al., 2017). Besides, according to Irwin et al. (2013), sponsorship of sporting events had been acknowledged as an efficient tool for firms to engage with target audiences about their social responsibility activities.

### 2.2 Corporate image of the sponsor (CI)

Keller (1993) proposed that the image of corporations would be the impression of the organization by its stakeholders. It is the combination of a person's feelings, thoughts, attitudes, knowledge, perceptions, and beliefs about a company (Trivedi, 2020). According to studies in a variety of industries, A successful CI provides a competitive advantage by connecting current and prospective customers, enhancing customer satisfaction, and boosting market shares and sales (Nguyen and Leblanc, 1998). As a result, corporate image is a strong predictor of sponsorships success (Tsiotsou and Alexandris, 2009).

### 2.3 Customer loyalty (CL)

In research regarding the attendance of the marathon event, Du et al. (2015) characterized the intentions of customers to become loyal as "positive goal-directed behavioral responses toward an event". Customers become more loyal to a sponsor firm when they believe they would contribute to the improvement of society (Gürlek, Düzgün, and Meydan Uygur, 2017). CSR activity also influenced the loyalty of customers through brand image, as well as word-of-mouth (Du et al., 2015) in the sport sponsorship context (Martnez et al., 2014).

Customers' positive behaviors towards events impact the positive attitude towards the corporate sponsors, including social interchange, philanthropy, and a sense of involvement, according to Meenaghan (2001). Consumers' view of the sponsor and CL is directly influenced by their amount of goodwill toward the sponsor, as well as their engagement level in the sponsored event or activity. This discussion leads to the first hypothesis:

**H1**: CI has a positive effect on CL

### 2.4 Involvement with social impact (ISI)

Activity involvement is an indication of each person's behavior toward a specific sports event and has been

characterized by Havitz and Dimanche (1997) as "an unobservable state of desire, excitement, or interest towards a leisure activity or linked product". According to Ridinger et al. (2012), involvement is significant because it has the potential to change the behavior and attitude of the participants in terms of the brand's products, services, or activities, and integrating the sponsorship information process in customer impressions (Dos Santos et al., 2016) and sponsorship effectiveness (D'Astous and Bitz, 1995). Participation in this study will be defined as a personal link to children's disparity and orphans, as well as endangered wild animals. Considering the situation of this running event, the research hypothesizes that participants who have a strong sense of ISI will favorably appraise the sponsorship organization to the event.

**2.5 Attitude toward the event (AE)**

D'Astous and Bitz (1995) argued that AE is one of the most significant factors influencing sponsorship results and people attracted to the event tend to generate positive attitudes toward the corporate sponsor. Although some research has shown that an event's attitude is important, the impact of attendees' attitudes towards the event on the brand, especially after witnessing social responsibility activities sponsored by the brand, remains inconclusive (Mao and Zhang, 2013). Bal et al. (2010) observed that emotional reactions impacted the development of attitudes about events and the consequences of sponsorship. As a result, the hypotheses are developed:

**2.6 Sponsorship Fit (FIT)**

"Fit" is defined in sponsorship research as consumer perceptions of a sponsor's or event's direct or indirect link (Pham and Johar, 2001). The approach of FIT, according to the researchers, may be impacted by both "functional-based similarity" (Gwinner, 1997) and "image-based similarity" (Benezra, 1996). Ellen et al. (2006) stated that a close fit among sponsors, as well as an activity, can lead to positive results since FIT allows the attitude of customers gained from the activity to the sponsor's CI. In other words, once an activity connects with the brand visually or functionally, the transfer system positively enhances, leading to the hypotheses:

Hence, the theoretical framework is indicated below:

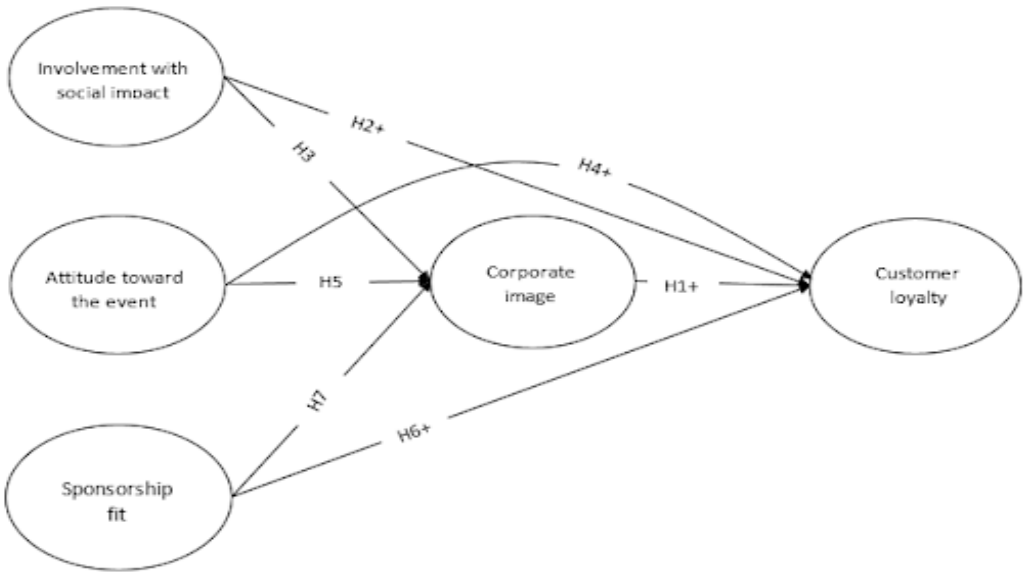

**Figure 1: The proposed model**

## III. METHODOLOGY

### 3.1 Sample and procedures

The survey design implemented a convenience sampling methodology, aiming to acquire a broad spectrum of participants (Oliver C.R, 2014). The selection of this technique was driven by its perceived advantages in terms of cost efficiency, rapid turnaround time, and reduced procedural complexity. Besides, individuals who took this survey would be ensured that they understand about sport-charity programs and online running events. In this research, primary data will be the main resource and observations, and they were collected by quantitative methods. Data were collected by

questionnaire structure, including four parts, 14 questions, collected online via the Qualtrics form, and offline via paper survey. The questionnaire was designed following the variables measured from previous studies. As this research is related to running events and the impacts of CSR initiatives on brand image and customer loyalty, the sample was narrowed to 250 people nationwide, who have joined UpRace online and offline running events in 2022 and before. After removing invalid and incorrect answers during the two-week data collection in March 2023, the survey received 237 valid forms from respondents, constituting a returned ratio of 94.8 percent. Both Vietnamese and foreigners, male and female participants who are above 18 years old were the target audiences for the data collection. To reduce participant response bias, individuals were carefully chosen and requested to complete the survey independently. The survey was only available to event attendees aged 18 and over, and attendees were asked in advance if they agreed to participate. A drafted survey questionnaire was created in English language, then translated into Vietnamese under the principles of double translation for the pilot test and data collection, then translated back to English for data analysis.

**3.2 Measurement**

The survey consisted of four main sections, First, two screening questions were used: 'Do you know about VNG Corporation?' and 'Do you know about the online running platform called UpRace?'. Next, general questions explored participants' running event frequency, distances, reasons for participation, and concerns about joining such events. Next, the five-point Likert-scale question collected opinions from joiners about distinct factors: AE, FIT, ISI, CI, and CL, which ranged from 1 – 'strongly disagree' to 5 – 'strongly agree'. Following this, a five-point Likert scale assessed opinions on the factors of AE, FIT, ISI, CI, and CL, with responses ranging from 1 ('strongly disagree') to 5 ('strongly agree'). Twenty-seven items were generated from these factors, revised and adjusted based on previous research. Finally, demographic questions collected data on participants' gender, age, education level, and salary.

In this research, partial least square structural equation modeling - PLS-SEM 3, designed by Ringle et al. (2015) - was used to uncover the correlations between variables. The acquired data was evaluated in two steps, beginning with examining the reliability and validity of questions using a range of indicators such as factor loadings, composite reliability, and average variance extracted. SEM was then used in the research to describe the structure's relationships, as it was considered useful for understanding hidden factors in markets (Haenlein and Kaplan, 2004). Each construct of this study employed measurement items from previous relevant research.

– ISI: Three scales adapted from Sung and Lee (2016) and two additional items from Junior et al. (2015).

– AE: Three items adapted from Mazodier and Merunka (2011), one item adapted from Kulczycki and Koenigstorfer (2016), and three additional items from Sung and Lee (2016).

– FIT: Even-sponsor fit scales were measured by five items from Gwinner and Bennett (2008).

– CI: The three measurement scales of the corporate image were adapted from studies of two groups of co-written authors - Mao and Zhang (2013); and the other three items from Gürlek, Düzgün, and Meydan Uygur (2017).

– CL: five items of corporate loyalty measurement scales were inherited from Mao and Zhang (2013), He and Lai (2014), and Aramburu and Pescador (2019).

**4.1 Demographic statistics**

Among 237 valid forms obtained, the proportion of males who joined UpRace was significant, which accounted for 65.6% of the total respondents. More than 75% of participants were from 19 – 30 year-olds, followed by 17% of people from 31 – 45 years old, and the remaining 8% of joiners from above 45 years old. The proportion of joiners who graduated with a bachelor's degree was significant, 85%, while other 13% were postgraduates, and other 2% were those who had an uncompleted high-school education. In terms of salary, around 43% of the participants had an income ranging from 10 - 25 million VND, followed by 26 – 40 million VND, 0 – under 10 million VND, and above 40 million VND (24.5%, 22%, and 10.5% respectively). Besides, insights extracted from the respondents indicate that most people prefer the running distance of 5 kilometers (46.7%), followed by 10 kilometers (19%), and half-marathon (16%). Meanwhile, around 58% of runners join the running events 1-3 times a year, and 25% of other people join running 4-6 times. Most participants choose running for health and delight benefits, and many of them prefer the race-kit and the scenery of running roads.

**4.2 Measurement model assessment**

The measurement model evaluation, which included reliability and validity testing, was applied to all constructs. Two methodologies were utilized to measure the reliability of the construct: Cronbach's alpha and composite reliability (CR). The reliability criteria for both ways need to be greater than 0.7 (Hair, Howard, and Nitzl, 2020). In Table 1, the values of Cronbach alpha ranged from 0.904 to 0.947, which were desirable. Besides, all measures of CR varied from 0.908 to 0.948, which were good as recommended. The outer loadings of all indicators were greater than 0.708, which means that the correlation between those observed variables and the factors was ideal (Hair, 2010).

**Table 1. Outer Loadings, CR, CA, and AVE Results**

| Construct | Items | Outer Loadings | Cronbach's Alpha | CR | AVE |
|---|---|---|---|---|---|
| Attitude toward the event (AE) | 6 | 0.725 – 0.884 | 0.908 | 0.911 | 0.687 |
| Sponsorship Fit (FIT) | 5 | 0.894 – 0.921 | 0.947 | 0.948 | 0.826 |
| Involvement with social impact (ISI) | 5 | 0.812 – 0.880 | 0.904 | 0.908 | 0.722 |
| Corporate image (CI) | 6 | 0.862 – 0.895 | 0.935 | 0.936 | 0.756 |
| Customer loyalty (CL) | 5 | 0.868 – 0.925 | 0.939 | 0.940 | 0.805 |

Next, the research applied Average Variance Extracted (AVE) to indicate convergent validity. All the indicators ranged from 0.687 to 0.826, which measured the sufficient average variance shared between each item and the constructs, exceeding the suggested measurement of 0.5 (Fornell and Larker, 1981). From the results of Table 1, the validity and reliability tests were adequate for the reflective constructs. To measure the distinctiveness of the construct, the research applied two criteria - the heterotrait-monotrait ratio of correlations (HTMT) and Fornell-Larcker. For Fornell Larker's criterion, the cross-loading indicator is suggested to exceed the opposed constructions. Meanwhile, if the AVE square root for each construct would be higher than the absolute value for the correlation of other constructs, the scale discriminability is guaranteed (Fornell and Larcker, 1981). For HTMT, Henseler et al. (2015) state that the HTMT value between two constructs should be less than 0.85. Table 2 and Table 3 show the discriminant validity supported by the total constructs of two criterions.

**Table 2: Discriminant validity – Fornell-Larcker criterion**

| Constructs | AE | FIT | ISI | CI | CL |
|---|---|---|---|---|---|
| AE | 0.829 | | | | |
| FIT | 0.716 | 0.869 | | | |
| ISI | 0.677 | 0.827 | 0.897 | | |
| CI | 0.789 | 0.719 | 0.662 | 0.909 | |
| CL | 0.586 | 0.630 | 0.603 | 0.574<br>0.850 | |

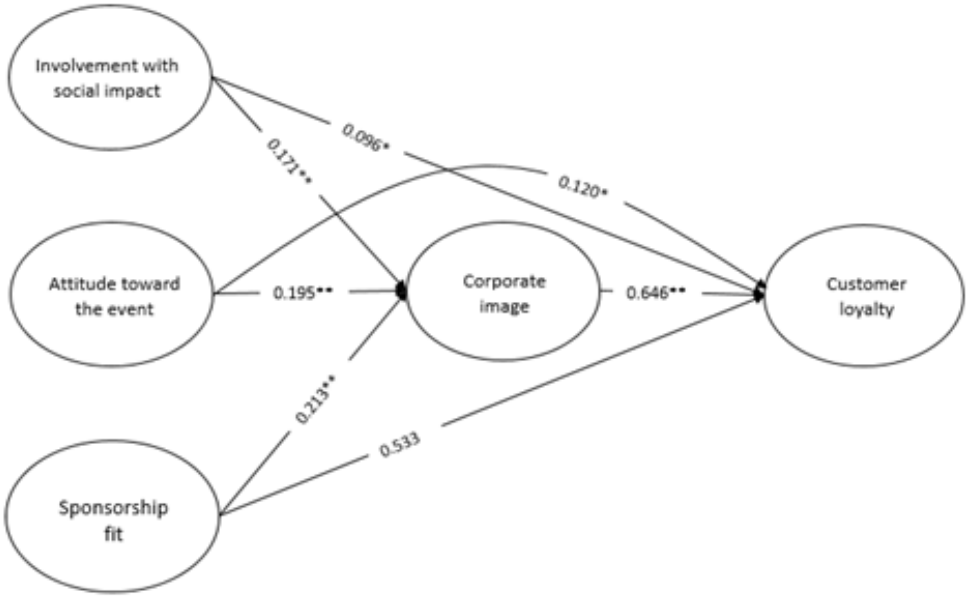
*Notes: AE = Attitude toward the event; FIT = Sponsorship Fit; ISI = Involvement with social impact; CI = Corporate image of the Sponsor; CL = Customer loyalty*

**Table 3: Discriminant validity – HTMT criterion**

| | AE | CI | CL | FIT | ISI |
|---|---|---|---|---|---|
| AE | | | | | |
| CI | 0.773 | | | | |
| CL | 0.730 | 0.882 | | | |
| FIT | 0.846 | 0.762 | 0.700 | | |
| ISI | 0.643 | 0.681 | 0.648 | 0.616 | |

***Notes:*** *AE = Attitude toward the event; FIT = Sponsorship Fit; ISI = Involvement with social impact; CI = Corporate image of the Sponsor; CL = Customer loyalty*

**4.3 Structural model assessment**



The structural model is evaluated once the measurement model has been accessed, while all good results have been obtained. Standard assessment criteria include the statistical significance and the relevance of the path coefficients, the measurement of cross-validated redundancy based on blindfolding (Q2), and the coefficient of determination (R2) (Hair et al., 2019). According to the findings, the model can account for 61.4% of the variance in CI and 70.1% of the variance in CL. Furthermore, the Q2 value of endogenous variables should be greater than 0.2 to confirm predictive significance. The study findings reveal that all Q2 values satisfy the requirement, indicating a satisfactory model fit (Hair et al, 2020). The value of f2 is considered useful for the model adjustment with the range of 0.016 – 0.541 since it exceeds the medium and large suggested values, which are 0.15 and 0.35 respectively (Junior et al., 2015).

**Table 4. Path coefficients – effects on corporate image and organization customer loyalty**

| Hypothesis | Relationship | Path coefficient | *p* values | f-square | Decision |
|---|---|---|---|---|---|
| *Direct effects* | | | | | |
| H1 | CI → CL | 0.646 | 0.000** | 0.541 | Supported |
| H2 | ISI → CL | 0.096 | 0.064* | 0.017 | Supported |
| H4 | AE → CL | 0.120 | 0.071* | 0.016 | Supported |
| H6 | FIT → CL | 0.048 | 0.533 | 0.003 | Rejected |
| - | ISI → CI | 0.265 | 0.002** | 0.115 | Supported |
| - | AE → CI | 0.301 | 0.000** | 0.084 | Supported |
| - | FIT → CI | 0.329 | 0.000** | 0.102 | Supported |
| *Indirect effects* | | | | | |
| H3 | ISI → CI → CL | 0.171 | 0.003** | - | Supported |
| H5 | AE → CI → CL | 0.195 | 0.000** | - | Supported |
| H7 | FIT → CI → CL | 0.213 | 0.001** | - | Supported |

**Notes:**

AE = Attitude toward the event; FIT = Sponsorship Fit; ISI = Involvement with social impact; CI = Corporate image of the Sponsor; CL = Customer loyalty; * *p* < 0.1; ** p < 0.05

**Note**: *p < 0.1; ** p < 0.05

**Figure 2: The PLS-SEM result**

Along with these recommendations, non-parametric bootstrapping (Preacher and Hayes, 2008) was applied with 1000 replications to determine the statistical significance with the acceptable level of ≤0.10. SEM was conducted using Smart-PLS to test H1-H7. Table 4 displays the direct and indirect effects of the proposed constructs. The indicator of

H1 presented a positive effect of CI on CL. H1 is supported with significant satisfaction from the confidence level. H2 showed that ISI has a small direct effect on CL, so H2 is supported. H3 anticipates the positive effect of ISI on CL through CI, and it is supported. Therefore, the total effects of ISI on CL would be higher than the sole direct and indirect effects (0.267), showing the empirical support of these hypotheses. H4 is supported, as AE has a positive direct effect on CL. H5 predicts that CI mediates the effect of AE on CL, and it is supported because AE's indicator has an indirect effect on CL. H4 and H5 had the total effect of AE on CL, and AE on CL via CI is higher than the supportive direct and indirect effects of AE on CL (0.315). H6 predicts FIT to affect directly on CL, but H6 is rejected because the confidence interval was unsatisfactory. The final prediction of H7 also indicates the indirect effect on CL via FIT, which is supported. In addition, CI had a considerable direct effect on CL ($\beta = 0.646$, $p^{**} = 0.000$, $f2 = 0.541$), while the direct path coefficient of ISI ($\beta = 0.096$, $p^{*} = 0.064$, $f2 = 0.017$), and AE ($\beta = 0.120$, $p^{*} = 0.071$, $f2 = 0.016$) on CL are small.

## V. DISCUSSION AND LIMITATIONS

In conclusion, the current study identified the theoretical relationship among the involvement of customers with social, the attitudes toward the sporting event, the perceptions of participants regarding the fit of sponsor and social impacts, and the customer behavior towards the corporate's products and services perceiving that the corporate is the sponsor for the sporting event. CSR initiatives for the marketing mix can enhance the positive image of the corporate, and there are significant roles of building a good image toward customer loyalty.

### 5.1 Academic application

From academic application, while many previous studies investigated the effectiveness of CSR on general customers, this research investigates the attitudes and perceptions of those who are the customers and also the actual participants of an event created by CSR initiatives. In addition, the present research becomes notable given that the majority of investigations on CSR and sponsorship for charitable sports events have been geographically centered on English-speaking countries (Matten and Moon, 2004). Since corporate activities are expanding internationally, it is significant for firms to recognize CSR initiatives and their effectiveness in different countries with diverse cultures. Vietnamese is a collectivist country that emphasizes interdependence and promotes a harmonious environment between individuals (Nguyen and Truong, 2016). Most Vietnamese believe that big companies should invest more to build a better society, and it would gain the loyalty from people in the society when using corporate products (Tran, 2022). Therefore, investigating CSR practices, especially in sport sponsorship events for social impacts is obligatory for corporations to effectively build the reputation and endure customer loyalty towards its products and services.

### 5.2 Practical application

For practical application, this research results indicate the essential of CSR initiatives in the marketing industry. For corporations, before sponsoring for a social impact-related sport event for CSR purposes, the company should target joiners who are involved with social impacts. The results collected from insight questions indicate that choosing the meaningful impacts addressed by trustworthy non-profit organizations for funding would evolve the interests of customers to join the event. Among those customers who are less involved in social causes, marketing, and communication campaigns would help deliver messages and responsibility of the corporate effectively. The campaign message should involve the benefits of sports for health. Image and content activations created before the event should have a friendly tone and mood to deliver delightful and meaningful messages. In addition, for CSR initiatives to maximize values, the company should support events that receive positive attitudes from participants. Attitudes towards the event can be analyzed through surveys from previous events, feedback, and sharing of joiners on social media channels. To create positive attitudes, the sport, particularly the running event, should choose the running roads that have stunning scenes, and provide a useful race-kit for runners to attract their interests.

### 5.3 Limitations

There are some limitations of this research. First, the findings can reflect a certain company's cause-related sports event in Vietnam. If these findings are transferred to other firms, the possible impact of other criteria defining corporations and CSR initiatives must be investigated. Moreover, due to cultural differences, there would be a variable in CSR motivations for practices among nations. Therefore, further studies should consider these aspects to evaluate the

effectiveness when applying to other contexts of sports events.

# THE IMPACT OF DIGITAL MARKETING ON BRAND SUSTAINABILITY IN THE TELECOMMUNICATIONS INDUSTRY: THROUGH BRAND LOYALTY AND BRAND STRENGTH

**Nguyen Tran Sy[1]*, Truong Bich Phuong[1], Bui Gia Phuc[1], Đao Minh Phuc[1], Banh Vu Tu Quan[1], Le Mai Gia Linh[1]**

[1] Foreign Trade University - Campus II, Vietnam
*Corresponding Author: nguyentransy.cs2@ftu.edu.vn

**ABSTRACT**

Today, the utilization of digital marketing within the telecommunications service sector exhibits numerous favorable indicators. Digital marketing serves to fortify brand loyalty, thus augmenting a firm's competitive advantages within the marketplace and facilitating the attainment of a sustainable brand position relative to its competitors. Consequently, this study was undertaken to meticulously analyze the correlation between digital marketing and competitive advantage as well as sustainable branding, incorporating the mediating influences of brand loyalty and brand strength. Research data were gathered through the administration of a survey involving 418 consumers of telecommunications services located in the southern provinces of Vietnam. Partial least squares structural equation modeling was utilized to evaluate the proposed theoretical framework. The findings indicate that digital marketing exerts a beneficial influence on brand strength, brand loyalty, competitive advantage, and sustainable branding. Specifically, the findings fill the gap in previous research by exploring the mediating roles of brand loyalty and brand strength in the relationship between digital marketing and both sustainable branding and competitive advantage, in the context of consumers in the telecommunications service industry in Vietnam. In light of these findings, the research proffers several recommendations for managers operating within the telecommunications services sector aimed at enhancing competitive advantage and fostering sustainable branding.

## I. INTRODUCTION

With the rapid development of modern society, the Internet has become extremely important, especially in business (Becherer & Halstead, 2004). E-commerce has opened up many new opportunities for industries, and Marketing has always played a key role in building brand image and promoting revenue. Jackson and Ahuja (2016) pointed out that Digital Marketing is gradually replacing Traditional Marketing, with the trend of digital transformation becoming increasingly important to compete and develop in the digital age, research on Digital Marketing is extremely necessary.

In recent years, the rapid development of information technology and the economy has significantly impacted customer loyalty to brands, making it an important issue in marketing research. Doostar & Mohammadi (2014) point out that many studies have used different methods to demonstrate the value of loyalty to businesses. However, current theories have not fully explained the strategies that help customers return to businesses. Therefore, research on brand loyalty is extremely necessary, as it directly affects revenue and the survival of businesses.

In business, competitive advantage is an important factor that helps businesses survive and develop. Švárová and Vrchota (2014) believe that businesses use their competitive advantages to build business strategies, create differentiation and gain advantages in the market. And businesses can build their competitive advantage through advertising and introducing the advantages of the brand. Advanced strategies, leveraging digital content and improving digital skills also help businesses increase competitiveness and expand market share (Mohammad, 2022).

Building customer loyalty not only helps maintain stable revenue but also promotes the sustainable development of a brand in the context of intense competition. Research on sustainable development helps businesses identify the necessary factors to maintain and strengthen customer relationships, while also creating long-term value. Therefore, sustainability is not just about creating quality products/services but also about strategies for retaining customers and

building long-lasting relationships. Studies show that the combination of long-term benefits for both customers and businesses can create sustainable competitive advantages for businesses in the future (Kotler et al., 2017).

Although the three main definitions related to brand value (total brand value, brand strength, and brand image) were asserted by Feldwick (1996) as distinct, there is a special consistency between these concepts. Specifically, brand image influences brand strength, which in turn impacts brand value (Aaker, 1992; Keller, 1993). Therefore, it cannot be denied that brand strength is one of the strategic factors in brand management, and also a measure to evaluate brand value (Wymer, 2013). Moreover, a strong consumer attachment to the brand is linked to positive brand consideration, purchase intention, actual purchasing behavior, and brand choice (Priester et al., 2004; Suh & Youjae, 2006). However, the relationship between brand strength and other aspects of consumer attitudes, such as loyalty, remains limited in previous studies.

The telecommunications industry has undergone significant changes due to a combination of deregulation (the removal of government restrictions on competition), technological advancements, legislation, and organization. This sector has witnessed unprecedented transformations as global monopolies were dismantled, leading to mergers and restructuring (David et al., 1994). In this rapidly evolving environment, digital technologies have emerged as a driving force, fundamentally reshaping the landscape and compelling enterprises to reconsider their strategic objectives and business practices (Bruhn et al., 2012; Ianenko et al., 2023). Against the backdrop of these profound shifts, telecommunications companies now face the pressing challenge of maintaining their brand sustainability and competitive advantage in a highly dynamic market (Hamdoun et al., 2014; Meena & Geng, 2022). The rise of digital marketing has been a critical factor in this transformation, enabling companies to engage with customers in more personalized and interactive ways (Rao, 2001; Ianenko et al., 2023). As digital platforms and channels become increasingly prominent, telecommunications firms must explore how to effectively leverage these tools to strengthen their brand and gain a competitive advantage and brand sustainability (Leeflang et al., 2014). And telecommunications businesses in Vietnam are no exception. Vietnam's telecommunications sector has undergone approximately 27 years since entering the international market and has achieved significant milestones. According to a report from the Ministry of Information and Communications of Vietnam (2023), the total revenue from telecommunications services is estimated at around 139.26 trillion Vietnamese dong, a 0.41% increase compared to the same period in 2022, achieving 99.5% of the plan for 2023. Currently, competitors in the telecommunications sector are fiercely racing to increase revenue and market share through expanding infrastructure and implementing promotional and communication policies. Among them, Mobifone is currently facing a shrinking market share due to the rapid growth of Viettel and VinaPhone. One of the reasons behind this decline in market share and competitive capability is directly related to marketing activities. With the strong development of the Fourth Industrial Revolution, the issue receiving attention from telecom company managers is how digital marketing activities influence competitive strategies to retain customers and ensure sustainable development in the future (Mahalaxmi & Ranjith., 2016; Hawary & Harahsheh, 2014). Therefore, telecommunications enterprises need to intensify their digital marketing efforts to enhance market competitiveness and build brand sustainability to secure their market share. Additionally, companies in the telecommunications market also need to actively develop digital marketing to strengthen the intermediary impact of brand strength and brand loyalty, aiming for competitive advantage and brand sustainability goals (Bedi & Chopra, 2018; Diez-Martin et al., 2019).

Although many studies have demonstrated the positive impact of digital marketing on competitive advantage and brand sustainability, there is still a limitation in exploring the mediating roles of brand strength and brand loyalty in these relationships (Khan & Islam, 2017; Ahmed et al., 2019; Makau, 2021). In particular, previous studies often did not focus on the relationship between digital marketing and brand strength. Moreover, most research has been conducted in specific contexts, lacking representativeness for the unique characteristics of the Vietnamese market and the telecommunications sector. This study aims to investigate the impact of digital marketing on brand sustainability and competitive advantage in the telecommunications industry, with a focus on the mediating role of brand strength and brand loyalty. Specifically, this research will explore how telecommunications companies can strategically utilize digital marketing techniques to bolster their brand strength, which in turn can contribute to the achievement of customer loyalty, brand sustainability and competitive advantage.

## II. MATERIAL AND METHOD

### 2.1. The theory of sustainable competitive advantage.

Sustainable competitive advantage is a key tool in strategic management which any serious organization cannot afford to ignore. Sustainable competitive advantage is a business's ability to deliver unique value that competitors cannot replicate (Porter, 1985). There are two types: cost advantage (lower costs with equal quality) and differentiation advantage (unique products/services). According to the VRIN model (Barney, 1991), sustainable resources must be valuable, rare, inimitable, and non-substitutable. This advantage enables businesses to maintain high profits and growth through differentiation, quality, innovation, excellent service, and strong branding. This theory is applied to establish hypotheses about the relationship between digital marketing, brand strength, brand loyalty, and competitive advantage.

### 2.2. Conceptual foundation

#### Digital marketing

In the current era where technology is thriving, Marketing has expanded beyond sales and advertising at the point of sale to include digital marketing. The rapid advancements in technology and changes in market dynamics have contributed to this growth (Mort & Drennan, 2002). Chaffey et al. (2019) describe digital marketing as communication supported through content and interactive services provided by various digital technology platforms. The Digital Marketing Institute (DMI) outlines it as utilizing digital technologies to create a comprehensive, focused, and measurable communication strategy. Digital Marketing is divided into Internet Marketing, which includes online channels such as social media and web banners, and Non-Internet Marketing, which involves offline techniques such as MMS and video marketing (Atshaya & Rungta, 2016). Digital Marketing also positively impacts cost efficiency by maintaining effective information delivery to customers when businesses introduce their best products (Dwivedi et al., 2020).

#### Brand strength

Brand strength measures a brand's ability to generate customer loyalty (Rocha,2012). It is an economic asset of the brand that describes the current value of future ownership benefits (Birkin, 1994; Sinclair & Keller, 2014). The brand strength model is used to determine the value of a brand based on the assumption that a stronger, more reliable brand will generate future income with less risk (Rocha, 2012). Building a strong brand relies crucially on establishing enduring brand-customer relationships (Kollmann & Suckow, 2008). Brand strength is a tool that conveys customer online evaluation and impacts sales volume layer by layer (Ho-Dac et al., 2013). Consumer behavior impacts brand strength based on the image when consumers develop personal and novel activities related to the brand (Rindell et al., 2011). Customer-based measures of brand strength help uncover customer segments and analyze market reactions to assumed changes in the market (François & MacLachlan, 1995).

#### Brand loyalty

Brand loyalty is the result of overall customer satisfaction. Therefore, loyal customers are satisfied and motivated to purchase products and services (Al-Dmour et al., 2019). Aspects of customer loyalty are categorized into two types: attitude and behavioral aspects (Shammout, 2018). Attitudinal customer loyalty develops based on customer perceptions, emotional consciousness, and purposefulness. These three stages lead to behavioral customer loyalty. Attitudinal loyalty can be described as positive recommendations, word-of-mouth advocacy, repeat purchase intentions, and willingness to pay a premium for specific products or services compared to competitors' offerings (Oliver, 1999; Ong et al., 2016). Co-creation services with business customers improve customer relationships and lead to customer loyalty (Jouny-Rivier et al., 2017). Brand loyalty is when customers continue to buy products repeatedly from the same brand, regardless of whether competitors also offer the product similar products or services. Don't just keep interacting and buying from the same brand, customers also express positive emotions towards that brand.

#### Brand sustainability

Brand Sustainability is demonstrated by a business's ability to deliver superior value to the market that no competitor can replicate. This superior value can be manifested in lower prices, higher quality, or some unique differentiation (Porter, 1985). A sustainable brand is the ability of a brand to continue growing and thriving over time without being destroyed, emphasizing that Brand Sustainability is not just about long-term survival, but also the ability to develop and evolve over time (Schultz & Block, 2013).

**Competitive advantage**

Competitive advantage is “the unique position that an organization develops in comparison to its competitors.” Competitive advantage primarily arises from a company's resources and capabilities (Hofer & Schendel, 1978). Sustainable competitive advantage is created by utilizing a company's resources and capabilities, specifically how the company uses and leverages its resources (Porter, 1985). Competitive advantage is the ability of a business to create greater economic value compared to its competitors (Peteraf & Barney, 2003).

### 2.3 Proposed model

#### 2.3.1 The relationship between digital marketing and brand sustainability

Digital marketing allows professionals in the field to target customers more precisely than ever before. It also offers many superior features compared to traditional marketing. One of the standout features of digital marketing is its ability to reach a vast customer base anytime, in any manner, and anywhere (Bellman et al., 2011) Thus, it can be said that digital marketing has helped companies enhance brand value through connection, conversation, and community building (Fetais et al., 2022). As a result, brands can sustainably exist and grow in a competitive market. Therefore, it can be seen that digital marketing plays a crucial role in building brand sustainability. Hence, the research team proposes the hypothesis:

H1: Digital marketing has a positive impact on brand sustainability.

#### 2.3.2 The relationship between digital marketing and brand strength

Digital marketing helps businesses enhance brand strength through networking, conversations, and community building (Krishnaprabha & Tarunika, 2020). Digital marketing underscores that a consistent multisensory marketing strategy has significant potential to create memorable brand experiences, thereby enhancing customer perception and brand strength (Wiedmann et al., 2017). Therefore, it can be argued that digital marketing positively impacts brand strength. Through building brand awareness by providing tools and channels for brands to reach and engage potential customers, creating various experiences through online platforms, the study expects that digital marketing positively impacts brand strength.

H2: Digital marketing positively influences brand strength.

#### 2.3.3 The relationship between digital marketing and competitive advantage

Digital marketing offers significant benefits including faster response times, higher response rates, global reach, efficient market access and cost-effectiveness, higher conversion rates, 24-hour operation, and ease of campaign tracking and expansion (Chaffey et al., 2019), contributing to a brand's competitive advantage. Additionally, Digital marketing opens new markets for existing companies, creates new business models like virtual organizations, and provides users with easier and more convenient interaction capabilities (Krishnamurthy & Singh, 2005). Digital marketing has also been confirmed to enable organizations to achieve increasing efficiency and effectiveness through customer interaction (Harridge-March, 2004). Therefore, the research proposes the hypothesis:

H3: Digital marketing has a positive impact on competitive advantage.

#### 2.3.4 The relationship between brand strength and brand loyalty

Brand strength builds customer trust in the brand (Urde, 1994; Aaker, 1996), leading to repeat purchases (Aaker, 1996; Veloutsou, 2015) and positive word-of-mouth advertising (Kollmann & Suckow, 2008; Rosenbloom & Haefner, 2009; Yadav & Rahman, 2018). Thus, the strength of the relationship between the brand and customers influences behavioral intentions, and brand attachment has been shown to significantly impact future purchasing behavior (Esch et al., 2006). A strong brand strength is a predictor of brand loyalty (Veloutsou, 2015; Salinas, 2016). Therefore, the study expects that brand strength will positively influence brand loyalty.

H4: Brand strength positively affects Brand Loyalty.

#### 2.3.5. The relationship between brand strength and brand sustainability

Brand strength is a crucial tool for businesses to better understand their brand. It provides insights into strengths and weaknesses in areas such as consumer perception, customer loyalty, and brand competitiveness (Rocha, 2012).

Strong brands are closely linked to positive business outcomes, as they tend to attract more consumer choices, generate higher profits, and are more resilient against competitors (Aaker, 1996; Birkin, 1994; Tiwari, 2010). Strong brands also lead to cost leadership and differentiation, allowing businesses to negotiate better prices from suppliers and charge higher prices for their products or services. Additionally, strong brands can attract more loyal customers who are less price-sensitive, helping to create a sustainable competitive advantage (Aaker, 1996; Kotler, 2011). Furthermore, brand strength helps develop a solid customer base, driving repeat purchases and long-term profitability (Wang & Jiang, 2019). In conclusion, brand strength plays a vital role in a business's success, leading to sustainable demand and profits, cost leadership, differentiation, and a strong customer base. Therefore, it is expected that brand strength positively impacts brand sustainability.

H5: Brand strength positively impacts brand sustainability.

**2.3.6 The relationship between brand strength and competitive advantage**

Brands can be classified into weak and strong brands based on brand strength factors, with strong brands characterized by high brand recognition, good reputation, and a strong connection between the brand and customers' minds (Keller, 1993; Wang & Barnes, 2017). Strong brands provide key differentiators among competitive products, enhance perceptions of service quality among buyers, and contribute to the financial effectiveness of sellers (Wang & Barnes, 2017; Ballantyne et al., 2006; Kumar et al,. 2014). Therefore, Brand Strength influences the competitive advantage of a business by enhancing users' perceptions of the brand's benefits compared to others and the financial effectiveness of brands with varying strengths. Based on the statements above, the research expects that Brand Strength will have a positive relationship with the brand's competitive advantage.

H6: Brand strength positively influences competitive advantage.

**2.3.7 The relationship between brand loyalty and brand sustainability**

A market-leading brand has a good opportunity to maintain brand recognition and trust, which contributes to the brand's sustainability (Vukasovič, 2012). Brand loyalty leads to customer trust in the brand, resulting in repeat purchases and positive word-of-mouth. Therefore, brand loyalty is a tool ensuring sustainable demand and profitability for any brand in the future (Aaker, 1996; Birkin, 1994; Tiwari, 2010). A large number of loyal customers globally contribute to the brand's sustainability (Saroha & Diwan, 2020); thus, in the global service economy, brand loyalty positively impacts brand sustainability (Alam, 2002). Brand loyalty effectively maximizes revenue towards brand sustainability (Panneer Selvam et al., 2010).

H7: Brand loyalty has a positive impact on brand sustainability.

**2.3.8 The relationship between customer loyalty and competitive advantage**

Brand loyalty is the willingness of customers to continue purchasing a company's goods and services over an extended period and voluntarily recommend the company's products to friends and colleagues (Lovelock et al., 1999). Brand loyalty can be formed as an attitude or favorable belief towards a brand, manifested in emotional attachment to the brand (Dowling & Uncles, 1997). The long-term success (including advantages to compete with other competitors) of a business depends on the loyalty of its foundational customers (Jacoby & Fisher, 1978). The research group proposes the hypothesis:

H8: Brand loyalty positively influences competitive advantage.

**2.3.9 The relationship between digital marketing and customer loyalty**

Many previous studies have shown that factors of digital marketing, such as content quality, customer service, value-added attributes, and constant presence, have a significant impact on customer satisfaction and brand loyalty. Specifically, Khan and Islam (2017) emphasize that these digital marketing factors can enhance customer loyalty by building strong relationships with customers, fostering trust, and promoting long-term engagement. Other studies, such as those by Adam et al. (2020) and Dilham et al. (2018), also confirm that when digital marketing is effectively utilized, particularly in improving customer satisfaction and relationships, it can drive customer loyalty and repeat purchases. Therefore, implementing effective digital marketing strategies not only helps attract customers but also strengthens their loyalty to the brand over the long term. Thus, the authors propose the following relationship:

H9: Digital marketing has a positive impact on brand loyalty.

**2.3.10 The mediating role of brand strength**

Digital marketing is increasingly being adopted by companies to promote products and services, as traditional marketing methods have become less effective in the modern era (Prodea & Constantin, 2023). Through digital marketing activities, businesses increase customer exposure to their brand name, logo, and slogan, thus strengthening brand power (Hoeffler et al., 2003). This highlights the crucial role of digital marketing in building a strong brand.

Brand strength helps companies establish a good reputation and position in customers' minds (Salinas, 2016), boosting competitive advantage. A strong brand enables competitive advantage through cost leadership and service differentiation (Hamdan, 2017). It also enhances brand sustainability by creating a positive perception of the business (Dumitriu et al., 2019). The research group proposes the hypothesis:

H10: Digital Marketing has a positive impact on brand sustainability through brand strength.

H11: Digital Marketing has a positive impact on competitive advantage through brand strength.

**2.3.11 The mediating role of brand loyalty**

Brand loyalty has become a core element in maintaining and developing sustainable relationships with customers (Chaudhuri & Holbrook, 2001). With the rapid growth of digital marketing, promotional strategies through digital channels such as social media, online advertising, and email marketing have had significant effects on customer loyalty (Keller, 2013). This loyalty not only helps increase brand sustainability but also plays a crucial role in creating a competitive advantage in the modern marketplace (Porter, 1985).

The theory of brand loyalty has been widely supported in research as an intermediary factor, bridging the gap between digital marketing and business outcomes, such as brand sustainability and competitive advantage. Specifically, two research hypotheses are proposed:

H12: Digital marketing has a positive impact on competitive advantage through brand loyalty

H13: Digital marketing has a positive impact on brand sustainability through brand loyalty

**2.4 Method**

**Research design**

The objective of this study is to gain a comprehensive understanding of the impact of digital marketing on the sustainability and competitive advantage through the intermediary variable of brand strength in telecommunications businesses.The relationships in the model have been hypothesized and their accuracy will be assessed through the collection of survey samples from telecommunications users in Vietnam.

Through previous studies and theories, the author team has collected observational variables to measure concepts in the proposed research model. However, they found that existing scales in previous studies are not entirely suitable for the current context in Vietnam, given the cultural, economic, and developmental differences from predominantly developing countries. Therefore, a qualitative study was conducted to validate appropriate observational variables to describe the variables in the research model, including digital marketing, brand strength, brand loyalty, brand sustainability, and competitive advantage (Table 1). Next, quantitative research methods was carried out to test the research model.

**Table 1. The original scales of the observed variables**

| Observed variables | Original scales |
|---|---|
| Digital marketing | Dewi & Cangara (2023) (70) |
| Brand strength | Wang & Zhang (2018) (27) |
| Competitive advantage | Lone et al,. (2015) (72) |
| Brand loyalty | Ismail (2017) (73) |

| | |
|---|---|
| Brand sustainability | Ray & Sharma (2020) (13) |

*Source: Compilation by the group of authors*

**Samples and sampling method**

We applied a convenient, non-probability sampling method to explore and observe survey subjects. To align with the theoretical foundation of the research topic, ensuring realism and wide applicability, the subjects chosen for the survey were consumers of telecommunications services residing and working in southern provinces. Survey participants were accessed online through a questionnaire created on Google Form. Data collection lasted for 5 weeks. Instructions emphasized that the study focused solely on individual opinions to minimize bias.

After excluding invalid responses, the authors collected a total of 418 survey responses. Through calculations, the survey obtained a sample size considered good (Hair et al., 2014), ensuring reliability. Therefore, the valid survey sample size used for research data is 418 individuals.

The statistical data shows: there were 182 male respondents, accounting for 43.54%, and 236 female respondents, accounting for 56.46%. There were 213 respondents under 20 years old, making up 50.96%, 143 respondents aged 20-30, accounting for 34.21%, 24 respondents aged 31-40, accounting for 5.74%, and 38 respondents over 40 years old, accounting for the lowest proportion at 9.09%. Regarding income levels, there were 294 respondents earning less than 10 million VND, making up 70.33% of the total respondents; 77 respondents earning between 10 and 20 million VND, accounting for 18.42%; 30 respondents earning between 20 and 30 million VND, accounting for 7.18%; 5 respondents earning between 30 and 40 million VND, accounting for 1.2%; and 12 respondents earning over 40 million VND, accounting for 2.87%.

## III. RESULT AND DISCUSSION

### 3.1. Results of the reliability and validity assessment of the measurement scale:

To verify the reliability of the relationships and variables, we use measurement indicators through Cronbach's alpha coefficient and average variance extracted (AVE) (Table 2). Accordingly, the Cronbach's alpha values are all above the threshold of 0.8 and none exceed 0.95. This indicates that the values in the model have high reliability, and there is a low likelihood of observation variable overlap. Specifically, the Cronbach's Alpha values for variables range from 0.865 (brand sustainability) to 0.907 (brand loyalty), with fluctuations at 0.867 (brand strength), 0.889 (digital marketing), and 0.890 (competitive advantage). It can be seen that these figures are extremely promising, demonstrating that the measures have achieved the necessary reliability for proceeding with subsequent testing steps. Regarding AVE – a measure of how much the observed variables explain the variance of the underlying construct – all values exceed the recommended threshold of 0.5, ranging from 0.643 (digital marketing) to 0.819 (competitive advantage). The lowest AVE value for digital marketing (0.643) suggests that customers' perceptions of digital marketing activities can be diverse, due to differences in how they approach or understand these activities. In contrast, the highest AVE value for competitive advantage (0.819) highlights that customers clearly recognize the distinctiveness in strategies aimed at enhancing the competitiveness of brands in the market. These observations highlight the importance of linking reliability and validity indicators to the theoretical framework. This alignment with theoretical insights reinforces the robustness of the measurement model and provides a solid foundation for subsequent hypothesis testing.

**Table 2. The results of measuring the reliability of the scale and extracting the average variance extracted**

| Research variable | Cronbach's alpha coefficient | Average variance extracted (AVE) |
|---|---|---|
| **Digital marketing** | 0.889 | 0.643 |
| **Brand strength** | 0.867 | 0.655 |
| **Brand loyalty** | 0.907 | 0.782 |
| **Brand sustainability** | 0.865 | 0.778 |
| **Competitive advantage** | 0.89 | 0.819 |

*Source: Analysis results from SmartPLS 4.0 software*

**3.2 Evaluation results of outer loadings**

To assess the convergence validity of the measurement scale, the authors rely on the outer loadings, which are extracted from the variance-covariance matrix. If the outer loadings of a measurement variable are high, it may indicate that the measurement variable converges well with the common underlying construct it seeks to measure. Conversely, if outer loadings have low values, it might suggest that the measurement variable contributes less to capturing the overall shared information and may need reconsideration or removal from the measurement model. Through the analysis, the research team found that all convergence values exceeded the threshold of 0.7 (Table 2), specifically ranging from 0.720 to 0.914. This indicates that the convergence values for variables (digital marketing, brand strength, brand loyalty, brand sustainability, competitive advantage) are consistently ensured.

**Table 3. Evaluation results of outer loadings**

| | **Outer loadings** |
|---|---|
| **Digital marketing (DM00)** | |
| DM01 ← DM00 | 0.817 |
| DM02 ← DM00 | 0.720 |
| DM03 ← DM00 | 0.799 |
| DM04 ← DM00 | 0.843 |
| DM05 ← DM00 | 0.809 |
| DM06 ← DM00 | 0.819 |
| **Brand strength (BS00)** | |
| BS01 ← BS00 | 0.807 |
| BS02 ← BS00 | 0.852 |
| BS03 ← BS00 | 0.868 |
| BS04 ← BS00 | 0.729 |
| BS05 ← BS00 | 0.784 |
| **Brand loyalty (BL00)** | |
| BL01 ← LTT00 | 0.914 |
| BL02 ← LTT00 | 0.853 |
| BL03 ← LTT00 | 0.896 |
| BL04 ← LTT00 | 0.891 |
| **Competitive advantage (CA00)** | |
| CA01 ← CA00 | 0.904 |
| CA02 ← CA00 | 0.905 |
| CA03 ← CA00 | 0.906 |
| **Brand sustainability (SB00)** | |

| | |
|---|---|
| SB02 ← SB00 | 0.865 |
| SB03 ← SB00 | 0.906 |

*(Source: Results derived from the analysis using SmartPLS 4.0 software)*

**3.3 The results of the discriminant validity test**

Continuing the examination of discriminant validity, which assesses the extent to which factors are distinct and unrelated to each other. In Table 4, the discriminant validity of the measurement scale appears highly satisfactory as all values are below the threshold of 0.9 (Henseler et al., 2016), specifically ranging from 0.897 or lower. Thus, all factors meet the criteria for discriminant validity.

**Table 4. The results of the discriminant validity test**

| | BS00 | DM00 | CA00 | BL00 | SB00 |
|---|---|---|---|---|---|
| **BS00** | | | | | |
| **DM00** | 0.786 | | | | |
| **CA00** | 0.820 | 0.846 | | | |
| **BL00** | 0.868 | 0.740 | 0.756 | | |
| **SB00** | 0.846 | 0.809 | 0.897 | 0.782 | |

*(Source: Results derived from the analysis using SmartPLS 4.0 software)*

Upon conducting analysis and statistically testing the gathered data, the research team observed that the reliability, convergence, and discriminant validity of the measurement scale all meet the necessary conditions for the study concepts. Therefore, to validate the research hypotheses, both the measurement scales and research concepts were utilized.

**3.4 The significance testing of path coefficients and evaluation of mediating factors**

Initially, the authors conducted tests for multicollinearity among the independent variables. In cases of collinearity or multicollinearity, regression coefficients and p-values for significant effects may be distorted, leading to erroneous conclusions about relationships within the model. According to Hair et al. (2019), a VIF value of < 5 suggests the absence of multicollinearity issues in the research model (Hair et al., 2011). In the proposed research model, the authors found that all VIF values (Table 5) were below 3 following the tests, with the highest value of 2.868 observed in the relationships between brand strength and competitive advantage, as well as brand strength and brand sustainability. Consequently, it can be inferred that multicollinearity issues are unlikely to occur.

Based on Table 5, it can be seen that all relationships have mutual impacts on each other. The statistical significance of a relationship's impact (path coefficient) depends on its standard error. The authors assess this based on the p-value for all path coefficients in the structural model. As the commonly used significance level is 5% (0.05), p-values are compared against this threshold. It can be observed that the p-values for all relationships are less than 0.05. Specifically, the values range from 0.000 to 0.031, indicating that all relationships are statistically significant. The research team conducted an experiment on the presence of mediating roles in the model (Table 5). With a p-value of less than 0.05, the model demonstrates the mediating roles of brand strength and brand loyalty.

**Table 5. The results of testing the significance level of the path coefficients, multicollinearity test and evaluation of mediating factors**

| Hypothesis | Relationship | VIF | Original Sample | $f^2$ | t-value | P-value | Result |
|---|---|---|---|---|---|---|---|
| **H1** | DM00 → SB00 | 2.098 | 0.339 | 0.151 | 6.191 | 0.000 | Accept |
| **H2** | DM00 → BS00 | 1.000 | 0.690 | 0.907 | 18.742 | 0.000 | Accept |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| **H3** | DM00 → CA00 | 1.907 | 0.447 | 0.274 | 9.273 | 0.000 | Accept |
| **H4** | BS00 → BL00 | 1.907 | 0.594 | 0.504 | 11.715 | 0.000 | Accept |
| **H5** | BS00 → SB00 | 2.868 | 0.345 | 0.114 | 5.754 | 0.000 | Accept |
| **H6** | BS00 → CA00 | 2.868 | 0.290 | 0.084 | 5.150 | 0.000 | Accept |
| **H7** | BL00 → SB00 | 2.721 | 0.202 | 0.041 | 3.436 | 0.001 | Accept |
| **H8** | BL00 → CA00 | 2.721 | 0.158 | 0.026 | 2.756 | 0.006 | Accept |
| **H9** | DM00 → BL00 | 1.907 | 0.259 | 0.096 | 5.007 | 0.000 | Accept |
| **H10** | DM00 → BS00 → SB00 | - | 0.238 | - | 5.205 | 0.000 | Accept |
| **H11** | DM00 → BS00 → CA00 | - | 0.200 | - | 2.161 | 0.031 | Accept |
| **H12** | DM00 → BL00 → CA00 | - | 0.041 | - | 3.303 | 0.001 | Accept |
| **H13** | DM00 → BL00 → SB00 | - | 0.052 | - | 2.577 | 0.000 | Accept |

*(Source: Results derived from the analysis using SmartPLS 4.0 software)*

The results of the significance testing of path coefficients (Table 5) affirm the importance of digital marketing, brand strength, and brand loyalty in building competitive advantage and brand sustainability. First, the relationship between digital marketing (DM00) and dependent variables is clearly demonstrated through hypotheses H1, H2, and H3. Specifically, DM00 → SB00 (β = 0.339, p-value = 0.000) indicates that digital marketing has a significant impact on brand sustainability. This aligns with the perspective of Bellman et al. (2011) and Fetais et al. (2022), where digital marketing helps strengthen customer connections through online channels, thereby promoting sustainable brand development. Similarly, the strong impact of DM00 → BS00 (β = 0.690, p-value = 0.000) supports Wiedmann et al.'s (2017) perspective that digital marketing underscores that a consistent multisensory marketing strategy has significant potential to create memorable brand experiences, thereby enhancing customer perception and brand strength. Furthermore, DM00 → CA00 (β = 0.447, p-value = 0.000) shows that digital marketing plays a critical role in creating competitive advantage, consistent with Chaffey et al.'s (2019) perspective on the cost-efficiency and rapid customer reach enabled by digital marketing. Next, the role of brand strength (BS00) is highlighted through the relationships in H4, H5, and H6. BS00 → BL00 (β = 0.594, p-value = 0.000) confirms that brand strength has a significant influence on brand loyalty, aligning with Veloutsou's (2015) perspective, which asserts that a strong brand fosters trust and encourages customers to return for brand loyalty. Moreover, the impact of BS00 → SB00 (β = 0.345, p-value = 0.000) and BS00 → CA00 (β = 0.290, p-value = 0.000) also confirms that brand strength acts as a variable in enhancing brand sustainability and competitive advantage. These results reinforce Aaker's (1996) perspective that a strong brand not only attracts customers but also reduces price sensitivity, paving the way for long-term and sustainable growth. Furthermore, brand loyalty (BL00) is also demonstrated to be a crucial factor through hypotheses H7 and H8. The relationships BL00 → SB00 (β = 0.202, p-value = 0.001) and BL00 → CA00 (β = 0158, p-value = 0.006) support the perspectives of Aaker (1996) and Vukasovič (2012), which suggest that brand loyalty helps build competitive advantage and ensures long-term demand, thus creating stability for the brand in a highly competitive environment. Finally, hypotheses H10, H11, H12 and H13 are accepted. These prove that there are the mediating roles of brand loyalty and brand strength in the relationship between digital marketing and both sustainable branding and competitive advantage. This is the contribution of this research.

Overall, these results not only align with the researchers presented earlier but also reinforce the mediating roles of brand strength and brand loyalty in the relationship between digital marketing, brand sustainability, and competitive advantage. This underscores the importance of investing in digital marketing and brand building in the telecommunications industry.

**3.5 The results of evaluating the coefficient of R-square, and R-square adjusted**

Based on A Primer on Partial Least Squares Structural Equation Modeling (PLS-SEM), assessing the structural

model is a crucial criterion in the PLS-SEM method, and it is suggested to evaluate it through the coefficient of determination ($R^2$). The explanatory power of $R^2$ increases as its values get higher, typically ranging from 0 to 1. Values such as 0.75, 0.50, and 0.25 are considered substantial, moderate, and weak, respectively (Hair et al., 2011). So, based on the results in Table 6, all observed variables have an average predictive ability. Therefore, the relationships in the research model exhibit an explanation level suitable for the impact of digital marketing techniques. The adjusted R-square is utilized to assess the importance of independent variables. If the adjusted R-square value is less than 0.02, the impact is extremely small or negligible. If it falls within the range of 0.02 to 0.15, the impact is considered small, from 0.15 to 0.35 is considered moderate, and equal to or greater than 0.35 is considered substantial. Therefore, based on Table 6, all the adjusted R-square values for the variables are greater than 0.35. This indicates that the relationships proposed in the model have a substantial impact.

**Table 6. The coefficient of R-square and R- square adjusted**

| | R-square | R-square adjusted |
|---|---|---|
| **BS00** | 0.476 | 0.474 |
| **CA00** | 0.651 | 0.649 |
| **BL00** | 0.633 | 0.631 |
| **SB00** | 0.635 | 0.633 |

## IV. CONCLUSION

This study contributes to both the theory and practice of digital marketing while providing clear practical implications for businesses. First, the findings confirm that digital marketing has a significant positive impact on brand sustainability and competitive advantage. This reinforces the theoretical foundation of digital marketing, emphasizing the importance of leveraging modern technology to enhance brand performance and maintain a competitive edge in the market. The study offers a fresh perspective on digital marketing by focusing on building long-term customer relationships and fostering brand loyalty, which ultimately creates sustainable business value. Additionally, the study highlights the mediating role of brand loyalty and brand strength in the relationship between digital marketing, brand sustainability, and competitive advantage. These findings not only suggest that brand loyalty and brand strength explain the effects of digital marketing strategies but also provide practical insights for businesses to develop more effective marketing approaches. Specifically, companies should focus on improving customer experience, strengthening emotional connections, and reinforcing brand value through digital channels such as social media, websites, and online communication tools. Furthermore, the study offers specific recommendations for telecommunications companies in Vietnam. To maintain sustainability and competitive advantage, businesses should maximize the potential of digital marketing by personalizing customer experiences, utilizing advanced technologies such as AI and big data analytics, and developing creative content tailored to different target audiences. These strategies not only enhance marketing effectiveness but also establish long-term brand differentiation in a highly competitive market. In this context, the study not only enriches the theoretical foundation of digital marketing but also provides actionable strategies for businesses to optimize their marketing efforts, enhance brand loyalty, and strengthen brand equity. By implementing these strategies, companies can achieve sustainable growth and long-term success in the digital era.

In addition to its theoretical contributions, this study provides important practical implications. First, customer loyalty is a key factor that helps businesses increase revenue and achieve sustainable growth. To enhance customer loyalty, businesses need to improve customer experience at all touchpoints, from information access to post-sales services. Second, brand strength is a crucial factor for Vietnamese telecommunications companies to create a competitive advantage. Digital marketing helps build brand strength by enhancing presence on digital channels, creating professional websites, engaging on social media, and using email marketing to provide information and promotions. Creative content, tailored to target customers, such as articles, videos, and high-quality images, along with an engaging brand story, strengthens brand recognition and creates emotional connections with customers. Third, businesses need a

well-structured digital marketing strategy, clearly defining goals, target audiences, and messaging. Selecting appropriate channels, creating high-quality content, and tracking and evaluating campaign effectiveness are essential to improve performance. Fourth, businesses should leverage advanced technologies such as AI and big data to analyze customer behavior, use chatbots for 24/7 support, and utilize online advertising tools to reach customers effectively. Measuring KPIs such as website traffic, conversion rates, and sales revenue helps optimize the strategy. Fifth, training human resources in digital marketing is crucial. Businesses need to invest in research, optimize service costs, and implement community-focused campaigns. This helps build a sustainable brand, create a competitive advantage, and generate high profits. Digital marketing allows businesses to interact and connect with customers through channels such as social media, email, and messaging, while personalizing the experience based on behavioral data, creating a sense of being cared for and increasing customer loyalty.

In conclusion, this study not only enriches our understanding of the impact of digital marketing on brand effectiveness but also proposes new theoretical models focusing on the mediating role of brand loyalty, brand strength, and relational factors in digital marketing. These contributions pave the way for future research on the intersection of digital marketing, brand management, and business strategy.

**ABSTRACT**

Urban areas serve as vital centers for social, economic, and environmental activities, making them crucial for reimagining our future in terms of sustainable development. This study aims to explore the interplay between place branding techniques and green marketing concepts in fostering sustainable urban regeneration. By focusing on Southeast Asian cities, it seeks to contribute to the discourse on local-level sustainable transformation by investigating how these cities can leverage their unique characteristics and sustainable initiatives to cultivate attractive place identities. Additionally, the study will assess the effectiveness of these strategies in promoting sustainable development and identify key factors contributing to the success of these cities. It also delves into the significant precursors influencing urban revitalization, such as social equity, sustainable development, and economic prosperity. Drawing from various literature reviews, this article offers insights into best practices for crafting sustainable place brands that resonate with both residents and visitors, thereby fostering a more socially and environmentally conscious urban landscape. Ultimately, it provides a comprehensive framework for exploring avenues to reimagine our collective future and achieve sustainable transformation.

*Key words*: “Place branding”, “sustainability”, “green marketing”, “urban regeneration”, “Southeast Asia cities digitalization”.

## I. INTRODUCTION

### 1.1 Background of the study

In an era marked by social injustice, environmental degradation, and rapid urbanization, it becomes imperative for cities across Southeast Asia and beyond to prioritize sustainable urban regeneration. A promising avenue to tackle these multifaceted challenges lies in sustainable place branding, which involves strategically communicating a location's distinctive attributes and values to attract residents, visitors, and investments while fostering social equity and environmental stewardship (Kavaratzis & Kalandides, 2015). Concurrently, green marketing principles—emphasizing the promotion of eco-friendly products, services, and behaviors—offer valuable strategies for promoting sustainability initiatives and engaging consumers (Polonsky, 2011).

Southeast Asia offers significant potential alongside unique challenges concerning sustainable place branding and urban regeneration. While cities like Bangkok, Singapore, and Kuala Lumpur rank among the world's top tourism destinations, many others in the region grapple with rapid urbanization, population growth, and economic development, leading to issues such as traffic congestion, social inequality, and environmental degradation (Hashmi et al., 2021). For instance, as of 2024, the population of the Manila metro area stands at 14,942,000, reflecting a 1.87% increase from the previous year, while Jakarta's population reached 11,436,000, marking a 1.66% increase over the same period. Consequently, there is a growing need to implement sustainable place branding strategies that promote social inclusion, environmental stewardship, and economic resilience. However, Southeast Asia also presents distinct challenges, including cultural diversity, administrative complexities, and resource constraints, which may impede the effective execution of sustainable place branding efforts (Kavaratzis, 2012).

Comprehensive and integrated approaches to urban regeneration face obstacles such as competing development

agendas, fragmented governance structures, and limited access to data and resources (Booth & Richardson, 2001). Furthermore, cultural perspectives on sustainability and green marketing vary among nations and communities in the region, necessitating tailored approaches to stakeholder engagement and the dissemination of sustainability messages (Salleh et al., 2022). Despite these challenges, Southeast Asia presents unique opportunities for innovation and collaboration in sustainable place branding, with growing interest and funding for sustainable development projects at local, regional, and national levels (Holzhacker & Agussalim, 2019). By leveraging the region's cultural diversity, economic dynamism, and commitment to sustainability, Southeast Asian cities can fully harness the benefits of sustainable place branding, stimulating urban renewal and fostering a more resilient and livable future.

The concept of stakeholder participation and co-creation serves as a foundational element in addressing the issues explored in this study, as it plays a pivotal role in determining the effectiveness and longevity of sustainable place branding strategies (Kavaratzis & Kalandides, 2015). Stakeholder engagement, which involves actively involving a diverse range of stakeholders such as locals, businesses, government entities, and non-profit organizations in the co-design and implementation of place branding projects, is essential. By engaging stakeholders in meaningful communication and collaboration, cities can ensure that sustainability objectives align with the needs, values, and priorities of local communities. This not only enhances the legitimacy and relevance of place branding initiatives but also maximizes their long-term impact. Furthermore, methodologies emphasizing co-creation underscore the importance of involving stakeholders in participatory decision-making processes, empowering them to contribute their ideas, resources, and expertise to the development of sustainable place branding strategies (Reed, 2008).

**1.2 Research Problem**

While the importance of sustainability in urban development is increasingly recognized, there remains a theoretical gap regarding the effective integration of green marketing principles into place branding strategies to facilitate urban regeneration. Despite extensive theoretical frameworks existing for both fields independently, there is a notable scarcity of empirical research that systematically investigates the convergence of sustainable place branding and green marketing within the context of urban regeneration initiatives (Bianchi & Pike, 2011). This gap in the literature hinders the development of comprehensive strategies that capitalize on the synergies between green marketing and sustainable place branding to address the environmental, social, and economic challenges faced by metropolitan areas. Additionally, as highlighted by Kavaratzis and Kalandides (2015), theoretical models often overlook the complex network of stakeholders involved in urban regeneration initiatives, as well as the contextual and temporal dynamics that shape the effectiveness of sustainability messaging across different geographical contexts and over time. Consequently, there is a pressing need for empirical research to bridge the theoretical gap between green marketing and sustainable place branding.

Furthermore, cities aiming to demonstrate tangible results of their sustainability efforts encounter practical barriers due to limited access to data and resources for assessing the impact of sustainable place branding projects (Crippa et al., 2023). To address these practical obstacles, stakeholders must collaborate closely to develop useful toolkits and resources. Additionally, establishing robust frameworks for measurement and evaluation is crucial to monitor the effectiveness of sustainable place branding tactics in achieving urban regeneration objectives. Only through concerted efforts to overcome these pragmatic challenges can cities successfully implement sustainable place branding strategies that contribute to meaningful urban regeneration.

The integration of green marketing principles into sustainable place branding strategies to support urban regeneration is an area that needs more theoretical understanding and practical application, despite the growing recognition of the significance of sustainability in urban development (Bianchi & Pike, 2011; Zenker & Petersen, 2017). Addressing this gap, the aim of this study is to explore the intersection of green marketing and sustainable place branding with urban regeneration. The objective is to provide actionable strategies and best practices for cities seeking to enhance their competitiveness in the global market while achieving sustainability goals. This article also delves into the concept of sustainable place branding, with a specific focus on the role of green marketing in urban regeneration—a topic rooted in the significant challenges mentioned earlier. Additionally, it elaborates on three key sustainability impacts: economic development, social equity, and environmental sustainability.

## II. LITERATURE REVIEW

The literature review section of this article explores the foundational concepts and empirical research surrounding sustainable place branding strategies, green marketing principles, and urban regeneration, particularly within the context of Southeast Asian cities.

### 2.1. Place Branding

Place branding has emerged as a pivotal strategy for cities aiming to distinguish themselves in the global arena, attracting investment, tourism, and talent (Zenker & Braun, 2010). As cities increasingly prioritize sustainable development, they integrate sustainability principles into their branding endeavors, striving to cultivate identities that are economically competitive and environmentally responsible (Bianchini & Landry, 1995). This involves a conscious effort by cities and regions to shape and promote their image, identity, and reputation to attract citizens, tourists, investors, and businesses. For instance, the Tourism Authority of Thailand (TAT) has led the "Amazing Thailand" campaign, positioning Bangkok as a vibrant gateway to the country's rich cultural heritage, diverse culinary scene, and bustling urban life. Similarly, "Enjoy Jakarta" serves as a prominent theme in the place branding efforts of Jakarta, the capital city of Indonesia. This slogan encapsulates the city's vibrant culture, diverse attractions, and dynamic urban lifestyle, aiming to attract tourists, investors, and businesses to Jakarta. Through initiatives such as the "Enjoy Jakarta" campaign, the Jakarta Tourism and Creative Economy Office (JTCO) promotes the city's rich cultural heritage, culinary delights, and modern amenities to both domestic and international audiences. Place branding involves deliberately communicating a place's unique qualities, promises, and ideals to establish a favorable reputation and gain a competitive edge in the international market.

In Southeast Asian cities, place branding incorporates sustainability principles to address pressing urban issues such as pollution, traffic congestion, and social inequality, while also highlighting the city's cultural heritage, natural resources, and economic opportunities (Anholt, 2005). These cities leverage their historical sites, culinary offerings, and cultural diversity to differentiate themselves in the global market and create a distinct sense of place (Zenker & Braun, 2017). However, place branding in Southeast Asia goes beyond mere promotion and advertising; it involves engaging stakeholders in the co-creation of a shared vision and narrative for the city's future, including businesses, residents, government agencies, and civil society organizations (Mackrodt & Kalandides, 2014). By adopting an inclusive and participatory approach to place branding, Southeast Asian cities can harness the collective creativity, skills, and resources of multiple stakeholders to develop sustainable solutions to urban challenges and enhance their global competitiveness.

### 2.2 Sustainability

Sustainability has become increasingly vital for urban development, driven by concerns about environmental degradation, resource depletion, and climate change (Bulkeley & Betsill, 2005). In response, cities are progressively integrating sustainability principles into their planning and governance frameworks, aiming to create resilient, equitable, and environmentally responsible urban environments (Bulkeley & Castán Broto, 2013). The Singapore government has implemented various policies and programs across sectors like urban planning, transportation, energy, and waste management to promote sustainability. For example, the Sustainable Singapore Blueprint outlines long-term goals and strategies for achieving a sustainable and livable environment (National Climate Change Secretariat, 2014). At its core, sustainability means meeting present needs without compromising the ability of future generations to meet their own, encompassing environmental, social, and economic dimensions.

In the context of place branding, sustainability involves incorporating principles of social justice, economic growth, and environmental preservation into the development and promotion of cities or regions. Fudge and Fien (2015) describe sustainability in Southeast Asian cities as a multifaceted strategy for urban development that seeks to balance social justice, environmental conservation, and economic feasibility. In Southeast Asian contexts, sustainability encompasses measures aimed at enhancing long-term resilience, livability, and inclusivity, while addressing pressing urban challenges such as pollution, traffic congestion, inadequate infrastructure, and social inequality. This involves initiatives focused on improving environmental sustainability through the reduction of greenhouse gas emissions, conservation of natural resources, and promotion of environmentally friendly infrastructure and transportation options

(Webster, 1995).

Moreover, sustainability in Southeast Asian cities encompasses efforts to address poverty, inequality, and access to essential services such as healthcare, education, and housing, thereby promoting social inclusion and community cohesion (Croissant & Walkenhorst, 2019). Additionally, economic sustainability—encompassing initiatives to support economic growth, job creation, and entrepreneurship while ensuring an equitable distribution of income and opportunities—is a critical aspect of urban development in Southeast Asia (Parker, 2015). By embracing a holistic approach to sustainability that integrates environmental, social, and economic components, Southeast Asian cities can enhance their resilience, competitiveness, and quality of life for present and future generations.

**2.3 Green Marketing Principles**

Green marketing principles provide a strategic framework for cities to communicate their sustainability commitments to stakeholders and encourage consumer preferences for eco-friendly products and services (Peattie & Crane, 2005). By integrating green marketing strategies into place branding initiatives, cities can bolster their reputation as sustainable destinations while promoting environmental stewardship (Govers & Go, 2009). Green marketing entails the advertising and promotion of goods, services, or projects that align with sustainability objectives or benefit the environment. This encompasses tactics such as waste minimization, sustainable packaging, renewable energy usage, environmentally friendly product design, and responsible consumption. In the context of place branding, green marketing concepts are utilized to inform locals, tourists, and stakeholders about a city's sustainability programs, policies, and achievements. In Southeast Asian cities, green marketing principles are applied through various tactics and methods to reduce environmental degradation and promote sustainable development (Baktash & Talib, 2019). These strategies play a crucial role in encouraging eco-friendly consumption habits, reducing resource consumption, and minimizing waste production in the face of serious environmental challenges posed by rapid urbanization, industrialization, and population growth in the region (Davis, 2015).

Examples of green marketing strategies in Southeast Asian cities include corporate social responsibility (CSR) programs, product certification, and eco-labeling aimed at improving firms' environmental performance and influencing consumer behavior (Huang et al., 2024). Additionally, efforts to encourage sustainable lifestyles, raise public awareness of environmental issues, and promote community involvement in sustainability projects are integral components of green marketing strategies in Southeast Asia (Rao, 2002). By implementing these strategies, Southeast Asian cities can address environmental issues, enhance their competitiveness, attract investment, and position themselves as regional leaders in sustainable development.

**2.4 Urban Regeneration**

Urban regeneration involves revitalizing and renewing urban areas to enhance economic, social, and environmental well-being (Roberts & Sykes, 2000). Sustainable urban regeneration takes this concept further by integrating place-based strategies that prioritize environmental sustainability, social equity, and economic prosperity (Evans & Shaw, 2004). It encompasses the revival, redevelopment, and rejuvenation of urban areas, aiming to address environmental, social, and economic challenges while fostering vibrant, sustainable communities. Singapore provides a notable example of this approach, renowned for its comprehensive and innovative urban planning and development efforts. Initiatives such as the redevelopment of former industrial areas like Tanjong Pagar into vibrant mixed-use districts and the rejuvenation of public housing estates through programs like Remaking Our Heartland have transformed the city-state's urban landscape (Urban Redevelopment Authority, 2020). Sustainable place branding techniques have significant potential to contribute to urban regeneration by attracting investment, engaging communities, promoting environmental stewardship, and enhancing overall quality of city life.

In Southeast Asian cities, urban regeneration involves deliberate efforts to revive and transform metropolitan areas, addressing social, cultural, and economic issues while promoting sustainable growth and improving the standard of living for residents (Roberts & Sykes, 2000). Urban regeneration is essential for revitalizing deteriorating neighborhoods, enhancing urban resilience, and fostering inclusive growth in Southeast Asia, where rapid urbanization, population growth, and infrastructural shortages are prevalent (Roy & AlSayyad, 2004). To tackle poverty, unemployment, and social exclusion, a combination of social and economic interventions alongside physical

interventions—such as infrastructure upgrades, brownfield redevelopment, and the creation of green spaces—are employed (Vanolo, 2018).

Furthermore, to ensure that redevelopment projects support long-term environmental, social, and economic sustainability, urban regeneration in Southeast Asian cities often integrates sustainability principles such as eco-friendly design, energy efficiency, and community engagement (Ali et al., 2021). By incorporating sustainability concepts into urban regeneration initiatives, Southeast Asian communities can develop dynamic, resilient, and livable urban environments that enhance their competitiveness and attractiveness as places to live, work, and invest.

### 2.5 Underpinning Theory

Stakeholder Theory provides a crucial framework for examining sustainable place branding strategies, especially within the context of urban regeneration in Southeast Asian cities. According to Freeman (1984), stakeholders are individuals or groups who can influence or are influenced by an organization's objectives. In the realm of sustainable place branding, stakeholders encompass a diverse range of actors, including local residents, businesses, government agencies, non-governmental organizations (NGOs), and tourists. These stakeholders possess varying interests, expectations, and power dynamics that shape the development and implementation of place branding initiatives aimed at urban regeneration. By employing Stakeholder Theory, researchers can identify and analyze the multifaceted perspectives, needs, and concerns of stakeholders to inform the creation of effective and inclusive sustainable place branding strategies.

In the context of this study, Stakeholder Theory is applied to understand and engage the diverse stakeholders involved in developing and implementing sustainable place branding strategies. For instance, local residents are crucial stakeholders whose perspectives and needs must be considered to ensure the legitimacy and acceptance of place branding initiatives within the community. Through surveys, focus groups, or participatory workshops with residents, researchers can gather insights into their perceptions of the city's identity, values, and priorities. This information can then guide the development of place branding strategies that align with local aspirations (Buhmann & Ingenhoff, 2015).

Similarly, businesses operating within the city are essential stakeholders whose support and engagement are vital for the success of place branding efforts. Researchers can collaborate with local businesses through interviews, forums, or partnerships to understand their sustainability practices, marketing strategies, and preferences for branding initiatives. By aligning place branding strategies with the interests and objectives of businesses, researchers can foster buy-in and collaboration, leading to more effective and sustainable urban regeneration outcomes (Freeman, 1984).

Government agencies and NGOs also play critical roles as stakeholders in sustainable place branding initiatives. Researchers can engage with these organizations through interviews, policy analysis, or collaborative projects to understand their mandates, priorities, and initiatives related to urban regeneration and sustainability. By incorporating the perspectives and expertise of government agencies and NGOs into place branding strategies, researchers can leverage their resources, networks, and credibility to amplify the impact of branding efforts and drive positive change at the local level (Zenker & Braun, 2010).

## III. RESULT AND DISCUSSION

### 3.1 The Antecedents

The integration of green marketing principles in urban regeneration across Southeast Asian cities is driven by three key factors: environmental sustainability, social equity, and economic development.

#### 3.1.1. Environmental Sustainability

Combining environmental sustainability with green marketing and urban regeneration programs presents an opportunity to create dynamic and resilient urban settings in Southeast Asian cities. Green marketing techniques can effectively promote ecologically friendly goods, services, and behaviors among locals, businesses, and tourists. These techniques include eco-labeling, product certification, and corporate social responsibility (CSR) initiatives (Rao, 2002). By highlighting the environmental benefits of sustainable goods and services, green marketing can stimulate demand for eco-friendly alternatives and encourage consumer adoption of environmentally responsible behaviors.

Simultaneously, urban regeneration initiatives aimed at improving environmental sustainability and enhancing

livability may incorporate green infrastructure, energy-efficient architecture, and sustainable transport systems (Ali et al., 2021). For instance, brownfield rehabilitation initiatives have the potential to transform abandoned industrial sites into parks, green spaces, and mixed-use developments, mitigating urban heat islands, improving air quality, and enhancing community well-being (Vanolo, 2018). By integrating green marketing concepts into urban regeneration activities, cities can effectively communicate the environmental benefits of redevelopment projects to residents and stakeholders, generating support and involvement.

Furthermore, aligning green marketing campaigns with urban regeneration goals can enhance a city's attractiveness as an eco-friendly destination, attract investment, and strengthen its place branding as an environmentally conscious urban hub (Baktash & Talib, 2019). Through the integration of green marketing and urban regeneration, Southeast Asian cities can create a win-win scenario where social well-being, economic development, and environmental sustainability reinforce each other.

Singapore provides a compelling example of how green marketing techniques have been successfully integrated into urban renewal initiatives to support environmental sustainability and elevate the city's profile. The Gardens by the Bay project, a flagship endeavor in Singapore's urban regeneration efforts, leverages green marketing strategies to inform both locals and tourists about the environmental advantages of the development (Chang, 2006). Sustainable design features incorporated into The Gardens by the Bay, such as rainwater harvesting systems, energy-efficient lighting, and native plant species, not only reduce energy and water consumption but also promote biodiversity and air quality in the surrounding area.

Furthermore, Singapore's green marketing campaigns extend beyond individual projects to encompass city-wide sustainability initiatives. The city-state has implemented green building guidelines, including the Green Mark program offered by the Building and Construction Authority, which incentivizes developers to incorporate eco-friendly elements into their structures (Siva et al., 2017). Moreover, Singapore promotes the use of eco-friendly transportation options, such as its extensive public transportation network and the adoption of electric vehicles, to reduce carbon emissions and alleviate traffic congestion (Siva et al., 2017). By merging green marketing principles with city-wide sustainability programs and urban regeneration projects like the Gardens by the Bay, Singapore has effectively enhanced its environmental sustainability while bolstering its reputation as a green and livable city in Southeast Asia.

#### 3.1.2. Social Equity

Encouraging inclusive and sustainable development in Southeast Asian cities necessitates integrating social equality considerations into green marketing and urban regeneration projects. Green marketing techniques can play a significant role in addressing issues of social justice by facilitating access to eco-friendly goods and services for people from diverse socioeconomic backgrounds (Laroche et al., 2001). To ensure that all citizens, particularly those in low-income neighborhoods, have access to sustainable living options, projects such as community gardens, affordable eco-housing initiatives, and renewable energy programs can be promoted through targeted green marketing campaigns (Chan et al., 2016). Furthermore, urban regeneration initiatives can incorporate principles of social justice by prioritizing the needs of marginalized communities, such as access to affordable housing, accessible transportation, and community facilities (Singh et al, 2021). By combining green marketing with urban redevelopment efforts, Southeast Asian cities can address social inequality while advancing environmental sustainability and enhancing community well-being. Moreover, involving people and stakeholders in the co-creation of inclusive and sustainable urban landscapes can foster a sense of empowerment and ownership among various populations, leading to more resilient and cohesive societies.

In Jakarta, green marketing techniques have been employed to promote access to eco-friendly goods and services across various socioeconomic classes. For instance, through targeted marketing initiatives, the city government has partnered with local businesses to promote affordable, environmentally friendly housing solutions for low-income neighborhoods. By highlighting the financial and environmental benefits of water-saving technologies, renewable energy systems, and energy-efficient building designs, marginalized populations gain greater access to sustainable living options (Wijaya & Ng, 2021).

Additionally, urban regeneration projects in Jakarta have prioritized social fairness by addressing the needs of

marginalized communities and improving access to essential amenities. For example, the revitalization of waterfront areas along the Ciliwung River has not only enhanced environmental sustainability but also fostered social inclusion by providing public spaces, recreational areas, and affordable housing options to residents of informal settlements (Wijaya & Ng, 2021).

Through the fusion of green marketing ideas with urban reconstruction activities, Jakarta has successfully alleviated socioeconomic inequities while promoting environmental sustainability and enhancing community well-being. These initiatives serve as exemplars of how cities in Southeast Asia can become more resilient and inclusive by taking proactive measures to advance social fairness.

### 3.1.3. Economic Development

Fostering resilient and sustainable growth in Southeast Asian cities necessitates integrating green marketing and urban regeneration programs into economic development strategies. Green marketing principles can play a crucial role in supporting economic development by encouraging the adoption of eco-friendly behaviors and products, thereby increasing demand for green technologies, renewable energy sources, and sustainable goods and services (Bansal & Sharma, 2018). For instance, green marketing efforts can incentivize companies to invest in waste reduction programs, energy-efficient technology, and environmentally friendly supply chains, leading to enhanced competitiveness, innovation, and cost-effectiveness (Rao, 2002).

Moreover, urban regeneration projects can contribute to economic development by revitalizing underutilized areas, attracting investment, and creating job opportunities in industries such as construction, renewable energy, and green infrastructure development (Ali et al., 2021). By incorporating green marketing ideas into urban regeneration initiatives, Southeast Asian cities can reap economic benefits including improved market demand, job creation, and business innovation. Additionally, by fostering a green economy, cities can promote social well-being and environmental sustainability while enhancing competitiveness, attracting investment, and achieving long-term success.

In Ho Chi Minh City, green marketing strategies have been deployed to encourage companies and consumers to embrace eco-friendly practices and products (Souguir et al., 2024). For example, the city government has initiated green marketing campaigns to incentivize companies to adopt energy-efficient technologies, waste reduction strategies, and sustainable production methods, emphasizing the financial benefits of going green, such as lower operating costs, enhanced brand recognition, and access to new markets (Nguyen et al., 2019).

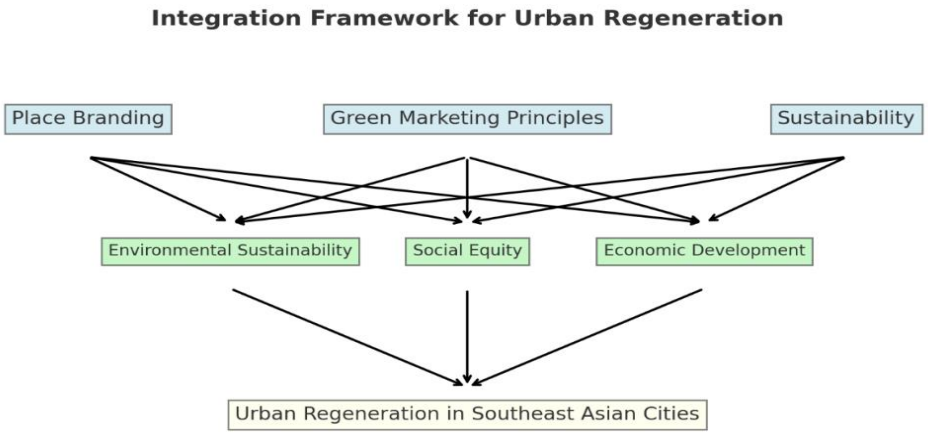

**Figure 1: The Framework of Integrating Green Marketing Principles for Urban Regeneration in Southeast Asia Cities**

Furthermore, urban regeneration initiatives in Ho Chi Minh City have played a pivotal role in advancing sustainability and economic growth. For instance, the restoration of the Saigon River shoreline has attracted investment for mixed-use projects, business complexes, and recreational facilities, creating employment opportunities and boosting the local economy (Nguyen et al., 2016). Additionally, the development of urban parks and green corridors, along with other green infrastructure projects, has not only improved the city's environmental quality but also contributed to the

expansion of the tourism industry, creating jobs and income (Nguyen et al., 2016).

Ho Chi Minh City has effectively combined environmental resilience, social well-being, and economic benefits of sustainability by integrating green marketing concepts into urban regeneration initiatives. These programs demonstrate how vigorously promoting a green economy can stimulate economic growth and elevate the overall standard of living in Southeast Asian cities.

### 3.2 The Challenges

The integration of sustainable place branding activities with green marketing and urban regeneration efforts presents several challenges in Southeast Asian cities, despite their potential benefits. A significant issue faced by stakeholders, including businesses, the public, and policymakers, is a lack of knowledge and understanding of sustainability concepts (Grimm et al., 2020). This can hinder the implementation of sustainable urban regeneration projects and the adoption of green marketing strategies, as there may be skepticism about the revenue-generating potential of sustainability efforts or resistance to change (Vanolo, 2018). Additionally, major obstacles to the execution of sustainable place branding projects include insufficient funding and technical expertise, particularly in cities with limited resources (Bolay, 2018). Moreover, the fragmented governance framework and conflicting interests of various stakeholders may impede cooperation and coordination in sustainability initiatives, making it challenging to develop integrated strategies that comprehensively address social, economic, and environmental issues (Ali et al., 2021).

Identifying specific Southeast Asian cities facing challenges with sustainable place branding initiatives requires in-depth study, but it's acknowledged that several cities encounter difficulties. Jakarta, Indonesia, is one such example, grappling with issues like dispersed governance and conflicting stakeholder interests. The lack of coordination and collaboration among government agencies, businesses, and communities poses a challenge to the city's sustainable place branding project. This disarray can lead to inconsistent messaging, disjointed tactics, and sluggish implementation of sustainable projects and practices. For instance, the absence of a cohesive strategy for sustainability branding and planning may perpetuate inadequate infrastructure development, environmental degradation, and social inequality in certain parts of Jakarta, despite efforts to portray the city as green and livable. Thus, Jakarta exemplifies the challenges Southeast Asian cities face in implementing sustainable place branding strategies due to complex governance and stakeholder conflicts.

Cities in Southeast Asia like Bangkok, Manila, Ho Chi Minh City, and Phnom Penh encounter various obstacles when implementing sustainable place branding strategies. Despite efforts to promote environmental sustainability, Manila, Philippines, struggles to project an image of resilience and greenness due to issues with air and water pollution, inadequate waste management, and vulnerability to natural disasters (World Bank, 2016). Similar challenges affecting Bangkok, Thailand's livability and environmental sustainability include flooding, air pollution, and traffic congestion (Ross & Poungsomlee, 1995). Bangkok's aspirations to establish itself as a sustainable metropolis are hindered by these issues, exacerbated by rapid urbanization and deficient urban planning. Meanwhile, Ho Chi Minh City, Vietnam, grapples with growing urbanization, inadequate infrastructure, and environmental pollution, making it challenging to balance economic growth, environmental preservation, and social equity (Deakin, 2001). The city's environmental branding is hindered by inconsistent land use regulations and insufficient funding for public transit, despite efforts to support sustainable development. Sustainable place branding initiatives in Phnom Penh, Cambodia, face hurdles from the city's rapid urbanization, informal settlements, and environmental degradation (Flower et al., 2018). The city's efforts to become more sustainable are hampered by urban growth and infrastructure deficiencies, and its endeavors to project an image of inclusivity and greenness are further complicated by issues such as water pollution. Overall, these cities grapple with complex and interconnected challenges that necessitate comprehensive strategies and collaborative efforts to address sustainability concerns and effectively position themselves as resilient and environmentally friendly urban areas.

### 3.3 The City for future: Way forward

To effectively address urgent environmental, social, and economic concerns, Southeast Asian cities must continue prioritizing sustainability efforts that integrate green marketing and urban regeneration. Green marketing techniques, as highlighted by Baktash and Talib (2019) have the potential to encourage businesses and consumers to adopt eco-

friendly practices and products, thereby promoting sustainable consumption and production patterns. Public-private collaborations, incentives for sustainable innovation, and targeted marketing campaigns, as suggested by Dapice et al. (2009), can all contribute to accelerating the transition to a green economy.

In parallel, urban regeneration initiatives should prioritize sustainability principles by integrating affordable housing, green infrastructure, and community facilities, as emphasized by Wijaya & Ng (2021). By promoting cooperation among enterprises, government agencies, civil society organizations, and communities, Southeast Asian cities can develop comprehensive sustainability policies that address the interconnected challenges of urbanization, inequality, and climate change (Ali et al., 2021). Furthermore, by adapting successful projects to local contexts and objectives, cities can learn from best practices in green marketing and urban regeneration, as demonstrated by Nguyen et al., (2016). Adopting a proactive and integrated approach to sustainability will enable Southeast Asian cities to build more resilient, equitable, and livable urban environments for current and future generations.

Singapore serves as a notable example of a Southeast Asian city that has effectively leveraged sustainable place branding tactics, integrating green marketing principles to promote environmental stewardship and urban renewal. Through strategic positioning as a "Garden City" and "City in a Garden," Singapore has enhanced its global reputation and attracted talent, investment, and tourism (Chang, 2006). Policies such as green building standards, eco-friendly transport systems, and biodiversity conservation efforts have further supported Singapore's sustainable place branding initiatives (Siva et al., 2017). Through effective communication and engagement with stakeholders, including residents, businesses, and government agencies, Singapore has strengthened social cohesion, economic competitiveness, and environmental resilience, demonstrating the transformative potential of sustainable place branding for urban regeneration in Southeast Asia.

While Bangkok, Kuala Lumpur, and Jakarta have made varying degrees of progress in implementing sustainable place branding initiatives, they face substantial obstacles related to urbanization and sustainability. Bangkok, for instance, is investing in green spaces and mass transit systems to combat urban heat islands and traffic congestion, positioning itself as a "Green Metropolis" (Adulkongkaew et al., 2020). Kuala Lumpur is prioritizing sustainable development through initiatives like the River of Life project and the Kuala Lumpur Green City Action Plan, aiming to improve environmental sustainability and attract investment and tourists (Kanniah, 2017). Jakarta, despite environmental challenges, is implementing programs such as the Transjakarta Bus Rapid Transit system and the Jakarta Green and Blue Open Space Development Programme to address air quality, floods, and urbanization impacts, aligning with its branding as an "Emerging Global City" committed to sustainable development (Indraprahasta, 2018).

## IV. CONCLUSION

In conclusion, the integration of green marketing with urban regeneration initiatives is intricately linked to the sustainable place branding of Southeast Asian cities. By adopting a comprehensive strategy that encompasses environmental sustainability, social equality, and economic development, cities in Southeast Asia can enhance their global competitiveness while fostering livability, resilience, and inclusivity (Zenker & Braun, 2017).

Green marketing tactics play a crucial role in increasing the demand for eco-friendly products and services and promoting a sustainable culture among locals, businesses, and tourists by highlighting the environmental benefits of sustainable practices and products (Rao, 2002). Simultaneously, urban regeneration initiatives offer opportunities to enhance environmental quality, address social injustices, and revitalize urban areas, contributing to the creation of resilient and vibrant urban environments (Vanolo, 2015).

By integrating green marketing strategies with urban revitalization projects, Southeast Asian cities can effectively demonstrate their commitment to sustainability, attract investment, and cultivate a favorable reputation as environmentally conscious and forward-thinking urban centers (Chang, 2006). Furthermore, by involving stakeholders in the co-creation of inclusive and sustainable urban environments, cities can strengthen communities and ensure that the benefits of development are equitably distributed among all citizens (Singh et al, 2021). In summary, sustainable place branding offers a promising path forward for the future prosperity, equity, and environmental sustainability of Southeast Asian cities.

# TRUST AND FLOW EXPERIENCE IN TIKTOK LIVE STREAMING: HOW STREAMERS BUILD CONSUMERS' INTERNAL STATES AND DRIVE ACTUAL PURCHASE BEHAVIOR THROUGH THEIR CHARACTERISTICS

**Na Nguyen Tran Le[1], Ly Pham Thi Minh[1], Anh Vu Ta Quynh[1*]**

[1]Faculty of Business Administration, Ton Duc Thang University, Ho Chi Minh City, Vietnam.
*Corresponding: quynhanh24062003@mail.com

**ABSTRACT**

With Vietnam's rapidly growing e-commerce market and increasing internet penetration, live streaming has emerged as a powerful platform for brands to connect with consumers in real time. As a result, the live streaming industry in Vietnam has experienced explosive growth, especially on the TikTok platform, reshaping how consumers interact with brands and make purchasing decisions. This study investigates the streamers' characteristics influencing consumers' actual purchase behaviors in this dynamic context. There is a control variable, gender, to examine its impact on consumers' actual purchase behavior. Drawing on S-O-R theory, source credibility, and flow experience theories, this study aims to uncover the mechanisms driving purchases in TikTok live streaming among Vietnamese customers. Through rigorous empirical analysis using partial least squares path modeling PLS-SEM, this research highlights the complex interactions between variables, as well as the differences in gender that lead to varying purchase behaviors. Streamers' attractiveness and trustworthiness impact all variables except actual purchase behavior; conversely, streamers' expertise only affects cognitive trust and actual purchase behavior. The findings offer valuable insights for streamers, businesses and sellers, and the TikTok live streaming platform helping them optimize strategies and capitalize on opportunities in Vietnam's live streaming commerce.

*Key words:* "consumer trust", "flow experience", "live streaming", "streamers' source credibility", "purchase behavior".

## I. INTRODUCTION

### 1.1 Background of the study

The rapid evolution of the internet has led to the creation of numerous innovations, with social media being one of the most significant. According to a report by Datareportal (2024), there are 5.35 billion internet users globally, accounting for 66.2% of the world's population. Of these, 94.21% (5.04 billion users) engage with social media. The development of social media has greatly transformed communication and marketing practices, providing consumers with new channels to share and seek product information.

In recent years, the advent of live streaming has emerged as a powerful marketing tool on social media platforms. Live streaming refers to the real-time broadcast of video content online, allowing viewers to interact with the content through likes, comments, and sharing. Popular platforms such as Facebook, TikTok, YouTube, and Instagram have incorporated live streaming features, attracting vast audiences for viewing content. These platforms enable users to share daily activities, events, and interviews, thereby enhancing interaction within their communities.

The COVID-19 pandemic accelerated the growth of live streaming, transforming it from a simple content-sharing format into a thriving e-commerce tool. According to Ankit Gupta (2020), the live streaming industry is projected to reach a market value of $559.62 billion by 2032, driven by a robust compound annual growth rate of 25.6%. Live streaming now integrates with e-commerce, allowing businesses to sell products directly to viewers through live broadcasts. These live selling sessions often feature product showcases, demonstrations of product benefits, Q&A sessions, interactive mini-games, exclusive deals, and customer support—all in real-time. This type of shopping experience builds trust, fosters a sense of urgency, and encourages immediate purchasing decisions.

As a growing trend, live streaming has increasingly influenced traditional purchasing behaviors and become a vital marketing tool for major platforms. It has significantly altered how consumers engage with products, creating a more interactive, engaging, and transparent shopping experience. The rise of live streaming has made it an indispensable

component of brands' marketing strategies.

In Vietnam, live streaming is gaining significant traction. The live-streaming e-commerce market in Vietnam is projected to hit $11 billion by 2026, with an impressive annual growth rate of 28% (Asiacircles, 2024). More than 70% of internet users in Vietnam have watched a live stream, and half of them have made a purchase during or following the stream. This underscores the immense potential of live streaming as a marketing tool in Vietnam, making it a promising market for brands, influencers, and e-commerce platforms.

Live streaming in e-commerce typically operates under two models: in-house live streaming and influencer live streaming (Xin et al., 2023). In - house live streaming involves brands using their own employees to showcase and sell their products, giving the brand control over the content and communication strategy. In contrast, influencer live streaming features collaborations with influencers who promote products. This can either be in the form of influencer-led special live streams, where influencers exclusively promote a brand, or influencer-led mixed live streams, where influencers feature products from various brands. The streamer appears and interacts with the audiences therefore, their role is crucial in shaping consumer behavior. The interaction between the streamer and the audience - whether through product demonstrations or engagement tactics - can significantly impact viewers' willingness to make a purchase (Huang et al., 2023).

Even though many previous studies have examined the relationship between source credibility of streamers and consumer trust or purchase behavior (Li et al., 2024; Faizza & Roostika, 2024; Rungruangjit, 2022). However, the impact of source credibility of streamers on consumer flow experience is not be considered significantly, and traditional research on consumer flow experience and purchase behavior is not fully applicable to live streaming scenarios, particularly in the context of Vietnam and TikTok live streaming platform. Therefore, the impact of source credibility of streamers on both consumers' trust, flow experience, and purchase behavior and the influence of gender in consumers' purchase decision in TikTok live streaming are determined and evaluated in this study.

### 1.2 Research Questions and objectives

To fill this gap, the research aims to investigate consumer purchase behavior under the impact of streamers' source credibility through live streaming in TikTok. There are several main objectives of the research:

– RO1: Assess the extent to which the source credibility factors of streamers influence trust, flow experience, and purchase behavior of viewers.

– RO2: Examine how gender differences among viewers affect their behavior.

– To accomplish the above-mentioned goals. The following are some of the most important questions that will be answered:

– RQ1: How do the source credibility factors of streamers influence trust, flow experience, and purchase behavior of viewers?

– RQ2: How do gender differences among viewers affect their behavior?

## II. MATERIAL AND METHODOLOGY

This section is to review theoretical backgrounds and hypotheses development. The proposed research methods and models are also captured in the pieces of literature which include hypotheses and relations between attributes.

### 2.1. Conceptual Foundation

#### Source credibility theory

In the realm of traditional marketing and advertising, the source of a message plays a pivotal role in its persuasiveness and the subsequent actions of the receiver. This phenomenon, known as source credibility, has been extensively studied for its impact on attitude change and consumer behavior. Positive traits of a message's source that affect a receiver's response to the message are commonly referred to as source credibility (Ohanian, 1990). The majority of research has concurred that source credibility is a multidimensional concept that centers on trust, expertise, and attractiveness of the source, despite differences in findings and names for aspects (Eisend, 2006).

Numerous academic disciplines have undergone radical change as a result of social media's increasing popularity

(Qualman, 2012). Previous research (Cunningham & Bright, 2012; Edwards et al., 2013) that attempted to comprehend the function of source credibility in online contexts primarily examined the perceived credibility of an individual publishing static information online (bloggers, for example, or the person who publishes a specific message on Facebook or Twitter). Other research investigated the veracity of the messages themselves or the social media platform where they were placed (Lee & Ahn, 2013). Regarding e-commerce, the audience's perceptions of the information sources for goods and services mostly indicate the reliability of information sources. According to the aforementioned situations, people are more likely to be persuaded by high source credibility while they are less likely to be persuaded by low source credibility (Li et al., 2024). Higher perceived credibility streamers have been shown to positively influence followers' opinions toward businesses and buy intentions. Therefore, in live streaming, viewer behavior and decisions are likely to be influenced by the credibility of streamers who interact with viewers in real-time (Lee et al., 2024).

**Flow experience**

According to Csikszentmihalyi (2000), flow is "the comprehensive sensation that appears when we act with total engagement in a point of time." Users in this condition will have a high degree of control over their own conduct, disregard the existence of nearby objects, filter out unpleasant sensations, and be unaffected by the outside environment while working on activities.

The flow theory was first expanded in the online setting by Hoffman and Novak (1996). According to Hoffman and Novak (2009), when one is fully engaged in an online activity, they might experience online flow. According to Hyun et al. (2022), the flow experience on the Internet is characterized by a feeling of control, curiosity, concentration, enjoyment, internal skills, and personal difficulties. In addition, Chen and Lin (2018) investigated live-stream usage intention and discovered that entertainment improves viewers' flow during live streaming. According to this research, when viewers watch live streaming, the streamer depends on their own performance to allow viewers to engage, create an immersive experience, and then encourage them to indulge, focus, and enjoy it, forget their problems, experience a state of flow, and produce purchase behavior.

**SOR**

SOR theory is a theoretical framework for interpreting consumer behavior which was originally proposed by Mehrabian (1974). The model contains three key elements, namely “Stimulus, Organism, Response”, various external environmental factors act as stimuli (S) that influence an individual's internal psychological states (O), which then leads to their corresponding behavioral responses (R) (Jacoby, 2002).

The framework has been applied in many fields: instant messaging social software (Li et al. 2024), user adoption studies of mobile apps (Ashraf et al. 2021; Wu et al. 2021), e-commerce (Lin et al. 2021). In the realm of live streaming, this research employs the S-O-R model to explore the psychological state between the streamer and the viewer's impulsive buying behavior, considering the streamer as the external stimulus (S), the flow experience and trust as the consumer's internal state (O), and the customer's purchase behavior as the resulting response (R).

### 2.2 Hypotheses development

#### 2.2.1. Streamers’ characteristics on Purchase behavior

In recent years, live streaming has increased gradually and streamers are assessed to play a crucial role in shaping users' purchase behavior. Attractive streamers are perceived as more credible, which increases the likelihood of viewers trusting their recommendations (Hui, 2017; Sokolova & Kefi, 2019). The physical appeal of streamers can boost the impact of live streaming, making them more persuasive. Research shows that attractive streamers are more likely to increase consumer awareness and purchase intention (Schouten et al., 2020). In addition, the "halo effect" (Lee & Watkins, 2016) explains why attractive streamers are perceived as more intelligent and reliable, further boosting purchase behavior. Thus, streamer attractiveness, through increased credibility and the halo effect, significantly enhances consumer purchase behavior.

Schouten et al. (2020) argue that streamers, who have established themselves as domain experts, are more trusted than those whose endorsements may lack relevance. When streamers have direct experience with the products they introduce, their knowledge enhances their credibility, distinguishing them from streamers who often lack personal

product experience. As Hu et al. (2016) suggest, when users perceive a streamer as an expert, they rely on their judgment and are less likely to seek additional information, trusting the endorsement as a reliable source. Research by Gao and coauthors (2023) and Thompson and Johnson (2017) further supports the idea that expertise of a streamer boosts purchase intention, as users are more likely to trust, and increase purchase behavior.

Streamers who are relatable, unbiased, and transparent with their content tend to build stronger trust with their audience (Temperley & Tangen, 2006). When streamers are perceived as genuine and credible, their followers are more likely to trust their product recommendations, leading to higher purchase intent (Erdem & Swait, 2004). Cheung et al. (2008) note that trustworthiness defines the expected value of the information shared, impacting purchase behavior. Studies confirm the positive relationship between trustworthiness and purchase behavior (He et al., 2022). Thus, hypothesis H1 is as follows:

*H1. The streamer's (a) attractiveness, (b) expertise, (c) trustworthiness has a positive impact on consumers' purchase behavior.*

**2.2.2 Streamers' characteristics on Trust**

The physical attractiveness of a communicator plays a significant role in shaping how they are perceived, influencing both initial judgments and ongoing opinion agreement (Snyder & Rothbart, 1971). Attractively perceived individuals are often seen as more sociable, kind, logical, and informed, which boosts their credibility and message acceptance (Dipboye et al., 1977). These positive traits make attractive individuals more trustworthy and persuasive in the eyes of their audience. Thus, the physical attractiveness of a social media influencer increases followers' trust. In addition to cognitive trust, attractiveness also plays a role in fostering emotional trust. A streamer's appearance can positively shape viewers' emotional perceptions, leading to more favorable impressions. This emotional trust is further strengthened by the streamer's perceived goodwill, which is associated with their charm and positive image (Li et al., 2024).

Similar to how online medical credentials influence perceptions of skill, platform-bestowed titles in live streaming signal professionalism and expertise. Research on source credibility in social media supports this. For example, Djafarova and Rushworth (2017) found that Instagram users trusted celebrity product reviews based on perceived expertise. In live streaming, viewers are likely to trust streamers who display expertise, whether through credentials or demonstrated knowledge. Specifically, these indicators shape emotional trust, as viewers assume that a skilled streamer will behave honorably. Moreover, expertise enhances cognitive trust, as viewers perceive the streamer as more dependable and capable (Li et al., 2024).

Similar to attractiveness and expertise, streamer trustworthiness has a positive impact on consumers' trust (Lou & Yuan, 2019). For example, Breves et al. (2019) found that online consumers' evaluations of brands and products can be positively influenced by the expertise and trustworthiness of streamers. Lou and Yuan (2019) also observed that the trustworthiness and attractiveness of streamers can enhance consumers' trust. Furthermore, Wiedmann and Mettenheim (2021) argued that a key factor behind streamers' success is the positive transfer of their trustworthiness and attractiveness, which increases brand trust.

*H2. The streamer's (a) attractiveness, (b) expertise, (c) trustworthiness has a positive impact on consumers' cognitive trust.*

*H3. The streamer's (a) attractiveness, (b) expertise, (c) trustworthiness has a positive impact on consumers' emotional trust.*

**2.2.3 Streamers' characteristics on Flow experience**

According to Source Credibility Theory, factors such as attractiveness, expertise, and trustworthiness of the information source can positively influence the perceptions and behaviors of the audience (Hovland et al., 1953). In the context of livestreaming commerce, highly trustworthy streamers often foster positive interactive experiences, facilitating viewers' attainment of a "flow" state - a condition characterized by enjoyment and intense focus (Csikszentmihalyi, 1990). Specifically, streamer attractiveness, through physical appearance or communication style, can enhance viewers' enjoyment and concentration on the livestream content (Ohanian, 1990). Similarly, streamer expertise, demonstrated by in-depth knowledge of the product or service, instills confidence in viewers, thereby

increasing their focus and satisfaction during the livestream (Sternthal et al., 1978). Furthermore, streamer trustworthiness helps build trust and connection, creating an environment conducive to viewers achieving an immersive experience (McCroskey & Teven, 1999). Thus, the following hypothesis is derived.

*H4. The streamer's (a) attractiveness, (b) expertise, (c) trustworthiness has a positive impact on consumers' enjoyment.*

*H5. The streamer's (a) attractiveness, (b) expertise, (c) trustworthiness has a positive impact on consumers' concentration.*

**2.2.4 Trust on Purchase behavior**

Just as trust in a salesperson can reduce uncertainty and lead to a higher likelihood of purchase (Crosby, 1990), trust in a streamer influences followers' attitudes toward the products they recommend. Research consistently supports this connection between trust and purchase intention (Chao et al., 2015), indicating that viewers are more likely to engage with a product when they trust the streamer's integrity, competence, and benevolence (Budyastuti & Iskandar, 2018).

In the context of live streaming, viewers' decisions to follow, engage, or support a streamer are driven by their trust in the streamer's behavior and ability to fulfill their commitments (Chen et al., 2024). As seen in e-commerce, where trust is essential for consumer purchase decisions (Putra et al., 2017), viewers similarly need to trust that their engagement with a streamer will be rewarding and beneficial. Therefore, trust plays a critical role in determining whether viewers will act on the influencer's product recommendations, with stronger trust leading to greater engagement and a higher likelihood of purchase.

*H6. The consumers' (a) cognitive trust and (b) emotional trust has a positive impact on purchase behavior.*

**2.2.5 Flow experience on Purchase behavior**

Research by Rettie (2001) shows that flow prolongs internet use, and Hsu and Lu (2004) demonstrate that flow positively impacts intentions to engage with online content, such as games. Wu and Chang (2005) found that flow enhances transaction intentions, a pattern observable in online shopping, where users are more likely to generate transaction intentions. Additionally, flow significantly impacts online shopping behaviors such as purchase behavior (Kim et al., 2022). This holds true in live streaming, where viewers experiencing flow are more likely to form purchase behavior due to increased emotional engagement and immersion.

*H7. The consumers' (a) enjoyment and (b) concentration has a positive impact on purchase behavior.*

**2.3. Research model**

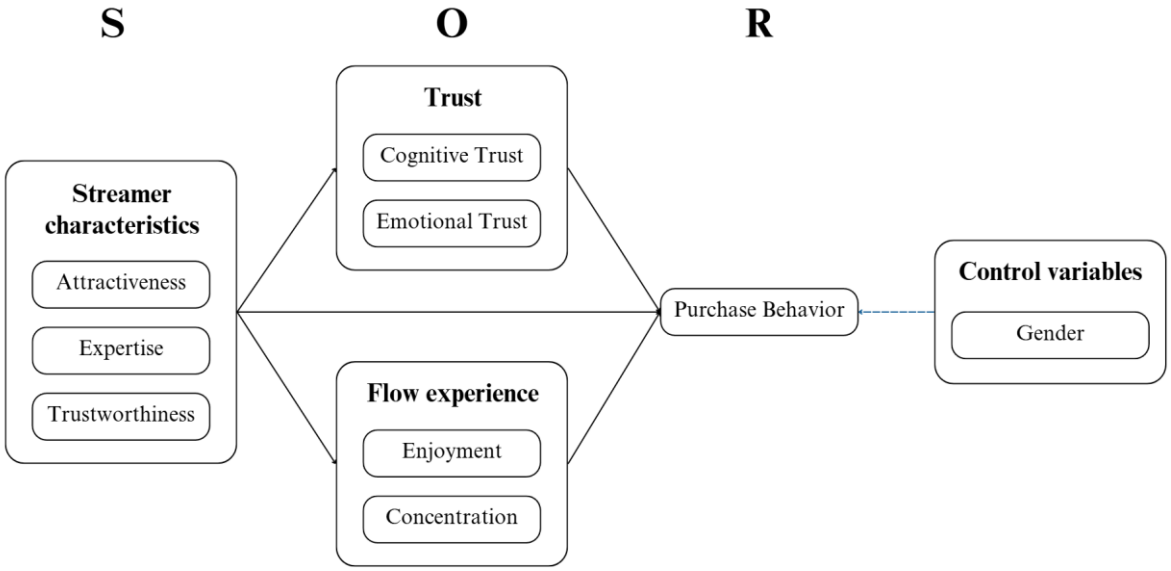

**Fig 2. 1 - Proposed Conceptual Model**

**III. RESULT AND DISCUSSION**

**3.1. Study design**

Consumers over 18 years old who watched and made a purchase directly in TikTok live streaming are targeted for this study. A convenience sampling method was employed for this study. We measured the constructs on a 5-point Likert scale and questionnaires were distributed online using Google Forms. This sampling procedure yielded 334 usable responses. According to the survey results, the gender distribution of participants reveals that the majority are females, accounting for 72.5% of the total respondents, while male participants make up only 27.5%. Although the percentage of females is much greater than that of male, it makes sense because prior research has shown that women are frequently more prone than males to make online purchases (Pradhana & Sastiono, 2019).

### 3.3. Model results

To analyze the causal relationships and evaluate the conceptual model, we employed structural equation modeling (SEM) (Henseler et al., 2009). Partial Least Squares (PLS) was deemed the most suitable method due to: (a) the early stage of theoretical development, and (b) the novelty and complexity of the conceptual model. First, we assessed the measurement model to evaluate indicator reliability, construct reliability, convergent validity, and discriminant validity. Subsequently, we tested the structural relationships outlined in the proposed conceptual model.

#### 3.3.1. Measurement Model

To examine the item reliability, we used Cronbach's Alpha and composite reliability (CR) to measure items. With the threshold of Cronbach's Alpha and CR being higher than 0.70 (Henseler et al., 2009), all items satisfy the requirements. In order to analyze the indicator reliability, the outer loadings should be higher than 0.7 (Henseler et al., 2009). All item loadings exceed 0.7 (Appendix), confirming the indicator reliability. Moreover, the average variance extracted (AVE) is above the critical threshold of 0.50 (Hair et al., 2017), which confirms the reflective constructs' convergent validity and internal consistency (see Table 3.1). Finally, the discriminant validity has been assessed using HTMT criteria. The Hetrotrait–Monotrait ratio (HTMT) table is available upon request, and all values are lower than the threshold of 0.9 (Henseler et al., 2015). The assessment of the construct reliability, convergent validity and indicator reliability suggest satisfactory results, indicating that all constructs can be used to test the theoretical model.

**Table 3.1 - Reliability and validity of variables**

| | Reliability and convergent validity | | | Discriminant validity | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | **Alpha** | **CR** | **AVE** | **1** | **2** | **3** | **4** | **5** | **6** | **7** | **8** |
| 1. Concentration | 0.915 | 0.939 | 0.795 | | | | | | | | |
| 2. Cognitive Trust | 0.892 | 0.925 | 0.755 | 0.691 | | | | | | | |
| 3. Enjoyment | 0.932 | 0.948 | 0.786 | 0.842 | 0.849 | | | | | | |
| 4. Emotional Trust | 0.880 | 0.917 | 0.735 | 0.768 | 0.872 | 0.849 | | | | | |
| 5. Purchase Behavior | 0.895 | 0.927 | 0.760 | 0.612 | 0.758 | 0.701 | 0.688 | | | | |
| 6. Attractiveness | 0.895 | 0.923 | 0.705 | 0.519 | 0.709 | 0.620 | 0.617 | 0.696 | | | |
| 7. Expertise | 0.934 | 0.950 | 0.791 | 0.414 | 0.667 | 0.521 | 0.556 | 0.716 | 0.752 | | |
| 8. Trustworthiness | 0.928 | 0.946 | 0.777 | 0.498 | 0.680 | 0.596 | 0.640 | 0.696 | 0.723 | 0.792 | |

#### 3.3.2. Structural Model

This study used a bootstrapping of 500 resamples to estimate the statistical significance of the path coefficients (Tenenhaus et al., 2005). Attractiveness had a positive but non-significant effect on purchase behavior (ß = 0.108; p = 0.079), and trustworthiness similarly showed a positive yet non-significant influence (ß = 0.109; p = 0.095), leading to both H1a and H1c being unsupported. In contrast, expertise demonstrated a significant positive impact on purchase behavior (ß = 0.269; p < 0.001), supporting H1b. Attractiveness had a positive and significant impact on cognitive trust (ß = 0.332; p < 0.001), supporting H2a (see Table 3.2). Among the antecedents, attractiveness presented the strongest influence on cognitive trust, indicating its critical role in shaping trust based on perceptions of credibility. Similarly, trustworthiness exhibited a significant positive effect on cognitive trust (ß = 0.261; p < 0.001), supporting H2c, and emotional trust (ß = 0.356; p < 0.001), supporting H3c. These findings suggest that individuals who perceive higher trustworthiness are more likely to experience both cognitive and emotional trust. Expertise also showed a significant positive effect on cognitive trust (ß = 0.192; p <0.01), supporting H2b. However, its effect on emotional trust was not

significant (ß = 0.059; p = 0.410), not supporting H3b. While expertise influences logical trust, it does not significantly contribute to emotional trust. Attractiveness had a significant impact on emotional trust (ß = 0.279; p < 0.001), supporting H3a, and enjoyment (ß = 0.352; p < 0.001), supporting H4a. These findings highlight attractiveness as a key driver of positive emotional responses. On the other hand, expertise did not have a significant effect on enjoyment (ß = 0.019; p = 0.807), not supporting H4b. Cognitive trust significantly influenced purchase behavior (ß = 0.172; p <0.5), supporting H6a. This highlights cognitive trust as a vital mediator in driving consumer decisions. However, emotional trust did not have a significant impact on purchase behavior (ß = 0.035; p = 0.644), not supporting H6b. Similarly, enjoyment (ß = 0.134; p = 0.098) and concentration (ß = 0.118; p = 0.056) also failed to show significant effects on purchase behavior, not supporting H7a and H7b.

In summary, hypotheses H1b, H2a, H2b, H2c, H3a, H3c, H4a, H4c, H5a, H5c and H6a are supported, while hypotheses H1a, H1c, H3b, H4b, H5b, H6b, H7a, and H7b are not supported. These results underscore the importance of cognitive trust and specific antecedents, such as attractiveness and trustworthiness, in shaping consumer behavior.

**Table 3.2 - Path coefficients of direct effects**

| Hypotheses | Relationship | | ß | P Values | |
|---|---|---|---|---|---|
| **1a** | Attractiveness | → Purchase Behavior | 0.108 | 0.079 | Not supported |
| **1b** | **Expertise** | **→ Purchase Behavior** | **0.269** | **0.000** | **Supported** |
| **1c** | Trustworthiness | → Purchase Behavior | 0.109 | 0.095 | Not supported |
| **2a** | **Attractiveness** | **→ Cognitive Trust** | **0.332** | **0.000** | **Supported** |
| **2b** | **Expertise** | **→ Cognitive Trust** | **0.192** | **0.007** | **Supported** |
| **2c** | **Trustworthiness** | **→ Cognitive Trust** | **0.261** | **0.000** | **Supported** |
| **3a** | **Attractiveness** | **→ Emotional Trust** | **0.279** | **0.000** | **Supported** |
| **3b** | Expertise | → Emotional Trust | 0.059 | 0.410 | Not supported |
| **3c** | **Trustworthiness** | **→ Emotional Trust** | **0.356** | **0.000** | **Supported** |

### 3.3.3. Multi-Group Analysis

A multigroup analysis (MGA) was conducted to assess the effect of gender on the structural relationships in the model. The sample was divided into male and female groups, and differences in path coefficients were examined. As shown in the table, significant gender-based differences were observed in the relationships hypothesized in H1c, H2c, and H6b, as the p-values of the differences were below the 5% threshold. Specifically, the impact of trustworthiness on purchase behavior (H1c) was stronger for females (ß difference = -0.286; p = 0.037), while trustworthiness had a significantly greater effect on cognitive trust (H2c) for males (ß difference = 0.329; p = 0.010). Additionally, emotional trust was a significantly stronger predictor of purchase behavior (H6b) for females (ß difference = 0.458; p = 0.016). These findings indicate a significant moderating effect of gender on these relationships.

Conversely, the p-values for the differences in other hypothesized relationships, including H1a, H1b, H2a, H2b, H3a, H3b, H3c, H4a, H4b, H4c, H5a, H5b, H5c, H6a, H7a, and H7b, were above 5%, suggesting that gender does not significantly impact these structural relationships. These results imply that while gender plays a role in certain relationships, such as those involving trustworthiness and emotional trust, it does not universally moderate the pathways in the model.

**Table 3.3 - Results of the multi-group analysis (MGA) – Gender differences**

| | Relationship | | Path coefficient (Male) | Path coefficient (Female) | Difference \|Males-Females\| | p Value |
|---|---|---|---|---|---|---|

## IV. CONCLUSION

The results of hypotheses H1b, H2a, H2b, H2c, H3a, H3b, H3c, H4a, H4c, H5a, H5c, H6a and H6b align with theoretical predictions. Streamers' expertise demonstrates a significant positive effect on purchase behavior and cognitive trust supporting the idea that streamers' expertise enhances consumer confidence in logical trust and purchase decisions that align to previous studies (Johnson & Grayson, 2005; Weismueller et al., 2020; AlFarraj et al., 2021). Different from streamers' expertise, attractiveness and trustworthiness show strong positive impacts on both trust (Kim & Kim, 2021; Zhou & Lou, 2024; Li et al., 2024) and flow experience of consumers, reaffirming its centrality in fostering deeper consumer engagement. Similar to the study of Li and coauthors (2024) which consider the impact of trust in impulsive buying behavior, only cognitive trust impacts purchase behavior, not emotional trust. Modern online shoppers, especially in live streaming, tend to adopt a more rational approach. When making purchasing decisions, they often evaluate their needs based on objective considerations. This trend highlights how consumers are increasingly focused on meeting their specific needs and reflects the ongoing improvement in the standards and quality of online shopping experiences.

In contrast, the results of hypotheses H1a, H1c, H2b, H2c, H3a, H6a, H7a, and H7b are not aligned with theoretical predictions. Streamers' attractiveness and trustworthiness do not influence consumers' purchase behavior while expertise does. Whereas attractiveness and trustworthiness can enhance the overall experience or create a positive

impression, they do not necessarily provide the specific, actionable information that consumers need to justify a purchase. Moreover, streamers' expertise does not influence consumers' flow experience (enjoyment, concentration). Flow experience is heavily influenced by entertainment and emotional connection while expertise is primarily focused on providing product-related information and answering questions exhibits. This engages consumers' cognitive processes but may not elicit emotional responses necessary for enjoyment. Finally, flow experience does not impact purchase behavior that can be explained TikTok live streams often serve as both entertainment and commerce platforms. Consumers may enjoy the content and stay engaged (flow) but treat the shopping aspect separately, requiring rational consideration, focusing on product details or offers when deciding to buy.

The Multi-Group Analysis (MGA) underscores gender as a control variable. The significant difference in the streamers' trustworthiness - purchase behavior relationship and influences male purchase behavior but is not significant for females. This highlights that for males, streamers' trustworthiness is crucial for purchase decisions, reflecting their focus on reliability and factual cues in decision-making. In contrast, for females, streamers' trustworthiness seems less influential, with emotional connections, social interactions, and experiential factors likely playing a greater role in purchase decisions. The relationship between streamers' trustworthiness and cognitive trust also experiences a difference in gender that males are more influenced by streamers' trustworthiness to have the cognitive trust. Furthermore, the significant gender difference in the emotional trust - purchase behavior link suggests that emotional trust has a statistically significant positive effect on purchase behavior for female consumers, whereas the relationship is not statistically significant for males. For female consumers, emotional trust—rooted in comfort, security, and connection with the streamer - plays a key role in purchase decisions, fostering loyalty and reducing perceived risks. Conversely, male consumers prioritize logical factors like product quality and streamer expertise, with emotional trust having less influence on their buying behavior.

These findings offer theoretical and practical implications. Theoretically, this study offers significant theoretical implications for understanding consumer behavior in TikTok live streaming commerce. Cognitive trust, driven primarily by streamer expertise, emerges as the dominant factor influencing purchase behavior, while emotional trust and flow experience (enjoyment, concentration) have limited impact. These findings challenge traditional Source Credibility Theory by emphasizing the superiority of expertise over attractiveness and trustworthiness in shaping consumer decisions. According to the gender differences in the relationship of trustworthiness impact purchase decisions, while streamers' trustworthiness is crucial for male audiences, streamers targeting female consumers may need to incorporate additional elements that foster emotional engagement and create a more immersive shopping experience. Due to the gender differences in the relationship of emotional trust impact purchase decisions, focusing on emotional connections for women and cognitive factors for men—can enhance the effectiveness of marketing in livestream shopping. In addition, flow experience (enjoyment and concentration) has no significant impact on purchase behavior. This finding challenges existing theories, such as Csikszentmihalyi's Flow Theory, which argue that an immersive, enjoyable experience leads to behavioral outcomes. Moreover, the results also refine the S-O-R framework, illustrating that cognitive trust impacts purchase behavior, with gender acting as a critical control variable. This underscores the growing rationality of online consumers and the need to account for demographic nuances in future research and practical applications. Practically, to optimize the effectiveness of TikTok live streaming commerce, streamers, businesses, and the platform must align their strategies. Streamers should focus on demonstrating expertise to build purchase behavior. To optimize gendered purchase behavior, streamers should tailor their approach: focus on expertise and transparency to build trust with male audiences, while using emotional storytelling and interactive engagement to connect with females. Businesses should prioritize collaborations with knowledgeable streamers, provide training on product knowledge and audience engagement, and design campaigns that cater to gender-based consumer behaviors. TikTok, as a platform, can enhance its role by promoting credible content through its algorithms, offering gender-specific audience insights, and integrating features like verified streamer badges and interactive tools to support cognitive trust-building. Together, these strategies can create a more trusted and effective live-streaming commerce ecosystem, enhancing purchase behavior.

This study has five key limitations, alongside recommendations for future research. First, it does not focus on specific industries, providing a holistic view of streamer credibility but limiting applicability to sectors with high-value

products or niche markets. Future studies could explore how streamer credibility impacts purchase behavior in specific industries. Second, using only TikTok restricts generalizability, as user behaviors vary across platforms. Future research could investigate factors influencing consumer behavior on different platforms. Third, additional elements like time constraints (Harahap & Wahyuni, 2024) and satisfaction (Wang et al., 2024), beyond flow experience and trust, may impact purchasing in live streaming. Exploring these factors in various scenarios could provide deeper insights into impulsive buying behavior. Fourthly, focusing solely on purchase behavior overlooks long-term benefits for streamers and platforms, such as repurchasing (Farida et al., 2024, and word-of-mouth (Chen et al., 2023). Future studies could examine these behaviors to support the sustainable growth of live-streaming commerce. Lastly, this study focuses on how gender influences purchase decisions in TikTok live streaming commerce. However, limiting the scope to gender overlooks other important control variables like age and income. Future research should include these variables to provide more comprehensive and diverse insights into consumer behavior in this context.

# DIGITAL MARKETING FOR DEVELOPING PRIVATE PRESCHOOL BRANDING

**Bui Thi Hong Hanh**[1]

[1]Graduate Student – Saigon University.
*Corresponding: hanhbui8824@gmail.com.

**ABSTRACT**

Internationalization and competition have become common trends in all aspects of socio-economic life, and private school education is invariably facing new challenges and opportunities. The increased competition requires preschool managers to equip more appropriate methods to develop their schools. The article applies a theoretical approach to digital marketing through strategies, actions, and controls in preschool branding development. This approach supports brand positioning, identification, attracting potential customers, finding clients, building customer relationships, and analyzing and evaluating the competitive market. Digital Marketing provides a significant opportunity for preschool branding development, fostering trust with parents, and achieving sustainable growth. The research results recommend a comprehensive strategy to optimize resources and increase marketing efficiency. On the other hand, it is possible to use digital tools flexibly, and the content supplied through them to reveal professionalism, i.e., sincerity and alignment with the preschool education features.

*Keywords:* "Digital Marketing", "brand development", "private prechools", "competitive market", "strategy".

## I. INTRODUCTION

After 10 years of implementing Resolution No. 29-NQ/TW, dated November 4, 2013, of the 11th Party Central Committee on "Fundamental and comprehensive innovation of education and training, meeting the requirements of industrialization and modernization in the context of a socialist-oriented market economy and international integration." Prime Minister Pham Minh Chinh said, "Building and developing human beings must be based on the foundation from the early years of life to comprehensively develop children in terms of physical strength, intelligence, and aesthetics, forming the first elements of personality, laying the foundation for the comprehensive development of Vietnamese people". This affirms that preschool education plays a crucial role in the national education system, in the strategy of human resource development, and in the development of Vietnamese people. Currently, the number of immigrants and the rate of preschool-age children in Ho Chi Minh City is increasing, leading to a trend of investment in private preschools in Ho Chi Minh City to meet the increasing demand. Private preschools provide an additional option for parents, helping to reduce pressure on public schools while creating a more diverse and flexible learning environment. In the future, the preschool education system in our country, especially in Ho Chi Minh City, will have developments in scale, quality, care-education services, and building reputation. Therefore, developing preschool brands is necessary and urgent.

The development of the internet has significantly transformed human behavior and lifestyles. Additionally, digital marketing tools have taken over the market helping businesses and organizations reach and interact with the public more effectively. The development of digital technology and educational globalization pose numerous challenges for educational institutions worldwide, including those in Vietnam. Beyond communication activities and providing professional knowledge, marketing, and branding activities in educational institutions to enhance the reputation and attract students are more competitive and create intense pressure. However, traditional marketing activities are no longer sufficient to meet the information demands of learners, businesses, and society. The emergence of digital marketing activities has opened up numerous opportunities and rapidly satisfied the need for educational information access. It helps educational organizations clearly understand their target customer, and information connectivity, as well as enhancing information sharing and having a better experience of educational qualification. Utilizing digital marketing tools has become a vital trend for educational organizations (Le Thi Hai Van, 2020, 276). Recent studies show that more than 90% of parents search for information before they decide to send their children to school or not through online channels such as websites, social networks, and reviews playing a crucial role in the decision-making

process (Nielsen, 2023). Every day, internet users in Ho Chi Minh City spend an average of 6.5 hours on activities online, creating great opportunities for digital marketing strategies to reach and interact with target customers (Statista, 2022).

According to Associate Professor Dr. Nguyen Xuan Nghi, former Rector of Hanoi University of Industrial Fine Arts, until now, society has been familiar with businesses building brands, while it is strange with educational institutions. If the products of businesses are goods, then for schools, their product is students — human beings. This fundamental difference makes education a special type of service, as the product of school is human (Ha An, 2019). Digital marketing is a fast and effective way for preschools to understand customer needs, provide services, and interact with customers. To develop a sustainable customer base, private preschools need to understand customer needs, which is a basis for building a marketing strategy suitable for the target market (Philip Kotler, 2013), (Harvard Business Review, 2019). This article presents how to apply digital marketing strategy to brand development for Ho Chi Minh City's private preschools focusing on brand positioning, brand recognition, attracting and retaining potential customers, building long-term relationships with parents, and analyzing the competitive market. The study uses the RACE Planning model to implement specific action steps and effective control tools.

## II. MATERIAL AND METHODOLOGY

### 2.1 Literature review

#### 2.1.1. The definition of Digital Marketing

In 2017, Philip Kotler updated the definition of marketing "Marketing is the science and art of exploring, creating, and delivering value to satisfy the needs of a target market, create interactions with target customers for profit". Compared to his 2005 definition, marketing not only evolved brand positioning by emphasizing product advantages, but it now also indicates concern for the community, and society, while enhancing customer interaction with the brand. In 2019, Dr. Nguyen Thi Minh Ha introduced comprehensive educational marketing on a digital platform: "The use of online IT platforms by educational institutions to establish an integrated, goal-oriented, and measurable interaction channel that attracts and retains customers, thereby building and developing sustainable customer relationships" (Le Thi Hai Van, 2020, 277).

In essence, Digital Marketing is a form of advertisement that takes advantage of the unique characteristics of digital platforms to bring messages from brands to the right target audience. Hence, Digital Marketing is an advertising method using electronic devices, such as personal computers, smartphones, mobile phones, tablets, etc. to interact with users. Digital Marketing uses digital technologies via multiple platforms, such as websites, emails, applications (both basic and mobile), and social networks. (Le Thi Hai Van, 2020, p. 277; Tran Thi Huong, 2022).

#### 2.1.2. Private preschool

In the field of education, the product of the education and training process is people with a combination of standards of personality, qualifications, skills, ethics, etc. that are extremely diverse, complex, and always changing and developing. Although individual learners share the same social regime, political system, training environment, and even study in the same school, class, etc., their personality development is completely different because they differ in motivations, attitudes, abilities, resilience, conditions, etc. No matter the approach, schools cannot create completely identical people; even if they can, that is not the goal that an advanced education system aims for (Nguyen Thi Ha, 2022).

With the current trend of viewing education as a service, private preschools are considered as a business unit providing educational services. The primary customers are learners (those who use the service). Thus, it is necessary to place private preschools in a competitive market, which means private preschools and learners themselves must know whether the service provider is good or not compared to other units.

#### 2.1.3. Enrollment Decision

According to Tran Thi Ngoc Quyen and colleagues (2022), enrollment decision is a complex psychological process for students and their parents. It is influenced by multiple factors and often requires a long period of consideration before deciding where to pursue their education. There are two primary factors affecting the enrollment decision:

personal factors related to students or their parents, and external factors. Among these are influences from surrounding individuals (family, friends, academic advisors, alumni, etc.), and the school's communication efforts with students and parents during the student recruitment campaigns are identified as the key target in digital marketing strategies for attracting potential students to the institution (pp. 70, 72, 73).

### 2.1.4. Brand and the brand of private preschool

According to the definition of the World Intellectual Property Organization (WIPO), "A brand is a special sign (tangible and intangible) to identify a product or service produced or provided by an individual or an organization. Therefore, a brand can be understood as an important form of intangible asset of businesses, organizations, and individuals." (Nguyen Thi Ha, 2022).

Aaker (1996) defined: "A brand is an absolute commitment to quality, service, and value over a long period, and it is validated through its effectiveness and customer satisfaction. A brand is also a cultural, rational, emotional, visual, and unique image that customers associate with when mentioning a product or organization" (David Aaker, 1996).

From the traditional opinion, a brand is considered a component of the product — its name, a combination of colors, symbols, images, and signs to distinguish it from other companies' products. However, from the modern perspective, a brand is also a unique style, values, beliefs, and the emotional connection between customers, the public, and a business. A brand represents an organization, reflecting its tradition, values, culture, people, and strategic direction (Aaker, 2004). Two points of view about product and brand perspectives are illustrated in the following figure (Nguyen Thi Nhu Quynh 2022).

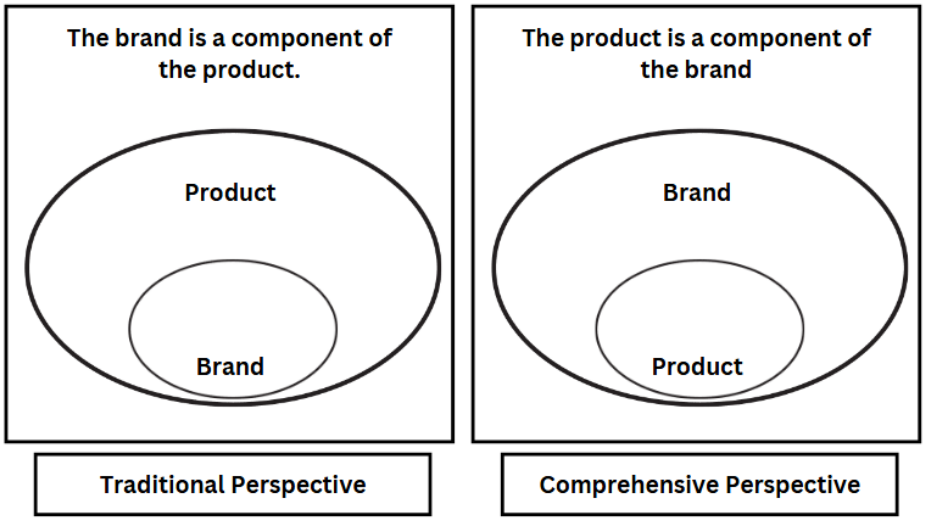

**Figure 1. Two Perspectives on the Relationship Between Product and Brand.**

It can be understood that "Preschool's brand is the holistic combination of identity factors, core elements, commitment and distinctiveness of a preschool institution. Identity factors (tangible aspects) include the preschool's name, logo, resources, educational quality, and service quality. Core elements (intangible aspects) include vision and mission, core values, educational philosophy, reputation, and trust from parents and society. A strong brand is not only identified through image, but also the commitment and distinctive value including human competencies, culture, and competitive strategies".

Development is a process of progressing from lower to higher levels, imperfection to perfection in all aspects. This movement happens both gradually and breakthroughs, leading to the emergence of new elements replacing the old ones (Marxist-Leninist Philosophy Textbook, 2017).

From these arguments, it can be summarized that: "Developing a preschool brand is a process of implementing breakthrough strategies and continuous improvements to enhance educational quality, establish credibility, and build sustainable value for the preschool brand".

## 2.2. Digital Marketing platforms in preschool brand development

### 2.2.1. Search Engine Marketing (SEM)

Search Engine Marketing (SEM) is marketing through search engines. This is a comprehensive solution to enhance the website's ranking and visibility of keywords for educational organizations on search engine result pages, helping to meet the information-seeking needs of potential customers. In Vietnam, Google is the most widely used search engine. SEM includes Search Engine Optimization (SEO), Content marketing, and Pay-Per-Click (PPC) Advertising. With SEO, the organization does not need to spend a significant amount on advertising, but it is necessary to identify the correct keywords, as well as follow Google's algorithm to ensure high-quality content (articles, images, and videos). Additionally, a marketing strategy for suitable and effective content is essential, including correct keywords that align with customers' needs and interests. It is represented in blogs, ebooks, whitepapers, infographics, etc. Unlike SEO, which focuses on organic search results, PPC advertising allows organizations to immediately appear and reach customers by investing in paid ads, boosting their website's ranking on search engine result pages.

### 2.2.2. Social Media Optimization (SMO)

Social Media Optimization (SMO) is an advertising activity on social media platforms, such as Facebook, Instagram, YouTube, Twitter, Zalo, etc. Customers use this tool to search the information. It achieves a high interaction and plays a crucial role in shaping customer perception, behavior, and attitudes toward the services and products of an educational institution's brand.

### 2.2.3. Customer Relation Manager (CRM)

Customer Relation Manager (CRM) is a customer relationship administrator tool based on technical connectivities between organizations and customers. With educational organizations, CRM allows customers to register for enrollment, track learning progress, make tuition payments, etc. on digital platforms. Therefore, educational institutions can build a database of learners, gaining insights into student needs and learning activities at any given time.

### 2.2.4. Website and mobile marketing refers

Website and mobile marketing refers to the use of websites and mobile devices to promote products, and services to customers. This approach encourages users to create and complete accounts to gain access to educational institution resources. The primary goals are to guide potential customers to explore information, build trust in the institution's operations, demonstrate social responsibility, and strengthen relationships. The main activities on marketing websites and mobile devices are email marketing, sms marketing, and display advertising on websites (including images, videos, animations, and text-based content). However, educational institutions need to pay attention to ad dimensions and formats to capture customers' attention and build emotional connections, particularly with customers who are parents and preschool-aged children (Le Thi Hai Van, 2020, pp. 277–278).

### 2.2.5. Video marketing:

YouTube has become a popular search engine thanks to its informative and interesting content, which attracts a large audience. Its fast-paced content delivery makes it more time-efficient compared to browsing websites. Today, many users are using YouTube to research products and services before making any purchase decisions or to gain knowledge on a specific topic. Besides YouTube, other platforms such as Facebook Video, Instagram, and Vimeo are also utilized for running video marketing campaigns (Tran Thi Huong, 2022).

## III. RESULT AND DISCUSSION

### 3.1. The impact of Digital Marketing on brand development in private preschools in Ho Chi Minh City

### 3.1.1. Brand Positioning

According to Lantabrand Branding Company, brand positioning is the process of creating the distinctive position of a brand in a competitive environment, ensuring that customers can differentiate it from its competitors (Nguyen Thi Hai Len, 2010, pp. 6).

Brand positioning involves determining the position of a brand in the market. In business practice, proactive positioning plays a vital role in shaping business marketing strategies for the following three reasons (P. Kotler, 2005): (1) If marketers do not select and proactively position their products, consumers will do it for them; (2) product positioning plays a crucial role in customers' purchasing decisions, and (3) positioning is a key factor for the best

combination of Marketing-mix variables (Tran Viet Dung, 2019, pp. 12)

Based on the selected brand development strategy (using Digital Marketing tools), brand positioning should be implemented by determining the brand's position relative to competitors in the market, as perceived by parents or students. There are eight steps in the brand positioning process:

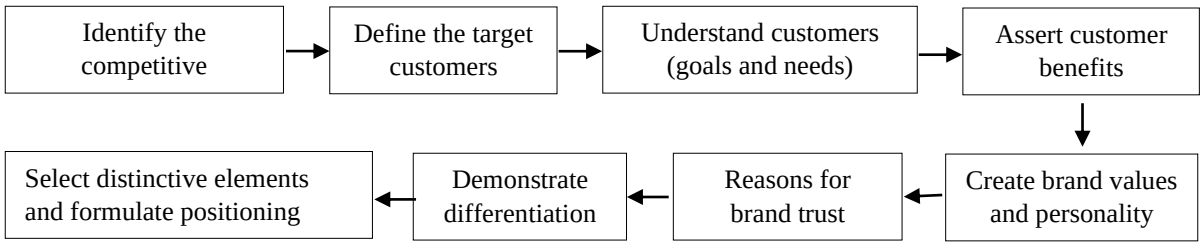

**Figure 2. The 8 Steps of Brand Positioning (Le Dang Lang, 2006)**

Preschool brand positioning should focus on the vision - mission, strengths, educational quality, etc. of the school. For example, the Vietnam Australia International School (VAS) pursues the vision of becoming an outstanding school system, providing students with a strong academic foundation by integrating the National Education Program with the Cambridge International Program. It may help students be well-prepared to face life's challenges and preserve the cultural, and traditional values of their country. This brand positioning is prominently advertised on the school's official website: https://www.vas.edu.vn/ve-vas. SEO supports effective positioning by optimizing online content, helping the school appear in prominent positions on Google when parents search for information about special education methods or creative learning environments. Using strategic keywords such as "International preschool" or "Cambridge International education programmes" not only increases search rankings but also affirms the school's reputation in modern education. SEO also helps enhance search visibility, attracting parents in the target area through keywords such as "Preschool in Ho Chi Minh City" or "International PreSchool in District 10". This creates a competitive advantage and expands its reach.

Some suggestions for using Digital Marketing platform for brand positioning:

Researching target customers: CRM allows data to be collected from many sources, such as surveys of parents, feedback from Open Day events, or data from social media. In Ho Chi Minh City, where most young parents deeply understand technology and use the internet to search for information, researching the market using CRM is especially useful. Schools can use CRM to identify trends in parents' behavior, such as: Priority criteria when choosing a school (curriculum, facilities, distance); Need for additional services (pick-up and drop-off, nutritious meals, or care after school); Expectations about educational methods (Montessori, STEM, or bilingual education). By analyzing this data, preschools can adjust their strategies to meet the right needs, thereby creating a difference in the market.

Personalize the customer experience: Particularly, parents in Ho Chi Minh City often have busy schedules, so providing messages appropriate to personal needs is key to making an impression. CRM can help automate thank-you notes after a visit to a school or send detailed information about programs tailored to their child's age and needs. These messages not only increase engagement but also demonstrate the school's professionalism and care, helping build trust and credibility.

Customer segmentation for brand development: CRM helps preschools better understand the needs, interests, and characteristics of each group of parents, thereby adopting appropriate outreach and care strategies. Collecting customer data CRM integrates information from many sources such as online registration forms, school tours, social media interactions, or feedback from advertising campaigns. This information includes: Personal information: Name, address, phone number, email, and age of children; Behavior: Frequency of parents attending events, viewing websites, or responding to email campaigns; Interests and needs: Desired curriculum (Montessori, STEM, bilingual), additional services (pick-up and drop-off, meals); Optimizing marketing resources: Customer segmentation helps preschools in Ho Chi Minh City focus their budget and efforts on the most potential customer groups. Instead of adopting a broad advertising strategy, CRM ensures that messages are delivered to the right audience, reducing costs and increasing reach effectiveness.

Personalize customer outreach strategies: After segmentation, CRM helps create personalized strategies that are

appropriate to each customer group: Send emails with content focused on the benefits of the curriculum that parents are interested in; Advertise on platforms like Facebook or Google Ads, targeting by area of living or interests; Organize events like "Open Day" specifically for each group of parents in different segments; Cooperate with famous parents, education experts, or parenting bloggers to help preschools increase their credibility and reach more potential customers.

Measure effectiveness and adjust strategies: CRM tracks the effectiveness of each strategy for each segment. Based on data such as email open rates, school visits, or enrollment conversion rates, schools can evaluate which strategies are effective and adjust plans accordingly. Ho Chi Minh City has a large disparity in income and educational priorities between regions. For example: District 1, District 3 and Phu Nhuan District: parents here are often willing to invest in international or bilingual education programs. CRM can focus on promoting the benefits of modern education methods and high-quality facilities. Meanwhile, parents in Binh Tan District, District 9 and Thu Duc City prioritize reasonable costs and amenities around their home. CRM helps optimize messages about competitive prices, shuttle services, and flexible schedules.

**3.1.2. Brand identity system**

The preschool brand identity system is a standardized framework that defines the images, colors, dimensions, logo utilization principles, slogans, office materials, public relations, e-commerce, outdoor graphics, and other related branding elements both inside and outside the preschool. The preschool brand identity system must maintain consistency based on the unified concept applied throughout the system. This is the visual expression of the brand (the face of the brand) representing what preschools want parents and students to perceive about the brand and embedding it in their minds (Tran Viet Dung, 2019, pp. 12). Content marketing is an important strategy that helps private preschools build their brand by creating quality articles, videos, and infographics that communicate core values, special educational methods, and a creative learning environment. High-quality content not only builds trust but also promotes interaction and enhances brand recognition. Posting on the right platforms: The act of posting content on the right platforms such as YouTube, Facebook, Instagram, and LinkedIn are an important strategy for reaching parents and building the brand of the preschool. Each platform has its distinctive advantages, for example, YouTube is an ideal channel for sharing videos introducing unique educational methods such as Montessori or STEAM, while Facebook and Instagram are suitable for sharing images, short articles, and short videos which are easy to access. On YouTube, it is necessary to optimize the title, description, and tags to make the video easily searchable, while on Instagram, using the right hashtags and posting regularly will increase visibility. On LinkedIn, sharing in-depth articles about educational methods helps establish a professional and reputable image. Optimizing content on these platforms not only increases accessibility but also strengthens brand awareness, thereby increasing the trust of parents in choosing a school for their children.

**3.1.3. Brand Promotion**

According to Lê Đăng Lăng (2006), the cost of brand promotion varies depending on the desired objectives and the branding tools used, which include: brand mission, resources, market size, market characteristics—target customers, and media channels (p. 22). According to Watkins et al. (2021), while workflow optimization is the state-owned enterprise's primary purpose, medium and small businesses, including private preschools prioritize enhancing customer experience. Customers of private preschools are students, parents, and teachers (whose importance is increasing due to growing competition and severe teacher shortages), government agencies, and the local community. Given their limited resources, small and medium-sized private preschools (with approximately fewer than 300 children) should analyze their value chain (Figure 2) based on their operational model and evaluate each stage in the value chain to maximize value creation while maintaining reasonable investment costs. It is essential to avoid the "cost trap," where efforts to cut short-term expenses result in higher long-term costs and inefficiencies. Digital Marketing serves as a key tool for effective brand promotion while also optimizing investment costs for the school's value chain (Do Thi Huong Nhu, 2024, pp. 58–61).

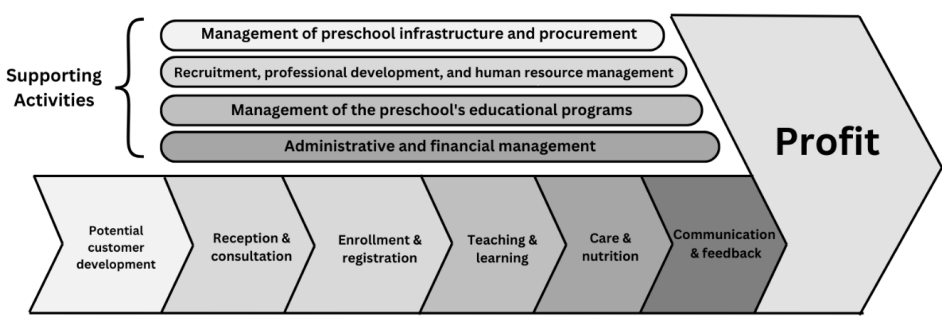

**Figure 3. Simulation of the Value Chain of a Preschool Based on Porter's Value Chain Model**

Effective Digital Marketing Tools for Preschool Brand Promotion:

Pay-per-click (PPC) and advertising on social media: In digital marketing strategies, paid advertising such as Google Ads and advertising on social platforms such as Facebook and Instagram serve an important role in reaching potential parents. These tools allow preschools to precisely target customers through specific classification criteria such as children's age, potential areas, and educational needs. Simultaneously, paid advertising helps highlight the school's unique factors, such as innovative teaching methods and professional teaching staff, thereby promoting brand awareness and building trust from parents.

**Content Marketing**: Content marketing is an important strategy that helps private preschools build their brand by creating quality articles, videos, and infographics that communicate core values, special educational methods, and a creative learning environment. High-quality content not only builds trust but also promotes interaction and enhances brand recognition.

**Diversifying content**: Creating articles, videos, and infographics to share unique educational methods, highly qualified teaching staff, and creative learning activities. For example: a video introducing a Montessori classroom or a STEAM project; an article sharing the benefits of the STEAM education method; an infographic summarizing the learning process according to each stage of child development.

**Posting on the right platforms**: The act of posting content on the right platforms such as YouTube, Facebook, Instagram, and LinkedIn are an important strategy for reaching parents and building the brand of the preschool. Each platform has its distinctive advantages, for example, YouTube is an ideal channel for sharing videos introducing unique educational methods such as Montessori or STEAM, while Facebook and Instagram are suitable for sharing images, short articles, and short videos which are easy to access. On YouTube, it is necessary to optimize the title, description, and tags to make the video easily searchable, while on Instagram, using the right hashtags and posting regularly will increase visibility. On LinkedIn, sharing in-depth articles about educational methods helps establish a professional and reputable image. Optimizing content on these platforms not only increases accessibility but also strengthens brand awareness, thereby increasing the trust of parents in choosing a school for their children.

**Demonstrate core values**: Include the educational mission, unique teaching methods, and key points of differentiation from competitors. By demonstrating these values through articles, videos, or other forms of content, parents can understand why they should choose the school for their children, while also building trust and loyalty from potential customers.

**Website and mobile marketing through**: Email marketing, Sms marketing, Display advertising. Sending valuable, useful, and personalized information helps parents feel the value provided by the school, thereby increasing loyalty and trust in the brand. Parents need not only information about tuition fees or study programs but also content that helps them better understand educational methods and their impact on the development of their children, which can be effectively conveyed through email. After collecting information from events such as seminars or Open Days, an email marketing strategy can be implemented to send free materials, monthly newsletters, and information about innovative educational methods. Personalizing email marketing based on customer data (such as child age, living area, and educational needs) will help enhance strategy effectiveness and encourage parents to take action such as enrolling in school or attending events. In fact, preschools today not only use email as a means of notification but also to provide valuable educational information, helping parents better understand special curriculums such as Montessori, STEAM methods, or extracurricular activities in the school, typically sending monthly newsletters on topics such as "Introducing STEAM projects: The Magic of Paper". These newsletters not only provide information about children's learning activities but also are an opportunity for preschools to affirm their core values, thereby building trust and support from parents. In addition, personalizing emails is also an important factor in enhancing the effectiveness of the strategy.

Preschools can create email marketing strategies to reach different groups of people based on the interests of parents. For example, parents can receive various emails depending on whether they are interested in Montessori, STEAM, or extracurricular activities. Not only does this make the message more relevant, but it also increases the likelihood that the recipient will feel cared for and build a stronger relationship. However, one of the practical challenges in applying Email Marketing, Sms Marketing, Display advertising in preschools is maintaining consistency and effectiveness in strategies. Sending too many emails might annoy parents while sending too few emails might cause schools to lose the opportunity to maintain a connection with parents. Therefore, determining the appropriate frequency and content is an important factor to ensure a highly effective email marketing strategy.

### 3.2. Digital Marketing planning for brand development in private preschools in Ho Chi Minh City

#### 3.2.1. Define clear goals and measure performance.

Define specific goals before implementing a marketing campaign, such as increasing brand awareness and school tour registrations, or improving enrollment rates. Set KPIs (Key Performance Indicators): Measure important indicators such as website visits, conversion rates from advertising, and the number of parents registering information via social networks. Analyze performance: Use tools such as Google Analytics and Meta Business Suite to monitor the effectiveness of marketing activities and adjust when necessary.

Performance Analytics: Tools such as Google Analytics, Meta Business Suite, or A/B testing can be used to monitor the effectiveness of marketing efforts and make adjustments as necessary. Google Analytics: Tracks traffic, user actions, and important metrics like bounce rate and average time on page. This enables the adjustment of content strategies and website optimization for improved customer attraction and retention.. Meta Business Suite: Use this tool to monitor the effectiveness of your Facebook and Instagram ad campaigns, looking at metrics like engagement, video views, and conversion rates from ads. A/B Testing: Run A/B testing to compare the effectiveness of different strategies, testing ads with different messages or different images to find the most effective strategy.

Adjust marketing strategy for better results: Change the advertising budget; if a campaign has a good conversion rate, the budget for that strategy can be increased. Adjust the message or image in advertising to better align with the demands and interests of customers. Use Google or Facebook targeting tools to target the potential customers, such as parents with preschool children in specific areas in Ho Chi Minh City.

#### 3.2.2. Controlling Media Content

Ensure Content Quality: All images, videos, and posts shared on social media must present a professional, positive image of the school. Content must accurately reflect the values and educational methods that the school aims for.

Check for appropriateness: Before posting, ensure that content is not misleading or violates the policies of platforms such as Facebook and Instagram.

#### 3.2.3. Cost management and budget optimization

Regular budget monitoring: Use tools to monitor daily advertising spending on Google Ads, and Facebook Ads. This helps control financial resources and avoid overspending on campaigns that do not bring expected results.

Plan reasonable spending for each month, week, or specific campaign. This will help schools easily adjust their budgets and ensure that marketing costs are always within the limit.

Track the spending situation of each strategy to identify which advertising channels are spending a lot of budget but not bringing the expected results. Regular monitoring and adjustment are very important in the rapidly changing digital marketing environment.

Optimize strategy: Use performance analytics tools like Google Analytics, Facebook Insights, and Meta Business Suite to track and evaluate advertising strategies on different channels. Key metrics to track include conversion rate, click-through rate (CTR), reach, and bounce rate. Based on performance analysis, preschool should focus its budget on channels that are likely to deliver high conversion rates and cost savings. For instance, if Facebook ads demonstrate higher conversion rates than Google ads, the budget can be adjusted to allocate more to Facebook ads while reducing spending on Google ads.

Improve conversion rates and reduce cost per acquisition (CPA) Optimize landing page: A well-designed landing

page will increase conversion rates, thereby reducing CPA. In Google Ads and Facebook Ads, schools can adjust bidding strategies to reduce cost per click (CPC) or cost per mille (CPM). These platforms' automated bidding strategies can help optimize advertising budgets based on campaign objectives.

**3.2.4. Controlling interactions with parents**

Follow comments and reviews on social media and websites to ensure that all feedback from parents is handled promptly and professionally. This demonstrates the school's care and responsibility for each relationship.

Responding quickly and sincerely will help build trust and strengthen the brand image. When receiving negative feedback from parents, it should be received openly and resolved quickly and professionally to minimize negative impacts on the school's reputation. Praise or positive reviews from parents should be acknowledged and thanked publicly, as this will encourage other parents to share their experiences. Positive reviews play an important role in building trust in the community.

Staff training: online feedback skills to handle sensitive situations, especially when there is negative feedback

A friendly and open online interactive environment, so that parents feel comfortable when contacting the school through channels such as Facebook, Instagram, or the website. Online seminars and sharing sessions on preschool education methods might be an effective way to connect with the parent community.

**3.2.5. Controlling legal compliance and privacy**

Advertising content and digital strategies must comply with legal regulations on educational advertising and customer protection.

Ensure that the data of both children and parents are kept confidential and used for the right purposes, avoiding violations of privacy regulations, which protects the benefits of parents but also maintains the school's reputation. Using reliable data management platforms such as CRM helps minimize the risk of information leakage. Any data collected from parents must be used for the original purpose as announced, such as sending information about the school's curriculum or events. Schools are not allowed to use data for sale or share it with third parties without agreement from parents. Employees who access personal data must be trained in legal regulations and security procedures. This helps limit the risk of information leakage due to subjective errors.

Publish the privacy policy on the school website and online platforms. Provide parents with data control, including the ability to allow or deny the use of personal information for purposes other than the original purpose.

**3.2.6. Monitor effectiveness through regular reporting**

Aggregating data from multiple sources for comprehensive evaluation: Data from advertising platforms such as Google Ads, Facebook Ads, and Instagram Ads provides detailed information on ad views, click-through rates (CTR), and cost per conversion (CPC). Using tools such as Google Analytics helps track traffic, bounce rates, and time on site. Engagement metrics (likes, shares, comments) and conversion rates from social media platforms provide a clear view of content effectiveness. Data from customer relationship management systems provides information on the number of parents registering for school tours, conversion rates from interest to enrollment, and post-service feedback. Tools such as Data Studio, HubSpot, or Tableau help consolidate data from multiple sources, allowing for comprehensive analysis and visualization of strategy effectiveness. Key performance indicators (KPI) such as ad views, number of parents visiting, and enrollment rates should be compared with initial goals to evaluate true effectiveness.

Evaluate and adjust campaigns: Consider effectiveness from awareness to action. For example, a high click-through rate containing a low conversion rate may indicate a problem with the landing page or sign-up process. Analyze ROI (Return on Investment): Measure the ROI of each marketing channel to identify which one is most cost-effective. Use the A/B testing with elements like headlines, images, and calls-to-action (CTA) to improve click-through and conversion rates. Adjust target audience: Use targeting tools to re-segment parent base based on real data, such as living area or children's age.

**3.2.7. Risk Management and Crisis Management**

Detect potential issues early: Use tools like Google Alerts, Brand24, or Mention to monitor keywords related to the school's name, curriculum, or other sensitive keywords. These tools help schools early detect potentially harmful posts,

comments, or rumors. Categorize the severity of the detected information to identify the priority level of handling.

Monitor social media activity: Observe Facebook groups, preschool parent forums, or review sites to detect negative comments and discussions related to the school. Use tools like Social Blade or BuzzSumo to evaluate the speed and reach of the spread of posts or misinformation.

## IV. CONCLUSION

Digital Marketing has proven to play an extremely important role in building and developing the brand of private preschools. By applying the right digital marketing strategies - ranging from content creation to the use of advertising tools and analytics - private preschools can not only quickly attract potential customers but also build trust and loyalty among parents, supporting the growth of the school's brand. To achieve maximum effectiveness, preschools need to focus on optimizing user experience, enhancing engagement, and utilizing analytical technology to continuously adjust their marketing strategies.

# FROM DIGITAL TO ACTUAL: UNDERSTANDING THE PSYCHOLOGICAL PATHWAYS OF PRO-ENVIRONMENTAL BEHAVIOR

**Huynh Bao Thach[1]***

[1]Falculty of Business Administration, HCMC University of Foreign Languages - Information Technology (HUFLIT)
* Corresponding: thachhb@huflit.edu.vn

**ABSTRACT**

Despite increasing environmental engagement on digital platforms, global environmental metrics continue to decline, presenting a paradox in digital environmental activism. To address this gap, this study investigates the psychological mechanisms mediating the relationship between digital pro-environmental behavior (D-PEB) and actual pro-environmental behavior (A-PEB). Through structural equation modeling analysis of survey data from 195 respondents, this study validates a comprehensive framework explaining how digital engagement translates into environmental actions. The findings reveal that D-PEB significantly influences both cognitive gratification (β = 0.193) and social gratification (β = 0.639), which subsequently shape environmental self-concept. This identity formation process drives actual pro-environmental behavior (β = 0.314), while D-PEB maintains a direct effect on A-PEB (β = 0.542). The model explains 50.3% of the variance in actual pro-environmental behavior. These findings advance theoretical understanding of behavioral change processes and suggest that digital environmental platforms should enhance both cognitive and social gratification elements to maximize their impact on actual behavior

*Keywords:* "digital engagement", "environmental behavior", "online platforms", "psychological mechanisms", "self-concept"

## I. INTRODUCTION

### 1.1. Background

Environment related content on digital platforms has reached more audiences than ever before. According to a 2021 Pew Research Center study, 45% of 18- to 24-year-old US adults on social media (Generation Z) have followed, liked or commented on posts that advocate for climate action, or shared content. This compares with 40 percent of Millennials (25-44), 27 percent of Generation X (41-56), and 21 percent of Baby Boomers (57 and older) (Blazina, 2024). Moreover, 21% follow accounts devoted to climate action, and 12% have recently shared posts dedicated to climate action (Nadeem, 2024). This phenomenon has caught academic interest as digital environmental and climate activism has evolving rapidly as a research topic, with more than a third of papers on the topic published between 2021 and the first half of 2022 (Baran & Stoltenberg, 2023). This is a sign of both broader practical and academic attention to and understanding of the importance of online environmental activism.

Conventional wisdom and literature recommend that such digital environmental activities promote sustainable behaviour through heightened consciousness (Adisa et al., 2024; Ballew et al., 2015), sharing knowledge (Boncu et al., 2022; Ermolaeva et al., 2020), and reinforcement of communities (McKenzie-Mohr, 2000; Zawieska et al., 2022). But there's been a baffling trend, too: despite growing environmental engagement on digital platform, environmental metrics around the world keep falling. In particular, global greenhouse gas emissions will reach 37.41 billion metric tons by 2024, up 1.08% from 2023, breaking an all-time record (Statista, 2025). Every hour, 300 football fields of forest are lost, further accelerating climate change through release of trapped carbon dioxide into the atmosphere (Rinkesh, 2016). The world produces approximately 300 million tons of plastic waste a year, 91% of which is never recycled (Robinson, 2024). This detrimental situation is likely to become significantly severe if nothing is done.

One might even claim that never has so much digital environmental engagement yielded so little environmental outcome. This paradox raises a critical question about the socio-psychological mechanisms underlying the relationship between pro-environment behavior (PEB) on digital platforms (hereafter referred to as **D-PEB)** and actual environmental behavior (hereafter referred to as **A-PEB)**. While digital platforms have successfully mobilized environmental engagement, the complexity of translating online participation into tangible environmental impact

remains inadequately understood. This phenomenon necessitates a systematic investigation of the psychological mechanisms mediating the relationship between digital and actual environmental behavior.

### 1.2 Research Gap and Significance

First, while extant literature has documented the direct relationship between D-PEB and A-PEB (M. Liu et al., 2024; Lu et al., 2024; Ruiu et al., 2024) the psychological mechanisms mediating this relationship remain insufficiently theorized. Moreover, while digital environmental engagement is believed to provide psychological benefits that may influence behavior (Byman et al., 2022; Van Houwelingen-Snippe et al., 2022), the specific nature and impact of these benefits on real-world environmental actions remain underexplored. This gap limits our understanding of the psychological processes that drive the transition from digital engagement to offline environmental behavior.

Second, pro-environment identity, or an individual's perception of themselves in relation to environmental values, has been recognized as a strong predictor of pro-environmental behavior (Moser & Kleinhückelkotten, 2017; Stets & Biga, 2003). However, there is limited research examining how this self-concept is shaped through digital engagement and how it influences real-world behavior. This gap constrains our understanding of how environmental self-concept functions as a mediating mechanism in pro-environmental behavior.

These gaps are particularly significant given the growing importance of digital platforms in environmental activism and the urgent need to understand how online engagement can more effectively translate into meaningful environmental action. This study addresses these gaps by developing and testing a comprehensive framework examining the psychological mechanisms mediating the relationship between digital and actual pro-environmental behavior.

### 1.3 Research Questions and objectives

Building upon established pro-environmental behavior frameworks and the identified research gaps, this study focuses on understanding the psychological mechanisms that mediate the relationship between digital environmental engagement and actual environmental behavior.

Research Objective 1: To examine the underlying psychological mechanisms that translate digital pro-environmental behavior into actual pro-environmental behavior.

Research Question 1: What are the key psychological mechanisms mediating the relationship between digital and actual pro-environmental behavior?

Research Objective 2: To analyze the role of environmental self-concept in facilitating the transition from digital engagement to actual environmental behavior.

Research Question 2: To what extent does environmental self-concept mediate the relationship between digital engagement and actual environmental behavior?

Drawing upon these research objectives and questions, we develop a theoretical framework and propose six hypotheses examining the interrelationships between digital engagement, psychological mechanisms, and behavioral outcomes. The subsequent sections detail our theoretical development and hypothesis formulation.

## II. MATERIAL AND METHOD

This section is to review concepts of pro-environment behavior (PEB), digital pro-environment behavior (D-PEB), and theories of media effects. The proposed research methods and models are also captured in the pieces of literature which include hypotheses and relations between attributes

### 2.1. Digital Pro-environment behavior (D-PEB) and media effects

Pro-environmental behavior (PEB) is a multifaceted concept that encompasses a range of actions aimed at minimizing negative impacts on the environment (Lu et al., 2024). At its core, PEB is driven by intrinsic motivation, where individuals pursue environmentally conscious actions based on personal satisfaction and ethical considerations rather than external rewards (Klaniecki et al., 2018; Silvi & Padilla, 2021), while environmental values and beliefs form the foundational basis for environmental identity and attitudes that directly influence such behaviors (Walton & Jones, 2022). The manifestation of PEB is further shaped by social norms that create societal expectations for environmentally responsible actions, alongside external conditions such as green infrastructure availability and monetary incentives that can amplify intrinsic motivations (Silvi & Padilla, 2021)

The complex nature of pro-environmental behavior, with its intricate interplay of psychological, social, and contextual factors, has undergone significant transformation in the digital age (Ruiu et al., 2024). While traditional frameworks of PEB have primarily focused on direct, observable actions in physical spaces, the emergence of digital platforms has fundamentally altered how individuals engage with environmental causes (Palacin et al., 2020). This study perceives D-PEB as the actions and attitudes that individuals exhibit online, which are aimed at promoting environmental sustainability (He et al., 2017). This particular behavior manifests in various ways across different digital contexts. For example, on social media and review platforms, users engage in pro-environmental discourse by sharing environmental concerns in their reviews and ratings of tourism and hospitality services (Mariani et al., 2022).

To understand how this digital engagement translates into actual environmental behavior, it is crucial to examine the theoretical mechanisms through which media effects operate in the contemporary digital landscape. Initially, media effects were perceived as strong and direct, impacting audiences in a straightforward manner. However, this view was later challenged by the minimal effects model, which suggested that media's influence was limited and often mediated by other factors such as personal predispositions and social networks (Neuman & Guggenheim, 2011). Recent research has further refined these models, acknowledging that media can exert both direct and indirect influences (Jin et al., 2018)

In the similar vein, research on digital media effects reveals both direct and indirect pathways through which online behavior influences offline actions. the transactional nature of communication in newer media environments, such as social media, has been recognized, highlighting the reciprocal and dynamic interactions between media and audiences (Valkenburg et al., 2016). Online activism, facilitated by social media, often translates into offline collective action, as seen in the positive relationship between online and offline activism, where social media posts can mobilize others for offline protests (Greijdanus et al., 2020). This is further supported by the dual pathway model, which suggests that, for instance, online petition campaigns can evoke emotions like compassion and anger, leading to both online support and offline negative word of mouth against companies' (Antonetti & Manika, 2017). Similarly, online communication about local issues can influence offline behavior, such as increased civic engagement and personal safety measures (Erete, 2015). Social networks also play a crucial role in influencing offline behavior, as demonstrated by a study on physical activity tracking applications, where new social connections led to increased offline physical activity (Althoff et al., 2017). Overall, these studies illustrate the multifaceted ways in which online behaviors can directly and indirectly shape offline actions, emphasizing the intertwined nature of digital and physical worlds.

### 2.2 Research method

Hypotheses Development based on Past Studies

#### 2.2.1 D-PEB, cognitive gratification and social gratification

The relationship between D-PEB and cognitive gratification is grounded in the educational potential of online social networks. When individuals engage in digital environmental activities, they transition from passive information consumers to active content creators and participants in environmental discourse (Ermolaeva et al., 2020). This active engagement through social media platforms facilitates environmental learning and knowledge acquisition in multiple ways.

Research has shown that social networks like Facebook serve as effective tools for environmental education, where users report increased understanding of environmental issues through sharing climate change news and engaging in peer interactions (Robelia et al., 2011). Furthermore, this digital engagement helps bridge the environmental knowledge gap, as studies demonstrate that internet access and usage positively correlate with environmental knowledge acquisition, particularly benefiting those with previously limited access to environmental information (Cheng, 2023). The cognitive satisfaction derived from this learning process and enhanced understanding of environmental issues represents a form of cognitive gratification, suggesting that digital pro-environmental behavior positively influences cognitive outcomes.

Likewise, digital pro-environmental behavior fosters social gratification through enhanced community engagement and social capital development. Research demonstrates that online platforms facilitate community-driven environmental initiatives, where social capital serves as a crucial motivator for pro-environmental behavior adoption, as evidenced in German community sustainability projects (Broska, 2021). These digital spaces enable peer role modeling and

environmental discourse through social networks like Facebook, where users experience increased social support through sharing and commenting on environmental issues (Robelia et al., 2011). The intentional design of online social networks further amplifies these effects by enabling collective pro-environmental actions and shifting environmental social norms, ultimately creating a stronger sense of community belonging and mutual support (Dickinson et al., 2013). This collective engagement and social reinforcement contribute to users' social gratification through meaningful community connections and shared environmental values.

H1: Digital Pro-environmental Behavior has a positive impact on cognitive gratification

H2: Digital Pro-environmental Behavior has a positive impact on social gratification

**2.2.2 Pro-identity environment**

The relationship between cognitive gratification and pro-environmental identity is grounded in both digital practices and cognitive processes. The concept of digital-environmental habitus suggests that individuals' digital engagement patterns reflect and reinforce their environmental orientations, linking digital behaviors with environmental identity formation (Ruiu et al., 2024). Media exposure and social networking involvement enhance environmental concern and personal responsibility, which are fundamental to developing environmental identity (Y. Liu & Li, 2021). Additionally, cognitive flexibility in processing environmental information leads to increased cognitive satisfaction from digital pro-environmental actions, contributing to a stronger and more adaptable environmental identity (Lange & Dewitte, 2019). Thus, cognitive gratification serves as a crucial mechanism in developing and strengthening pro-environmental identity through digital engagement and cognitive adaptation.

Social interactions through digital platforms play a vital role in environmental identity formation. Research shows that diverse social interactions, particularly with peers and those affected by climate change, enhance environmental identity salience and action motivation (Stapleton, 2015). Social media platforms facilitate this process by creating spaces where shared environmental values and behaviors reinforce identity development through peer influence and identity bubbles (Domalewska, 2021) Similar to successful online health communities, environmental digital platforms unite individuals under common environmental causes, fostering collective practices and strengthening members' commitment through social value creation (Chamakiotis et al., 2021). This digital social engagement cultivates a stronger pro-environmental identity through collective identification and shared purpose.

H3: Cognitive gratification has a positive impact on pro-environment Identity

H4: Social Gratification has a positive impact on Pro-environment Identity

**2.2.3 A-PEB**

Pro-environment identity serves as a powerful predictor of actual environmental behaviors across various contexts. Research demonstrates that individuals with strong environmental self-identity exhibit higher levels of pro-environmental purchasing behavior, particularly when influenced by cultural values like horizontal individualism and collectivism (Jung & Cho, 2023). This identity-behavior relationship extends to specific domains like sustainable clothing, where pro-environmental self-identity moderates psychosocial predictors differently by gender (Carfora et al., 2024). Furthermore, this relationship is particularly evident in urban settings, where nature connectedness strengthens the link between identity and behavior (Sierra-Barón et al., 2023) and within family dynamics, where environmental values and behaviors are mutually reinforcing (Balundė & Perlaviciute, 2023)

H5: Pro-environment Identity has a positive impact on Actual Pro-environment Behavior

**2.2.4 D-PEB and A-PEB: a direct relationship**

While the previous hypotheses establish the mediated pathways through gratifications and identity, digital pro-environmental behavior can also directly influence actual environmental actions. Digital environmental activism transforms individuals from passive information consumers to active environmental agents (Ermolaeva et al., 2020), while social media platforms facilitate civil discourse that influences offline environmental actions, as demonstrated in China's environmental movements (Zhang, 2017). This digital-to-actual behavior transition is further reinforced through environmental education in home settings (Lin & Ardoin, 2023) and gamification-based applications that promote practical environmental actions (Zawieska et al., 2022), suggesting that digital pro-environmental engagement directly

translates into real-world environmental behaviors.

H6: D-PEB has a positive impact on A-PEB

### 2.3. Research model

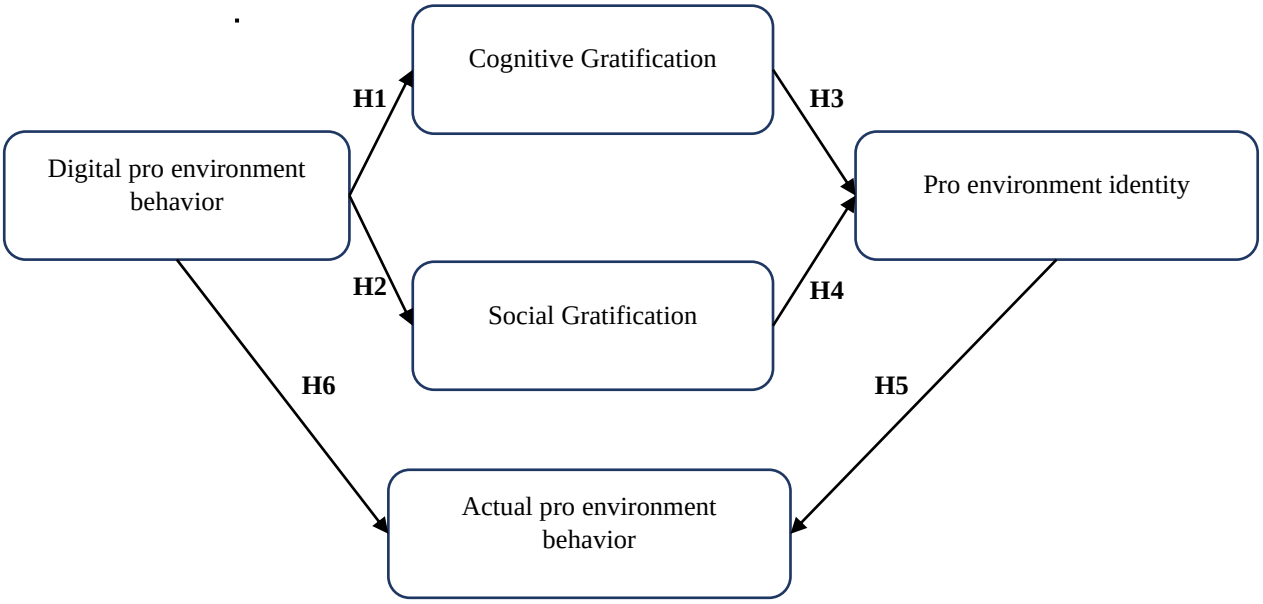

**Fig. 1 - Proposed Conceptual Model**

## III. RESULT AND DISCUSSION

### 3.1. Research subjects

**Table 1: Demographic Profile of Respondents**

| Item | | Frequency | Percent |
|---|---|---|---|
| Gender | Male | 38 | 19.49 % |
| | Female | 157 | 80.51 % |
| Age | < 18 | 1 | 0.51 % |
| | 18 - 25 | 180 | 92.31 % |
| | 26 - 35 | 9 | 4.62 % |
| | 36 - 45 | 3 | 1.54 % |
| | > 45 | 2 | 1.03 % |
| Highest education | High school graduate | 31 | 15.90 % |
| | Bachelor | 155 | 79.49 % |
| | Master | 9 | 4.62 % |
| In your opinion, can environmental activities on digital platforms create positive impacts on the environment? | Yes | 186 | 95.38 % |
| | No | 9 | 4.62 % |

The survey results indicate that the majority of participants were female (80.51%), while males accounted for only 19.49%. In terms of age, the 18-25 age group dominated with 92.31%, while other age groups (under 18, 26-35, 36-45, and over 45) represented very small percentages. Regarding educational background, 79.49% of participants held bachelor's degrees, 15.90% were high school graduates, and 4.62% had master's degrees. Notably, 95.38% of respondents believed that environmental activities on digital platforms could create positive impacts on the environment.

### 3.2. Measurement Model Assessment

The results of the model analysis show the potential impact of Digital pro environment behavior (D_PEB) on the

actual pro environment behavior (A_PEB), both directly and indirectly (Figure 2 )

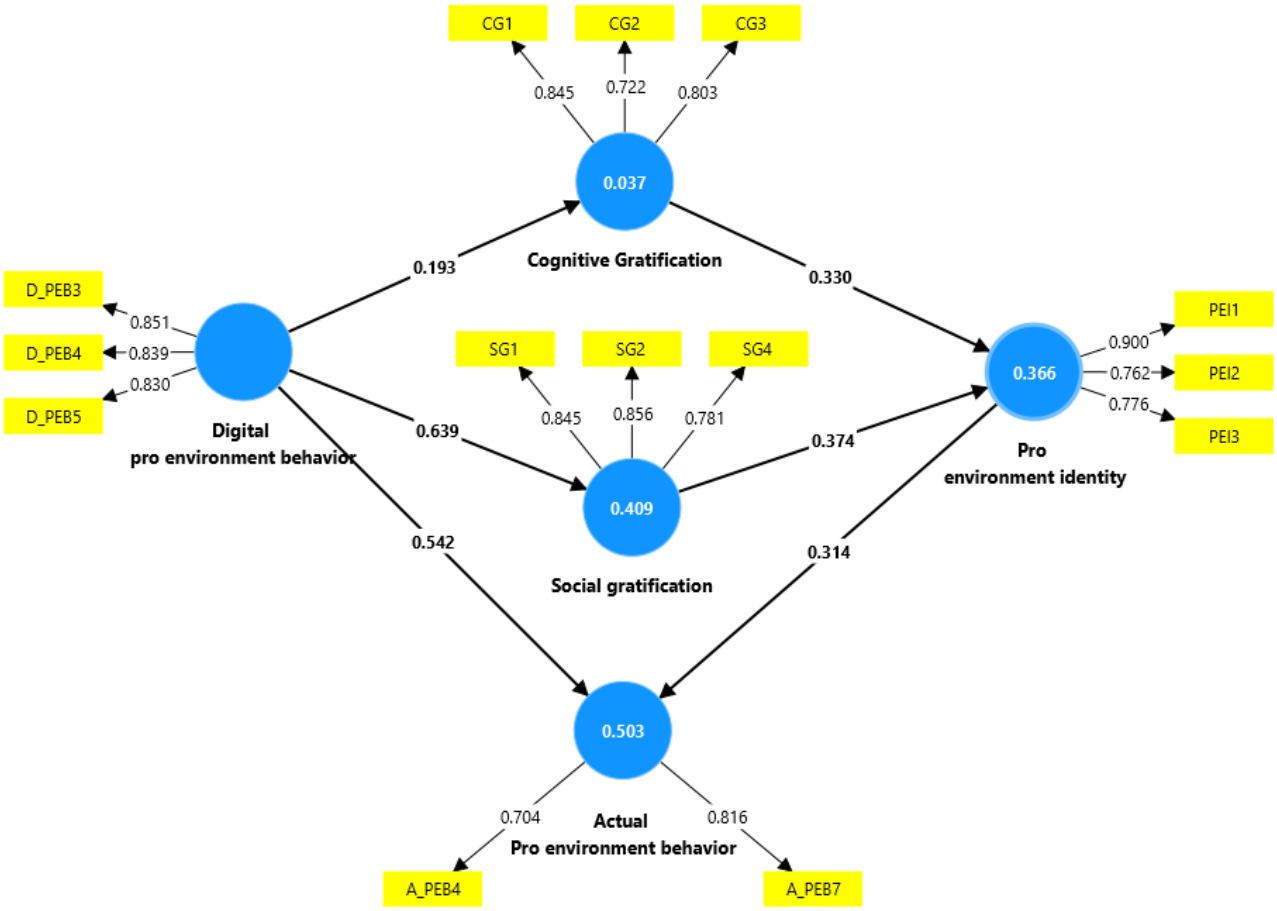

**Fig 2 – The result of Research model**

Table 2 assesses the reliability and validity of constructs related to pro-environmental behavior in both digital and actual contexts. All item loadings exceed the recommended threshold of 0.7, reflecting that indicators reliably measure their intended constructs such as actual pro-environment behavior (A_PEB), digital pro-environment behavior (D_PEB), social gratification (SG), cognitive gratification (CG), and pro-environment identity (PEI). The Cronbach's alpha values, ranging from 0.73 to 0.878, confirm internal consistency among the items within each construct. Similarly, composite reliability scores, exceeding the minimum standard of 0.7, ensure that the measurement model consistently captures the latent variables. Furthermore, the average variance extracted (AVE) values surpass the benchmark of 0.5, indicating sufficient convergent validity by showing that more than half of the variance in the indicators is attributable to their respective constructs. Finally, variance inflation factors (VIFs) remain well below 5, affirming the absence of multicollinearity.

**Table 2: Convergent Validity and Construct Reliability.**

| | Items | Loadings | Cronbach's alpha | Composite reliability (rho_a) | Composite reliability (rho_c) | Average variance extracted (AVE) | VIF |
|---|---|---|---|---|---|---|---|
| **A_PEB** | **A_PEB** | 0.704 | 0.73 | 0.741 | 0.734 | 0.581 | 1.492 |
| | **A_PEB** | 0.816 | | | | | 1.492 |
| **CG** | **CG1** | 0.845 | 0.837 | 0.838 | 0.834 | 0.627 | 1.772 |
| | **CG2** | 0.722 | | | | | 2.678 |
| | **CG3** | 0.803 | | | | | 2.084 |
| **D_PEB** | **D_PEB** | 0.851 | 0.878 | 0.878 | 0.878 | 0.706 | 2.287 |
| | **D_PEB** | 0.839 | | | | | 2.733 |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| | **D_PEB** | 0.830 | | | | | 2.344 |
| | **PEI1** | 0.900 | 0.853 | 0.862 | 0.855 | 0.664 | 2.545 |
| **PEI** | **PEI2** | 0.762 | | | | | 2.362 |
| | **PEI3** | 0.776 | | | | | 1.79 |
| | **SG1** | 0.845 | 0.866 | 0.869 | 0.867 | 0.686 | 2.765 |
| **SG** | **SG2** | 0.856 | | | | | 2.829 |
| | **SG3** | 0.781 | | | | | 1.821 |

The discriminant validity of the constructs was evaluated using the HTMT criterion (Henseler et al., 2015). As shown in Table 3, all HTMT values are below the conservative threshold of 0.85, indicating adequate discriminant validity between all latent constructs. Notably, the HTMT values for D_PEB – A_PEB (0.646) and SG – A_PEB (0.699) are relatively higher but remain well within the acceptable range, confirming that these constructs are sufficiently distinct. Therefore, the measurement model satisfies the discriminant validity requirement, ensuring that each construct represents a unique theoretical concept.

**Table 3: Discriminant validity – HTMT matrix**

| | **A_PEB** | **CG** | **D_PEB** | **PEI** | **SG** |
|---|---|---|---|---|---|
| **A_PEB** | | | | | |
| **CG** | 0.226 | | | | |
| **D_PEB** | 0.646 | 0.193 | | | |
| **PEI** | 0.486 | 0.505 | 0.322 | | |
| **SG** | 0.699 | 0.477 | 0.641 | 0.534 | |

### 3.3. Structural Model Assessment

The results from Table 4 confirm that all proposed hypotheses in the study were statistically supported at the 5% significance level. The path from digital pro-environment behavior (D_PEB) to cognitive gratification (CG) was significant ($t = 2.149$, $\beta = 0.193$, $p < 0.05$), affirming hypothesis 1. Similarly, the relationship between D_PEB and social gratification (SG) was strongly supported ($t = 10.576$, $\beta = 0.639$, $p < 0.001$), validating hypothesis 2. Cognitive gratification (CG) demonstrated a significant positive effect on pro-environment identity (PEI) ($t = 3.510$, $\beta = 0.330$, $p < 0.001$), supporting hypothesis 3, while SG also significantly influenced PEI ($t = 4.101$, $\beta = 0.374$, $p < 0.001$), confirming hypothesis 4. Finally, both the direct path from PEI to actual pro-environment behavior (A_PEB) ($t = 4.127$, $\beta = 0.314$, $p < 0.001$) and the direct path from D_PEB to A_PEB ($t = 7.008$, $\beta = 0.542$, $p < 0.001$) were statistically significant, supporting hypotheses 5 and 6.

**Table 4: Results of hypotheses testing (Path coefficient after bootstrapping)**

| **Hypothesis** | **PLS Path** | **Original sample (O)** | **Sample mean (M)** | **Standard deviation (STDEV)** | **T statistics (\|O/STDEV\|)** | **P values** | **Remark** |
|---|---|---|---|---|---|---|---|
| **H1** | **D_PEB -> CG** | 0.193 | 0.196 | 0.090 | 2.149 | 0.032 | Supported |
| **H2** | **D_PEB -> SG** | 0.639 | 0.640 | 0.060 | 10.576 | 0.000 | Supported |
| **H3** | **CG -> PEI** | 0.330 | 0.329 | 0.094 | 3.510 | 0.000 | Supported |
| **H4** | **SG -> PEI** | 0.374 | 0.378 | 0.091 | 4.101 | 0.000 | Supported |
| **H5** | **PEI -> A_PEB** | 0.314 | 0.315 | 0.076 | 4.127 | 0.000 | Supported |
| **H6** | **D_PEB -> A_PEB** | 0.542 | 0.542 | 0.077 | 7.008 | 0.000 | Supported |

The results in Table 5 reveal varying levels of explanatory power among the constructs. Actual pro-environment behavior (A_PEB) achieved an $R^2$ value of 0.503, indicating that 50.3% of its variance was explained by its predictors, including PEI and D_PEB. This level of predictive accuracy is considered moderate and underscores the importance of both digital engagement and identity in shaping real-world environmental actions. Pro-environment identity (PEI) had an $R^2$ value of 0.366, also reflecting moderate explanatory power, primarily driven by cognitive gratification (CG) and social gratification (SG). However, cognitive gratification (CG) exhibited a much lower $R^2$ value of 0.037, suggesting

that only 3.7% of its variance is explained by D_PEB. This low value indicates that while D_PEB contributes positively to CG, other unexamined factors, such as individual cognitive capacities or external stimuli, may play a larger role in influencing cognitive outcomes.

Table 6 further assesses the effect sizes of individual predictors using $f^2$. The effect size of D_PEB on A_PEB was 0.53, indicating a large impact, while PEI had a moderate effect ($f^2 = 0.178$). However, the effect of D_PEB on CG was relatively small ($f^2 = 0.039$), implying that while D_PEB contributes to cognitive gratification, other external variables may play a more significant role. These findings suggest that digital environmental engagement has a strong direct impact on real-world environmental behavior, with identity formation playing a crucial mediating role.

The predictive relevance ($Q^2$ predict) for all constructs was positive, confirming the model's capability to predict outcomes beyond the sample data. A_PEB, for example, had a $Q^2$predict value of 0.261, reinforcing its predictive utility. In contrast, the low predictive relevance of CG suggests that its relationship with D_PEB and other constructs may need further theoretical refinement. However, the PLS-SEM model achieved high predictive performance since none of its root mean squared error (RMSE) indices was larger than the linear model benchmark in Table 6. These findings emphasize the robust predictive power of the overall structural model while identifying cognitive gratification as an area requiring additional exploration.

**Table 5: Predictive relevance ($Q^2$) and predictive accuracy ($R^2$)**

| | R-square | $Q^2$predict | RMSE | MAE |
|---|---|---|---|---|
| **A_PEB** | 0.503 | 0.261 | 0.869 | 0.683 |
| **CG** | 0.037 | 0.01 | 1.005 | 0.815 |
| **PEI** | 0.366 | 0.072 | 0.972 | 0.795 |
| **SG** | 0.409 | 0.304 | 0.845 | 0.666 |

**Table 6: f-square $f^2$**

| | A_PEB | CG | D_PEB | PEI | SG |
|---|---|---|---|---|---|
| **A_PEB** | | | | | |
| **CG** | | | | 0.133 | |
| **D_PEB** | 0.53 | 0.039 | | | 0.692 |
| **PEI** | 0.178 | | | | |
| **SG** | | | | 0.17 | |

## IV. CONCLUSION

This research illuminates the complex psychological mechanisms underlying the paradoxical relationship between digital pro-environmental behavior (D-PEB) and actual pro-environmental behavior (A-PEB). Through rigorous structural equation modeling, our findings validate a comprehensive framework that explains how digital engagement translates into environmental actions through multiple pathways, with psychological gratifications and environmental self-concept serving as crucial mediating mechanisms.

The empirical results reveal that D-PEB significantly influences both cognitive gratification ($\beta = 0.193$, $p < 0.05$) and social gratification ($\beta = 0.639$, $p < 0.001$), which subsequently shape environmental self-concept through distinct psychological pathways. This identity formation process, reinforced by both cognitive and social elements, drives actual pro-environmental behavior ($\beta = 0.314$, $p < 0.001$). Notably, D-PEB maintains a direct effect on A-PEB ($\beta = 0.542$, $p < 0.001$), suggesting parallel mechanisms of behavioral influence. The model demonstrates robust predictive power, explaining 50.3% of the variance in actual pro-environmental behavior.

These findings advance theoretical understanding in several ways. First, they elucidate the psychological mechanisms mediating the transformation of digital engagement into tangible environmental actions, extending previous work on behavioral change processes. Second, they demonstrate the dual role of cognitive and social gratifications in environmental identity formation, contributing to the literature on digital environmental psychology. Third, they validate environmental self-concept as a critical mediating mechanism in the digital-to-actual behavior transformation process.

From a practical perspective, these results suggest that digital environmental platforms should focus on enhancing both cognitive and social gratification elements to maximize their impact on actual behavior. Environmental organizations and digital platform designers should incorporate features that facilitate knowledge acquisition while fostering meaningful social connections among users, as these elements collectively strengthen environmental identity and drive real-world actions.

This study's limitations include its cross-sectional nature and reliance on self-reported measures. Future research should employ longitudinal designs to examine the temporal dynamics of behavioral transformation and incorporate objective behavioral measures. Additionally, investigating potential moderating effects of demographic and contextual factors could provide more nuanced insights into the D-PEB to A-PEB transformation process. Finally, exploring the role of emerging technologies and digital platforms in environmental behavior change could offer valuable insights for both theory and practice.

**ABSTRACT**

With global environmental degradation driven by the demand and consumption of conventional foods, green food consumption offers a counteraction by increasing consumers' intake of sustainable foods. Given that the organic food industry in Vietnam is still in its infancy as a niche market, research on green marketing with local applications remains limited and has not significantly boosted demand for organic foods. This study aims to explore the role of green advertising receptivity and green brand image in driving green food purchase intentions, surveying 298 Gen Z green food consumers in Ho Chi Minh City through convenience sampling. The results indicate that green advertising receptivity positively influences green brand trust and green food purchase intentions. Furthermore, green brand image positively impacts both green brand trust and purchase intentions for green foods. Additionally, the study reveals that green brand trust has a positive effect on green food purchase intentions. These findings are valuable for marketers and green food producers in identifying effective green marketing strategies.

*Keywords*: “Green food; Green advertising; Green marketing; Green brand

## I. INTRODUCTION

In industrial economies, food consumption has shifted towards a range of socially balanced and diverse food choices, including organic foods (Latip et al., 2020; Naja & Hamadeh, 2020). The sustainability efforts of market participants in promoting their products and services are closely linked to green marketing, which incorporates specific elements of environmental sustainability. These efforts play a critical role in understanding consumers' purchase intentions for green foods (Latip et al., 2020).

In recent years, in response to the increasing environmental challenges, firms have been required to project a positive image and promise greater environmental benefits than they currently provide to environmentally conscious consumers (Sun et al., 2021). Simultaneously, public awareness of the importance of environmental protection has continuously improved, reaching the level of a gradual consensus among nations worldwide with the shared goal of achieving sustainable development (Wu & Long, 2024). Twenty-first-century consumers are increasingly aware of the impact of their consumption patterns on the environment and are thus shifting towards sustainable consumption models for the welfare of future generations (Jaiswal & Singh, 2018).

According to the Ministry of Industry and Trade, the demand for green products in Vietnam has grown at an average rate of 15% annually during the period from 2021 to 2023. Approximately 72% of Vietnamese consumers are willing to pay more for green products, indicating a growing awareness and concern among the population regarding environmental protection issues. According to a report by Euromonitor, the green food market in Vietnam reached a value of 100 million USD in 2023, reflecting a 20% growth compared to 2020. According to research findings by Nielsen Vietnam, brands with commitments to being "green" and "clean" have experienced higher growth rates, averaging around 4%. For instance, in the food and beverage sector, growth rates have outpaced the overall market, ranging from 2.5% to 11.4%. Additionally, the survey revealed that approximately 80% of Vietnamese consumers are willing to pay more for products that use environmentally friendly materials and carry "green" and "clean" brand.

Many businesses are currently developing green promotion strategies aimed at influencing consumers and stimulating the purchase of green products (Klockner, 2015). Green communication focuses on individuals' environmental awareness and how these perceptions shape their attitudes and behaviors toward the environment (Jarreau et al., 2017). This shift has led to the rise of green advertising campaigns, with marketers leveraging it to

encourage the adoption of environmentally friendly products (Bailey et al., 2016).

The rise of green advertising as an appealing promotion tool is increasing, attracting many individuals interested in purchasing green products (Bailey et al., 2016). However, despite the perceived advantages, consumer skepticism regarding the reliability of green advertising remains widespread. Doubts persist as to whether green products genuinely offer ecological benefits compared to non-green products (Moussa & Touzani, 2008; Peattie, 2010). Issues of trust and credibility have thus become central in this context (Moussa & Touzani, 2008; Nguyen-Viet, 2022).

Green advertising receptivity refers to the consumer's acceptance of green advertisements (Sun et al., 2021). According to Bailey et al. (2016), consumer responses to environmental communication and demands vary significantly depending on their receptivity to green communication, particularly green advertising. Several studies suggest that green advertising receptivity positively influences green brand trust (Nguyen-Viet, 2022; Sun et al., 2021; Nguyen-Viet & Thanh Tran, 2024) and affects consumers' intentions to adopt green products (Wu & Long, 2024; Nauman, 2024; Jog & Singhal, 2024; Nguyen-Viet & Thanh Tran, 2024). Furthermore, customers' green brand trust aligns positively with green consumption intentions (Amin & Tarun, 2021; Nguyen-Viet, 2022; Rahman & Nguyen-Viet, 2023; Nguyen-Viet & Thanh Tran, 2024).

Brand image can be defined as the mental representation of a brand in the consumer's mind, associated with a specific offering (Cretu & Brodie, 2007). Green brand image fulfills consumers' environmental expectations and mitigates arising issues (Khandelwal et al., 2019). In this way, a strong green brand image positively impacts consumer trust by reducing perceived risks (Chen, 2010; Rahman & Nguyen-Viet, 2023). Additionally, green brand image also positively influences green product consumption behavior (Sembiring, 2021; Ronaldo et al., 2018).

Previous studies have indicated that minimizing environmental harm through increased green consumption behavior is highly beneficial for the environment. Consequently, green consumption behavior plays a crucial role in establishing and maintaining environmental protection. This study aims to examine green advertising as a means to enhance corporate green brand trust, leading to Vietnamese consumers' intentions to purchase green food. Additionally, the research investigates how green brand image affects green brand trust and green food purchase intentions. The study employs the Stimulus-Organism-Response (SOR) model to provide empirical evidence. Furthermore, it offers recommendations to improve green advertising effectiveness in alignment with Vietnamese consumers' perceptions.

## II. LITERATURE REVIEW AND METHODOLOGY

This study is grounded in the Stimulus–Organism–Response (SOR) theory (Jacoby, 2002), which can explain behavioral differences arising from various marketing stimuli and cognitive factors (Sultan et al., 2021). Previous research on green consumption has applied the SOR framework to illustrate how external factors influence consumers' cognitive and emotional evaluations, thereby shaping their behavioral intentions (Gil & Jacob, 2018; Nguyen-Viet, 2022; Sun et al., 2021). In this study, green advertising receptivity and green brand image function as the stimuli, green brand trust is conceptualized as the organism component, and green purchase intention serves as the response factor.

### 2.1. Green advertising receptivity, green brand trust, and green food purchase intention

Green advertising refers to advertisements that typically emphasize the overall environmental benefits associated with purchasing specific products, such as reducing greenhouse gas emissions, lowering water pollution, and facilitating biodegradation (Nyilasy et al., 2014). Green advertising receptivity denotes the extent to which consumers accept green advertisements. When consumers are exposed to green advertising, their emotions and judgments are shaped, influencing their attitudes toward the green advertisements themselves and building trust in green brands or products (Bailey et al., 2016).

Accurate and truthful message delivery through advertising plays a crucial role in building brand trust and credibility (Nguyen Viet & Nguyen Anh, 2021; Nguyen-Viet, 2022). When exposed to advertisements, consumers develop emotions (affective responses) and judgments (cognitive evaluations), which influence their trust in the brand (Nagar, 2015). In the context of green advertising, the information provided often focuses on the environmental impacts of business activities, primarily revolving around raw materials, production processes, logistics, and post-use product activities (Leonidou et al., 2011). Consumers' receptivity to green advertising strengthens the connection between the appeal of green messages and brand trust, positively influencing consumer trust in green brands (Bailey et al., 2016;

Nguyen-Viet, 2022; Sun et al., 2021). Additionally, Nguyen-Viet & Thanh Tran (2024) suggest that greater green advertising receptivity enhances customer trust in green brands.

Previous studies indicate that the goal of green advertising is to influence consumer purchase intentions by encouraging consumers to buy green products and helping them recognize the positive impacts on both themselves and the environment (Rahbar & Abdul Wahid, 2011). Therefore, green advertising receptivity is positively associated with consumers' intentions to purchase green products (Chang et al., 2015). Findings by Sun et al. (2021) highlight that green advertising receptivity has a positive impact on consumers' green purchase intentions. Sun et al. (2021) explored the correlation between green advertising receptivity and consumers' intentions to purchase eco-labeled products, while Joyal-Desmarais et al. (2022) also suggest a positive relationship between green advertising receptivity and green purchase intentions. Furthermore, green advertising receptivity is positively correlated with green purchase intention (Wu & Long, 2024; Tewari et al., 2022; Latip et al., 2023; Nauman, 2024; Jog & Singhal, 2024; Nguyen-Viet & Thanh Tran, 2024). Based on the prior literature, this study hypothesizes that:

$H_1$: Green advertising receptivity positively influences green brand trust.

$H_2$: Green advertising receptivity positively impacts green food purchase intention.

**2.2. Green brand image, green brand trust, and green food purchase intention**

In a green context, green brand image is defined as a set of consumer perceptions about a brand's environmental commitments and concerns (Chen, 2010; Martínez, 2015). Green brand image is essential for companies, especially as consumers become more environmentally conscious and as strict international environmental regulations emerge (Delafrooz & Goli, 2015). A green brand image meets consumer environmental desires and mitigates emerging issues (Khandelwal et al., 2019). By reducing perceived risks, green brand image positively influences consumer trust (Chen, 2010). Prior studies have explored the relationship between green brand image and trust (Rahman & Nguyen-Viet, 2023; Bashir et al., 2020; Bekk et al., 2015). Furthermore, green brand image has a positive effect on green purchase intention, as noted by Ronaldo et al. (2018), Kijpanjasub & Jitkuekul (2019), Sembiring (2021), supporting the hypothesis:

$H_3$: Green brand image positively influences green brand trust.

$H_4$: Green brand image positively impacts green food purchase intention.

**2.3. Green brand trust and green food purchase intention**

Brand trust is founded on the consumer's belief that a brand is consistent, competent, honest, and responsible (Doney & Cannon, 1997). According to Chen (2010), green brand trust specifically refers to the trust and reliance consumers place on a brand's environmental claims, as well as its ability to fulfill ecological commitments associated with its products or services. In the green context, trust reflects consumers' willingness to rely on a brand based on the belief or expectation that it is reliable, considerate, and capable of effective environmental performance (Martínez, 2015).

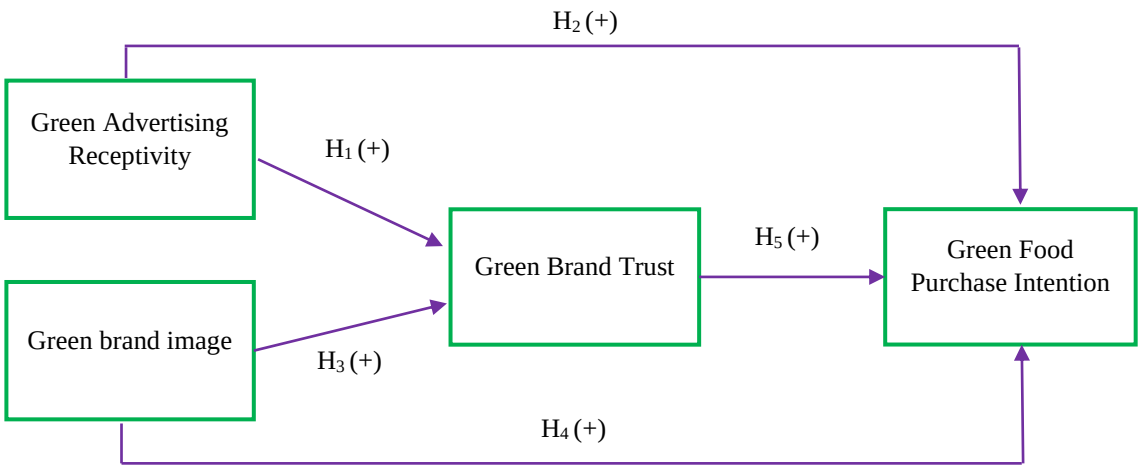

**Figure 1: The conceptual model**

Therefore, green trust can lead to stronger purchase intentions (Kahraman & Kazançoglu, 2019; Ng et al., 2018). Previous studies have shown that trust is one of the important factors determining consumers' green purchase intentions (Chen, 2010; Gil & Jacob, 2018; Konuk et al., 2015). Recent research supports these findings and shows that trust in green brands positively affects consumers' green purchase intentions (Amin & Tarun, 2021; Nguyen-Viet, 2022). Furthermore, Rahman & Nguyen-Viet (2023); Nguyen-Viet & Thanh Tran (2024) found that green brand trust has a positive effect on green purchase intentions. Based on these findings, it is hypothesized that:

$H_5$: Green brand trust positively influences green food purchase intention.

### 2.4. Methodology

#### 2.4.1. Measures

The questionnaire was created based on the English version collected from previous studies, then translated into Vietnamese. Next, the questionnaire was tested through interviews with a group of 10 people who are customers actively participating in green food consumption activities. The purpose of this interview was to adjust the scale to ensure its usability and reflect the actual context of the study. The survey questions were divided into two main parts: (1) detailed description of the personal characteristics of the survey participants and (2) detailed description of the research concepts.

Research scale: Green brand trust was measured by 4 observed variables and green food purchase intention was measured by 3 observed variables adopted from Konuk et al. (2015); Green advertising receptivity was measured by 4 observed variables adopted from Tewari et al. (2022); Green brand image was operationalized using 4 scale items from the study of Lin & Zhou (2022).

#### 2.4.2. Sample and data collection procedure

A survey on green food consumers of Gen Z in Ho Chi Minh City. Convenience sampling method was used to design the study. Then, the questionnaire was sent electronically to respondents who were university students in Ho Chi Minh City. Data collection was carried out for 3 months (from June 2024 to September 2024) and 298 sheets were used.

#### 2.4.3. Statistical technique

Using PLS-SEM model to measure collected data through measurement model to evaluate composite reliability index, convergent validity and discriminant validity. Structural model evaluates standardized root mean square residual (SRMR), multicollinearity coefficient (VIF), predictive relevance (Q2), and coefficient of determination (R2). SmartPLS 3 software is used for evaluation (Hair et al., 2021).

## III. RESULTS AND DISCUSSION

### 3.1. Demographics

The sample includes 298 respondents who consume green food belonging to Gen Z generation in Ho Chi Minh City. Shown in Table 1.

**Table 1. Demographics**

| Characteristic | Items | Frequency | Percentage |
|---|---|---|---|
| Gender | Male | 142 | 47,7 |
| | Female | 156 | 52,3 |
| View green ads | Viewed | 219 | 73,5 |
| | Unviewed | 79 | 29,5 |
| Purchase frequency | 1 - 5 times | 111 | 37,3 |
| | 6 - 10 times | 7 | 2,4 |
| | 11 - 15 times | 7 | 2,3 |
| | 16 - 20 times | 6 | 2,1 |
| | More than 20 times | 4 | 1,2 |
| | Daily | 14 | 4,8 |

| | | | |
|---|---|---|---|
| | Weekly | 4 | 1,2 |
| | Monthly | 29 | 9,6 |
| | Frequently | 25 | 8,4 |
| | Don't remember | 91 | 30,7 |

*Source: Result of data analysis*

### 3.2. Measurement model evaluation

#### 3.2.1. Results of scale reliability and convergent validity

The reliability results of the measurement scale (Table 2) assessed reliability using composite reliability, achieving values ranging from 0,874 to 0,901. Internal consistency, measured by Cronbach's Alpha, exceeded 0,6. Convergent validity was confirmed with standardized factor loadings ranging from 0,673 to 0,894 and an average variance extracted (AVE) from 0,663 to 0,698, thereby meeting the criteria for convergent validity.

**Table 2. Results of scale reliability**

| Constructs | Loading | Alpha | CR | AVE |
|---|---|---|---|---|
| **Green Brand Trust (GT)** | | | | |
| GT1. I feel that this brand's environmental commitments are generally trustworthy. | 0,843 | **0,837** | **0,891** | **0,672** |
| GT2. I feel that this brand's environmental performance is generally reliable. | 0,783 | | | |
| GT3. I feel that this brand's environmental claims are generally credible. | 0,825 | | | |
| GT4. This brand keeps its promises and commitments to environmental protection. | 0,827 | | | |
| **Green Advertising Receptivity (RGA)** | | | | |
| RGA1. I support brands that are environmentally friendly. | 0,894 | **0,829** | **0,886** | **0,663** |
| RGA2. The use of green messages in advertising affects my attitude toward the advertisement. | 0,776 | | | |
| RGA3. I am the type of consumer who responds positively when brands use green messages in their advertising. | 0,894 | | | |
| RGA4: I am the type of consumer who is willing to buy products marketed as green. | 0,673 | | | |
| **Green Brand Image (BI)** | | | | |
| BI1. This brand is professional in its environmental reputation. | 0,865 | **0,854** | **0,901** | **0,695** |
| BI2. This brand is successful in environmental performance. | 0,843 | | | |
| BI3. This brand is established in its environmental concern. | 0,798 | | | |
| BI4. This brand is trustworthy in its environmental commitments. | 0,828 | | | |
| **Green Food Purchase Intention (PI)** | | | | |
| PI1. I am willing to purchase this brand's products in the future because of its environmentally friendly performance. | 0,833 | **0,785** | **0,874** | **0,698** |
| PI2. I intend to buy this brand's products due to its environmental concern. | 0,838 | | | |
| PI3. I will make an effort to buy this brand's products because it is environmentally friendly. | 0,835 | | | |

*Source: Result of data analysis*

#### 3.2.2. Results of discriminant validity

Discriminant validity, measured by the Fornell-Larcker coefficient (Table 3), showed that all square roots of AVE values were higher than the correlation values with other concepts (Fornell & Larcker, 1981). The results presented in Table 4 shows that the Heterotrait-Monotrait ratios for all the constructs were less than the threshold value of 0.85

(Henseler et al., 2015). Discriminant validity was met.

**Table 3. Results of discriminant validity (Fornell-Larcker criterion)**

| | BI | GT | PI | RGA |
|---|---|---|---|---|
| **BI** | 0,834 | | | |
| **GT** | 0,560 | 0,820 | | |
| **PI** | 0,503 | 0,653 | 0,836 | |
| **RGA** | 0,458 | 0,433 | 0,468 | 0,814 |

*Source: Result of data analysis*

**Table 4. Results of discriminant validity (Heterotrait-Monotrait ratio)**

| | BI | GT | PI | RGA |
|---|---|---|---|---|
| **BI** | | | | |
| **GT** | 0,656 | | | |
| **PI** | 0,601 | 0,798 | | |
| **RGA** | 0,544 | 0,513 | 0,556 | |

*Source: Result of data analysis*

### 3.3. Structural model evaluation and hypotheses result

The model was evaluated with indices including SRMR (0.064), VIF (ranging from 1.427 to 2.968), $Q^2$ (0.232 and 0.322), and $R^2$ (0.352 and 0.481). The results indicate that the model aligns well with the research framework. Bootstrapping (5,000 samples) confirmed statistical significance, supporting hypotheses H1 - H5 (Table 5 and Figure 2).

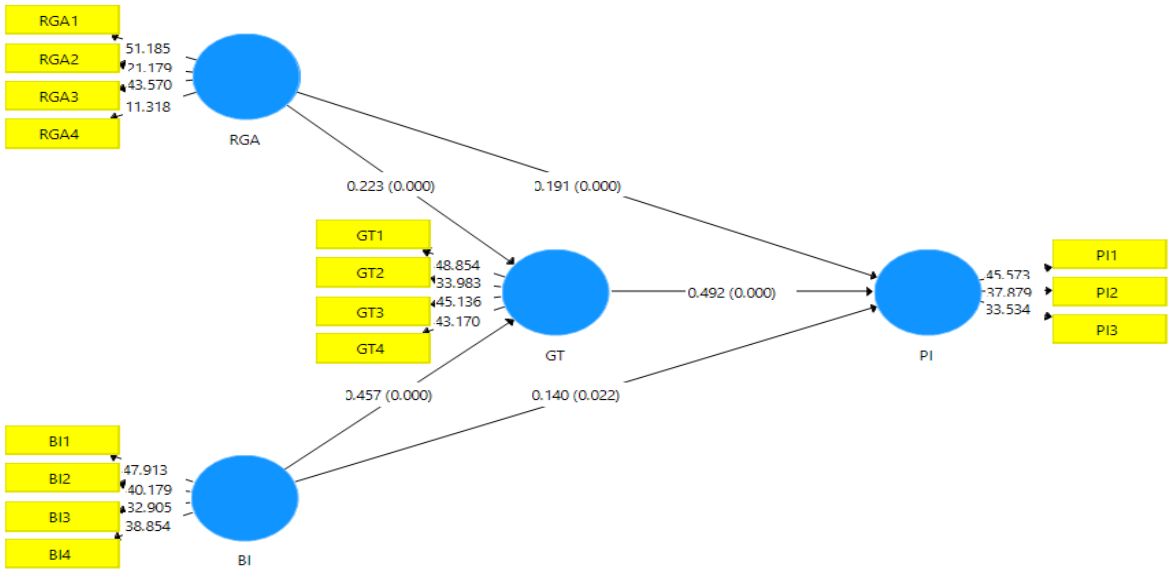

**Figure 2. Results of the research mode**

**Table 5. Hypotheses result**

| Hypotheses | Path | Estimat | P Values | Results |
|---|---|---|---|---|
| H1 | GRA➔GT | 0,223 | 0,000 | Supported |
| H2 | GRA➔PI | 0,191 | 0,000 | Supported |
| H3 | BI➔GT | 0,457 | 0,000 | Supported |
| H4 | BI➔PI | 0,140 | 0,022 | Supported |
| H5 | GT➔PI | 0,492 | 0,000 | Supported |

### 3.4. Discussions

Table 5 indicated that GRA positively impacts GT with β = 0,223, supporting Hypothesis H1. This finding aligns with previous studies by Bailey et al. (2016), Nguyen-Viet (2022), Sun et al. (2021), and Nguyen-Viet & Thanh Tran (2024), which suggest that green advertising receptivity positively influences green brand trust.

H2: GRA positively impacts PI with β = 0,191 (Table 5), supporting the hypothesis. This result aligns with findings from Wu & Long (2024), Nauman (2024), Jog & Singhal (2024), and Nguyen-Viet & Thanh Tran (2024), indicating that green advertising receptivity positively impacts green food purchase intention.

Furthermore, Table 5 showed that BI positively influences GT with with β = 0,457, supporting Hypothesis H3. This result is consistent with Rahman & Nguyen-Viet (2023), Bashir et al. (2020), Bekk et al. (2015), which suggest that green brand image positively influences green brand trust.

Besides, data displayed in Table 5 show a statistically significant relationship between BI and PI with β = 0,140 (p=0,022) hypothesis H4 is supported. This result is consistent with by Ronaldo et al. (2018), Kijpanjasub & Jitkuekul (2019), Sembiring (2021), indicating that green brand image positively impacts green food purchase intention.

Addition, Table 4 shows that GT positively impacts PI with β = 0,492, supporting Hypothesis H5. This result is consistent with previous studies by Amin & Tarun (2021), Nguyen-Viet (2022), Rahman & Nguyen-Viet (2023), and Nguyen-Viet & Thanh Tran (2024), which indicate that green brand trust positively influences green food purchase intention.

## IV. CONCLUSIONS

Today, marketing strategies convey the green benefits of food companies' products to consumers through advertising. A critical point to consider here is whether consumers differ in their receptivity to such advertisements (Do Paco et al., 2019). Bailey et al. (2016) emphasize the importance of identifying green advertising receptivity for effective message delivery. From a marketing perspective, it is essential to develop differentiated communication strategies tailored to individuals based on their receptivity to green messages. Green brand mage meets consumers' environmental expectations and addresses emerging concerns (Khandelwal et al., 2019). Consequently, a robust green brand image enhances consumer trust by lowering perceived risks (Chen, 2010; Rahman & Nguyen-Viet, 2023). However, in consumer behavior research, this factor has received limited attention (Do Paco et al., 2019). Therefore, this study seeks to address this critical issue by examining the impact of green advertising receptivity, green brand image on green brand trust and the green food purchase intention of 298 Gen Z green consumers in Vietnam.

This study has expanded knowledge on green marketing strategies to enhance corporate green brand trust and promote green consumption towards sustainable development. However, the research has limitations due to its focus on Gen Z green food consumers and the use of measurement scales adapted from foreign sources.

**ABSTRACT**

This study extends socialization theory in investigating the roles of parents and social media on youth's intention to use non-alcoholic beer and applying socialization theory and and social learning theory to examine the direct and indirect roles of interpersonal and media health socialization agents in shaping the intention of consuming non-alcoholic beer. To analyze those hypotheses, this research used quantitative methods, from which the survey collected 603 young people aged 8-25 from the two largest cities in Vietnam. Our regression analysis results show that parents and social media are significantly and positively related to the intention of drinking non-alcoholic beer through the mediation of adolescent health literacy. Social media is proven to play a stronger role in consumption orientation, not much weaker than parental influence. From there, it emphasizes the need to provide implications or marketing strategy for non-alcoholic beer producers to increase non-alcoholic beer consumption.

*Keywords:* "non-alcoholic beer", "non-alcoholic purchase intention", "parents", "socialization agents", "social media".

## I. INTRODUCTION

Non-alcoholic or zero-alcohol beers contain no or very low amounts of alcohol (0.0–0.5% alcohol by volume) but share the appearance and taste of alcohol-containing beverages (Okaru & Lachenmeier, 2022). The global non-alcoholic beer market has witnessed significant growth in recent years, driven by increasing consumer interest in healthier beverage options and a shift towards moderate alcohol consumption. According to a report by Statista, the market generated approximately $34.1 billion in revenue in 2023, with projections estimating it will reach $50 billion by 2028. These findings highlight the sustained global expansion of non-alcoholic beer consumption and its increasing importance in the beverage industry (Statista, 2023).

Central to understanding consumer behavior in adolescents is the exploration of factors that shape their intentions and preferences. Adolescence is a critical developmental stage where social influences play an important role in shaping attitudes, beliefs, and behaviors (Moschis & Churchill, 1978). The consumption of non-alcoholic beer, an emerging category in the beverage industry, offers a unique context for studying these influences. While extensive research has examined the role of socialization agents in shaping adolescent behaviors related to health, education, and risk-taking (Albert Bandura et al., 1977; Arnett, 1995; Pechmann & Knight, 2002), less attention has been paid to their impact on consumer intentions of non-alcoholic beer (Scott & Ogilvie, 2020).

Given the increasing popularity of non-alcoholic beer as a healthier alternative to traditional alcoholic drinks (Baker, 2024), understanding the role of socialization agents - such as parents, peers, and social media - in influencing adolescents' intentions to consume these beverages is essential. The promotion of non-alcoholic beer has often aligned with themes of health consciousness, maturity, and social belonging, raising critical questions about how adolescents perceive and respond to such messages. Furthermore, studies have shown that the consumption intentions of adolescents are significantly influenced by the interplay of interpersonal interactions and media exposure (Albert Bandura et al., 1977; Arnett, 1995). These findings underscore the need for a deeper understanding of how adolescents process and internalize marketing messages, particularly those that frame consumption as socially and personally beneficial.

The overall purpose of this study is to investigate the roles of parents in shaping adolescents' intentions to consume

non-alcoholic beer. Drawing on socialization theories, including the Socialization Theory and Social Learning Theory, this research seeks to contribute to understanding how adolescents form consumption intentions in response to varying social influences. The findings of this study could provide valuable insights into how people form their consumption norms and the implications for designing responsible marketing and educational interventions (Weitzman et al., 2003).

## II. LITERATURE REVIEW

### 2.1 Theory

#### 2.1.1 Socialization theory

Socialization theory is useful for understanding factors that can influence children's and youth's knowledge, attitudes, and behaviors. Socialization theory provides a useful framework to conceptualize the collective processes by which young people acquire consumption styles, skills, knowledge, and orientations that are relevant to their performance as consumers in the marketplace. Research has demonstrated that parents play a primary role in modeling consumption behavior, guiding financial decision-making, and transmitting attitudes toward brands and purchasing. Peers and media also contribute significantly, especially during adolescence, as they shape preferences and norms through shared experiences and exposure to marketing content (Moschis & Churchill, 1978). More recent studies have extended the theory to include digital and social media as critical agents, emphasizing their role in shaping contemporary consumer identities (John, 1999). This theoretical framework provides a foundation for understanding how consumer habits and attitudes evolve, particularly in the context of social and technological changes.

#### 2.2.2 Social learning theory

Social Learning Theory, developed by (Albert Bandura et al., 1977), highlights the role of observational learning in behavior acquisition. According to the theory, individuals learn not only through direct experiences but also by observing and imitating others. Key processes involved include attention, retention, reproduction, and motivation. In consumer behavior, Social Learning Theory underscores how individuals internalize consumption patterns by watching others, particularly those who serve as role models, such as family members, peers, celebrities, and influencers. The rise of social media has amplified this dynamic, as platforms facilitate easy access to a wide range of role models, often showcasing aspirational lifestyles and consumption choices (Chen G. M., 2018). Moreover, Bandura's concept of vicarious reinforcement explains how observing positive or negative outcomes of others' consumption behaviors influences one's decision-making. This theory is instrumental in understanding the diffusion of trends, the impact of advertising, and the development of brand loyalties through social observation.

### 2.2. Intention to consume non-alcoholic beer

An intention to purchase is a person's choice to buy a good or service from the same company or brand (Hellier et al., 2003; **Linh, 2023**). According to the results of studies conducted in the UK and the Netherlands, people prefer low- and non-alcoholic goods because they taste good and to replace alcoholic beverages when it would be improper to use a stronger product (for example, after driving) (de Wit et al., 2021). Increased availability of low- and no-alcohol drinks indicates that the industry is responding to consumer demand, which may be connected to the general trend of decreased alcohol consumption in Western nations (Manthey et al., 2019).

### 2.3. Socialization agents

#### 2.3.1. Social Media

Social media refers to the online platforms and tools that people use to share opinions and experiences, including photos, videos, music, insights, and perceptions (Sin et al., 2012; Linh, 2023). Brands and merchants can use social media as a tool to interact with and sway their customers. With an average of 5.54 social media accounts, over 70% of Internet users are active social media users as of July 2015 (McClure & Seock, 2020). People may use social media for a variety of purposes, such as amusement, networking opportunities, or pointless seeking. The convenience of connecting and the freedom to choose who to connect with, when to connect, and what to share are the main reasons for social media's consistent growth (McClure & Seock, 2020). Besides, study of Tran & Thanh (2017) in Vietnam found that social media had a beneficial effect on customer purchasing intentions. Interacting with social media marketing increases customer engagement and consideration for purchases. Similarly, the usage of social media has considerably

influenced customer intentions (Linh, 2023).

Peer, influencer, or community endorsements have a major impact on validation and trust, which in turn increases customers' willingness to interact with and use goods and services (McClure & Seock, 2020). Social media platforms enhance these components by providing targeted advertising, customized interactions, and real-time feedback, resulting in individualized customer experiences. Deeper consumer connections are fostered via relatable narrative and influencer partnerships, which enhance audiences' trust, loyalty, and long-term relationships with businesses (Chung & Muk, 2017).

Besides that in Asian countries, Thai millennials believe that non-alcoholic beer is a healthier and more socially acceptable option for parties; yet, the market is hindered by factors such as low brand awareness and high prices (Leewatnakit, 2019). While platforms in Indonesia also improve brand recognition and image by serving as a mediator between customer attitudes and purchase decisions (Kharismatyawati & Janfry Sihite, 2023). Social media not only makes non-alcoholic beer a popular option but also encourages deeper engagement through influencer relationships, community involvement, and storytelling strategies (Kharismatyawati & Janfry Sihite, 2023; McClure & Seock, 2020). Thus, we developed the following hypothesis:

H1: Social media has a direct positive impact on the intention to consume non-alcoholic beer.

#### 2.3.2. Parental influence

Parents are the key suppliers of early educational experiences for children, giving them important life skills and values from a young age (Asih, 2020; Hasni, 2021). Positive interactions and supervision are crucial for forming a child's maturity and social ideals (Więcławska, 2018). Children see their parents as role models. Thus, parents have an important role in setting consumption intentions, particularly for young people's beverage intake, by influencing their views and actions through a variety of processes (Gottlieb & Baker, 1986; Manuel Sancho et al., 2011; Matjila, 2017). Young people frequently model their alcohol-drinking behavior after their parents (Gottlieb & Baker, 1986; Manuel Sancho et al., 2011; Matjila, 2017). This suggests that parents serve as role models for their children (Fleary et al., 2013). When parents practice good eating habits, their children are more likely to follow as well, resulting in healthier food and drink choices for their children. Another study found that children's eating habits are highly connected to their parents' beliefs, actions, and habits (Keleş Ertürk, 2019). This shows that if parents promote good eating and drinking habits, their children are more likely to follow.

Furthermore, parental guidance on alcohol use has a considerable impact on young people's intentions to drink alcohol and take substitutes (Matjila, 2017). This involves establishing regulations for alcohol usage and addressing the consequences of consuming alcohol. (Matjila, 2017) emphasizes that when parents create clear rules and restrictions for alcohol use, it can lower both intake and frequency of alcohol use among youth. Setting boundaries with children can reduce their desire to consume alcohol (Matjila, 2017; Østergaard et al., 2018), supporting better beverage consumption habits among young people.

According to (Gottlieb & Baker, 1986), young people's opinions about the effectiveness of behavior change in lowering health risks are negatively associated with their alcohol usage. This suggests that effective guidance for parents on health problems might reduce alcohol use intentions while increasing the possibility of purchasing healthier alternatives, such as non-alcoholic beer. Some researchers have indicated that non-alcoholic beer is a safer choice and has greater health advantages than alcoholic beer (Bagchi et al., 2001; Sohrabvandi et al., 2010). Thus, the hypothesis is proposed:

H2: Parents have a direct positive effect on the intention to consume non-alcoholic beer.

### 2.4. The meditating factor

#### 2.4.1. Health literacy

Health literacy is defined as the ability of individuals to obtain, process, and understand basic health information and services necessary for making appropriate health decisions (Hye-Jin Paek et al., 2011; Nielsen-Bohlman & Lynn, 2004). It encompasses more than just reading skills; it includes advanced cognitive and social skills that empower individuals to find, critique, and process health information confidently (Zarcadoolas et al., 2006).

The health socialization model suggests that health literacy can be influenced by various socialization agents, including interpersonal relationships and media, which play significant roles in how adolescents acquire health-related information (Nutbeam, 2000).

### 2.4.2. The relationship between health literacy and socialization agents

#### Social media influence

Social media serves as a significant health socialization agent, influencing adolescents' understanding of health information. Frequent exposure to health information through media can enhance overall health literacy (Bush et al., 1999; Moschis & Churchill, 1978b). Hye-Jin Paek et al. (2011) indicated that adolescents increasingly turn to the Internet as a primary source of health information, which can positively impact their health literacy levels. Similarly, the exponential growth of the Internet has made it an optimal channel for disseminating health information, contributing to adolescents' ability to access and understand health-related content (Bernhardt & Cameron, 2003; Brodie et al., 2003). Social media environments can foster autonomy and decision-making skills, which are crucial for young people to reflect on their health knowledge and intentions. Overall, social media plays a crucial role in shaping health literacy by providing diverse and accessible health information to adolescents, thereby influencing their health behaviors and decisions (Dudley et al., 2018).

H3: Social media has a direct positive effect on health literacy.

H4: Health literacy positively moderates the impact of social media on the intention to drink non-alcoholic beer.

#### *Parental influence*

Past socialization literature has noted the roles of family and peers in the socialization process. Many peer researchers indicate that parents play a crucial role in health literacy by frequently communicating health information to their children (Lee et al., 2007; Moschis & Churchill, 1978). The more often adolescents hear about health topics from their parents, the higher their health literacy levels tend to be (Moschis & Churchill, 1978). Easy access to parents for health-related inquiries is positively associated with health literacy. Hence, adolescents who can readily approach their parents for health information are likely to have a better understanding and knowledge of health issues, hence, they can choose to consume things that are good for health.

Moreover, family members, especially parents, serve as role models for adolescents. If parents engage in alcohol use, they may inadvertently normalize these behaviors, which can affect adolescents' perceptions and understanding of substance use risks. Given that, if parents engage in non-alcohol use, they can imitate and come to more non-alcohol beer.

H5: Parents have a directly positive impact on health literacy.

H6: Health literacy positively moderates the impact of parents on the intention to drink non-alcoholic beer.

### 2.4.3 The relationship between health literacy and intention to drink non-alcoholic beer

Health literacy significantly influences alcohol use behaviors among young people. Youth with higher health literacy are better equipped to understand health messages related to alcohol. This understanding can shape their perceptions and expectations about alcohol consumption, leading to more informed decisions regarding its use (Chisolm et al., 2014). In contrast, it may imply that with higher health literacy, young people will focus on healthier things, especially non-alcoholic beer. Specifically, the positive impact of non-alcohol expectancies on actual drinking behaviors is stronger in teens with higher health literacy. This suggests that those who can comprehend health information are more likely to align their behaviors with their expectancies (Andrew F. Hayes, 2022).

H7: Health literacy has a positive impact on the intention to drink non-alcoholic beer.

## III. METHODOLOGY

### 3.1. Sampling and data collection

The research team used a survey to evaluate the influence of socialization agents on intentions to consume non-alcoholic beer in Vietnam. The survey sample consisted of people aged 18 to 25, selected through a random sampling method.

The study was conducted in Vietnam between December 1, 2024, and December 14, 2024. A total of 603 valid answers were gathered, with responses from 30.7% male participants and 69.3% responses from female participants. This showed that in Vietnam, women are more interested in non-alcoholic beer than men. This can be explained by the fact that women tend to be interested in healthier drinks such as non-alcoholic beer.

The questionnaire used a five-point Likert scale. The intention to consume non-alcoholic beer was measured using five items on a five-point Likert scale modified from Armitage & Conner (2001). In addition, the investigation included the functions of socialization agents such as parents and social media. Parents' impact was examined using measures of parental guidance, parental restrictions on alcoholic beer, and the frequency of non-alcoholic beer use, which were rated using a five-point Likert scale. The last component of the questionnaire included demographic information such as age, and gender.

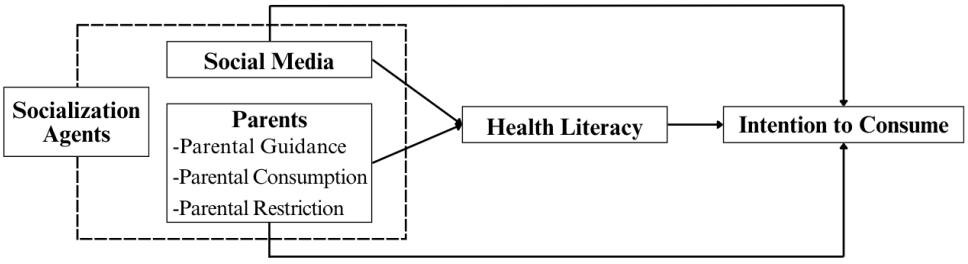

**Figure 1. Conceptual model**

### 3.2. Scales

We created the scales and their components by focusing on previous research and modifying the substance of statements or questions to the study's setting and the distinct sociological characteristics of each place. The scales were particularly developed to guarantee clarity and stability.

A five-point Likert scale (1 - Strongly Disagree, 2 - Disagree, 3 - Neutral, 4 - Agree, and 5 - Strongly Agree) was used to assess respondents' levels of agreement with each statement, assuring measurement reliability. To assess the intention to consume non-alcoholic beer, Armitage & Conner (2001) items were modified slightly. Four questions modified from Chinn & McCarthy (2013) study were used to assess health literacy. A three-item scale from the research by Emini & Zeqiri (2021) was used to evaluate the effect of social media. Parental influence and its three main components: parental guidance (PG - 4 items), parental consumption (PC - 3 items), and parental restrictions (PR - 5 items) —were measured using items adapted from the studies of Yee et al. (2021); Koning et al. (2021); Birch et al., (2001).

### 3.3 Common method bias

To examine common method bias from systematic bias, The final 39-item measurement model's maximum variance contribution rate was 30.159%, which is less than the 50% cutoff point suggested by Podsakoff et al., (2003). Consequently, the results indicated that CMB was not an issue in this model.

## IV. RESULT AND DISCUSSION

Using empirical data from questionnaires, structural equation modeling (SEM) is a useful method for predicting the pathways of a multivariable model with latent components. (Hair et al., 2020). Partial least structural equation modeling (PLS-SEM) was chosen for this study's model parameter estimation because of the formative and high-order structures present in the SEM (Zhuang et al., 2023). The SmartPLS 4.0 software was used for this purpose.

### 4.1. First-order measurement model

First-order reflective constructs, including INT, HL, SMM, PG, PC, and PR, were evaluated for discriminant validity, convergent validity, internal consistency reliability, and indicator reliability (Sharma et al., 2023). Besides PG4, outer loadings of all indicators (0.746–0.885) exceeded the 0.7 cutoff point (Basco et al., 2022). This result

suggests that the indication reliability is adequate. Even though PG4's outer loading was 0.685, it might be acceptable because Cronbach's alpha (α) and composite reliability (CR) values were good. (Cheah et al., 2023; Christmann & Van Aelst, 2006; Davis et al., 2006), indicating that the internal consistency dependability of the first-order reflective measurement model was suitable (Zhuang et al., 2023). Additionally, the AVE was used in this study to assess convergent validity, and the results ranged from 0.593 to 0.764, all of which were above the suggested threshold of 0.5 (Idiana et al., 2022). Additionally, the Fornell-Lacker and HeterotraitMonotrait ratios (HTMT) criteria were used to evaluate discriminant validity. All HTMT ratios are below 0.9, as shown in Table 1, and italicized values highlight the highest correlation between each construct and itself within each column, confirming the model's discriminant validity (Zhuang et al., 2023).

**4.2 Higher-order measurement model**

All first-order construct indicators were reused for the second-order construct in the repeated indicator approach of the higher-order reflective-reflective assessment model for parents (PC, PG, and PR). This method was used to improve path coefficient accuracy and parameter estimation in the higher-order structure (Zhuang et al., 2023). First, every VIF value shows that there are no multicollinearity problems with this model. Then, by carefully examining the variability in the sample data, non-parametric resampling bootstrapping is used to evaluate estimated path coefficients (β) (Guenther et al., 2023). Each dimension's path coefficients were statistically significant, according to Table 2, with values far above the suggested cutoff point of 0.5 for higher-order model path coefficients (Hair et al., 2020). With PG ($\beta = 0.759$, $p < 0.001$) playing the most important role in shaping parents, PC ($\beta = 0.713$, $p < 0.001$), and PR ($\beta = 0.563$, $p < 0.001$) following closely behind, the β values also indicated variation in the effects of the three dimensions.

In conclusion, the results of every measurement model show that the suggested models and the data suit each other well. Strong validity and reliability are shown by each measurement model, opening the door for a comprehensive structural model evaluation.

**Table 1. Reliability, construct validity, and HTMT discriminant validity.**

| Constructs | Heterotrait-Monotrait ration (HTMT) criterion | | | | | |
|---|---|---|---|---|---|---|
| | **HL** | **INT** | **PC** | **PG** | **PR** | **SM** |
| HL | | | | | | |
| INT | 0.559 | | | | | |
| PC | 0.240 | 0.329 | 0.841 | | | |
| PG | 0.298 | 0.449 | 0.931 | 0.512 | | |
| PR | 0.367 | 0.453 | 0.939 | 0.355 | 0.389 | |
| SM | 0.546 | 0.655 | 0.545 | 0.205 | 0.361 | 0.595 |

*Notes: N = 603.*

*Source(s): Author's elaborations based on the research data*

The parameters of the structural models, which describe the link between constructs, can be evaluated when the measurement models have been completed. A bootstrapping technique was used to evaluate the PLS-SEM's statistical significance (Hair et al., 2020). The path coefficients' impact magnitude matched the matching f2 values. None of the constructs' Q2 values were less than 0, as shown in Table 1, confirming the path model's predictive relevance. Figure 2 showed that the final model had significant explanatory power, explaining 39.8% of the variance for INT. According to Table 3, there were no collinearity issues because all constructs had VIF values less than 3.

**Table 2. Assessment of second-order reflective measurement model**

| Higher-order constructs and first-order construct | | β | S.D. | *T*-value | *p*-value | $f^2$ | VIF |
|---|---|---|---|---|---|---|---|
| Parents | → Parent Consumption | $0.715^{***}$ | 0.020 | 17.438 | 0.000 | 1.049 | 1.000 |
| | → Parent Guidance | $0.759^{***}$ | 0.021 | 20.525 | 0.000 | 1.357 | 1.000 |
| | → Parent Restriction | $0.563^{***}$ | 0.030 | 18.766 | 0.000 | 1.448 | 1.000 |

***Note(s):*** *N =603. *p < 0.05. **p < 0.01. ***p < 0.001*

*Source(s): Author's elaborations based on the research data*

The findings showed that SM (β = 0.342, p < 0.001), PA (β = 0.209, p < 0.001), and HL (β = 0.261, p < 0.001) all had a direct beneficial impact on INT, while SM (β = 0.393, p < 0.001) and PA (β = 0.132, p < 0.001) had a favorable impact on HL. The information backed up H1, H2, H3, H5, and H7. The results of our study are consistent with and bolster the body of current literature, especially when it comes to highlighting the critical impact that PA and SM have on INT (Gottlieb & Baker, 1986; Manuel Sancho et al., 2011; Sin et al., 2012). Additionally, it demonstrates the more general conceptual knowledge that people who possess healthy literacy are more likely to make positive decisions, feel supported by their environment, and intend to drink non-alcoholic beer. The favorable relationships between SM, PA, HL, and INT that have been found support the larger body of research and highlight the crucial influence that socialization and health literacy have on consumers' decisions to buy non-alcoholic beer (Dudley et al., 2018; Lee et al., 2007; Moschis, 1985). It also implies that people who possess health literacy are more likely to take the initiative to use alcohol-related solutions to make wise drink choices. The socialization theory framework's strength in comprehending the socialization determinants of INT is further supported by the validity of these correlations in our study.

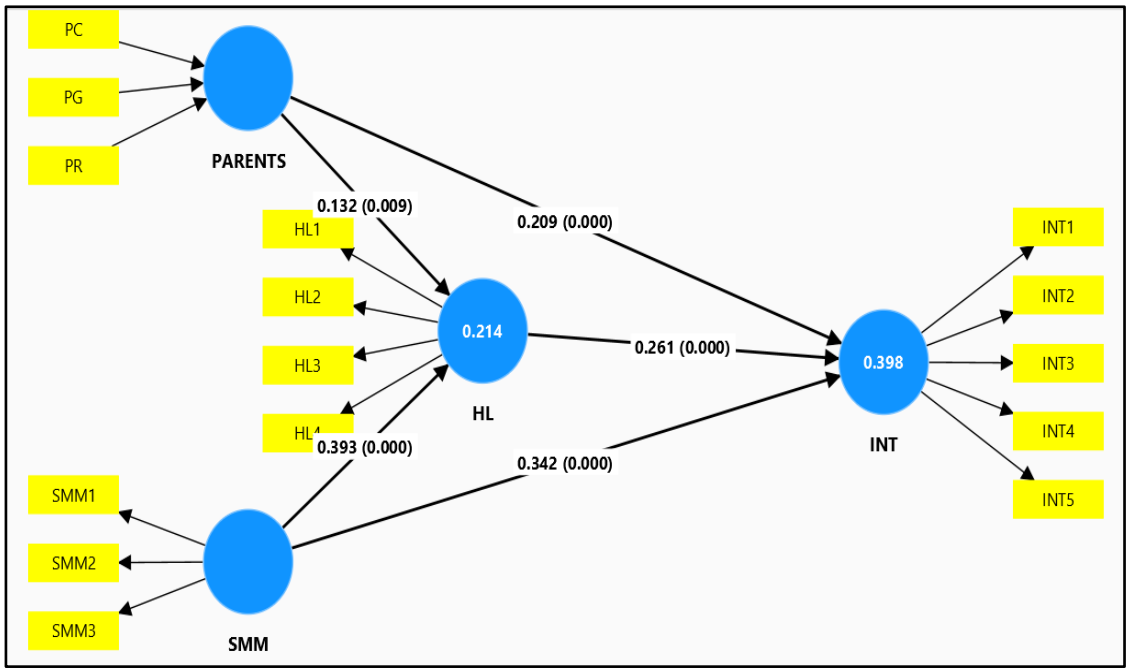

**Figure 2. Second-order structural model**

*Source: Results from SMART-PLS4*

Therefore, the findings of our study provide compelling evidence for the little-known hypothesis that an individual's purchase intention positively influences their entrepreneurial mindset and cognitive processes. This factor has not yet gotten as much attention in the literature, although being conceptually recognized. Our research provides empirical evidence for this notion by shedding light on the transforming potential of socialization agents such as parents and social media on the consumer's attitude, which was derived from PA, SM, and HL to their DEI. This research is a major advancement because it thoroughly investigates and provides empirical evidence for this theory.

**Table 3. Hypotheses testing results**

| Hypotheses | β | S.D. | *T*-value | *p*-value | $f^2$ | VIF | Supported [Yes/No] |
|---|---|---|---|---|---|---|---|
| H1. SM → INT | 0.342*** | 0.041 | 8.279 | 0.000 | 0.139 | 1.394 | Yes |
| H2. PA → INT | 0.209*** | 0.042 | 4.923 | 0.000 | 0.064 | 1.219 | Yes |
| H3. SM → HL | 0.393*** | 0.046 | 8.577 | 0.000 | 0.164 | 1.197 | Yes |
| H5. PA → HL | 0.132*** | 0.050 | 2.614 | 0.009 | 0.022 | 1.197 | Yes |
| H7. HL → INT | 0.261*** | 0.044 | 5.887 | 0.000 | 0.089 | 1.394 | Yes |

H6 and H4 were supported since Table 4 showed that HL positively moderated the effect of PA and SM on INT (β = 0.034, p < 0.05; β = 0.103, p < 0.001). The positive moderating effect of HL on the relationship between PA, SM, and INT suggests that people who believe parents and social media may offer knowledge to improve their health literacy to deal with alcohol-related problems. This highlights how crucial it is to identify and utilize social media and parental roles in the health journey with the health knowledge domain (Andrew F. Hayes, 2022; Dudley et al., 2018). The finding indicates that individuals who possess awareness from parents and positive content on social media may strategically deploy this health literacy to nurture and augment their non-alcoholic purchase intention.

**Table 4. Indirect effects**

| Hypotheses | β | S.D. | *T*-value | *p*-value | Supported [Yes/No] |
|---|---|---|---|---|---|
| H4. SM → HL→ INT | 0.103*** | 0.021 | 4.988 | 0.000 | Yes |

## V. CONCLUSION

The results indicated that social media has a stronger influence than parents in shaping young people's purchase intention. Based on the cognitive process of non-alcoholic beer, our study contributes to both theoretical and practical implications by applying health literacy to explore how socialization agents affect individuals' non-alcoholic beer purchase intention.

### 5.1 Theoretical contributions

This study adds a number of noteworthy pieces to the body of knowledge already available on non-alcoholic topics. First, this study extends health literacy in a complex and situation-specific way. Our research adds to the flexibility and usefulness of health literacy in explaining non-alcoholic beer consumption intentions. Second, our study explores the complex relationship between parents and social media, including how parental use, supervision, and limitation shape cognitive factors (health literacy) and, ultimately, intention. By providing empirical evidence of the impact of socialization agents on health-related cognition and intention, this makes a significant contribution to the body of current work. This study extends the theoretical framework by investigating the mediating effects of health literacy on the intent to consume non-alcoholic beer, the relationship between parents, and social media. This exploration expands the theoretical framework to incorporate the contemporary influence of health literacy in shaping individuals' intentions to drink non-alcoholic beer.

### 5.2 Practical implementation

The findings of our study yield several practical implications that can guide policymakers, educators, and consumers in fostering a conducive environment for non-alcoholic beer.

*First*, identifying specific parental influences, such as parental guidance, consumption, and restriction, not only highlights their significance but also necessitates a paradigm shift in educational approaches. For instance, in the context of parental guidance and parental restriction, the educational process could incorporate practical exercises that teach children to analyze and interpret information critically and make informed decisions based on the negative consequences of alcohol. Parental consumption could be a sample for children to learn, if the parent is likely to pick up healthy food, children can imitate and do the same thing. By giving more awareness, they become adept at consuming non-alcoholic things, thus contributing to addressing the issues about bad health-related alcohol in the world. This holistic approach to education ensures that individuals are well-prepared academically and possess the mindset to be healthier in real life.

*Second*, the distinction between socialization channels is blurred when obtaining health information. Recent advancements in social networks and online social media have the potential to bridge the gap between mass-mediated and interpersonal health information sources by fostering new kinds of connections and acting as a stand-in for interpersonal health information sources. Furthermore, in line with the two-step flow of information theory, our

mediation experiments indicate that interpersonal agents have a stronger mediating effect on media agents and health literacy than the other way around.

Thirdly, firms can build a multi-channel communication strategy to increase and widely reach people about non-alcoholic beer. At the same time, research to diversify flavors, provide transparent product information and cooperate with health and transportation organizations, clearly commit to accompanying services and policies to build long-term trust with consumers.

**5.3 Limitations and directions for further research**

Even though our study offers insightful information about the intention to purchase non-alcoholic beer, it is important to recognize several limits that present chances for further investigation. Firstly, our study's cross-sectional design makes it difficult to establish causal links. A more thorough understanding of how shifts in socialization agents across time affect purchasing intentions may be possible with future longitudinal research. Secondly, our study concentrated on a particular setting - Vietnam. Future studies could examine the applicability of our model in various scenarios, taking into account cultural differences and economic disparities, although it is important to exercise caution when extrapolating our findings to different cultural and economic contexts. Finally, other socialization agents including siblings, peers, and schools have not been mentioned in our study.

# SEO IN E-COMMERCE USING KEYWORDS OR META TAGS IDENTICAL OR SIMILAR TO TEXTUAL ELEMENTS OF OTHER PARTIES' TRADEMARKS FROM A LEGAL PERSPECTIVE

**Le Nho[1]**

[1] Faculty of Law, Ho Chi Minh City Open University.
*Corresponding: lenho77@gmail.com

**ABSTRACT**

E-commerce is rapidly growing worldwide. This activity takes place in an online environment within cyberspace, which makes it susceptible to situations involving the abuse of intellectual property rights. One common issue is the use of the textual elements of another party's trademarks as keywords or meta tags to describe or advertise products or services, thereby attracting users searching for those trademarks. This paper analyzes issues related to the use of the textual elements of other parties' trademarks as keywords or meta tags in e-commerce, evaluates the current legal framework, and provides recommendations for improving the law.

*Keywords:* "keyword", "e-commerce", "online advertisement", "meta tag", "trademark".

## I. INTRODUCTION

Along with the rapid advancement of science and technology, e-commerce is experiencing remarkable growth on a global scale (Shahriari et al., 2015). In Vietnam, this activity is also expanding rapidly, contributing the highest proportion to the country's digital economy development strategy (Tran, 2024).

In e-commerce activities, the amount of information about goods and services is vast, and search engine optimization (SEO) techniques are the primary tools for buyers to search for goods and services, while sellers use this tool to make information about their products or services visible to users (Zulkarnain, 2023). Buyers use search engines on e-commerce websites and enter keywords they are looking for, then the website displays goods and services whose descriptions or advertisements contain information that matches or is close to the searched keywords. On sellers' side, in order for their goods and services to be displayed to buyers, the descriptions or advertisements must contain keywords or meta tags that match or closely resemble the searched keywords.

A trademark may include textual elements. This gives rise to the situation where sellers in the e-commerce environment intentionally use keywords or meta tags that match or are similar to the textual elements of another party's trademark to describe or advertise their goods and services to attract buyers to their stores then buy their products or services. This behavior affects the legitimate rights of trademark holders, as without this behavior, buyers would see information about goods or services of trademark holders, not the infringing sellers. In practice, trademark infringement on e-commerce platforms in Vietnam is increasing rapidly (Nguyen, 2024). Therefore, it is necessary to implement measures to prevent actions that harm the rights of trademark holders, including the use of keywords or meta tags that are identical or similar to textual elements of another's trademark to describe or advertise their goods or services.

Based on this reality, this paper analyzes issues related to the use of textual elements of other parties' trademarks as keywords or meta tags in descriptions and advisements in e-commerce, evaluates current legal regulations, and offers recommendations for improving the law.

## II. METHOD

The research methodology employed in this paper is secondary analysis, which involves examining and interpreting existing legal materials. The study considers the law as a structured system of rules and norms established within applicable legislation. To achieve this, the research adopts a library research approach, focusing on the systematic review of secondary materials, including statutory laws, judicial decisions, legal commentaries, and scholarly articles.

The selection of legal documents and secondary sources follows specific criteria. First, priority is given to legally

binding instruments, such as national legislation, and authoritative court rulings. Second, academic and doctrinal sources are chosen based on their relevance, credibility, and contribution to legal discourse. Third, the research incorporates comparative legal perspectives, where applicable, to provide a broader contextual understanding.

The analysis is conducted using a qualitative legal research framework, emphasizing content analysis and doctrinal interpretation. Content analysis is used to identify key legal principles and interpretations within statutory provisions and case law. Doctrinal interpretation involves critically examining legal texts in light of established jurisprudence and scholarly opinions, ensuring a comprehensive and systematic approach to the research problem.

Through this methodological framework, the study aims to provide a structured and well-substantiated legal analysis based on authoritative and relevant sources.

## III. RESULT AND DISCUSSION

### 3.1. Keywords and meta tags for SEO in e-commerce

In online activities, to attract user traffic to websites, SEO techniques are used, with keywords and meta tags being key factors to make websites appear as a result of a search activity (Farahmand et al., 2011). E-commerce activities also take place on the Internet, so this technique is applied in e-commerce as well. As a result, for many e-commerce sellers, utilizing SEO techniques is crucial to increase customer attraction (Shashank et al., 2017).

E-commerce sellers can apply keywords and meta tags on websites they build themselves and on websites built by others, including platforms where many sellers and buyers gather, called e-commerce marketplaces (Wang, 2021). In this way, sellers can attract customers both passively and actively.

The passive approach is carried out when sellers add keywords and meta tags into the title or description of the goods or services. When buyers search, this information will be displayed, thereby attracting traffic to sellers' store.

The active approach involves sellers purchasing advertising services on websites based on keywords. When advertising in this way, sellers' goods and services will be actively displayed to buyers according to relevant criteria or when buyers perform a search (Yang & Li, 2023). This is an effective way to attract buyers in e-commerce, especially on platforms with a large number of sellers and buyers.

In this activity, legal issues arise when a seller uses keywords or meta tags that are identical or similar to the textual elements of other parties' trademarks in order to attract buyers to their stores through SEO.

Thus, in e-commerce, using SEO techniques with keywords and meta tags is an important activity to attract buyers. Legal issues will arise if sellers use keywords or meta tags that are identical or similar to the trademarks of other parties.

### 3.2. Legal regulations about the use of keywords or meta tags identical or similar to textual elements of other parties' trademarks in e-commerce

According to the principles of intellectual property law, the holder of a trademark is the exclusive owner of that trademark. Organizations or individuals can only use another person's trademark in accordance with legal regulations. A trademark can be or include texts in any words, name (Smith & Parr, 2005, p. 38). Vietnamese law also stipulates that trademarks can be visible in the form of letters or words (Law on Intellectual Property, 2005/2022, Art. 72). Therefore, the use of keywords or meta tags identical or similar to the textual elements of another person's trademark must be authorized by the holder, except in cases where exceptions are stipulated by law.

Pham (2016) argues that if a meta tag contains another person's trademark with the intention of redirecting traffic or deceiving customers to lead them to a different website, it should be examined for potential infringement or unfair competition regarding the trademark. This author references legal regulations and court rulings from some European and U.S. jurisdictions, which hold that when meta tags containing another party's trademark cause confusion and are intended for profit, they harm the trademark owner. Some instances of fair use, such as descriptive references, may be acceptable under the laws of specific countries.

In the legal perspective of some countries, using keywords from another party's trademark for advertising or SEO in e-commerce is also considered trademark infringement. A notable case is Interflora v. Marks & Spencer. Interflora, an international flower delivery network, sued Marks & Spencer (M&S) for using the keyword "Interflora" in Google AdWords advertising. The Court of Justice of the European Union (CJEU) ruled that M&S's use of this keyword could

mislead consumers about the origin of the services, thereby infringing Interflora's trademark rights (Interflora v. Marks & Spencer, 2013).

A similar perspective exists in U.S. law, as seen in Rescuecom Corp. v. Google Inc. Rescuecom, a computer services company, sued Google for allowing competitors to use the "Rescuecom" trademark as a keyword in its AdWords advertising program. The U.S. Court of Appeals ruled that Google's sale of trademarked keywords could constitute commercial use, paving the way for trademark infringement lawsuits related to online advertising (Atkinson, K., 2009).

In Vietnamese law, the use of identical or similar signs that could cause confusion about the origin of goods or services is considered an infringement of trademark rights (IP Law, 2005/2022, Art. 126). Regarding the act of a seller using keywords or meta tags identical or similar to the textual elements of another's trademark in e-commerce, several potential scenarios arise as outlined below.

Scenario 1: Sellers use meta tags identical or similar to textual elements of other parties' trademarks in titles or descriptions of goods or services

This act is essentially an abuse of others' trademarks to attract buyers to their goods or services through SEO tools, when, in fact, these buyers should be directed to information about the trademark holders' goods or services. However, this behavior, done by adding letters after the hash (#), does not constitute a trademark infringement because it does not cause confusion about the origin of goods or services, nor is it considered unfair competition under Article 130 of IP Law, 2005/2022. Although this act may harm trademark holders, it is not an infringement or unfair competition, so there is currently no legal basis to prohibit it under Vietnamese law.

Scenario 2: Sellers use keywords identical or similar to textual elements of other parties' trademarks in titles or descriptions of goods or services

According to the law, if this usage is applied to goods or services that are not identical, similar, or not related to the goods or services registered with trademarks, it does not constitute a trademark infringement. However, in practice, such use is primarily aimed at directing buyers to purchase similar goods or services from sellers, so these cases are typically considered trademark infringements and are prohibited. An exception may apply under the fair use doctrine (Leval, 1990), but such use should not cause confusion or harm to the trademark rights holder. In most cases in e-commerce, these requirements are not met. Therefore, the use of keywords identical or similar to other parties' trademarks in titles or descriptions of goods or services in e-commerce violates intellectual property law.

Scenario 3: Sellers purchase advertising services on e-commerce websites based on keywords identical or similar to textual elements of other parties' trademarks

The use of tools to promote products, goods, or services to the public constitutes advertising (Law on Advertising, 2012, Art. 2). Advertising goods bearing a protected trademark is one form of trademark use (IP Law, 2005/2022, Art. 124). Vietnamese law prohibits advertising activities that violate intellectual property laws (Law on Advertising, 2012, Art. 8). Therefore, purchasing advertising services on e-commerce platforms based on keywords identical or similar to other parties' trademarks is considered a use of the trademarks. If sellers purchase advertising services using keywords identical or similar to other parties' trademarks without permission from holders, it is an act of trademark infringement.

In practical e-commerce operations, sellers may combine these above activities related to the use of keywords or meta tags identical or similar to the textual elements of a trademark.

In conclusion, according to legal regulations, the act of using SEO techniques in e-commerce with keywords or meta tags identical or similar to the textual elements of other parties' trademarks is often a legal violation. However, in some specific situations, the law has not yet provided clear regulations, which could potentially affect the legitimate rights and interests of trademark holders.

3.3. Some proposals for improving legislation and practical application

In current e-commerce activities, the use of keywords and meta tags plays an important role in attracting user traffic (Kwon et al., 2008). The situation in Vietnam is no exception. However, the issue of using keywords and meta tags that are identical or similar to the text portion of another party's trademark still exists (Le, 2024).

To protect the legitimate rights of trademark holders, it is necessary to add provisions prohibiting such activities.

For the use of meta tags identical or similar to textual elements of other parties' trademarks in titles or descriptions of goods or services, it is necessary to classify it as an act of trademark infringement under intellectual property law and to establish responsibilities of website providers to prevent it under e-commerce law.

For paid ads or descriptions containing keywords identical or similar to the textual elements of another party's trademark, it is necessary to supplement regulations on the responsibilities of website providers to prevent such practices under e-commerce law. Specifically, an item should be added to Clause 4, Article 4 of Decree No. 52/2013/ND-CP to define this as a prohibited act. Additionally, specific sanctions for violations should be prescribed.

The three key scenarios above can be summarized in the table below when the seller uses text that is identical or similar to parts of other's trademarks:

| Scenario | Legal Basis | Current Challenges | Proposed Solutions |
|---|---|---|---|
| Meta tags | Not yet regulated in intellectual property law or e-commerce law. | Not a trademark infringement nor an unfair competition. Sellers can do. | Supplementing it as an act of trademark infringement under intellectual property law and establishing the responsibilities of website providers to prevent it under e-commerce law. |
| Keywords | IP Law, 2005/2022; Decree No. 52/2013/ND-CP | Trademark infringement (except fair use cases or applied to goods or services that are not identical, similar, or not related to the goods or services registered with the trademark). In fact, this behavior is still happening in e-commerce. | Supplementing regulations on the responsibilities of website providers to prevent it under e-commerce law. |
| Paid Ads | Law on Advertising, 2012; IP Law, 2005/2022; Decree No. 52/2013/ND-CP | Trademark infringement. But it is happening every day in ecommerce. | Supplementing regulations on the responsibilities of website providers to prevent it under e-commerce law. |

Regarding the responsibility of e-commerce platform providers, Decree No. 52/2013/ND-CP currently only requires them to cooperate with intellectual property rights holders to review and remove goods and services that infringe intellectual property rights. There are no provisions requiring platforms to create tools for rights holders to protect themselves, as stated in Article 198 of the Intellectual Property Law 2005, amended in 2022, in preventing and terminating intellectual property rights infringement. Therefore, it is suggested to add this provision to Article 36 of Decree No. 52/2013/ND-CP so that trademark holders can prevent and terminate others' use of textual elements in their trademarks for SEO on platforms.

In practice, for e-commerce platforms, in addition to websites built by domestic entities in Vietnam, there are websites built by foreign entities located outside of Vietnam's territory, providing cross-border services into Vietnam. These foreign platforms must comply with the regulations regarding handling violations where sellers use meta tags identical or similar to the text portion of other parties' trademarks in titles or descriptions of goods and services, if the platform is considered to be operating in Vietnam. This is the case when the platform has a Vietnamese domain, displays content in Vietnamese, or has more than 100,000 transactions from Vietnam in a year (Article 67a of Decree No. 52/2013/ND-CP as amended by Decree 85/2021/ND-CP). However, requiring foreign platforms to comply with Vietnamese law is quite difficult if they are not sufficiently concerned. Therefore, Vietnam needs to strengthen international cooperation in e-commerce to ensure that foreign platforms comply with Vietnamese legal regulations.

On the other hand, when Vietnamese individuals or organizations sell on foreign e-commerce platforms, they must advertise through a registered advertising service provider that is legally operating in Vietnam (Article 13 of Decree No.

181/2013/ND-CP). However, for small businesses or individual sellers, they may bypass this procedure and directly register to buy ads on the website and make payments easily through online payment methods, which complicates the monitoring of advertising activities that use keywords similar or identical to the text portion of other parties' trademarks on foreign e-commerce platforms. To address this issue, it is necessary to simplify registration procedures and promote the application of these procedures as well as implement management measures for foreign platforms.

In conclusion, to ensure the legal rights and interests of trademark holders in e-commerce platforms, as well as to maintain order in the e-commerce sector, it is essential to supplement and refine the legal provisions and monitor compliance with the law in practice, particularly regarding SEO techniques related to keywords or meta tags that involve text portions of trademarks.

## IV. CONCLUSION

Displaying goods or services and then proceeding with transactions is an essential part of e-commerce. Keywords and meta tags are elements used in SEO techniques. From this practice, there has been a situation where sellers use keywords or meta tags that are identical or similar to other parties' trademarks in order to attract buyers to their stores.

The use of keywords or meta tags that are identical or similar to other parties' trademarks in SEO techniques for e-commerce sales is an act of trademark abuse aimed at gaining unlawful profit. Vietnamese law has regulations in place to prohibit such acts. However, there are still shortcomings in these regulations, which need to be supplemented for legal refinement, as well as requiring proper monitoring of compliance in practice.

Improving legal regulations related to the use of SEO techniques in e-commerce, specifically concerning keywords or meta tags that are related to the text portion of a trademark, will help protect the legal rights and interests of trademark holders and maintain order in e-commerce activities in general.

# DETERMINANTS OF KNOWLEDGE SHARING IN VIRTUAL STUDENT COMMUNITIES

**Nguyen Vu Thanh An[1], Bui Thuy Trang[1*], Cao Thanh Huyen[1], Nguyen Mai Huong[1], Nguyen Ngoc Nhi[1], Nguyen Thi Hien[1]**

[1]National Economics University.
* Corresponding: 11226334@st.neu.edu.vn

**ABSTRACT**

The purpose of this study is to identify the factors that influence the knowledge sharing behavior of university students in virtual communities in Hanoi. On the basis of the Social Exchange Theory and the Social Cognitive Theory, the study proposes a research model exploring the impact of both contextual and individual factors. Employing a quantitative approach, the study collects data through an online survey combined with a qualitative approach (10 in-depth interviews) with university students from various institutions in Hanoi. With responses from 367 students, the findings reveal that knowledge-sharing behavior is influenced by the norm of reciprocity, interpersonal trust, self-efficacy, perceived compatibility, enjoyment of helping, and perceived relative advantage. The study therefore gives recommendations that may enhance students' behavior of sharing and acquiring knowledge in virtual student communities.

*Keywords:* "contextual factors", "individual factors", "knowledge sharing", "virtual communities"

## I. INTRODUCTION

In the digital era, 4.0 technologies and social networks have transformed the way people communicate and acquire knowledge. A report by We Are Social and Hootsuite (2023) indicates that over 72 million people in Vietnam use social media as a primary tool for connection, learning, and information exchange. Especially in the years of COVID-19, online work and study is required. This trend has not only helped people to carry on education and work during the tough period but also new opportunities for communication and cooperation. In this case, Facebook, Zalo, Microsoft Teams, and Google Classroom are the platforms that create the flexible space for learning and working and become the growing intermediaries for people and organizations to systematically depend on online platforms for communicating, sharing, and supporting each other. This has over some time led to the formation of particular online groups and communities of practice where individuals share common interests in specific fields or topics. They serve as interactive community platforms where members engage in knowledge exchange through computer-mediated communication, facilitating the sharing of information and experiences (Chen and Hung, 2010).

Virtual communities provide a lot of information such as lectures, specialized data and experts, and create discussion and idea-sharing platforms. In the business context, virtual communities are not only knowledge repositories but also a firm's key assets in terms of networking of experts, generating ideas, and building brands. Such communities have been used by different organizations to carry out market research, feedback from customers, and product enhancement. For example, organizations use Microsoft Teams and Trell to manage communication and knowledge sharing among teams in the organization. The educational application of virtual communities has been found to be of vital importance in the improvement of education quality; thereby introducing a shift in the way people gain knowledge. Some online student groups, including "NEU News Corner"; "NEU Student Information Group"; "ĐHBKHN Learning Support". In general, these communities are not only learning environments but also places that keep people connected with each other, with a similar purpose, to contributing to the exploration and maximization of knowledge potential. Since 2020, the rise of hybrid communities, blending online and offline interactions, has further reshaped how individuals engage and share knowledge. These developments underline the need to revisit and incorporate updated frameworks to better capture the modern dynamics of community building and knowledge sharing.

Internationally, knowledge sharing behavior in virtual communities has become a widely researched topic since the late 1990s. Studies in this field primarily focus on identifying factors influencing knowledge sharing behavior - a broad,

multidimensional area requiring in-depth elaboration. Knowledge sharing behavior in communities is defined as the act of transferring knowledge, information and experience between individuals, groups or organizations. It can be done by sharing articles, commenting, discussing or giving feedback on the web and social networks. Many of the present studies are located in East Asia and Europe, often in the context of enterprises (Zaqout and Abbas, 2012; Ong et al., 2011). Previous studies on knowledge sharing behavior have covered the following aspects: including influencing factors, the relationship between sharing behavior and work performance, and examining sharing behavior from the perspectives of knowledge collection and contribution. These studies also emphasize that different contexts produce different research results (Chih-Jou Chen and Shiu-Wan Hung, 2010).

In the context of Southeast Asia, especially Vietnam, studies on knowledge sharing behavior are still limited and have not been investigated extensively. The current studies in Vietnam are confined to direct academic settings and are aimed at university students and teachers. The study by Nguyen et al. (2024) at Ho Chi Minh City University of Natural Resources and Environment emphasizes that self-efficacy, teamwork, technology, and encouragement are the key drivers of students' knowledge-sharing behavior. Similarly, Bui Thi Thanh (2024) identified that for Vietnamese faculty members, rewards, organizational culture, and trust significantly influence knowledge-sharing behavior. However, these studies have not endeavored to develop a model grounded on two major elements: individual and contextual, but rather examine factors such as trust, teamwork, or intrinsic motivation affecting knowledge sharing behavior.

Due to differences in approaches and contexts of studies on the same topic thus, research in Vietnam, specifically with university students, is crucial to develop this line of research. University students are young people as the future generation, being the main driving force in the intellectual community as the core workforce in the organization and at the national level. This group is unique since its members require a lot of professional growth, and often share information through the Internet. Knowledge sharing behavior helps in the learning process and also contributes towards a positive learning environment, as the student community demonstrates social responsibility and collaboration.

A number of prior researches have established the theoretical framework for knowledge sharing behavior, investigating through personal and contextual characteristics. Chih-Jou Chen and Shiu-Wan Hung (2010) have focused trust, self-efficacy and perceived benefits with regard to reciprocity and flexibility. Likewise, Hsin Hsin Chang and Shuang-Shii Chuang (2011) emphasize on social capital such as social interaction, trust and language. However, these studies have not clearly and comprehensively classified factors into individual and contextual groups. Also, considering the context, the majority of the current research is based on business contexts (Mahajan et al., 2024; Gharib et al., 2017), brand communities (Jiang et al., 2021; Zhang et al., 2019) or professional communities (Frost et al., 2014; Hung et al., 2015; Keary, 2012) and the knowledge sharing behaviors of students in virtual communities, especially in Southeast Asia, is a research area that still has to be investigated. To move this area forward, the research will administer a survey to students who engaged in knowledge sharing within the virtual communities to gather information on their experience, perceived benefits and barriers. Furthermore, the team will examine the elements from two major groups, individual and contextual factors, to define how they influence the knowledge sharing behavior. On this basis, the study will provide recommendations that will enhance a better online learning environment.

## II. LITERATURE REVIEW

### 2.1. Conceptual Foundation

Davenport and Prusak (1998) define knowledge as the information acquired through learning or which has been accumulated in the course of working. The current knowledge-based economy considers knowledge as an essential valuable resource (Chang et al., 2015). Knowledge sharing behavior is defined as the act of sharing knowledge and learning between two or more people, or between two or more organizations. Hindah Mustika et al (2022) defined knowledge sharing for several reasons such as knowledge acquisition, knowledge reuse, and knowledge creation. The four essential attributes of this behavior include (1) personal and intrinsic nature, (2) deliberate purposefulness, (3) operation within regulatory frameworks and (4) collective knowledge ownership. Studies indicate that knowledge sharing behavior stands as a critical step for creating valuable resources which enhance service delivery quality (Mafabi et al., 2017) and arises from a need to share knowledge (Bai et al., 2019; Lin et al., 2018; Mirkovski et al., 2018; Sallam & Algammash, 2016). Previous studies have identified two main groups of factors influencing knowledge sharing

behavior: Individual factors and social context factors (Chih-Jou Chen and Shiu-Wan Hung, 2010). However, the way these factors are categorized and the names given to similar variables make it rather hard to evaluate their contributions. Moreover, current models cannot be easily adapted to fit the different types of communities; hence there is a need for an adaptive and integrated model.

Knowledge sharing behavior is assumed to have theoretical underpinnings in social theories, notably in social exchange theory and social cognitive theory. Social Cognitive Theory was developed by Bandura in 1986, this theory posits that people's behavior is influenced by the behavior, the environment and the person. This means that the cognition and the context play a role in the behavior of an individual. This hypothesis is based on the three-way reciprocal interaction of 'individual factors', 'contextual factors', and 'behavioral factors'. Social Cognitive Theory is often seen as a ''widespread theoretical model'', which comprises other theories that focus on behavior of an individual as subcategories of its many facets (Mobashar Rehman, 2019).

Social Exchange Theory was respectively introduced by George Homans in 1961, Peter Blau in 1964 and Richard Emerson in 1962 and 1972a & 1972b, which is one of the theories that explain social interaction and social structure. The core of this theory is the norm of reciprocity, which suggests that individuals are more likely to share knowledge if they perceive a balance between what they contribute and what they gain in return. Social Exchange Theory has been used in many studies to explain that knowledge sharing does have a great influence in enhancing the long-term relationships of the members. Past scholars have focused on a ratio of the perceived benefits and the costs (D. Gefen & M. Keil, 1998; W.L. Shiau & M.M. Luo, 2012; Liu & Hung, 2010). Thus, in this study, this framework is applied to understand the determinants of knowledge sharing behavior in virtual communities.

### 2.2. Research model

Building on the foundational theories of Social Exchange Theory and Social Capital Theory, Chih-Jou Chen and Shiu-Wan Hung (2010) developed a model encompassing two groups of variables: individual and contextual factors. The model focuses on understanding knowledge-sharing behaviors in professional virtual communities (PVCs) which function as online platforms to unite professionals with shared interests who need efficient collaboration and knowledge exchange. In the contextual factors group, there are two main variables: Norm of Reciprocity (Ming-Ji James Lin et al., 2009; P. Pai and H. Tsai, 2015) and Interpersonal Trust (Chao-Min Chiu et al., 2006; Hsin Hsin Chang and Shuang-Shii Chuang, 2011; Hoseini et al., 2019) - are examined as key drivers of cooperative behavior within online communities, grounded in Social Exchange Theory. In the individual factors group, there are four variables: Perceived relative advantage (Lin and Hsiu-Fen, 2006; Manli Wu et al., 2016), perceived compatibility (Hsiu-Fen, 2006; Lin, 2009; Ray, 2014), and self-efficacy (Elham Aliakbar, 2013; Kee-Young Kwahk and Do-Hyung Park, 2016). These factors are particularly relevant in online student communities, where intrinsic motivation, alignment with personal values, and confidence in one's abilities significantly drive participation and engagement in knowledge-sharing activities.

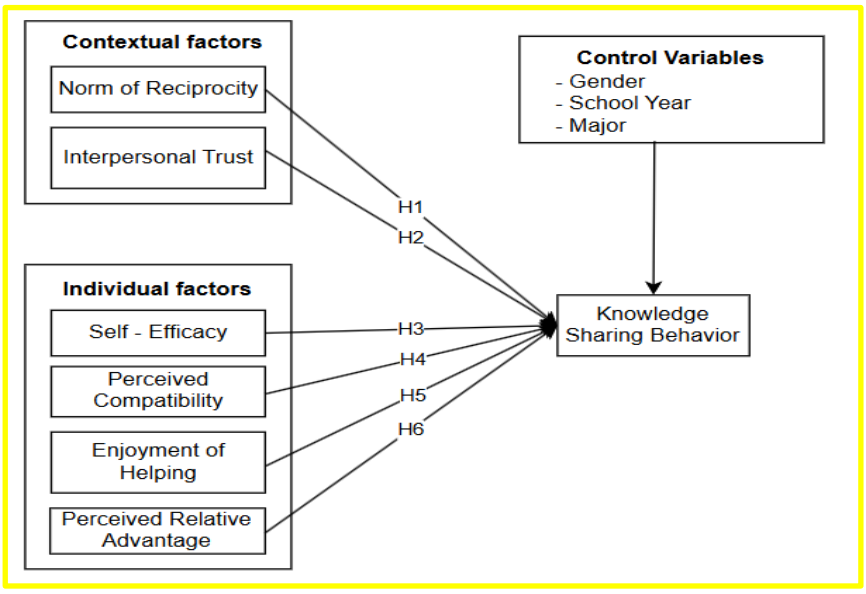

**Figure 2: Proposed Conceptual Model**

In addition to the commonly observed variables mentioned above, Kee-Young Kwahk and Do-Hyung Park (2016) incorporated the variable: Enjoyment of Helping, which represents a new perspective on understanding knowledge-sharing behavior within online communities. This factor reflects the intrinsic motivation individuals feel when assisting others, which often enhances their sense of fulfillment and satisfaction. Therefore, this variable is added to provide a more comprehensive understanding of the dynamics within online knowledge-sharing environments. Moreover, control variables, including gender, academic year, and major, are also incorporated into the research to investigate differences across student groups and clarify the impact of personal and academic characteristics on information sharing within the learning environment.

Based on theoretical foundations, the context, and the operational framework of online student communities, which differ from previous studies, the measurement scales have been inherited and adjusted as follows: Norm of Reciprocity (3 items), Interpersonal Trust (3 items) were adopted from the study by Ming-Ji James Lin *et al.* (2009), Self-efficacy (4 items), Perceived Compability (4 items), Enjoyment of Helping (3 items), Perceived Relative Advantage (3 items), and Knowledge Sharing Behavior (4 items) inherited from Kee-Young Kwahk and Do-Hyung Park (2016). All the scales were measured on a five-point Likert scale with labels: Strongly Disagree, Disagree, Neutral, Agree, and Strongly Agree.

**2.2.1. Norm of Reciprocity**

Norm of reciprocity is a basic social exchange mechanism that demands the recipient return the same value as the amount of resources received (Chen & Hung, 2010; Wu et al., 2006). This norm goes beyond the repayment and includes how people should respond to acts of benevolence or aggression. This norm fosters knowledge sharing and continuous cooperation in organizations (Kwahk & Park, 2016). Knowledge sharing behavior in virtual communities is influenced by the norm of reciprocity where members expect to receive the same in the future (Chen & Hung, 2010). In the same regard, Wasko and Faraj (2005) argue that this norm is vital in sustaining cooperation and support among the members. Individuals who consider knowledge as their personal property will be motivated to share their knowledge with others for tangible and intangible returns. In such exchanges, reciprocity creates a perceived fairness that motivates knowledge-exchange behavior (Chang & Chuang 2011; Chiu et al. 2006). Based on this foundation, the following hypothesis is proposed:

H1: Norm of Reciprocity positively influences knowledge sharing behavior within members of virtual student communities.

**2.2.2. Interpersonal Trust**

Interpersonal trust within the virtual communities is the degree to which members trust the knowledge sharers' goodwill, benevolence, competence, and reliability. This factor cuts across the interactions of the people in the community and has a very significant role in the sharing of knowledge and collaboration among the people (Chen et al., 2009; Lin et al., 2007). Especially in professional virtual communities (PVCs), trust is an essential antecedent of knowledge exchange relationships that foster a sharing climate and improve participation (Hung & Cheng, 2013). Chiu et al (2006) note that trust includes the values and norms that are followed in the group so as to encourage sharing. According to Lee and Choi (2007) people's readiness to engage actively rises in proportion to the degree of trust. Not only does trust continue cooperation but also it assists in expanding exchange relationships within virtual communities (Chiu et al., 2006; Lin et al., 2002). On the other hand, a lack of trust is a form of knowledge sharing impediment (Lee & Choi, 2003). When trust is enhanced, members are more active in sharing according to Chiu et al., (2006) & Chang & Chuang, (2011). Chen and Hung (2010) however point out that the level of impact of this factor depends on the situation and the members' commitment. Based on these arguments, the following hypothesis is proposed:

H2: Interpersonal trust positively influences knowledge sharing behavior within members of virtual student communities.

**2.2.3. Self - Efficacy**

In this case, self-efficacy is defined as an individual's perceived capacity to arrange and implement activities to yield the intended results (Jashapara & Tai, 2006). In the case of knowledge sharing it is defined as the extent to which an individual believes in his/her ability to offer relevant and valuable knowledge to others (Kankanhalli et al., 2005).

Self-efficacy is known to cause more enthusiasm and a proactive approach to knowledge sharing activities in the virtual community (Bock & Kim, 2002; Elham Aliakbar, 2013; Rohman et al, 2020). Many authors have stressed the role of self-efficacy in knowledge sharing behavior. According to Bock and Kim (2002), people who are self-confident are likely to contribute knowledge to the community in a positive and active way. Kee-Young Kwahk and Do-Hyung Park (2016) also add that self-efficacy not only motivates people to contribute but also to gain more knowledge, which makes the virtual community more proactive and useful. On the other hand, low self-efficacy is characterized by low participation in knowledge sharing activities as well as low involvement in the community, and therefore hampers the efficiency of the community. Based on these findings, the research team proposes the following hypothesis:

H3: Self-efficacy *positively influences knowledge sharing behavior within members of virtual student communities.*

**2.2.4. Perceived Compatibility**

Perceived compatibility is the degree to which knowledge sharing corresponds to an individual's organizational culture, personal requirements, and the needs of the community to which the person belongs (Moore, 1991). In virtual communities, compatibility is also shown in the extent to which knowledge sharing activities fit the working environments and personal life patterns of the participants (Hung & Cheng, 2013; Lin et al., 2009; Karahanna et al., 2006). Earlier research postulated that when people find a high level of fit between the knowledge sharing and their personal values, they are willing to share knowledge in virtual communities (Hsiu-Fen, 2006; Lin, 2009; Ray, 2014). Likewise, Lin (2009) found that community members' participation is higher when they consider knowledge sharing as aligned to their values and expectations. However, Chen & Hung (2010) in a survey of 2 virtual communities in Taiwan reported a lower correlation between adaptability and knowledge sharing behavior. Based on these findings, the research team proposes the following hypothesis:

H4: Perceived compatibility positively influences knowledge sharing behavior within members of virtual student communities.

**2.2.5. Enjoyment of Helping**

The enjoyment of helping is defined as the pleasure in sharing their knowledge to help others without the expectation of receiving rewards in the future (Moghavvemi et al., 2017). This intrinsic reward promotes member participation and increases the incidence of members' volunteering. Studies also show that this feeling elicits a positive impact on the knowledge sharing behaviour and improves the community involvement and delicateness of its members (Davenport & Prusak, 1998; Kankanhalli et al., 2005). Tai-Kuei Yu et al. (2010) also stress that the pleasure derived from helping is one of the major factors that should be used to encourage knowledge sharing. Similar research (Hoseini et al., 2019; Tang et al., 2016) has concluded that enjoyment in helping others has a positive effect on knowledge sharing. Based on this, the research team proposes the following hypothesis:

H5: The enjoyment of helping positively influences knowledge sharing behavior within members of virtual student communities.

**2.2.6. Perceived Relative Advantage**

Perceived relative advantage is the knowledge contributor's cognition of likely advantages and benefits that knowledge sharing behavior will produce and return (Chih-Jou Chen and Shiu-Wan Hung, 2010). This is one of the main factors that foster knowledge sharing. Past research has established that perceived relative advantage is a key determinant of knowledge sharing behavior. Lin (2009) stresses that the members contribute to obtaining value like the increase of their knowledge, getting support, developing friendships, or confirming their own abilities. Another reason is that while the benefits are clear, people will participate actively, but a lack of understanding of such benefits leads to decreased interaction with the community (Teunissen, 2009; Ray, 2014). Based on these prior studies, the research team hypothesizes:

H6: Perceived relative advantage has a positive effect on knowledge sharing behavior within members of virtual student communities.

**2.3. Research method**

This research design utilizes both qualitative with in-depth interviews and quantitative with cross-sectional online

questionnaire research techniques. Initially, in-depth interviews were conducted with 10 students from different universities to assess the relevance and clarity of the measurement variables. The team then adjusted t Ờm he measurement scale based on context derived from the interviews and conducted an online survey with 150 students from active communities in ten leading universities in Vietnam. The measurement scales showed a Cronbach's Alpha coefficient of ≥ 0.75, thereby indicating good internal consistency.

The research team resumed the online survey from March 2024 to May 2024 and received 389 responses from students currently engaging in virtual communities in Hanoi. The surveyed communities are mainly located in Hanoi, a city that accommodates numerous large universities and has a highly active exchange of academic information. These students are from prestigious universities and are participating in academic organizations and knowledge exchange processes. To achieve representativeness, the team targeted students in the fields of economics, technology, education, and the social sciences. Subsequently, 22 responses from students who did not report sharing knowledge were removed. Therefore, 367 valid responses were employed in the sample analysis to obtain a representation of the target group.

## III. RESULT AND DISCUSSION

In this study, we tested the reliability of the variables using Cronbach's Alpha coefficient. The results showed that all variables met the testing standards and all variables had values > 0.75.

**Table 1. Exploratory factor analysis for scales serving as independent variables**

| Observation variable | Factors | | | | | |
|---|---|---|---|---|---|---|
| | 1 | 2 | 3 | 4 | 5 | 6 |
| NLBT1 | 0.866 | | | | | |
| NLBT4 | 0.863 | | | | | |
| NLBT3 | 0.841 | | | | | |
| NLBT2 | 0.8 | | | | | |
| KNTU4 | | 0.846 | | | | |
| KNTU2 | | 0.815 | | | | |
| KNTU1 | | 0.804 | | | | |
| KNTU3 | | 0.775 | | | | |
| LI3 | | | 0.896 | | | |
| LI2 | | | 0.878 | | | |
| LI1 | | | 0.861 | | | |
| STT1 | | | | 0.894 | | |
| STT2 | | | | 0.868 | | |
| STT3 | | | | 0.824 | | |
| NV1 | | | | | 0.89 | |
| NV2 | | | | | 0.849 | |
| NV3 | | | | | 0.829 | |
| QTTH3 | | | | | | 0.9 |
| QTTH1 | | | | | | 0.852 |
| QTTH2 | | | | | | 0.749 |

| | |
|---|---|
| **KMO** | 0.798 |
| **sig of Bartlett's Test** | 0.000 |
| **Eigenvalue** | 1.047 |
| **Total extracted variance** | 73.879 |

The results of EFA also reveal that the Kaiser Meyer Olkin (KMO) value is 0.798. A high KMO value shows that the observed variables are quite suitable for factoring, since the observed variables have relatively high intercorrelations. The first 20 observed variables in 6 measurement scales were loaded into 6 factors at Eigenvalue of 1.047. This result validates that all six factors are valid in measuring the research constructs. Further, the total amount of variance, which is explained by the extracted 6 factors, is 73.879%. The observed variables within the same factor were accurately grouped, with high convergent validity (the variables within a factor are highly related) and discriminant validity (the variables in one factor are less related to those in another factor). Therefore, the research model is structurally confirmed, and ready for quantitative analysis to hypothesis testing and understanding of research relations.

**Table 2. Exploratory factor analysis for the scale serving as the dependent variable**

| Observation variable | Value |
|---|---|
| HVCS1 | 0.858 |
| HVCS2 | 0.836 |
| HVCS4 | 0.826 |
| HVCS3 | 0.824 |
| **KMO** | 0.824 |
| **sig of Bartlett's Test** | 0.000 |
| **Eigenvalue** | 2.796 |
| **Total extracted variance** | 69.904 |

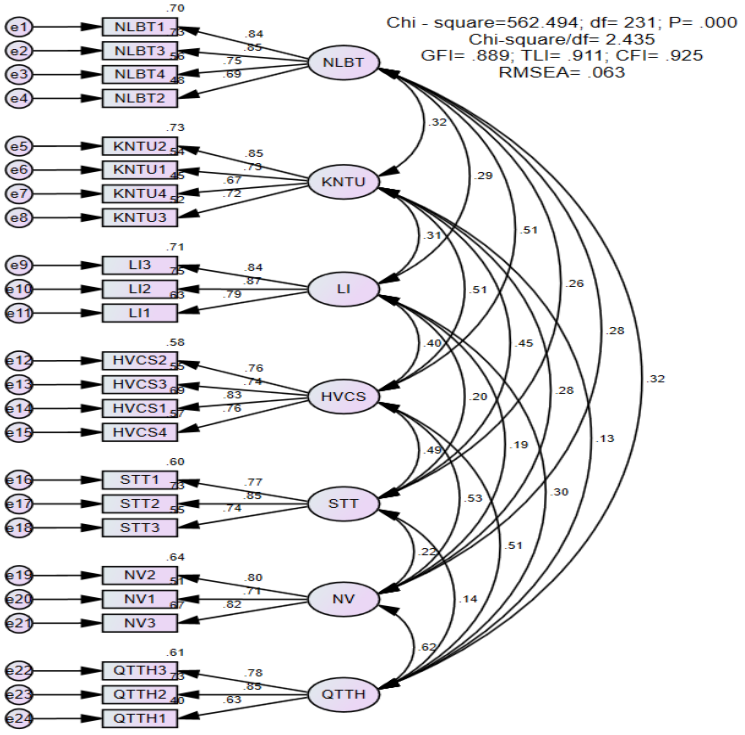

**Figure 2: Results of CFA model analysis**

EFA results of the dependent variable scale show KMO value is 0.824 which is greater than 0.6, so the survey data is suitable for factor analysis. The Bartlett's Test of Sphericity resulted to a sig of 0.000 which is less than 0.05. Further, the exploratory factor analysis shows that all the observed variables related to the dependent variable have a factor loading of more than 0.5. This shows that the observed variables are highly related to the knowledge sharing behavior factor that they represent, and also confirms that these variables capture the aspects of this factor.

In preparation for SEM, CFA was done to assess the fit of the measurement scales and to assess the actual structures of the scales in this study. By using CFA analysis, the measurement model was found to fit well with the survey data. The CMIN/DF value was 2.435 which is less than 5 and GFI, CFI and TLI were 0.889, 0.911 and 0.925 respectively, RMSEA was 0.063 which also supported the overall model fit. The survey data were measured with a high degree of accuracy and thus the convergent and discriminant validity was established, which forms the basis for SEM analysis.

**Table 3. Results of reliability, convergent and discriminant analysis**

| | CR | AVE | MSV | NLBT | KNTU | LI | HVCS | STT | NV | QTTH |
|---|---|---|---|---|---|---|---|---|---|---|
| **NLBT** | 0.865 | 0.617 | 0.262 | 0.785 | | | | | | |
| **KNTU** | 0.835 | 0.561 | 0.259 | 0.32 | 0.749 | | | | | |
| **LI** | 0.872 | 0.695 | 0.159 | 0.286 | 0.310 | 0.834 | | | | |
| **HVCS** | 0.856 | 0.598 | 0.285 | 0.512 | 0.509 | 0.399 | 0.774 | | | |
| **STT** | 0.834 | 0.626 | 0.240 | 0.256 | 0.447 | 0.201 | 0.490 | 0.791 | | |
| **NV** | 0.821 | 0.606 | 0.391 | 0.283 | 0.283 | 0.195 | 0.534 | 0.223 | 0.778 | |
| **QTTH** | 0.804 | 0.581 | 0.391 | 0.318 | 0.127 | 0.297 | 0.508 | 0.142 | 0.625 | 0.762 |

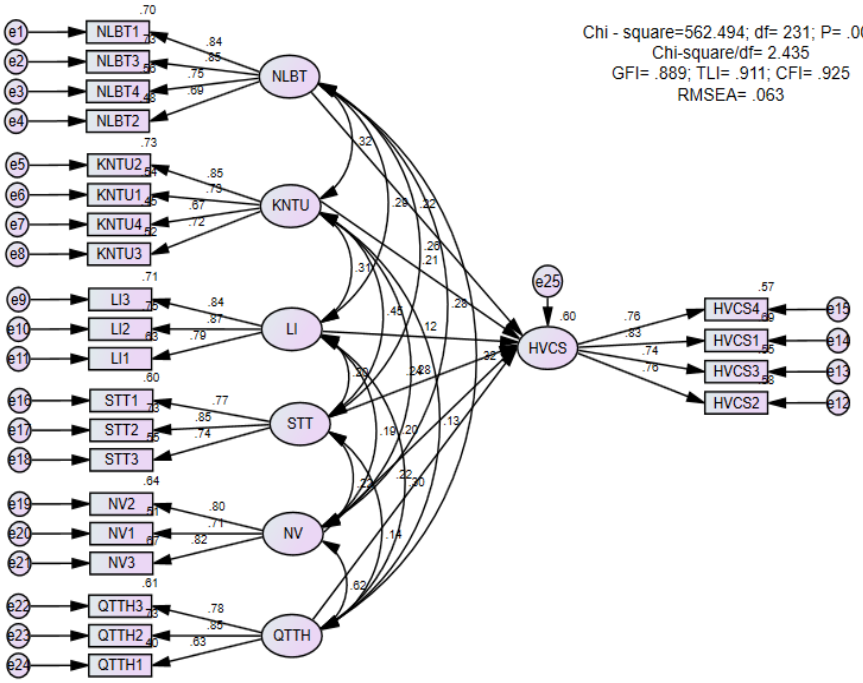

**Figure 3. Results of linear structural model analysis**

In order to assess the reliability of the factors in the proposed model, the Composite Reliability (CR) coefficient was used. The analysis results show that the CR values of all factors are greater than 0.7, which proves that the factors in the model have high reliability and can be used to measure the research constructs with good accuracy and stability. With regard to the convergent validity, the findings reveal that the AVE of all factors is more than 0.5. This means that

each of the factors accounts for more than 50% of the variability of the observed variables, which confirms that the factors have good convergent validity and represent the theoretical constructs adequately. For discriminant validity, The MSV of all factors is less than the AVE of each factor. This affirms our conclusion that the factors in the model possess adequate discriminant validity, and there is no significant crossover of the factors, and each of them is easily distinguishable from the others.

As seen from the result of the SEM analysis, the degrees of freedom are 231 and CMIN/DF ratio is 2.435 which is less than 5. Also, the significance value or sig is 0.000 < 0.05 which proves that the model is a good fit for the collected data. In addition, the indices GFI = 0.91, TLI = 0.97, and CFI = 0.95 are greater than 0.8, and the RMSEA = 0.063 which is less than 0.08, which also proves the fact that the proposed model has a good fit. Therefore, the validity of the structural equation model is assumed and is used for further research analysis.

**Table 4. Impact coefficient between factors in SEM model**

| The impact | | | Estimate | S.E. | C.R. | P |
|---|---|---|---|---|---|---|
| HVCS | <--- | NLBT | 0.179 | 0.041 | 4.363 | 0.000 |
| HVCS | <--- | KNTU | 0.166 | 0.046 | 3.650 | 0.000 |
| HVCS | <--- | LI | 0.113 | 0.048 | 2.365 | 0.018 |
| HVCS | <--- | STT | 0.188 | 0.043 | 4.434 | 0.000 |
| HVCS | <--- | NV | 0.201 | 0.068 | 2.936 | 0.003 |
| HVCS | <--- | QTTH | 0.216 | 0.069 | 3.143 | 0.002 |

The results of the SEM model show that all the effects are significant at 5 percent level of significance since all the p-values are less than 0.05. Thus, it is possible to state that hypothesis H1 in relation to the Norm of Reciprocity with regard to the studied indicators is confirmed. This finding indicates that when students are knowledge sharers, they want others to share with them as well. This result is different from the study by Chih-Jou Chen and Shiu-Wan Hung (2010), maybe due to the fact that Vietnamese culture is compatible with the spirit of solidarity and cooperation. The students in such communities are likely to exhibit such similar characteristics, needs and behaviors. In addition, the positive impact of the Norm of Reciprocity on the sharing behavior validates the studies conducted by Blau (1964), Chen & Hung (2010) and Wasko & Faraj (2005).

Regarding hypothesis H2: It is clearly stated that Interpersonal Trust has a positive effect on knowledge sharing behavior, the SEM results are 0.000 (p-value <0.05) and the effect coefficient is positive 0.188. Hence, hypothesis H2 is also supported. This indicates that trust leads to a sense of security among the members in as much as they wish to share their information, ideas or experiences with others without being laughed at, criticized or exploited. This result is supported by Chen et al. (2009), Lin et al. (2007), Hung and Cheng (2013) and other researchers who have emphasized trust in knowledge sharing behavior. For hypothesis H3 about self-efficacy, p = 0.000, and the effect coefficient is positive 0.179, we can accept H3. This hypothesis is well supported in the literature like Constant et al., (1994), Bock & Kim (2002) and Kankanhalli et al., (2005). When people are confident of their ability and have a lot of information in a certain area they are assured to give out information.

The SEM results of hypothesis H4: "Perceived Compatibility has a positive effect on knowledge sharing behavior" are 0.166 (positive effect coefficient) and 0.000 (p-value less than 0.05), which supports H4. Since tools, learning methods and communication approaches in online environments are dynamic, the more flexible students are able to accept and get acquainted with the changes, the more willing they will be to share knowledge in order to help others to embrace change. In the same regard, Hung and Cheng (2013), Lin et al. (2009), and Karahanna et al. (2006) share the same feelings.

Regarding hypothesis H5 which states that Enjoyment of Helping in sharing has a positive impact on knowledge sharing behavior, we find that the p-value is 0.003 <0.05 and the effect coefficient is positive 0.201. Thus, H5 is accepted. This finding supports the conclusions of Davenport and Prusak (1998), Kankanhalli et al. (2005), Wasko and

Faraj (2005), and Tai-Kuei Yu et al. (2010). These studies insist that people who derive pleasure from sharing knowledge with the intention of assisting others are likely to share knowledge, and therefore, emphasize "enjoyment of helping" as an important aspect of knowledge sharing behavior.

Hypothesis H6 "Perceived Relative Advantage has a positive effect on knowledge sharing behavior" the SEM results reveal a p-value of 0.018 and a positive effect coefficient of 0.113. Therefore, H6 is accepted. The above hypothesis is well supported by Lin (2009), Teunissen (2009) and Ray (2014) who posited that people are willing to devote time and effort in sharing knowledge in the same community if they see that they are benefiting from the same community.

With the aim of testing the mean difference of knowledge sharing behavior according to students' personal characteristics, the Independent Sample T-Test and One-way ANOVA tools are used. The analysis results of the qualitative variable Gender show that the sig of the F test is 0.629 > 0.05, so there is no difference in variance between the two gender groups. The T-test results with sig = 0.975 > 0.05 show that there is no mean difference in sharing behavior between the two groups of Male and Female.

**Table 5. Independent samples test**

| Independent Samples Test | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | Levene's Test for Equality of Variances | | T-test for Equality of Means | | | | | | |
| | | F | Sig. | t | df | Sig. (2-tailed) | Mean Difference | Std. Error Difference | 95% Confidence Interval of the Difference | |
| | | | | | | | | | Lower | Upper |
| HVCS | Equal variances assumed | .234 | .629 | .031 | 365 | .975 | .00250 | .07965 | -.15413 | .15913 |
| | Equal variances not assumed | | | .032 | 361.705 | .975 | .00250 | .07904 | -.15294 | .15794 |

With the qualitative variable consisting of 3 values, School year, in the Levene test, sig reaches a value of 0.378 > 0.05, so the ANOVA test is used to continue the review. The ANOVA test results show that sig = 0.301 > 0.05. Thus, no difference in knowledge sharing behavior is found between the groups of first-year, second-year, third-year and fourth-year students. The results of the Levene test analysis for the Major variable show that the sig value is 0.401 > 0.05, which is sufficient to use the ANOVA test. Accordingly, the sig of the ANOVA test is 0.574. This means that regardless of the major the students are studying: Economics, Engineering or Arts, there is no difference in knowledge sharing behavior between groups.

## IV. CONCLUSION

### 4.1. Implications of the study

Previous studies have shown that virtual communities' activities are vital in managing strategic knowledge-sharing practices among their members. This research finds that individual factors (such as perceived relative advantage, self-efficacy, enjoyment of helping, and perceived compatibility) and contextual factors (such as norms of reciprocity and interpersonal trust) play a critical role in encouraging knowledge-sharing behavior.

Building on this, the study theoretically develops a research model that integrates both individual and contextual factors to explore the determinants of knowledge-sharing behavior. In addition to clarifying how these factors influence knowledge sharing, this approach extends theoretical frameworks on knowledge-sharing behavior.

From a practical perspective, the research findings suggest that online community managers or organizations can implement policies and activities to foster trust, enhance knowledge-sharing practices, and strengthen members' sense of attachment. Trust among members plays a crucial role in promoting knowledge sharing, knowledge utilization, and community loyalty. Managers can encourage trust by appointing reputable student moderators who act as coordinators and create a safe environment for members. Additionally, establishing clear community guidelines that emphasize

mutual respect and support can help build a trustworthy atmosphere.

Organizing knowledge-sharing activities, such as the "Knowledge Exchange – Value Connection" program, where members share lessons, experiences, or materials and receive feedback as well as networking opportunities, can further reinforce the norm of reciprocity and enhance member engagement. Managers should ensure that every contribution, no matter how small, is acknowledged and positively reinforced. Simple expressions of gratitude like "Thank you for sharing this useful post!" can increase members' enjoyment of sharing.

At the same time, managers can provide tangible rewards such as study vouchers, free materials, or opportunities to participate in in-depth workshops for active contributors, highlighting the benefits of knowledge sharing. Furthermore, offering diverse sharing formats, such as videos, articles, livestreams, or infographics which allows students to choose the medium they feel most comfortable with, thereby improving their adaptability to knowledge-sharing activities.

For faculty members, creating a trustworthy and supportive environment through clear engagement guidelines, active moderation, and student moderators can enhance knowledge-sharing behavior. Faculty can encourage collaboration by designing interactive activities, recognizing student contributions, and leveraging diverse content formats such as videos, discussion threads, and live Q&A sessions. Additionally, ensuring accessibility and flexibility in participation will help students adapt more easily, fostering a dynamic and sustainable online learning environment.

### 4.2. Limitations and avenues for further research

This study has brought many important theoretical implications, helping to clarify the factors affecting students' knowledge sharing behavior in virtual communities, and at the same time offering practical recommendations on how to enhance the efficiency of virtual communities.

However, this study has its limitations. First, this study is limited to universities in Hanoi, so the generalizability of the findings may be limited to other regions and international contexts. Second, the study ignores technological factors, such as platform design, support features, or the use of digital tools. Underexplored within the scope of this research are these elements, which are important to encourage knowledge sharing behavior. Third, the study does not compare different online student communities. This limitation restricts the ability to identify distinctive properties or factors that distinguish the knowledge sharing behavior of different groups of students with different backgrounds or contextual influences.

To overcome the limitations mentioned above, future research could include universities from different regions of Vietnam in order to increase the coverage and cultural variability of the data collected. In addition, it is still important to examine the effects of the technology in more depth, for example, the attributes linked to the platform and the relations between students in order to discover the approaches to increase the effectiveness of the virtual communities. It will also be useful in the process of achieving the goal of making new advancements in the field as varied geographical, cultural, and technological contexts will be integrated. However, it will be more effective to compare different online student communities in different contexts or sites to find out influential factors and provide more useful suggestions.

# FACILITATING GREEN CONSUMPTION INTENTION THROUGH MINIMALISM & ITS DETERMINANTS: A THEORETICAL MODEL PROPOSAL

**Nguyen Vu Thanh An[1*], Bui Thi Nhu Quynh[2], Nguyen Ngoc Linh[2], Nguyen Viet Thanh[2]**

[1] Faculty of Marketing, National Economics University.
[2] School of Advanced Education Programs, National Economics University.
* Corresponding: annvt@neu.edu.vn

**ABSTRACT**

In response to global environmental challenges driven by overconsumption and resource depletion, green consumption has emerged as a crucial strategy for sustainability. Green consumption, characterized by reducing waste, lowering carbon emissions, and choosing eco-friendly products, emphasizes responsible consumption patterns to minimize environmental harm. Alongside this, minimalism - a lifestyle centered on reducing material possessions and prioritizing quality over quantity closely aligns with green consumption principles. This paper proposes a conceptual model that integrates three key factors influencing minimalism - environmental concerns, financial considerations, and social influence as well as explores how minimalism can foster green consumption, particularly focusing on Gen Z in Vietnam. The study applies the Theory of Reasoned Action (TRA) to analyze the relationship between psychological factors and consumer behavior. This model highlights the impact of elements such as attitude (environmental and financial concerns) and subjective norms (social influence) and examines how these factors influence green consumption behavior. By synthesizing insights from international research and the socio-economic dynamics of Vietnam, this model underscores how adopting minimalist practices can reduce overconsumption, promote environmental awareness, and encourage sustainable product choices among Vietnam's young consumers. The proposed framework aims to provide actionable strategies for advancing green consumption and achieving Sustainable Development Goal (SDG 12), with a focus on fostering sustainable practices in the rapidly developing Vietnamese market.

*Keywords:* “environmental concerns”, “financial concerns”, “green consumption”, “minimalism”

## I. INTRODUCTION

### 1.1. Background of the study

The global shift towards sustainable development has intensified the focus on green consumption (Nguyen & Tran, 2025). Consumers are becoming more conscious of the ecological impact of their purchasing decisions and, as a result, are seeking products and services that reduce harm to the environment. This transition is not only a response to environmental challenges but also a reflection of changing societal values. Simultaneously, minimalism has gained prominence as a contemporary lifestyle choice, emphasizing reduced material possessions and a focus on intrinsic values (Kang et al., 2021). Notably, Generation Z, those born in the late 1990s to early 2010s, stands out for its heightened environmental consciousness (Tran et al., 2022). Members of this generation often demonstrate a clear preference for eco-friendly products and place significant emphasis on ethical and sustainable practices in their purchasing decisions. According to Andruszkiewicz et al. (2023), Gen Z has a higher sensitivity to environmental degradation, reflecting a growing preference for green consumption behaviors. Similarly, studies in Vietnam and Australia confirm that Gen Z integrates sustainability into their purchasing decisions, such as preferring green cosmetics and alternative proteins, driven by personal values and pro-environmental beliefs (Hieu et al., 2021). These findings underscore Gen Z's role in advancing green consumption through minimalism, emphasizing their potential to influence sustainable market trends globally.

Green consumption intention (GCI) reflects consumers’ willingness to prioritize eco-friendly products in their purchases (Zaremohzzabieh, 2021; Nguyen & Tran, 2025). Studies on GCI mainly focus on developed nations like Korea (Han, 2015) and Taiwan (Rahimah, 2018). Previous studies have highlighted factors such as perceived value, green trust, and social influence (Zhuang et al., 2021; Sharma et al., 2022). However, barriers like high prices and mistrust in green products remain (Tian et al., 2022). In Vietnam, GCI is increasingly relevant due to growing

environmental challenges alongside economic development. Key drivers include attitudes, trust, and eco-labeling, while pricing and availability pose challenges (Nguyen et al., 2019; Duong et al., 2022). Social media also enhances environmental awareness (Nguyen et al., 2024). Collectively, these findings provide valuable insights for policymakers and businesses to develop strategies that encourage sustainable consumption, address price barriers, and leverage digital tools to foster greater environmental responsibility among Vietnamese consumers.

Over the past few years, minimalism has become a global movement, initially rising to prominence in Asian countries. This lifestyle encourages reducing material possessions and focusing on intrinsic values. Wilson and Bellezza (2021) define minimalism through three dimensions: limited possessions, sparse aesthetics, and mindful curation, aligning it with environmental sustainability and well-being. Minimalism emerged globally as a counter-response to materialism and overconsumption, major contributors to environmental degradation (Kang et al., 2021; Druică et al., 2023). Increasing awareness of mental health and sustainability has driven more people to adopt minimalism (Kang et al., 2021; Druică et al., 2023; Hashim et al., 2023). Most studies focus on global trends or the psychological benefits of minimalism, such as well-being (Matte, 2021) and happiness (Jain et al., 2023). In Vietnam, however, minimalism remains a new concept with limited research (Nguyen et al., 2023), with very few studies exploring it as a subject of academic investigation (Chung, 2023; Nguyen & Tran, 2025). Research on minimalism's impact on consumer behavior and sustainable consumption in Vietnam is scarce, creating opportunities for further exploration. Its growing adoption, especially among younger generations, reflects cultural and economic shifts toward simplicity and sustainability. Minimalism's principles can help tackle overconsumption, waste management, and environmental challenges, warranting deeper academic and practical study.

The relationship between minimalism and GCI is similarly underexplored, particularly in emerging markets like Vietnam. Globally, minimalism fosters mindful, eco-friendly consumption by reducing waste and prioritizing essential purchases (Wilson & Bellezza, 2021; Kang et al., 2021). Despite these synergies, empirical evidence linking minimalism to GCI remains limited. In Vietnam, where minimalism and GCI are nascent, studies like Chung (2023) explore minimalism's growing appeal, while Nguyen (2023) identifies barriers to green consumption, such as cost sensitivity, skepticism toward eco-labels, and limited product availability. This gap is especially relevant for Generation Z, a key demographic influencing consumption trends. This is especially pertinent for Generation Z, who, despite their environmental awareness, face materialistic pressures, highlighting an opportunity to advance sustainable practices.

Addressing this gap, this study introduces a conceptual framework to investigate the factors of minimalism and ít impact on GCI in Vietnam, with a particular focus on Gen Z consumers. By addressing the unique consumption behaviors and attitudes of this demographic, the research seeks to contribute to both theoretical advancements and practical applications in sustainable consumption. Given the growing urgency of promoting sustainable practices amid global environmental challenges, the findings could offer actionable solutions for businesses and policymakers to encourage green consumption in Vietnam's dynamic and influential Gen Z market.

### 1.2. Research Questions and Objectives

To fill this gap, the research aims to investigate green consumption intention through minimalism and its determinants. There are several main objectives of the research:

– RO1: To examine the relationship between minimalist lifestyles and green consumption intention among Gen Z.

– RO2: To ascertain the interactions of environmental concerns, financial concerns, and social influence impacting minimalism among Gen Z.

– RO3: To analyze the correlation between environmental concerns and green consumption intention among Gen Z.

– Three key questions will be addressed to achieve the stated objectives:

– RQ1: How does the adoption of minimalism correlate with Gen Z's green consumption intention?

– RQ2: How are the main factors influencing minimalism among Gen Z?

– RQ3: Is there a significant relationship between environmental concerns and Gen Z green consumption intention?

## II. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

### 2.1. Conceptual Foundation

**Minimalism**

The concept of minimalism is defined as a lifestyle that embodies the importance of reducing consumption and curating possessions to only those that are essential (Martin-Woodhead, 2022). This approach encourages intentional living by restricting material excess and maintaining a focus on simplicity. According to Matte et al. (2021), minimalism encourages individuals to reassess their core priorities, shifting focus from material possessions to meaningful relationships and fulfilling activities that add depth and purpose to life, reflecting a conscious effort to prioritize simplicity and intentionality over materialism. Minimalism, as researched by (Kang et al, 2021), emerged as a prominent lifestyle in Asian countries, with Japan being a notable example. While minimalism has garnered global attention, yet its interpretation and adoption can differ significantly across cultural contexts. Notably, in collectivist cultures, the concept of minimalism remains underexplored within academic research (Druică et al, 2023). This gap is particularly important to address, given that minimalism not only encourages a simplified lifestyle but also aligns with environmental sustainability by promoting mindful consumption patterns.

**Green Consumption Intention**

Green Consumption Intention (GCI) refers to consumers' willingness to purchase environmentally friendly products, influenced by personal values, beliefs, and external factors (Choi & Johnson, 2019), which serves as a key predictor of sustainable consumption behavior (Prentice et al., 2019). It reflects consumers' drive to seek out products from brands committed to sustainable manufacturing, despite external environmental influences (Nur et al., 2021). Eco-conscious purchasing involves choosing products that reduce environmental harm, are recyclable, and contribute to sustainability efforts (Djaelani et al., 2020). Although GCI has been widely examined in developed markets such as South Korea and Taiwan (Lee, 2017), research remains limited in emerging economies (Amin & Tarun, 2021). Understanding how economic and cultural contexts influence GCI is essential for businesses and policymakers aiming to promote sustainability. Encouraging green consumption requires addressing not only individual motivation but also systemic factors shaping consumer choices. By fostering environmental awareness and improving access to sustainable products, GCI can drive meaningful changes in consumer behavior, ensuring that sustainability becomes a fundamental consideration in purchasing decisions.

**Theory of Reasoned Action (TRA)**

The Theory of Reasoned Action (TRA), developed by Fishbein and later refined with Ajzen in 1975, explains the relationship between attitudes, behavioral intentions, and human actions. According to TRA, individual behavior is primarily driven by behavioral intentions, which are influenced by two critical factors: Attitude and Subjective Norm. Attitude reflects an individual's positive or negative evaluation of a behavior based on their beliefs about its outcomes, while Subjective Norm refers to perceived social pressure from influential figures, such as family, friends, or society, regarding whether to engage in a behavior. Together, these components make behavioral intention the strongest predictor of action. TRA has been widely applied across fields such as consumer behavior, voting patterns, and sustainable practices due to its simplicity and adaptability (Ajzen & Fishbein, 1980).

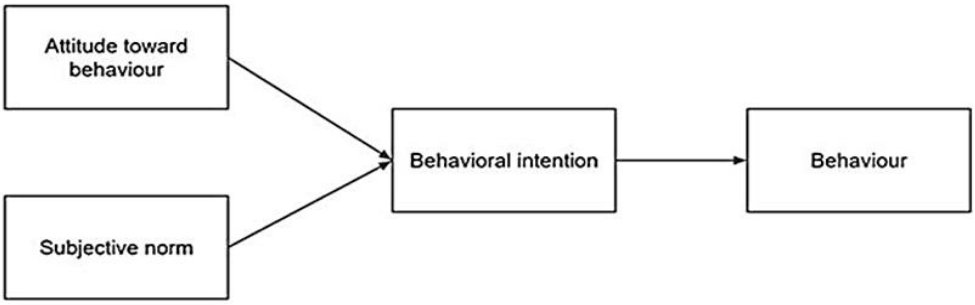

**Fig. 0.1 Theory of Reasoned Action - TRA Model**

*(Source: Pham et al., 2021)*

Minimalism is often examined through its dimensions (Kang, 2021; Wilson & Bellezza, 2021), but research on its adoption remains limited. This study applies TRA to explore how Environmental Concerns and Financial Concerns (as

components of Attitude) and Social Influence (as Subjective Norms) shape minimalist lifestyles and influence green consumption intention. Environmental Concerns are central to minimalism's sustainability focus, as those aware of ecological issues adopt minimalism to reduce consumption and waste (Jain et al., 2023; Nguyen et al., 2025). Financial Concerns also play a key role, as minimalism emphasizes expense simplification, prioritizing quality over quantity, and value-driven consumption (Meissner, 2019; Martin-Woodhead, 2021). Social Influence reinforces eco-conscious behaviors, as societal norms encourage sustainable lifestyles (Jain et al., 2023; Druică et al., 2023). Jain et al. (2023) previously examined Environmental Concerns and Social Influence together as key drivers of minimalist consumer behavior. While Financial Concerns and Minimalism have not been explicitly linked in prior studies, discussions suggest economic motivations significantly foster minimalist lifestyles, helping individuals regain autonomy amid financial insecurity and consumerist pressures (Martin-Woodhead, 2021).

Environmental Concerns, Financial Concerns, and Social Influence are interrelated yet distinct in shaping behavior. Environmental and Financial Concerns reinforce each other, as cost-saving sustainable practices boost environmental commitment. Social norms further strengthen Environmental Concerns by promoting sustainability, while Financial Concerns align with Social Influence when communities value frugality. Together, these factors complement and amplify each other while independently shaping minimalism.

This study applies the Theory of Reasoned Action (TRA) to examine how Attitude and Subjective Norms shape environmentally conscious behaviors. It investigates how Environmental and Financial Concerns (as Attitude components) and Social Influence (as a Subjective Norm) impact minimalist lifestyle adoption and green consumption. TRA offers a strong framework for understanding how consumer perceptions and social expectations drive sustainable choices. By applying this perspective, the research aims to uncover the psychological mechanisms linking attitudes, social influences, and eco-friendly behaviors.

### 2.2. Hypothesis Development

#### 2.2.1. Environmental concerns and Green consumption intention

Environmental concern has frequently been conceptualized as a broad-based attitude (Bamberg, 2003) which manifests through context-specific situations. The significance of environmental concerns (EC) is increasingly recognized in the context of sustainable consumption. EC encompasses an individual's thoughts, beliefs, perceptions, and actions related to environmental issues. It demonstrates a person's deep awareness of environmental challenges and their willingness to engage in addressing these problems (Liu et al., 2020). Environmental concerns are closely tied to emotional responses, knowledge, and readiness to adapt behavior.

Sung (2016) identified various types of anti-consumption, including the trend of anti-consumption driven by attitudes and behaviors linked to environmental concerns. People with eco-friendly concerns tend to exhibit more deliberate consumption habits, aligning their actions with minimalist lifestyles (Kuanr et al., 2020). For individuals adopting environmentally conscious lifestyles, minimalism provides a framework to align their practices with personal values and beliefs. It serves as an alternative approach to achieving environmental sustainability, prioritizing reduced consumption over material ownership. This study explores how environmental concerns act as a critical motivator for voluntary simplicity in consumer behavior. Building on prior research in sustainable consumption and minimalism, the study positions environmental concerns as a core element of voluntary anti-consumption, reflecting individuals' thoughts, beliefs, perceptions, and behaviors toward environmental issues in their consumption choices (Sung, 2016).

Based on the above arguments, the article proposes the first hypothesis as follows.

***H1: Environmental concerns positively influence the adoption of minimalist lifestyles.***

Environmental concern is frequently recognized as a critical predictor of environmentally conscious behavior, directly driving the intention to engage in green consumption. It is extensively employed as a foundational construct to elucidate pro-environmental actions, sustainable practices, and related behavioral outcomes (White & Simpson, 2013; Bamberg, 2003; Pagiaslis & Krontalis, 2014). Studies conducted by Tam & Chan (2017) underscore the role of environmental concern as a pivotal determinant positively influencing consumers' intentions to purchase eco-friendly products. According to Ramayah et al. (2010), heightened awareness and attention to environmental issues significantly facilitate the adoption of sustainable consumption practices. Furthermore, they posited that external factors exert

minimal direct influence on green consuming behavior; instead, it is the intrinsic concern for environmental preservation that compels consumers to take action. Supporting this perspective, the empirical findings of Paul et al. (2016) and Schmuck et al. (2018) identified a robust and positive association between environmental concern and the intention to engage in green consumption. On this basis, it is reasonable to postulate that individuals inclined toward purchasing green products must exhibit a heightened awareness and consciousness regarding environmental sustainability (Chi, 2021).

Hence, the following hypothesis is suggested.

***H5: Environmental concerns significantly influence the intention toward Green consumption intention***

**2.2.2. Financial concerns**

Fear is an unpleasant feeling that arises when individuals perceive a threat to their values or resources. Financial concerns, specifically, emerge when individuals are unable to meet their financial needs or assess their financial situation as inadequate (Friedman, 1991). These concerns are often accompanied by fear and anxiety, which, while distressing, can trigger adaptive responses such as improving financial management or seeking new income sources. Furthermore, Van Raaij (1991) posited that individuals' economic behavior is influenced by their subjective perception of financial stability, shaping their decision-making processes in times of financial stress. Building on these insights, this study hypothesizes that financial concerns act as a driver for the adoption of minimalist lifestyles. When individuals face financial uncertainty, they may re-evaluate their consumption patterns, prioritizing essential needs over materialistic desires. Minimalism, which emphasizes reducing material possessions and adopting intentional consumption, naturally aligns with this shift. While existing studies primarily focus on the outcomes of minimalism - such as significant financial advantages (Martin-Woodhead, 2021), improved financial well-being (Malik & Ishaq, 2023; Minter, 2023) or reduced psychological distress (Cappetto, 2020) - limited research has examined how financial concerns might serve as a catalyst for embracing minimalism.

Thus, the following hypothesis is derived.

***H2: Financial concerns has a direct positive effect on minimalism***

**2.2.3. Social influence**

Consumption is an inevitable aspect of human life, as it sustains our basic needs and supports our well-being. Social influence has emerged as a pivotal factor in understanding various societal outcomes, including education, income, and labor (Liebman et al., 2004), unemployment Topa (2001), relationships (Marmaros & Sacerdote, 2006) and etc. In addition, an increasing number of studies have been delving into its impact on customer choices.

Social influence explains the impact of our society on individuals's purchasing decisions. In some previous studies, social influence is considered as subjective norm (Wang, 2014). While social influence enhances recycling activities (Park & Ha, 2012) and drives the willingness to buy sustainable and environmentally-friendly products (Moons & De Pelsmacker, 2012); Wang (2014) proved that the social factors affect green consumption intention. On the other hand, minimalism emphasizes personal development by encouraging individuals to focus on meaningful experiences and personal values that promote environmental sustainability (Kropfeld et al., 2018) by recycling, and reducing waste. According to Nguyen and Tran (2025), this study presents the impact of minimalism on green consumption intention via pro-environmental behavior. Hence, this study aims to investigate the relationship between social influence and green consumption intention, with a focus on the mediating role of minimalism, to gain deeper insights into their relationship.

Thus, the following hypothesis is derived.

***H3: Social influence has a direct positive effect on minimalism***

**2.2.4. Minimalism and Green consumption intention**

Minimalism has gained significant influence, particularly in Japan (Dumnova, 2023). Martin (2017) describes his transition from consumerism to simplicity in Goodbye, Things: The New Japanese Minimalism. Sasaki differentiates his approach from Marie Kondo's, whose method focuses on organization rather than reducing possessions (Martin, 2017). Minimalism emphasizes eliminating excess, fostering contentment with fewer belongings, and making deliberate

purchasing choices. Green consumption intention refers to the motivation to purchase eco-friendly products that provide environmental or social benefits. Every purchase impacts health, ecosystems, and society throughout its lifecycle, contributing to a product's sustainability footprint. Green consumption has been widely examined due to its significance in mitigating environmental challenges and promoting responsible consumer choices.

Previous studies have extensively examined the link between minimalism and sustainable consumption, highlighting its role in reducing environmental impact. Research shows that materialism drives environmentally harmful behaviors (Kilbourne & Pickett, 2008), whereas minimalism fosters pro-environmental actions and ethical consumption (Lloyd & Pennington, 2020). Lloyd and Pennington (2020) found that minimalists often realign their values, opting for ethical and eco-friendly products. Similarly, Hüttel et al. (2020) emphasize resource conservation through reduced consumption, reinforcing minimalism's contribution to sustainability.

While existing research explores the broader link between minimalism and sustainability, this study focuses specifically on green consumption behavior. Although studies on minimalism's impact on green consumption intention remain limited, key research has examined its connection to eco-conscious purchasing. Beuria et al. (2024) found that minimalism, subjective norms, attitudes, and perceived behavioral control significantly influence the intention to buy eco-friendly fashion, supporting the Theory of Planned Behavior (TPB) among educated Gen Y and Z consumers in India. Chuming Qiu (2023) also confirms minimalism's role in shaping green consumption through TPB. Recently, Nguyen and Tran (2025) explored how minimalism affects green consumption intention via pro-environmental behavior. This study investigates how minimalism as a lifestyle directly influences green consumption intention and strengthens their relationship.

Hence, the following hypothesis is derived.

***H4: Minimalism has a direct positive effect on Green consumption intention***

### 2.3. Research model

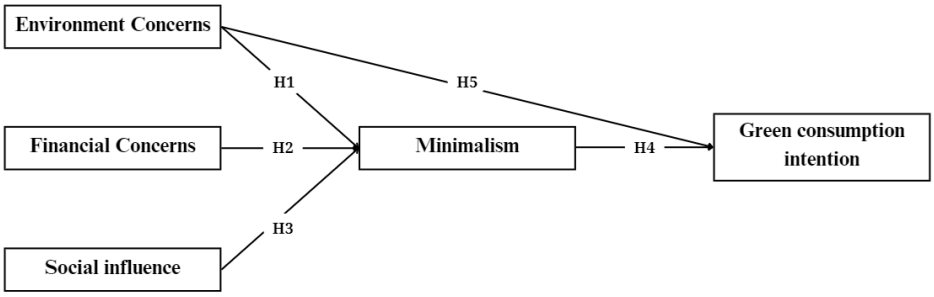

**Fig. 0.2 Proposed Conceptual Model**

## III. CONCLUSION

### 3.1 Research Findings

Green consumption has become an essential strategy in pursuing sustainability, emphasizing the responsible use of resources and adopting environmentally friendly practices. By minimizing and prioritizing products and services, green consumption intention is critical for fostering sustainable development. In addition, minimalism emphasizes the reduction of material possessions and the prioritization of quality over quantity. Accordingly, by encouraging mindful purchasing decisions and sustainable life, minimalism promotes a more intentional approach to green consumption. The relationship between minimalism and sustainable consumption has been proved in previous studies, but few studies investigate the impact of minimalism on green consumption intention. Besides, generation Z - young people currently represents a demographic with significant influence in the realm of consumer behavior. Their participation in shopping activities reflects a tendency to follow materialistic pursuits, driven by emerging trends and societal expectations. This study introduces a conceptual framework that synthesizes three main explaining variables of minimalism: environmental concerns, financial concerns, and social influence; it also examines the potential of minimalism to promote green consumption intention, with the survey for Gen Z in Vietnam.

### 3.2 Limitations and Future Research Directions

As a result, this research suggests several directions for future research. The proposed theoretical model explores the relationship between minimalism and green consumption intention (GCI) among Gen Z in Vietnam. However, several limitations should be acknowledged, which offer opportunities for future quantitative research. As a theoretical model, this study lacks empirical validation. Future studies should employ quantitative methods such as structural equation modeling (SEM) to test the proposed relationships using survey data. A larger sample size representative of Gen Z consumers in Vietnam would enhance the generalizability of findings. The research should employ validated measurement scales for key constructs, such as the Minimalist Lifestyle Scale (Wilson & Bellezza, 2021), the Green Purchase Intention Scale (Dima, 2013), Environmental Concern Measures (Paul et al., 2016), Financial Concern Measures (Wilson et al., 2020), Social Influence (Druică et al., 2023). A stratified random sampling approach targeting Gen Z consumers across different regions in Vietnam will enhance data generalizability. Besides, the study focuses on three determinants: Environmental concerns, financial concerns, and social influence; while other potential factors remain unexplored offering new directions for further investigation. Additionally, this research does not consider longitudinal changes in consumer behavior, meaning that future studies could benefit from tracking shifts over time to better understand the causality and evolution of minimalist and green consumption tendencies. Moreover, cultural and economic contexts may significantly moderate these relationships, suggesting the need for comparative studies across different countries or socio-economic groups to enhance the model's applicability. Addressing these limitations through rigorous empirical research will provide a stronger foundation for understanding the role of minimalism in fostering sustainable consumption behaviors.

# EXPLORING THE LINKAGE BETWEEN CUSTOMER PERSONALITY TRAITS AND E-CUSTOMER CITIZENSHIP BEHAVIOUR IN MOBILE COMMERCE APPLICATIONS

**Nguyen Dinh Toan[1*], Nguyen Tra My[1], Vu Mai Chi[1], Truong Hai Anh[1], Le Hoang Phuong[1]**

[1]Faculty of Marketing, National Economics University

*Corresponding: nguyendinhtoan@neu.edu.vn

**ABSTRACT**

The popularity of mobile devices facilitates the increasing adoption of mobile commerce applications, creating new opportunities for businesses to co-create with customers, particularly Gen Z. To better understand the individual-level factors driving customer behaviour, it is crucial to study the impact of personality traits, specifically the Big Five personality model, on e-Customer Citizenship Behaviour (e-CCB) in mobile commerce applications. This paper investigates the relationship between the Big Five personality model including extraversion, conscientiousness, neuroticism, agreeableness, openness, and e-CCB among Gen Z consumers in Vietnam. Drawing on peer-reviewed research, the study explores how these personality traits influence behaviours in mobile commerce. The findings highlight the significant role of extraversion, conscientiousness, and neuroticism in promoting e-CCB, while agreeableness and openness show no correlation. This paper also provides insights into how personality traits shape customer behaviour and offers recommendations for marketers to develop strategies for promoting e-CCB, especially with Gen Z customers in mobile commerce applications.

## I. INTRODUCTION

### 1.1 Background of the study

Mobile commerce, defined as transactions of monetary value conducted via mobile networks using handheld devices, has become a significant driver of global retail activity (Ngai & Gunasekaran, 2007). In 2024, mobile commerce accounted for 57 percent of e-commerce revenue, with this figure then projected to increase to 63 percent by 2028, highlighting the growing reliance on mobile platforms for online shopping (Statista, 2024a). Additionally, global mobile commerce revenue was estimated at 2.07 trillion USD in 2024, projected at 3.35 trillion USD by 2028, representing nearly 80 percent of retail website visits and 66 percent of worldwide orders (Statista, 2024a). In Vietnam, this growth is particularly pronounced, with mobile commerce revenue reaching 3.18 billion USD in 2021 and expected to rise to 8.67 billion USD by 2026 (Statista, 2024b). This trend demonstrates the importance of mobile commerce globally and locally, encouraging retail businesses to refine their marketing strategies for mobile platforms to maximise profitability.

In today's highly competitive retail environment, particularly within the online retail sector, e-CCB has emerged as a critical focus for businesses. This shift stems from the evolving nature of customer interactions, which are increasingly mediated by virtual interfaces rather than traditional face-to-face engagement with service personnel (Meuter et al., 2000). Moreover, previous research has emphasised the pivotal role of customer citizenship behaviour (CCB) in the success and sustainability of e-retail businesses, given the substantial economic and social benefits these behaviours yield (Chevalier & Mayzlin, 2006; Garma & Bove, 2011; Rosenbaum & Massiah, 2007). From an economic perspective, past research demonstrated that CCB contributes to enhanced customer satisfaction and loyalty, both of which are essential for long-term business success (Assiouras et al., 2019). Additionally, customers who engage in proactive behaviours such as recommending a brand or assisting other consumers significantly influence the financial outcomes of firms. These activities foster increased loyalty and customer lifetime value, as economic exchanges between customers and firms are sustained through mutually beneficial relationships, ultimately leading to improved customer retention rates (Mandl & Hogreve, 2020; Segarra-Moliner & Moliner-Tena, 2022). In terms of social benefits,

positive relationship between CCB and individuals' perceived contributions to the welfare of others, which, in turn, enhances overall happiness (Hsieh et al., 2018). This highlights the broader societal value of such behaviours, extending beyond the immediate economic implications. Taking all that into consideration, it is evident that the diverse economic and social benefits associated with e-CCB underscore the importance of examining its antecedents. By identifying effective strategies to promote and enhance these behaviours, retail businesses can not only achieve higher profitability but also contribute to broader societal well-being.

Personality traits are a particularly important factor in shaping e-CCB within the context of mobile commerce (Mishra & Vaithianathan, 2015; Pagani & Mirabello, 2011). Despite this, research on the role of personality traits in influencing e-CCB remains limited. This calls for further examination of how consumer personality traits affect e-CCB, aligning with numerous researchers' recommendations to explore personality traits as antecedents of e-CCB (Assiouras et al., 2019; Men et al., 2024; Tung et al., 2017). In this context, it is recommended to adopt the Big Five personality model, a framework encompassing conscientiousness, extraversion, agreeableness, neuroticism, and openness to experience (Mitrega et al., 2022). As highlighted in organisational literature, this model is considered a significant predictor of voluntary behaviours in customer domains (Choi & Hwang, 2019).

This study aims to address these research gaps by exploring the relationship between personality traits and e-CCB, examining how e-CCB impacts mobile commerce, and providing insights to optimise customer engagement and business outcomes in mobile commerce applications.

### 1.2. Research questions and objectives

This study aims to investigate the influence of customer personalities on e-CCB within the context of mobile commerce applications, thereby making suggestions for promoting e-CCB. Specific objectives are as follows:

- RO1: To gain an overview of the theoretical foundations of e-CCB and the Big Five Personality Model
- RO2: To examine the linkage between particular personality traits on e-CCB, given the context of mobile commerce applications
- RO3: To suggest for applications providers to promote e-CCB among young Vietnamese consumers
- To accomplish these objectives, this study will address the following research questions:
- RQ1: What are key theories regarding e-CCB and the Big Five Personality Model
- RQ2: What is the linkage between customer personalities and e-CCB in the context of mobile commerce applications?
- RQ3: What can be done to promote e-CCB among young Vietnamese consumers?

## II. MATERIAL AND METHOD

### 2.1. Hypotheses Development

#### 2.1.1. E-Customer Citizenship Behaviour

CCB refers to "voluntary and discretionary behaviours that are not required for the successful production and/or delivery of the service but that, in the aggregate, help the service organization overall" (Groth, 2005). E-CCB, which is the adaptation of CCB in an internet service environment, includes activities such as sharing comments, recommendations, and information aimed at fostering long-term service improvements (A. Anaza & Zhao, 2013). It also involves offering useful guidance, positive feedback, links, or pertinent details to assist other customers (Salem & Alanadoly, 2024; Türkdemir et al., 2023). E-shoppers exhibiting positive extra-role behaviours like e-CCB are deemed good online citizens, as their actions enhance service quality for e-retailers. Given that online services often require customers to participate in the delivery process, their readiness to exceed expected roles by supporting both the business and other e-shoppers reflects their commitment to the e-retailer's success (Anaza, 2014). E-CCB contributes to fostering customer loyalty, encouraging positive e-word-of-mouth, and promoting business sustainability. It also helps organisations gain a competitive edge, strengthen customer connections, and enhance the brand image by offering personalised products (Assiouras et al., 2019; Gong & Park, 2023; Li & Wei, 2021). For the mobile commerce apps context, e-CCB is reflected in actions such as providing constructive feedback, expressing appreciation for quality service, offering assistance to other customers, addressing others' service-related difficulties, and guiding them in proper service usage (Ahn et al., 2019). These behaviors are used as the scale for the research of e-CCB.

### 2.1.2. The Big Five Personality Model

Individuals display relatively consistent responses to environmental stimuli, reflecting their underlying personality traits (Kassarjian, 1971). Existing research highlights a significant relationship between personality traits and behaviours associated with mobile commerce applications (Mishra & Vaithianathan, 2015; Pagani et al., 2011). This study employs the Big Five Personality model to examine customer's individual characteristics. The model is widely recognised as a highly replicable and robust framework for understanding personality structure (Angelini, 2023; Costa Jr & McCrae, 1992; Digman, 1990). The Big Five model outlines five key dimensions of personality: extraversion, agreeableness, conscientiousness, neuroticism, and openness (Costa & McCrae, 1999).

**Extraversion**

Extraverted individuals are energetic, sociable, and outgoing (Costa & McCrae, 1992), often sharing experiences online to satisfy their social communication needs (Bowden-Green et al., 2021). Studies reveal a positive relationship between extraversion and organisational citizenship behaviour, which extends to CCB in mobile app contexts (Gong & Yi, 2021; Mitrega et al., 2022). Thus, the following hypothesis is derived:

H1: Extraversion is positively related to shoppers' e-CCB.

**Agreeableness**

Agreeable individuals value trust, kindness, and cooperation, often prioritising social harmony over their own needs (DeYoung et al., 2002). They are more likely to participate in supportive activities, such as sharing online reviews (Adamopoulos et al., 2018). It then further suggested that agreeableness is linked to knowledge-sharing behaviours, as agreeable individuals are typically more helpful, generous, and collaborative (Barrick & Mount, 1991; Matzler et al., 2011). Therefore, the following hypothesis is proposed:

H2: Agreeableness is positively related to shoppers' e-CCB.

**Conscientiousness**

Conscientious individuals display traits such as diligence, responsibility, and organisation (McCrae & Costa Jr, 1997). They are inclined to assist others and share information online, demonstrating strong customer-focused behaviours (Adamopoulos et al., 2018). Similarly, past research found that conscientiousness is positively associated with individuals' intentions to share knowledge, as they typically fulfil their responsibilities and are more willing to contribute to the success of a community through knowledge sharing (Wang & Yang, 2007). Hence, the following hypothesis is suggested:

H3: Conscientiousness is positively related to shoppers' e-CCB.

**Neuroticism**

Neuroticism is characterised by traits such as anxiety, fearfulness, and insecurity (Barrick & Mount, 1991). Neurotic individuals often seek social recognition through online engagement, improving their mood and CCB (Yang et al., 2023). Research also indicates a positive link between neuroticism and online review activity (Picazo-Vela et al., 2010). Thus, the following hypothesis is derived:

H4: Neuroticism is positively related to shoppers' e-CCB.

**Openness**

Open individuals are curious, creative, and open to new ideas and technologies (McCrae & Costa Jr, 1997). They often engage with online platforms to share information, demonstrating strong customer-oriented behaviours (Marshall et al., 2015). Previous research has also shown that openness is positively associated with knowledge-sharing intentions (Cabrera et al., 2006). As a result, the following hypothesis is put forward:

H5: Openness is positively related to shoppers' e-CCB.

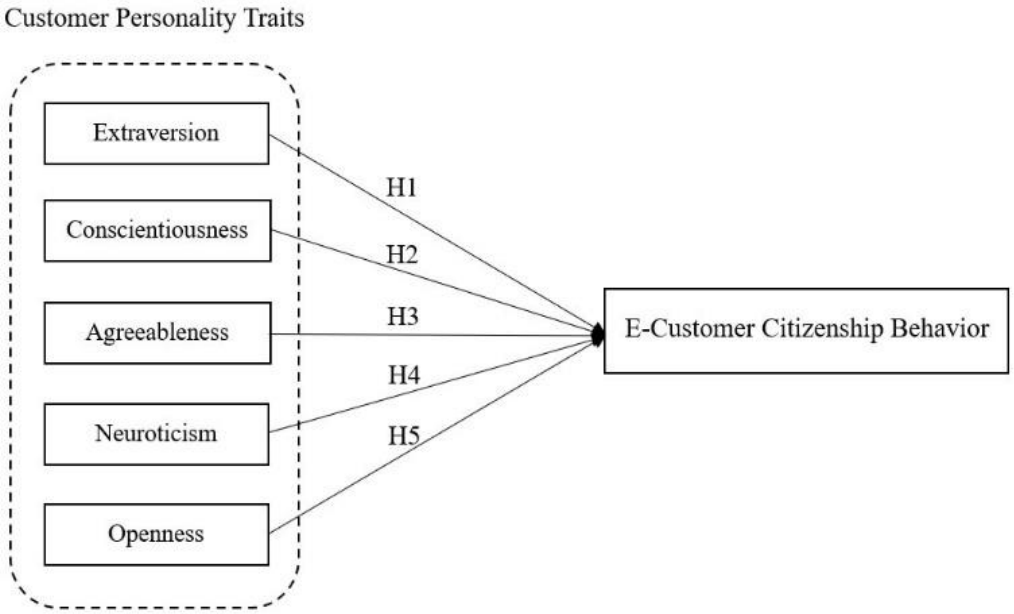

**Figure 1. Conceptual model**

### 2.2. Research method

The study was carried out using a quantitative approach and a self-administered survey utilized a convenience sampling method. Its purpose is to test the proposed hypotheses (Figure 1) about the relationship between the personality traits from The Big Five personality model and e-CCB. From September to November 2024, an online questionnaire was distributed to Gen Z consumers through social media platforms.

The questionnaire consisted of 3 parts. The first section aimed to understand participants' behaviour in mobile commerce applications. The next part includes questions about five independent variables, such as extraversion, conscientiousness, agreeableness, neuroticism, and openness to experience, and the dependent variable, which is e-CCB was constructed based on past studies (Ahn et al., 2019; Yoo & Gretzel, 2011). All statements used a Likert scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree). The last part is about demographics, including questions about respondents' age, gender, educational level, income level, and area of residence. These were measured using a nominal scale to analyze the representativeness of the study sample.

Out of 513 responses, 43 were excluded due to missing data or outliers, leaving 470 valid participants. Of these, 70.9% were female, and 29.1% were male, with age distribution as follows: 4% aged 12–18, 86.8% aged 19–22, and 9.1% aged 23–27. The majority of respondents were university students (87.7%) residing in metropolitan areas, including Ha Noi (56.6%) and Ho Chi Minh City (36.6%). Regarding mobile commerce usage, 62.3% had used such applications for over three years, 31.1% for one to three years, and 6.2% for less than one year. Monthly online shopping expenditures varied, with 50.2% spending between 500,000 and 2 million VND, 36% spending below 500,000 VND, and 13.8% spending above 2 million VND.

The results were then coded and analyzed using SPSS 26 and AMOS 24, following a two-step recommended by (Anderson & Gerbing, 1988). The first step involved confirmatory factor analysis (CFA) to validate the measurement model, while the second tested the structural equation model (SEM).

## III. RESULT AND DISCUSSION

### 3.1. Results

#### 3.1.1. Reliability analysis

First, this study used Cronbach’s alpha (Coefficient alpha) as a criterion of reliability. Table 1 illustrated that Cronbach’s alphas ranged from 0.838 to 0.869, while the Corrected Item-Total Correlation varied between 0.558 and 0.753. Thus, all scales are considered reliable and appropriate for further analysis.

**Table 1. Reliability analysis**

| Variables | | Cronbach's alpha values | Corrected Item-Total Correlation | Number of deleted items |
|---|---|---|---|---|
| **Extraversion** | EXT | 0.869 | 0.665-0.728 | 0/5 |
| **Conscientiousness** | CONS | 0.838 | 0.589-0.714 | 0/5 |
| **Agreeableness** | AGR | 0.838 | 0.613-0.687 | 0/5 |
| **Neuroticism** | NEUR | 0.845 | 0.618-0.683 | 0/5 |
| **Openness** | OPE | 0.854 | 0.558-0.753 | 0/5 |
| **E-CCB** | ECCB | 0.869 | 0.620-0.751 | 0/5 |

***Note:*** *Corrected Item-Total Correlations are demonstrated in the lowest and highest values*

### 3.1.2. Measurement model assessment

Before hypotheses testing, confirmation factor analysis (CFA) was adopted to evaluate overall model fitness. Results revealed that the measurement model exhibits a high degree of accuracy in predicting the studied phenomena, with all indices meeting satisfactory criteria, as shown in Table 2.

**Table 2. Assessment of model fitness**

| Index | Analysis value | Conclusion |
|---|---|---|
| CMIN/DF | 2.353 | Good fit (≤ 3) |
| GFI | 0.875 | Acceptable (> 0.8) |
| CFI | 0.922 | Good fit (≥ 0.9) |
| TLI | 0.913 | Good fit (≥ 0.9) |
| RMSEA | 0.054 | Good fit (≤ 0.06) |

As part of the measurement model, discriminant validity and convergent validity were then examined. The item OPE3 from the OPE construct was removed due to unsatisfactory composite reliability (CR). All average variance extracted (AVE) values were above 0.5 and exceeded the squared correlations between constructs, demonstrating adequate convergent and discriminant validity for each scale. The results are detailed in Table 3.

**Table 3. Model Validity Measures**

| | CR | AVE | MSV | MaxR(H) | EXT | CONS | AGR | NEUR | OPE | ECCB |
|---|---|---|---|---|---|---|---|---|---|---|
| EXT | 0.870 | 0.573 | 0.204 | 0.872 | 0.757 | | | | | |
| CONS | 0.839 | 0.512 | 0.249 | 0.846 | 0.451*** | 0.715 | | | | |
| AGR | 0.838 | 0.510 | 0.285 | 0.841 | 0.346*** | 0.499*** | 0.714 | | | |
| NEUR | 0.847 | 0.526 | 0.207 | 0.853 | 0.124* | 0.290*** | 0.455*** | 0.725 | | |
| OPE | 0.807 | 0.512 | 0.285 | 0.811 | 0.259*** | 0.465*** | 0.534*** | 0.424*** | 0.715 | |
| ECCB | 0.866 | 0.568 | 0.218 | 0.889 | 0.394*** | 0.467*** | 0.447*** | 0.422*** | 0.340*** | 0.754 |

***Note(s):*** *CR: composite reliability; AVE: average variance extracted; MSV: maximum shared variance*
*EXT: extraversion; AGR: agreeableness; NEUR: neuroticism; CONS: conscientiousness; OPE: openness; ECCB: e-customer citizenship behavior; ***p < 0.001*

### 3.1.3. Structural model assessment

Once the measurement model for reliability and validity had been tested, SEM analysis was performed to test the hypotheses. H1, H2, H3, H4 were all accepted, with the following findings: $p < 0.05$; H1: $\beta = 0.213$; H2: $\beta = 0.237$; H3: $\beta = 0.135$; H4: $\beta = 0.279$. Conversely, H5 was not supported due to exceeding p-value ($p = 0.812$). The impact of personality traits on e-CCB follows a hierarchy, with neuroticism, conscientiousness, extraversion, and agreeableness exerting the most to least influence, respectively.

Findings indicated that all personality traits, except openness, play a crucial role in enhancing e-CCB ($p < 0.05$; H1: $\beta = 0.213$; H2: $\beta = 0.237$; H3: $\beta = 0.135$; H4: $\beta = 0.279$). This means individuals with high neuroticism, conscientiousness, extraversion, and agreeableness tend to perform extra-role behaviour. Motivated by a desire to socialise, extroverted individuals would likely assist other customers willingly and enthusiastically. According to

Buckingham and Corkeron (2020) and Mammadov (2022), conscientiousness stands out as a strong predictor of performance, as this personality type is associated with diligence and a sense of responsibility. As such, individuals who possess this trait are more likely to make meaningful contributions that enhance the overall success of the service. Regarding H3, it is understandable that agreeableness is positively linked with e-CCB performance since this trait is typically characterised by friendliness, helpfulness, sociability, and empathy (Cuperman & Ickes, 2009). In particular, agreeable users tend to be sympathetic, readily sharing their knowledge and skills with fellow shoppers who have difficulties using mobile commerce applications for online shopping, including searching for products and utilising app features. With a strong sense of collaboration, they would also help the platforms enhance user experience by submitting feedback based on their perspectives. Notably, neurotic customers, albeit characterised by anxiety, fear, and emotional instability, are likely to perform voluntary behaviours, which can be attributed to their need for recognition as a way to alleviate emotional challenges (Yang et al., 2023).

By contrast, there is no correlation between openness and e-CCB (H5: p = 0.812), which indicates the reluctance of highly open customers to engage in e-CCB. Drawn to novelty seeking and personal exploration, individuals with a high scores on openness may prioritise discovering new things, such as app features, over investing in supporting others. Hence, they would engage neither in contributing ideas to the applications nor in offering other users guidance on how to use the app correctly, as these activities may not resonate with their interests.

**Table 4. Results of hypotheses testing**

| Hypotheses | | Path estimate | P-Value | Conclusion |
|---|---|---|---|---|
| H1 | ECCB ← EXT | 0.213 | *** | Supported |
| H2 | ECCB ← CONS | 0.237 | *** | Supported |
| H3 | ECCB ← AGR | 0.135 | 0.037 | Supported |
| H4 | ECCB ← NEUR | 0.279 | *** | Supported |
| H5 | ECCB ← OPE | -0.015 | 0.812 | Not supported |

***Note(s):*** *ECCB: e-CCB; EXT: extraversion; CONS: conscientiousness; AGR: agreeableness; NEUR: neuroticism; OPE: openness; ***p < 0.001; path estimates are standardised*

### 3.2. Discussion

#### 3.2.1. Discussion on the linkage between personality traits and e-CCB within mobile commerce applications

This study addresses a critical research gap by exploring the mechanisms through which customer personality traits influence e-CCB within the context of mobile commerce applications (Choi & Hwang, 2019; Men et al., 2024; Mitrega et al., 2022). The findings confirm a significant relationship between customer personality traits and e-CCB, indicating that a deeper understanding of these traits can enhance the effectiveness of strategies aimed at promoting e-CCB. This emphasises the importance of considering the nuanced effects of customer personality traits for mobile commerce applications.

The results demonstrate that four of the Big Five personality model, including neuroticism, extraversion, conscientiousness, and agreeableness, are particularly influential in encouraging e-CCB in the mobile commerce apps context. Customers who exhibit high levels of these traits are more likely to provide feedback on their experiences with mobile commerce applications and assist other customers in resolving issues. These results underscore the importance for managers to design mobile commerce experiences that cater to these specific personality traits, thereby enhancing levels of e-CCB.

Notably, the study also reveals that only openness does not affect e-CCB within this context. This finding indicates that this personality trait does not influence customers' citizenship behaviours in mobile commerce environments. The absence of impact from this trait may be attributed to the unique characteristics of digital platforms or their inherently transactional nature. This insight provides an opportunity for retail businesses to allocate resources more strategically by prioritising personality traits with a stronger influence on e-CCB, thereby enhancing the outcomes of their efforts and minimising costs associated with fostering these behaviours.

#### 3.2.2. Recommendations

First, by leveraging insights into neuroticism, extraversion, conscientiousness, and agreeableness businesses can craft personalised experiences that resonate with each customer segment. A fundamental step in this process is the categorisation of customers, which can be achieved by utilising Big Data and Digital Footprints. Analysing user interaction patterns, such as social sharing frequency, feedback activities, and purchase behaviours, enables the identification of personality-driven preferences. Machine learning algorithms can further refine this process by detecting behavioural cues linked to specific traits.

Second, neurotic individuals are prone to anxiety, stress, and negative anticipation. To support these customers, mobile commerce platforms should create an environment that minimises stress and instils a sense of security. Providing real-time customer support, such as a chatbot or live agent, can help alleviate concerns about purchases or service issues. For these customers, transparent and detailed product information (e.g., shipping timelines, return policies, or product guarantees) can mitigate doubts and fears. To incentivise their feedback, platforms can appeal to their fear of negative outcomes by crafting messages that emphasise the importance of their input in preventing future issues and enhancing the overall experience. These messages should highlight the role of customer feedback in improving service quality and ensuring more positive outcomes, thereby appealing to their concerns about avoiding negative experiences. Platforms could also implement simple and low-effort feedback mechanisms, such as single-tap ratings or emoji-based surveys, to reduce decision fatigue.

Third, customers with extraverted traits exhibit behaviours such as initiating conversations, feeling comfortable in social settings, and seeking attention. Mobile commerce applications can harness these tendencies by creating opportunities for interaction and social engagement. A dedicated "community hub" within the app, where users can discuss products or share reviews can cater to their sociable nature. Additionally, to capitalise on their ease of making connections, platforms could implement a referral program that rewards users for bringing in friends. These rewards could include discounts, exclusive access to new products, or virtual badges that are personalised and linked to the Digital Footprints, which help encourage extraverts to promote the platform actively. For those who enjoy being the centre of attention, creating user-generated content competitions, such as “Top contributor”, “Best product review” or “Creative use of the product”, can provide an avenue to showcase their talents and gain recognition.

Fourth, conscientious customers are detail-oriented, disciplined, and highly organised. To align with their methodical nature, mobile commerce platforms should prioritise functionality that enhances planning and precision. Features like advanced filtering and sorting options for products, detailed product descriptions, and side-by-side comparisons allow conscientious users to make informed decisions. Customisable shopping lists or goal-setting tools can help them track their purchases and adhere to their plans. For instance, if a user regularly buys a specific item, the platform can suggest recurring purchase reminders or subscription options, ensuring convenience and consistency. Platforms can also provide comprehensive tracking of order status, detailed return policies, and responsive customer support. Offering “progressive feedback mechanisms”, where users receive updates on how their specific feedback, not only rating from 1 to 5, improves the service, can further instil confidence and encourage participation.

Fifth, customers with agreeableness personalities usually show their helpfulness and collaborativeness. There should be an information system developed to enable customers to assist one another, thereby reducing reliance on traditional support centre. This system would make agreeable customers help others by sharing their personal experiences or the issues which they are familiar with. In return, customers who assist could receive tangible benefits or incentives, thereby fostering a collaborative and supportive community environment on the platform. Furthermore, it is recommended that the platform implement or maintain a feature that enables users to rate the usefulness of customers’ reviews. This functionality has been successfully employed by platforms such as Google Maps, which allows users to assess the quality of reviews for places they have visited and to accrue corresponding contribution points. Although similar features are present on platforms like Shopee, there is currently no notification regarding the number of 'helpful review' votes received. Addressing this shortfall could further incentivise user engagement, which in turn allows them to be more active in e-CCB.

## IV. CONCLUSION

The study's findings on the impact of the Big Five personality model on e-CCB make meaningful theoretical contributions by advancing dynamic capabilities theory and addressing a research gap in examining the relationship between the Big Five personality model and e-CCB and understanding CCB in mobile commerce environments (Choi & Hwang, 2019; Men et al., 2024; Mitrega et al., 2022). In terms of which individual personality traits drive CCBs in mobile commerce settings, the study found positive effects of extraversion, conscientiousness, agreeableness, and neuroticism on e-CCB. In contrast, the lack of an impact from openness challenges their applicability to e-CCB, suggesting the need to reassess traditional frameworks for mobile commerce applications. By implementing the findings, the study also offers insights into how mobile commerce applications can deploy customer personality traits to enhance the performance of e-CCB, which, in turn, contributes to improving their outcomes.

Despite the significance of the study's insights into customer citizenship behaviour in the context of mobile commerce applications, several limitations require further investigation. First, the reliance on a convenience sample through surveys limits the generalisability of the findings. Future research could incorporate varied methods, such as interviews, participant observations, or focus groups, to achieve a more in-depth understanding of CCB. Comparing results across these methods could also strengthen the validity of the findings. Second, the emphasis on the Big Five personality model as a primary determinant of e-CCB highlights the need to reconsider traditional personality models. Investigating alternative frameworks may provide more robust explanations for customer behaviour in the context of mobile commerce. Third, the findings' applicability to other generational groups, such as Gen X or Millennials is limited by the study's focus on Gen Z. Future research should explore differences across generations to better understand how various age groups engage with mobile commerce, enabling more effective and tailored marketing strategies. Addressing these limitations would advance both theoretical understanding and practical applications in CCB research, particularly in mobile commerce.

* Corresponding: nphtrang2111@gmail.com

**ABSTRACT**

Organic food has become a regular choice in shopping list of Vietnamese consumers who concern about their health and environment. Meanwhile, sustainable packaging solutions has risen in popularity in the market, but businesses still face challenges in attracting customer attention through packaging. Therefore, this study aims to investigate the effects of eco-friendly packaging on purchase intention of organic food as well as to explore the meditation of perceived values and customer trust in the relationship between eco-friendly packaging and purchase intention. Data is collected from the three most prominent cities in Vietnam with 385 millennial respondents. The data is tested against the research model using structural equation modeling with SMART-PLS 4.1. The results provide valuable findings for businesses to proceed eco-friendly packaging strategies, especially packaging design to enhance customer perceived values and trust, then boost their purchase intention of organic food. The study also has some limitations in terms of survey scale and conditions that future research may focus on to get more representative results. This study is one of first few research about the effects of eco-friendly packaging on purchase intention of Vietnamese consumers. Furthermore, it contributes to the extension of TPB and SOR, which has not been focused on much in earlier studies about consumer behaviros in the context of organic food.

*Key words:* "S-O-R", "Theory of planned behavior", "Organic food", "Eco-friendly packaging", "Perceived value", "Trust"

## I. INTRODUCTION

Packaging materials are one of the major causes of pollution from household consumption (Gupta & Prusty, 2023). With the rise of environmental concerns, eco-friendly packaging is considered by manufacturing firms in doing business to retain consumer purchasing intention (Wong et al., 2019). In Vietnam, food packaging is an indispensable part of the food industry, not only because of its function of protecting and preserving food, but also because it is a factor that creates attraction and brand recognition for products. According to the Vietnam Ministry of Industry and Trade, food packaging currently accounts for 30-50% of the packaging industry, clearly demonstrating the symbiotic relationship between the two fields: packaging and food (*Giants Lead Green Packaging Future*, 2023). In order to minimize negative impacts on the environment and create benefits for consumers, the trend of sustainable food packaging is becoming more and more popular in the food and beverage industry (Thanh An, 2024). However, packaging is one of the challenges for organic food businesses, especially individual one and small households when packaging is not attractive enough for customers to recognize the brand and understand the product (Dang, 2024).

In recent years, environmental and health concerns have made consumers more interested in organic food. Vietnamese consumers are no exception as this is increasingly evident in their daily food choices. They are more interested in nutritious foods and changing their cooking methods for a healthier life (Burrage, 2023). Therefore, organic food is gradually becoming popular and highly appreciated by Vietnamese consumers. In addition, the recent rise of information related to food safety and food poisoning has also made consumers increasingly concerned about their food choices (Ho & Van Vo, 2023), and organic food is one of the good options for consumers.

The trend of consuming organic food is increasing around the world in general and in Vietnam in particular. Despite of being considered to be small and fragmented, the Vietnam organic food market has great potential for development as it witnesses significant growth in recent years. Euromonitor's report shows that the market size reached 100 million USD in 2023, an increase of 20% compared to 2020. This growth is demonstrated by the increasing number

of organic products appearing in large supermarket chains such as Co.opmart, Winmart, Lottermart and MM Mega Market (Thi Ha, 2024).

To date, there have been many studies investigating consumers' purchase intention and behavior towards organic foods in general (Ayyub et al., 2021; Liu et al., 2021; Santos et al., 2021) and foods in eco-friendly packaging (Santos et al., 2021; Cammarelle et al., 2021). Most of them focus on factors that drive purchase intentions such as attitudes, subjective norms, and behavioral control, but have not expanded to external environmental factors such as packaging. Understanding the role of packaging in consumer behavior towards organic foods is important for businesses in this industry to pay attention to. For the above reasons, the main research question of this study is "The effects of eco-friendly packaging on purchase intention of organic foods: the mediations of perceived value and trust of Vietnamese customers." This study will contribute to the theory in the field of sustainable consumption in Vietnam on the influence of perceived valuew and trust on the intention to buy organic food in eco-friendly packaging. Furthermore, the research results also provide important information to help marketers who are planning to redesign packaging to better understand the relationship between perceived values, trust and puchase intention of organic food.

The following sections will present the background theory, research concepts and hypothesis development, research methodology, results, discussion and conclusion.

## II. MATERIAL AND METHODOLOGY

### 2.1. Theory background

#### Theory of Planned Behavior (TPB) and Stimulus-Organism-Response (SOR)

This study applied two fundamental theories, the Theory of Planned Behavior (TPB) and the Stimulus-Organism-Response (SOR) model, to explain the intention to purchase organic food under the influence of eco-friendly packaging.

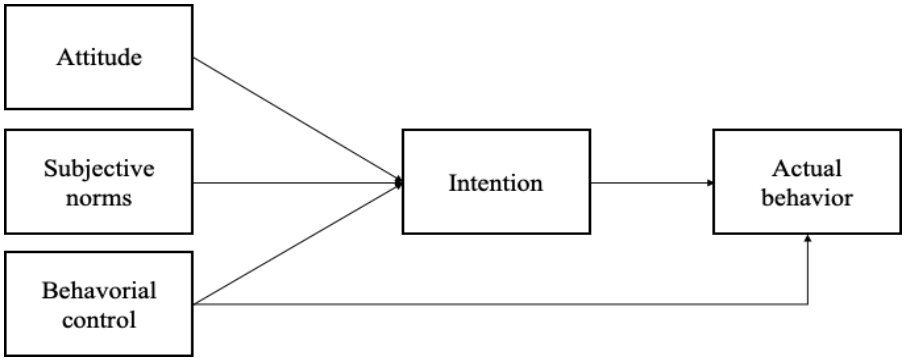

**Fig 1 - TPB model**

*Source: Ajzen (1991)*

TPB is widely applied in research on organic food purchasing behavior. According to a survey conducted by Huo et al. (2024), in 51 completed studies on consumer behavior related to organic food published in the period 2008-2022, TPB is the most applied theory, accounting for more than 50%. This was also confirmed by Le & Le (2021) in a similar study on an overview of 86 topics. In other words, consumers' consumption of organic food is mainly examined under the TPB model, which explains the effects of attitude, subjective norms and behavioral control. In the context of the Vietnam market, topics applying TPB to study consumers' purchase intention and behavior of organic food have also been carried out by many authors in recent years such as Phan et al. (2023); Tran (2024).

However, the model's suitability varies when applied to empirical verification with consumers across countries where surveys were conducted. Are there other factors besides attitudes, subjective norms and behavioral control that affect the intention to buy organic food? The above studies only focused on internal factors of the subject such as awareness and knowledge, but did not exploit the stimulating factors from the external environment, typically represented by packaging - the touch point between customers and brands. Packaging attributes can influence customers' personal feelings, thereby affecting their purchase intention and behavior. In addition, the TPB model has not explained where behavioral control originates from. This has been supplemented by some authors in studies on organic food consumption intention and behavior such as perceived values (Yadav & Pathak, 2017), customer trust

(Nuttavuthisit & Thøgersen, 2017). Thereby, the variables of perceived values and trust have been proven to have an impact on the intention to buy organic food.

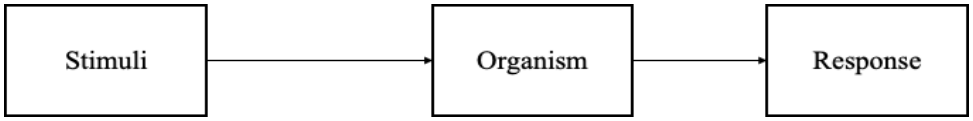

**Fig 2 - SOR model**

*Source: Mehrabian & Russell (1974)*

SOR is a widely used model in marketing research topics. The main content of this theory is to expand the understanding of how environmental stimuli (S) affect consumers' cognition (O), thereby activating additional emotions that create consumer responses (Rivas et al., 2022). According to the SOR framework, an individual will form a conscious or unconscious psychological response process created by the stimulation of external environmental factors and then motivate people to perform appropriate behavioral responses. Many scholars have also applied SOR to explain organic food purchase intention and behavior (Sultan, Wong, & Azam, 2021; Liu et al., 2021; Talwar et al., 2021). Previous studies have investigated the relationship between antecedents (stimuli) and postconditions (consumer responses) in organic food purchase behavior. In which, the authors also analyzed consumer perceptions or beliefs as a processing process in each individual before deciding to consume organic food. A typical study is by Liu et al. (2021) applying the SOR theoretical framework to study the influence of similarity effects including information anxiety, uncertainty, and sustainable consumption attitudes (S) on perceived value (O) and organic food purchase behavior (R). Similarly, the study by Cao et al. (2023) investigated the impact of of safety concerns (S) to perceived values (O) and organic food purchase behavior (R). Meanwhile, Khalid (2021) applied SOR to investigate the mediating role of trust in the relationship between corporate image and organic food purchase intention.

On the other hand, the SOR model is widely used to examine the input factors, the subject's processing, and the output results. SOR has appeared in many studies on consumer intentions and behaviors. For example, studies on the impact of marketing channels on perceived values and intention to purchase organic food (Sultan et al., 2021); the impact of social media interactions on perceived values and repeated fashion purchase behavior (Hewei & Youngsook, 2022); factors affecting advertising avoidance behavior of Youtube users in Can Tho city (Huynh et al., 2022). The SOR model is also the basis for many studies on the impact of packaging on purchase intention. For example, recently, there is a study by Pan et al. (2021) analyzing the impact of green packaging (S) on perceived values, perceived risk (O) and green satisfaction, green purchase intention (R).

The combination of SOR and TPB provides a solid research model on the impact of packaging on consumer purchase intention (Naszariah et al., 2024). Therefore, the author proposes to combine the TPB and SOR models in this research to better understand:

– The relationship between eco-friendly packaging and organic food purchase intention.

– The mediations of perceived value and trust in the relationship between eco-friendly packaging and organic food purchase intention.

**Eco-friendly packaging**

Kotler and Keller (2009) considered packaging is all activities related to the design and production of containers to help preserve, display and consume products on the market. According to Jahre and Hatteland (2004), packaging is the technology and art of creating a method to facilitate transportation, storage and business. The elements of packaging are also studied and discussed from very diverse perspectives of many author. Retti and Brewer (2000); Silayoi and Speece (2004) believe that packaging has two main groups of elements: visual and information elements. In which, visual elements include shape, size, graphics, color while product information and packaging technology belong to the group of information elements (Silayoi & Speece, 2004). Partially agreeing with the visual attributes, Underwood (2003) added structural factors such as shape, size, and material. Meanwhile, Kotler and Keller (2009) identified six packaging factors, including size, shape, material, color, font, and brand. In general, packaging in the above studies was measured by two main groups of factors: visual and information (Salem, 2018). Some criteria that sustainable packaging needs to meet are: being accessible and usable for all; utilizing recycled and renewable materials; designed for reuse, recycling

or composting; and applying clean production technology (Sustainable Packaging Coalition, 2024).

As consumers become increasingly concerned about the environment and food safety, their trust in plastic packaging is decreasing (Morashti et al., 2022). For consumers, green packaging is a solution to protect the environment (Hapsari & Widodo, 2023). According to Nguyen et al. (2020), Vietnamese consumers' perceptions of eco-friendly packaging can be classified into three main dimensions: packaging materials, packaging manufacturing techniques, and market appeal of the packaging. In summary, a consumer-defined eco-friendly packaging for food must be visually appealing while meeting their expectations regarding the materials and manufacturing processes of the packaging.

Within this framework, this study suggests three attributes of eco-friendly packaging according to consumers' perception, that are design, information and materials.

### 2.2 Hypothesis development

#### Eco-packaging and Perceive values (O)

Kotler and Armstrong (2018) believed that perceived values were ratio between the total cost that customers pay and the total benefits they receive. According to Sweeney and Soutar (2001), perceived values were measured by four dimensions and divided into two groups: utilitarian (functional value; economic value) and hedonic (social value; emotional value). This statement was aligned with Mackay (1999), that attraction of products or services came from both rational and emotional factors. Thus, perceived values in this study context is the overall subjective assessment of consumers about the benefits of organic food compared to price, along with the emotions that consuming food in eco-friendly packaging brought to them.

Generally, organic food consumers' perceived values were positively influenced by the attributes of the packaging (Lian & Mansori, 2016). According to Popovic et al. (2019), eco-friendly packaging had positive impact on perceived values of consumers and made them feel that the food having higher quality and better taste. The color combination on the packaging had been verified to have a significant affect to customers' perceived food taste (Kauppinen-Räisänen & Luomala, 2010). Meanwhile, graphics on packaging (Steenis et al., 2017), labels and certification (Lian & Mansori, 2016) were also verified to have influence on consumers' evaluation of eco-friendly packaging.

Consumers tended to positively evaluate brands that came with environment friendly packaging solutions. To them, eco-friendly packaging was an ethical and responsible choice. Consumers were more likely to support products that align with their own environmental standards, which increases their purchase intention (Imran et al., 2024). Hence, this study proposed three first hypotheses as below.

**H1:** The eco-friendly packaging design of organic food positively influence Perceived values.

**H2:** The eco-friendly packaging information of organic food positively influence Perceived values.

**H3:** The eco-friendly packaging material of organic food positively influence Perceived values.

#### Eco-packaging and Customer trust (O)

Customer trust had attracted many scholars to study its concept, especially in the field of marketing. Trust was defined as the level of trust that one party has for the other party in an exchanging relationship (Nguyen et al., 2013). In the food industry, trust makes customers believe that the food is in good condition and safe to consume (Skripnuk et al., 2021; Wu et al., 2021).

Many factors have been examined to influence trust, including packaging attributes. Specifically, packaging design elements like color (Tanus et al., 2023) and materials (Azad & Hamdavipour, 2012) have a significant impact on customer trust. Packaging not only attracts customers because of its appearance, but the information provided on the packaging also plays an important part of promoting customer trust (Wu et al., 2021). Sustainability certification labels, an element of eco-friendly packaging, are only effective in stimulating purchase decisions when and only when customers trust them (Thøgersen et al., 2017). Therefore, Teng and Wang (2015) suggested that the reputable certification labels and related information such as production, processing, and packaging of organic products are important factors enhance trust. Thereby, the following research hypotheses are proposed.

**H4:** The eco-friendly packaging design of organic food positively influence Customer trust.

**H5:** The eco-friendly packaging information of organic food positively influence Customer trust.

**H6:** The eco-friendly packaging material of organic food positively influence Customer trust.

**Purchase intention (R)**

Sustainable packaging solutions enhance consumers' awareness and concerns about environment, lead to positive evaluation on brand and increase purchase intetion (Imran et al., 2024). The significant impact of packaging design on awareness about eco-friendly packaging and intention to buy food in that has been studied by many authors (Popovic et al., 2019). Consumers admitted that packaging appeal positively influence their purchase intention (Lindh et al., 2016). Besides, recyclable and reusable materials are factors that increase their tendency to choose products in eco-friendly packaging (Rundh, 2005).

Consumers had bigger intention to purhase products in eco-friendly packaging if they were available in the market (Garcia & Campos, 2022). Eco-friendly packaging, measured by attributes like color, image, size, information and materials, has positive impact on purchase intention. That influence becomes stronger through the mediations of customers' awareness (Esvandiari et al., 2023). Thus, this study advances the following hypotheses.

**H7:** The eco-friendly packaging design of organic food positively influence Purchase intention.

**H8:** The eco-friendly packaging information of organic food positively influence Purchase intention.

**H9:** The eco-friendly packaging material of organic food positively influence Purchase intention.

**Mediator variable: Perceived values**

Perceived values have been proven to have influence on purchase intention and behaviors in the context of sustainable consumption (De Toni & Larentis, 2017; Curvelo et al., 2019; Chi et al., 2021; Liu et al., 2021; Hapsari & Widodo, 2023). In terms of green consumption, perceived values have positive and significant impact on green purchase intention, as the consumers who have knowledge and concerns about the environment, will attain products that cause no harm to the environment (Hapsari & Widodo, 2023). Likewise, positive affect of perceived values to purchase intention and behaviors of organic food was tested by De Toni and Larentis (2017); Curvelo et al. (2019); Liu et al. (2021).

Furthermore, perceived values are also proven to have mediating roles in the relationship between green packaging and green purchase intention. This shows that consumers, who have awareness about the environment, have interest in eco-friendly packaging as they can be recycled while reducing biodegradable waste (Hapsari & Widodo, 2023). On the other hand, perceived values also enhance the relationship between organic labels, nutrition information and purchase intention of organic food (Shawky Ebrahim, 2023).

Hence, this study proposes the hypotheses as below.

**H10**: Perceived values positively influence purchase intention of organic food.

**H11a**: Perceived values is the mediator in the relationship between the eco-friendly packaging design of organic food and purchase intention.

**H11b**: Perceived values is the mediator in the relationship between the eco-friendly packaging information of organic food and purchase intention.

**H11c**: Perceived values is the mediator in the relationship between the eco-friendly packaging materials of organic food and purchase intention.

**Mediator variable: Customer trust**

There are many studies proving the relationship between trust and purchase intention in various contexts (Prakash et al., 2023). Customer trust does not only have a positive and significant impact on buying decision, but also mediating role in the relationship between brand image and buying decision (Retnowati, 2021). Moreover, trust is considered as a essential construct in studies on food consumption behaviors in general (Teng & Wang, 2015) and organic food consumption in particular (Fernqvist & Ekelund, 2014; Nguyen, Park, & Choi, 2021). Trust is an important factor to consider when conduct studies on organic food consumption as consumers cannot verify whether the food is organic or not, even after they consumed it (Janssen & Hamm, 2012).

Base on above, this study proposes the following hypotheses.

**H12:** Customer trust positively influence purchase intention of organic food.

**H13a:** Customer trust is the mediator in the relationship between the eco-friendly packaging design of organic food and purchase intention.

**H13b:** Customer trust is the mediator in the relationship between the eco-friendly packaging information of organic food and purchase intention.

**H13c:** Customer trust is the mediator in the relationship between the eco-friendly packaging material of organic food and purchase intention.

### 2.3. Research model

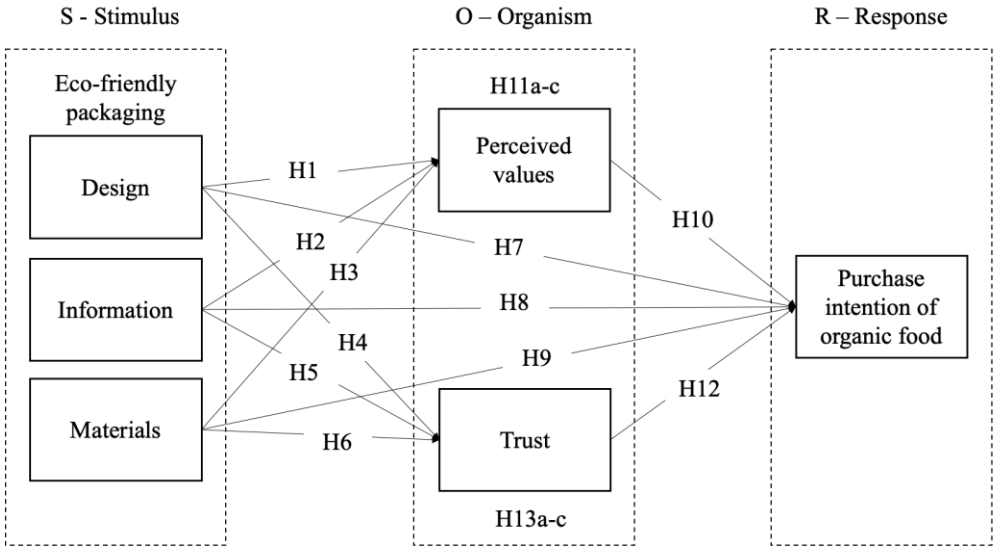

**Fig 3 - Proposed Conceptual Model**

## III. RESULT AND DISCUSSION

### 3.1 Descriptive

The final sample comprised 385 respondents who said to have intention to buy organic food at the present time or in the near future. Among that, nearly 35% were from Ho Chi Minh City, 34% Hanoi, 31% Da Nang and less than 1% from other provinces of Vietnam. Considering gender, 57% were women and 43% men. In term of age, 36% of the sample were from 18 to 24 years old, following by 25% were between 25 and 29, 25% were from 30 to 39, 11% were from 40 to 49 and less than 4% were from 50.

### 3.2. Measurement model assessment

**Internal consistency reliability**

Cronbach's Alpha and Composite Reliability (CR) tests were used for the reliability assessment of the variables. According to Hair et al. (2019), these indexes range from 0 to 1, the closer to 1 the higher the reliability. 0.6-0.7 is an acceptable level and 0.7-0.9 is optimal. If these indexes > 0.95, there is a possibility of duplication of observed variables. At the same time, the authors also pointed out that Cronbach's Alpha assesses low reliability, contrary to the CR index. Therefore, the actual reliability of the variables should be within the range of these two indexes. The results in Table 1 show that the reliability of the scales is guaranteed when the above conditions are satisfied.

**Table 1. Variables reliability testing results**

| | Cronbach's Alpha | Composite Reliability | AVE |
|---|---|---|---|
| **MAT** | 0.746 | 0.855 | 0.663 |
| **PV** | 0.886 | 0.909 | 0.556 |
| **CT** | 0.784 | 0.860 | 0.607 |
| **DES** | 0.915 | 0.929 | 0.567 |
| **INF** | 0.840 | 0.887 | 0.611 |

| | | | |
|---|---|---|---|
| **PI** | 0.809 | 0.875 | 0.636 |

**Convergent Validity**

The level to which a latent variable is explained by the variation of observed items is expressed through the average variance extracted index (AVE). If the AVE value is 0.5 or higher, the scale has convergent validity (Hair et al., 2019). In other words, the latent variables are explained by at least 50% of the variation of their observed items. The AVE values of the latent variables (Table 1) ranges from 0.556 (perceived values) to 0.663 (packaging materials); meeting the condition. Additionally, in order to know the degree of association between observed variables and the corresponding latent variable, the Outer loading factor needs to be considered. This index of the observed variables in the article is all greater than 0.7. Therefore, according to Hair et al. (2019), the scales in this study are reliable.

**Discriminant validity**

Discriminant validity indicates whether a construct overlaps with other constructs in the research framework. In order to evaluate discriminant validity, Fornell & Larcker analysis which was introduced by Fornell & Larcker (1981) and the Heterotrait-Monotrait (HTMT) correlation index proposed by Henseler et al. (2015) were used. According to Fornell & Larcker (1981), two factors do not overlap when the correlation coefficient between them is not greater than their two square roots of the AVE. Table 2 shows that all correlation coefficients of all pairs of factors are less than their two square roots of the AVE. Regarding the HTMT index, Henseler et al. (2015) assumed that the discriminant validity of a factor is violated when the HTMT index is from 0.9 or higher, and if it is below 0.85, the discriminant validity is well guaranteed. The analysis results in Table 3 show that all HTMT values are less than 0.85. Therefore, the discrimination of the variables in the model is guaranteed.

**Table 2. Fornell Larker**

| | MAT | PV | CT | DES | INF | PI |
|---|---|---|---|---|---|---|
| MAT | **0.814** | | | | | |
| PV | 0.478 | **0.746** | | | | |
| CT | 0.497 | 0.255 | **0.779** | | | |
| DES | 0.425 | 0.523 | 0.469 | **0.753** | | |
| INF | 0.439 | 0.495 | 0.455 | 0.394 | **0.782** | |
| PI | 0.556 | 0.520 | 0.512 | 0.521 | 0.549 | **0.798** |

**Table 3. HTMT**

| | MAT | PV | CT | DES | INF | PI |
|---|---|---|---|---|---|---|
| MAT | | | | | | |
| PV | 0.585 | | | | | |
| CT | 0.644 | 0.299 | | | | |
| DES | 0.513 | 0.577 | 0.550 | | | |
| INF | 0.554 | 0.575 | 0.556 | 0.447 | | |
| PI | 0.714 | 0.612 | 0.632 | 0.603 | 0.662 | |

**3.3. Structural model assessment**

The coefficiant of determination is often used in structual model assesment. In which, the $R^2$ and adjusted $R^2$ values indicate the level of explanation of the independent constructs on a dependent one. The dependent variable is well explained when $R^2$ reaches 0.75; on average if $R^2$ is 0.5 and weak if $R^2$ is 0.25, but this is not accurate for all study contexts and research fields (Hair et al., 2019). In particular, the $R^2$ value at 0.2 is considered high in consumer behavior research (Hair et al., 2017). The results of analysis show that the adjusted $R^2$ value of purchase intention is 0.505. Thus, the independent variables including packaging design, information, materials; perceived values and trust explain 50.5% of the variation in purchase intention. Similarly, packaging attributes explained 40.4% of the variation in perceived values and 36.2% in customer trust. Overall, dependent variables in the research framework are explained well by independent variables.

**Table 4. R2 and adjusted R2 values**

| | R Square | R Square Adjusted |
|---|---|---|
| PV | 0.409 | 0.404 |
| CT | 0.367 | 0.362 |
| PI | 0.511 | 0.505 |

Since R2 only reflects the level of explanation of the independent variables on the dependent variables withing the survey sample, we need to consider the Q2 index proposed by Geisser (1974) and Stone (1974) to evaluate the out-of-sample predictive ability of the model. The Q2 value should be greater than 0 and if all the component models have Q2 > 0, the overall research model is also of good quality. If Q2 < 0.25, the model has low predictive accuracy, < 0.5 is average and > 0.5 is high (Hair et al., 2019). The table below shows that the component models of the dependent variables perceived values and customer trust as well as the model of the dependent variable purchase intention has average predictive accuracy. In general, the overall research model is significant.

**Table 5. Q2 values**

| | $Q^2$ predict |
|---|---|
| PV | 0,394 |
| CT | 0,349 |
| PI | 0,469 |

The $f^2$ effect size is often considered along with the adjusted $R^2$ to evaluate the level of explanation of the independent variables to the dependent variable in the model. This evaluation is to consider whether the independent variable has an explanatory role for the dependent variable or not and if so, the level of explanation is strong or weak. The f2 value of 0.02 - 0.15 - 0.35 represents the small, medium and large prediction level of the independent variables on the dependent variable (Cohen, 1988). Normally, people often use the $f^2$ index to consider selecting variables with a high level of explanation in the research model to focus on improving these factors. According to the results in Table 6, it can be seen that purchase intention is slightly affected by packaging design, information and materials along with perceived values and customer trust. Perceived values and Trust are also slightly affected by all 3 packaging attributes.

**Table 6. f2 values**

| | **MAT** | **PV** | **CT** | **DES** | **INF** | **PI** |
|---|---|---|---|---|---|---|
| **MAT** | | 0.061 | 0.096 | | | 0.058 |
| **PV** | | | | | | 0.035 |
| **CT** | | | 0.080 | | | 0.041 |
| **DES** | | 0.135 | 0.062 | | | 0.034 |
| **INF** | | 0.094 | | | | 0.062 |
| **PI** | | | | | | |

Collinearity occurs when independent variables are not truly separate from each other, leading to a decrease in the reliability and accuracy of the research model. Therefore, it is necessary to determine the collinearity among independent variables through the VIF (variance inflation factor) values. According to Hair et al. (2019), the model does not experience collinearity when the VIF is lower than 3. The result shows that the independent construct in this study have satisfied the condition, so the collinearity issues do not exist.

### 3.4. Hypothesis testing result

The nonparametric bootstrap analysis with a sample size of 500 was conducted. The analysis results (Table 7) show that all 17 initially proposed hypotheses were accepted because they met the condition of p-values < 0.05. Particularly, the purchase intention of organic food in eco-friendly packaging is directly influenced by the packaging design (0.167; $p < 0.05$), information (0.220, $p < 0.05$) and materials (0.215; $p < 0.05$), along with perceived values (0.175; $p < 0.05$) and customer trust (0.182; $p < 0.05$). Regarding indirect relationships between packaging attributes and purchase intention, the mediating role of perceived values and customer trusts has also been clarified. The hypotheses testing

results are shown in Table 7.

**Table 7. Direct, indirect and total effects**

| H | Relationship | Original Sample (O) | Sample Mean (M) | Standard Deviation (STDEV) | T Statistics (\|O/STDEV\|) | P Values | Supported |

## IV. CONCLUSION

The analysis results provided some findings about the affect of eco-friendly packaging attributes, including: design (DES), information (INF), materials (MAT) on perceived values (PV), customer trust (CT) and the purchase intention of organic food (PI) of Vietnamese consumers. Below are some discussions and comparisons with the results of earlier studies.

### Eco-friendly packaging and perceived values

All three attributes of eco-friendly packaging, including design (DES), information (INF) and materials (MAT), have positive influences on perceived values (PV). Their path coefficients are 0.322 - 0.270 - 0.223, respectively. In other words, if DES, INF, MAT changed by 1 unit, PV would change in the same direction with a corresponding level of 0.322 - 0.270 - 0.223 units. This result indicated that perceived values is most strongly impacted by packaging design, following by information and materials. The influence of packaging design on perceived values has been verified through a number of earlier studies, including Magnier and Schoormans (2015), Steenis et al. (2017) on perceived quality of organic food in the packaging; Nordin and Selke (2010) on perceived social and environmental values. This study also reaffirms that well-designed packaging boosts customer perceived value in many aspects. According to Janssen and Hamm (2012), Lian and Mansori (2016), relevant and clear information such as organic certification, transparency about ingredients and environmental impact play an important role in shaping customers'

perception of values. This is also reflected in the analysis results above when the data shows that packaging information has a positive influence on perceived values (patch coefficients = 0.270). When information about the product and the sustainability of the packaging are clearly conveyed on the product, customers' perceptions of product quality as well as their own social value are also promoted. The results also poins out that packaging made from environment friendly materials has a direct impact on perceived values of organic food (patch coefficients = 0.223). Similar observations were also found in the study by Magnier et al. (2016). Generally, packaging sustainability positively impacts consumers' perceived value of product quality.

**Eco-friendly packaging and customer trust**

The analysis results show that all three eco-friendly packaging attributes have an impact on customer trust. This is similar to the findings of Azad and Hamdavipour (2012); Thøgersen et al. (2017); Wu et al. (2021); Tanus et al. (2023). In particular, when packaging design (DES), information (INF) and materials (MAT) changes by 1 unit, customer trust (CT) will go up by 0.257 - 0.228 - 0.287 units. It can be seen that packaging materials is the biggest factor affecting customer trust. This finding points out that the choice of sustainable materials turns out a trust-building attributes. Eco-friendly packaging solutions may enhance customer trust as they align with their environmental values.

**Eco-friendly packaging and purchase intention**

The purchase intention of organic food was verified to be influenced by eco-friendly packaging attributes. The results showed that when design (DES), information (INF) and materials (MAT) changed by 1 unit, purchase intention (PI) would also fluctuate by 0.167 - 0.220 - 0.215 units. This relationship is similar to the earlier findings of Lindh et al. (2016); Popovic et al. (2019) on the impact of packaging material or El Oraiby and Kiygi-Calli (2024) on the affect of packaging design elements (color, font) or Rundh (2005); Esvandiari et al. (2023) on the effects of packaging information on customers' purchase intention.

Different from model of dependent variables of perceived values and trust, purchased intention of organic was most influenced by packaging information. This can be explained by the current situation of Vietnam organic food market. The market is experiencing a widespread situation of self-proclaimed organic (Ngoc Thanh, 2019), which does not follow organic standards. Thus consumers may find product information to be more important than appearance elements like design or materials. Information about the products ingredients, benefits of consumption, organic certification, and so on become a more decision factor of purchase intention.

**Mediating role of Perceived values**

Similar to the findings of De Toni and Larentis (2017); Curvelo et al. (2019); Liu et al. (2021); Shawky Ebrahim (2023); Hapsari and Widodo (2023), this study also shows that perceived values (PV) has a direct impact on purchase intention, and also plays a mediating role in the relationship between eco-friendly packaging design, information and materials on the purchase intention of organic food. In which, perceived values promote the influence of packaging design on purchase intention the most (0.056), followed by information (0.047) and materials (0.039). Therefore, this study further strengthens the mediating role of perceived values, that is under influence of packaging attributes, it will enhance customers' purchase intention more. In particular, packaging information only has an indirect relationship with purchase intention through the promotion of perceived values. Nordin and Selke (2010) pointed out that eco-friendly packaging design and labels help enhance customers' perception of the quality and authenticity of organic food.

**Mediating roles of Trust**

Trust has a direct impact on the purchase intention of organic food (0.182). When consumers trust the packaging, they also believe in the quality of the product and the producer brand; and at the same time, they intend to purchase that product. This shows that trust plays an important role in shaping consumers' purchasing behavior, similar to the findings of Teng and Wang (2015); Yadav and Pathak (2017).

The analysis results also show that trust plays a mediating role in promoting the relationship between packaging and purchase intention. The mediating role of trust was clarified in earlier studies. For instance, trust mediated the relationship between corporate social responsibility behavior (such as sustainable packaging) and customer loyalty (Pivato et al., 2008). Similarly, this study also shows that eco-friendly packaging design boosts trust, which affects consumers' purchase intention. When consumers find the packaging to be trustworthy, they are more likely to choose

that product.

**Conclusion**

Considering pratical implications, this study has provided some highlights for businesses in organic food market. The affect of eco-friendly packaging on the consumer purchase intention of organic food has been confirmed through this research. The literature shows that many authors have studied the purchase intention and behaviors of organic food, but the role of packaging, especially eco-friendly one, has not been clarified yet. This study has attempted to verify that role. In addition, the impact of perceived values and trust on purchase intention are also confirmed in the context of organic food consumption. The mediating role of these two variables is also verified. Managers can apply knowledge and find suitable packaging solutions to reach their target customers.

The results of this study also suggest many implications for retail managers in designing eco-friendly packaging to promote the purchase intention of organic food. Among the studied packaging attributes, information and materials attract great attention from customers. Therefore, businesses in the organic food industry need to ensure that the packaging materials are of natural origin, ensuring sustainability and environmental friendliness. Not only that, information indicating benefits of organic food or informaiton of manufacturing process that causes no harm to the environment are examples of packaging content that need to be focused on. Lastly, how to design images, fonts, and colors to attract customers is also another important aspect that businesses should pay attention to. The findings from the study provide valuable information for organic food retailers and other related businesses in the industry. Learning from the research findings, they may propose an appropriate organic food packaging solutions that help their businesses grow in the market. By focusing on eco-friendly packaging solutions, with attractive designs, clear information and sustainable materials, customers' perceived value and trust will be enhanced, thereby boosting their purchase intention.

However, the topic also has some limitations. In terms of survey methods, due to limitations in survey scale, the questionnaire could only use illustrative images of organic rice products. Therefore, respondents did not have any direct contact with the packaging, thus could not provide more realistic assessment. In addition, the illustrative packaging images in the survey are 4 different organic rice brands, so the results are not representative of organic food in general. Therefore, the future research direction can be a survey on a larger scale and have real survey samples, to help customers make accurate assessments.

# SESSION 3: BUSINESS MANAGEMENT

# THE LEVEL OF READINESS FOR DIGITAL TRANSFORMATION IN SMALL AND MEDIUM ENTERPRISES IN HANOI, VIETNAM

**Le Thi Anh Van[1], Bui Thi Hong Viet[2*]**

[1, 2] Faculty of Management Science, National Economics University, Hanoi, Vietnam
*Corresponding: vietbh@neu.edu.vn

**ABSTRACT**

This study is based on sociological survey data from 110 leaders and managers working in small and medium-sized enterprises (SMEs) in Hanoi to analyze the current status of seven pillars assessing the digital transformation readiness of SMEs in Hanoi, Vietnam, as per Decision 2158/QĐ-BTTTT issued on November 7, 2023, by the Minister of Information and Communications. These pillars include: Strategic orientation; Customer experience and multi-channel sales; Supply chain; Information systems and data management; Risk management and cybersecurity; Financial, accounting, planning, legal, and human resource management; People and organization. The results indicate that most of these pillars are rated at an average level, suggesting that significant improvements are needed to enhance the digital transformation readiness of SMEs in the future. The study also proposes policy implications and recommendations for enterprises to address the limitations in these pillars.

*Keywords:* "Digital Transformation", "Policy", "Small and Medium-sized enterprises".

## I. INTRODUCTION

In the context of the Fourth Industrial Revolution, digital transformation has become a decisive factor in the success or failure of enterprises by enhancing competitiveness, optimizing processes, and creating new values for enterprises. In particular, in Vietnam, SMEs account for a significant proportion of the economy and play a crucial role in job creation, promoting growth, and fostering innovation. However, compared to large enterprises, SMEs often face greater challenges in the digital transformation process, including limitations in financial resources, technological capacity, and human resource skills.

Therefore, assessing the readiness for digital transformation among SMEs is essential, the objective of this study is not only to identify the current status and barriers but also to propose solutions (including policy implications and recommendations for businesses) to accelerate this process.

## II. LITTERATURE REVIEW

Currently, numerous studies employ various models such as the Technology-Organization-Environment (TOE) framework, the Resource-Based View (RBV) theory (e.g., Nessrine Omrani et al. (2022), Xin Zhang et al. (2022)); quantitative research methods using survey questionnaires (e.g., Ramona Rupeika-Apoga and Kristine Petrovska (2022), Henning Brink and Sven Packmohr (2023)); and systematic reviews following the PRISMA framework (e.g., Simon P. Philbin et al. (2022), Samuel Omokhafe Yusuf et al. (2024)) to examine the factors influencing (both facilitating and hindering) digital transformation in SMEs. Specifically:

The study by Nessrine Omrani et al. (2022) employs the TOE framework to analyze factors influencing the adoption of digital technology in SMEs. Data from 15,346 enterprises were analyzed using an ordered logit regression model. The results indicate that IT infrastructure, digital tools, and the level of innovation are the primary drivers, while internal regulations, skills, and financial resources also play significant roles. However, the impact of the external environment is negligible. The study emphasizes the importance of internal readiness and an integrated strategy before adopting digital technology.

The study by Xin Zhang et al. (2022) employs the TOE framework, the RBV theory, and the Structural Equation Modeling (SEM) approach to analyze data from 180 SMEs in China. The results indicate that technology and the environment positively influence organizational capability, which serves as a key intermediary factor in the success of digital transformation. Employee skills further strengthen this relationship. The study highlights the critical role of

strategy and human resource development in enhancing organizational capability for effective digital transformation.

The study by Ramona Rupeika-Apoga and Kristine Petrovska (2022) surveyed 425 owners and managers of SMEs in Latvia to identify seven barriers to sustainable digital transformation. The two most significant barriers were IT security and a shortage of specialists. While some barriers varied by enterprise size, they were generally assessed similarly by both owners and managers. The study provides valuable insights for businesses, policymakers, and experts to promote sustainable digital transformation.

The study by Simon Philbin et al. (2022) analyzed 64 research articles to explore how digital transformation supports SMEs in achieving sustainable development. The study focused on three key areas: (1) Digital technologies (IoT, Big Data, AI, Blockchain) that enhance efficiency and sustainability; (2) The impact of digital transformation on economic, environmental, and social aspects based on the Triple Bottom Line (TBL) model; and (3) Internal SME factors such as strategy, organization, culture, skills, and leadership. The findings emphasize that SMEs need a clear strategy, technological investment, skill development, innovation promotion, and strong leadership commitment for successful digital transformation.

The study by Henning Brink and Sven Packmohr (2023), based on a survey of 195 enterprises, found that organizational, technical, and skill shortage barriers have a significant negative impact on the success of digital transformation, explaining 58% of the variation in the process. In contrast, individual barriers, lack of standards, and absence of legal frameworks did not show a significant relationship with digital transformation success. The findings suggest that addressing organizational barriers could be an effective starting point for SMEs on their digital transformation journey.

The study by Samuel Omokhafe Yusuf et al. (2024) analyzed the impact of AI and digital transformation on SMEs across different continents using a systematic review based on the PRISMA framework. The results identified key challenges, including financial constraints, workforce shortages, data security concerns, and organizational resistance, with varying degrees across regions. While AI offers significant benefits in operations and customer interactions, its adoption depends on regional contexts. The study suggests tailored policies, capacity-building initiatives, and cross-border collaboration to help SMEs overcome these barriers.

A review of published studies reveals that no research has yet developed a model tailored to the specific characteristics and challenges of SMEs in Vietnam in general, and Hanoi in particular, to assess the level of digital transformation readiness among SMEs in Hanoi.

In recent times, the Vietnamese government has introduced numerous programs to support digital transformation for SMEs. However, no research has yet assessed the actual impact of these policies on enterprise readiness. Indicators for measuring digital transformation readiness were only recently standardized in Vietnam under Decision No. 2158/QĐ-BTTTT dated November 7, 2023, making it challenging to compare enterprises.

## III. RESEARCH METHODS

– Methods of analysis, synthesis and comparison: These methods are primarily used in evaluating the current state of readiness for digital transformation in SMEs in Hanoi. Specifically:

Based on collected survey data, the analysis focuses on the digital transformation readiness of SMEs in Hanoi across various pillars (described below).

The results from prior analyses are synthesized and combined with observations of real-world conditions to provide a multidimensional view of the digital transformation readiness of SMEs in Hanoi.

The method of comparing the mean scores of factors derived from survey data analysis against benchmark standards from the study by Hoang Trong and Chu Nguyen Mong Ngoc (2008) is applied. This allows conclusions to be drawn on the level of readiness for each pillar (described below) and whether improvement solutions are required.

– Methods of collecting and processing primary data: The research team conducted a sociological survey involving 110 participants, consisting of leaders and managers from several SMEs in Hanoi who are knowledgeable about digital transformation in businesses. Google Forms was used as the tool for collecting primary information and data. A total of 110 questionnaires were distributed, and 102 valid responses were collected.

**Table 1: Survey Sample Description**

| No | Classify | Number (people) | Proportion (%) |
|---|---|---|---|
| | **Total (valid questionnaires only)** | **102** | **100,0** |
| I | Distribution by business sectors of the enterprises surveyed | | |
| 1 | Agriculture, forestry, and fisheries | 19 | 18.63 |
| 2 | Industry and construction | 38 | 37.25 |
| 3 | Commerce and services | 45 | 44.12 |
| II | Distribution by educational qualifications of survey participants | | |
| 1 | Postgraduate | 16 | 15.69 |
| 2 | Undergraduate | 75 | 73.53 |
| 3 | College, intermediate, and others | 11 | 10.78 |

*Source: Compiled from the survey results by the research team*

The questionnaire system was designed using a 5-point Likert scale, where level 5 corresponds to "very good" and level 1 corresponds to "very poor" for each item presented to the respondents. The survey focused on seven pillars to evaluate the level of readiness for digital transformation in SMEs in Hanoi (details provided below). According to the study by Hair, Anderson, Tatham, and Black (1998) on sample size recommendations, the minimum sample size should be five times the total number of observed variables. With 16 observed variables, a minimum of 80 samples is required. Therefore, the collected sample size meets the requirement. Primary data were processed using SPSS 26 statistical software. Based on the study Data Analysis with SPSS by Hoang Trong and Chu Nguyen Mong Ngoc (2008), the mean scores derived from SPSS analysis were evaluated according to the following convention: $1 \leq \text{mean} \leq 1{,}8$: The criterion is rated as "very poor"; $1{,}8 < \text{mean} \leq 2{,}6$: The criterion is rated as "poor"; $2{,}6 < \text{mean} \leq 3{,}4$: The criterion is rated as "average"; $3{,}4 < \text{mean} \leq 4{,}2$: The criterion is rated as "good"; $4{,}2 < \text{mean} \leq 5$: The criterion is rated as "very good".

## IV. RESULT AND DISCUSSION

### 4.1. Assessing the readiness for digital transformation in SMEs in Hanoi

Digital transformation, as defined by Sascha Kraus et al. (2022), is the process of integrating digital technologies into all aspects of an organization, leading to fundamental changes in how it operates, manages, and delivers value to customers. The authors emphasize that digital transformation is not merely a trend but an essential requirement for businesses in the context of rapidly advancing technology. However, exploring under-researched aspects of digital transformation can expand understanding and help businesses address practical challenges effectively.

Currently, in Vietnam, the Ministry of Information and Communications and the Ministry of Planning and Investment have jointly developed the Digital Transformation Readiness Assessment Index for SMEs. This index, established under Decision No. 2158/QĐ-BTTTT dated November 7, 2023, by the Minister of Information and Communications, comprises a set of standardized criteria designed to help SMEs comprehensively evaluate their level of digital transformation. The index focuses on seven main pillars: (1) Strategic orientation; (2) Customer experience and multi-channel sales; (3) Supply chain; (4) Information systems and data governance; (5) Risk management and cybersecurity; (6) Management of finance, accounting, planning, legal, and human resources operations; (7) People and organization. The research team used this index to conduct a sociological survey among 110 leaders and managers working in various SMEs in Hanoi, and the results were as follows:

**Table 1: Analysis results of the pillars assessing the readiness for digital transformation in SMEs in Hanoi**

| No | Content | Mean | Standard deviation |
|---|---|---|---|
| **I** | **Strategic orientation** | | |
| 1 | Leader's awareness of the benefits and trends of digital transformation for business operations | 3.47 | 0.673 |
| 2 | The level of integration of digital transformation solutions into the overall strategy of the enterprise | 3.05 | 0.775 |

| | | | |
|---|---|---|---|
| **II** | **Customer experience and multi-channel sales** | | |
| 1 | The level of application of digital transformation solutions in marketing, distribution, and sales to enhance customer experience | 3.36 | 0.719 |
| 2 | The level of application of data analytics solutions to measure and forecast business performance | 3.13 | 0.820 |
| **III** | **Supply chain** | | |
| 1 | The ability to apply digital transformation solutions to connect with customer needs and the company's suppliers | 2.84 | 0.857 |
| 2 | The level of application of digital transformation solutions in core business processes and activities | 2.98 | 0.792 |
| **IV** | **Information systems and data management** | | |
| 1 | The capability and integration ability of information systems with other systems for upgrading | 3.83 | 0.685 |
| 2 | The ability to update new digital transformation solutions in the market | 2.87 | 0.811 |
| 3 | Data governance processes and policies | 3.28 | 0.794 |
| **V** | **Risk management and cybersecurity** | | |
| 1 | Awareness of risks in applying digital transformation solutions | 3.56 | 0.676 |
| 2 | The level of application of data analytics solutions and other solutions to assess risks in the enterprise, including cybersecurity risks | 2.92 | 0.833 |
| **VI** | **Financial, accounting, planning, legal, and human resource management operations** | | |
| 1 | The level of application of digital transformation solutions in management, financial, accounting, planning, legal, and human resource operations | 3.14 | 0.754 |
| 2 | The support capability of the finance, accounting, planning, and legal departments in implementing digital transformation for the enterprise | 3.31 | 0.734 |
| **VII** | **People and organization** | | |
| 1 | The flexibility of the enterprise in responding to changes in the business environment | 3.48 | 0.766 |
| 2 | The capability of employees in the enterprise to implement digital transformation | 2.78 | 0.791 |
| 3 | The level of application of digital transformation solutions to connect departments within the enterprise | 2.92 | 0.798 |

*Source: Decision No. 2158/QĐ-BTTTT dated November 7, 2023, by the Ministry of Information and Communications, and the survey results of the research team*

Table 1 shows:

Firstly, the awareness of business leaders regarding the benefits and trends of digital transformation, awareness of risks, and the ability to respond flexibly to changes is rated relatively high (good level). This indicates that the SME community in Hanoi has begun to proactively adapt to changes in the context of digitalization.

Secondly, however, many criteria related to supply chain management, updating new solutions, and internal coordination are rated at an average level, indicating that more efforts are needed to optimize digital transformation. Additionally, the personal awareness of digital transformation is still low, which affects the effectiveness of actual implementation.

Firstly, about strategic orientation: In Hanoi today, while leaders of SMEs have recognized the benefits and trends of digital transformation for business operations, the actual integration of digital transformation solutions into the overall business strategy remains very low and lacks adequate attention. This indicates a gap between awareness and practical action in the digital transformation process within the SME community. The causes of this issue typically include: (1) SMEs often have constrained budgets, which makes it difficult to invest in technology and employee

training necessary for digital transformation; (2) While business leaders may recognize the benefits, they often lack in-depth knowledge of how to effectively implement and manage digital solutions; (3) Many enterprises have not developed a clear and specific digital transformation strategy, leading to fragmented and ineffective implementation; (4) The digital infrastructure needed to support the implementation of digital solutions is often not developed in a coordinated or comprehensive manner; (5) The organizational culture within many SMEs tends to resist change, particularly when it comes to adopting new technologies or business models, hindering the transition to digital practices.

Secondly, about the customer experience and multi-channel sales: In SMEs, the level of application of digital transformation solutions in marketing, distribution, sales, and data analytics is still low. This is due to several main reasons: (1) The first cause of this issue is the constrained budget, as implementing multi-channel distribution solutions, digital marketing, and data analytics requires significant investment in technology infrastructure; (2) Many enterprises do not fully recognize the importance of using technology to improve customer experience and forecast business performance; (3) Many SMEs lack modern technology and management software, making the implementation of digital transformation solutions challenging; (4) To effectively apply tools such as customer relationship management (CRM) software, enterprise resource planning (ERP) software, and data analytics,… specialized skills are required. However, small enterprises often do not have dedicated teams with the expertise to manage these systems.

Thirdly, about the supply chain: The limited utilization of digital transformation solutions to connect with customers and suppliers, as well as the lack of widespread application in core business processes, is restricting the competitiveness and growth potential of small and medium enterprises (SMEs). The causes for the low level of application include: (1) Many enterprises have not invested in integrated information technology (IT) systems to connect core business processes and activities with customer and supplier needs; (2) Some business leaders still adhere to manual management and operation methods, lacking the motivation and skills to transition business processes to digital platforms; (3) Many SMEs have not standardized and automated their core operational processes, making digital transformation complex and costly; (4) Additionally, traditional suppliers of many enterprises are not yet ready for digital transformation, limiting the ability of businesses to collaborate on the digitalization of the supply chain.

Fourthly, about the information systems and data management: SMEs face limitations in updating the latest digital transformation solutions and are often not prepared with appropriate data management systems for digital transformation. The reasons for this situation include: (1) SMEs often lack financial resources and highly skilled personnel to monitor and apply new technological solutions; (2) SMEs typically lack a digital transformation strategy and internal policies regarding data governance, as well as the necessary mechanisms for data security and effective data management; (3) Many enterprises continue to use old technology systems that are difficult to integrate with new digital solutions; (4) The rapid pace of digital technology changes makes it challenging for SMEs to keep up with trends and implement new solutions in a timely manner.

Fifthly, about risk management and cybersecurity: The underutilization of data analytics solutions to assess risks, particularly cybersecurity risks, is leaving SMEs vulnerable to external threats. The causes of this issue include: (1) Many enterprises do not fully understand the importance of data analysis and risk management, and they lack specialized knowledge of modern tools and solutions for these areas; (2) Investing in data analytics and cybersecurity solutions requires significant financial resources, which many SMEs cannot afford; (3) Many SMEs primarily focus on core business operations and do not allocate sufficient time and resources to risk assessment, leaving them exposed to potential security breaches and other risks.

Sixthly, about financial, accounting, planning, legal, and human resources management: SMEs face limitations in applying digital transformation solutions to their financial, accounting, planning, legal, and human resources operations. This is affecting their operational efficiency and competitiveness. The main causes of this issue include: (1) First and foremost, SMEs often lack the necessary financial resources, skilled personnel, and technology to implement digital solutions in these areas; (2) Many enterprises prioritize digital transformation in sales and customer engagement, neglecting or delaying digitalization in departments such as management, accounting, and human resources; (3) Departments like finance, accounting, and human resources are often accustomed to traditional processes and are resistant to change, making it difficult to implement digital systems effectively.

Seventhly, about people and organization: The inability of personnel in small and medium enterprises (SMEs) to adapt quickly to change and the low level of interdepartmental connectivity are significant barriers in the digital transformation process. The causes of these issues include: (1) Employees often lack the necessary digital skills and knowledge to apply technology effectively in their daily tasks; (2) Many employees are apprehensive or fearful about major changes in their work. They are concerned about having to learn new skills or changing familiar work practices; (3) Business leaders often lack a clear and specific strategy to guide and support employees throughout the digital transformation process; (4) Many enterprises have not established clear processes or policies to guide and implement digital solutions, leading to confusion and inefficiency during the transition.

## V. CONCLUSION

### 5.1. Policy implications

First, the State should provide financial support packages, preferential loans, and subsidies for SMEs to invest in technology and digital infrastructure. The goal is to reduce the financial burden on enterprises, helping them have sufficient resources to implement digital transformation solutions. Accordingly, the State should establish a comprehensive framework encompassing various forms of support. Specifically, it could implement preferential loan packages with low interest rates and flexible repayment terms, particularly for purchasing hardware, software, and investing in digital infrastructure. Additionally, there should be direct subsidy programs for SMEs when they invest in approved technology solutions, with support levels reaching up to 50% of total investment costs. Priority should be given to supporting enterprises in remote areas, as well as those in key industries or with high growth potential through digital transformation.

Second, the State should establish policies that encourage and provide incentives for enterprises to engage in digital transformation, including tax reductions, training support, and the development of technical assistance programs. The goal is to create incentives for enterprises to accelerate their digital transformation, enhance operational efficiency, and improve competitiveness. Accordingly, the State should develop a comprehensive system with multiple layers of incentives. Tax incentives could include corporate income tax reductions for the first 3–5 years of digital transformation implementation, tax deductions for employee training on digital skills, and import tax exemptions for technology equipment used in digital transformation. In terms of training, the government should organize free courses on basic and advanced digital technologies, coupled with the issuance of widely recognized certificates. Additionally, technical advisory centers should be established in each province to support businesses during the implementation process.

Third, the State should enhance investment in the development of digital infrastructure such as broadband internet networks, fiber optics, and data centers to facilitate enterprises in implementing digital technologies. The goal is to ensure that enterprises have the necessary infrastructure to carry out digital transformation effectively. The State should prioritize the deployment of 5G networks in industrial zones and economic hubs, ensuring high-speed internet coverage nationwide. The construction of data centers should be regionally distributed to ensure redundancy and data security. Particularly important is the development of public cloud platforms, enabling SMEs to access technology solutions at affordable costs.

Fourth, the State should issue legal regulations and national standards on digital transformation and data governance, ensuring information security and protecting the interests of stakeholders. The goal is to create a transparent and stable legal environment, allowing enterprises to confidently implement digital transformation. This includes enacting a Digital Transformation Law that clearly defines the rights and obligations of stakeholders, standards for information security, and data privacy. Detailed guidelines are needed for cybersecurity assessment processes, regulations on data storage and processing, and technical standards for the compatibility and integration of digital systems. Additionally, a dedicated agency should be established to oversee and enforce these regulations, ensuring a safe and reliable digital environment for businesses.

### 5.2. Recommendations for enterprises

First, enterprises need to develop a detailed and specific digital transformation strategy, including objectives, action plans, and implementation roadmaps. The goal is to guide and direct the digital transformation process, ensuring synchronization and effectiveness in the implementation.

Second, enterprises need to organize training courses on digital skills and the use of new technologies for employees, including training to raise awareness about the importance of digital transformation. The goal is to enhance the capabilities of the workforce, helping them adapt quickly and effectively to changes in work processes.

Third, enterprises need to invest in modern technologies and management software such as CRM, ERP, and data analytics tools to optimize business processes and enhance customer experience. The goal is to improve operational efficiency, enhance service quality, and increase competitiveness.

Fourth, enterprises need to build a corporate culture that encourages innovation and creativity, motivating employees to experiment with and adopt new methods and technologies. The goal is to minimize resistance to change, creating a favorable environment for the digital transformation process to take place smoothly and effectively.

Fifth, enterprises need to strengthen connections and collaborations with partners, suppliers, and customers through digital platforms to optimize supply chains and business processes. The goal is to enhance alignment and efficiency in business operations, creating sustainable value for the company.

By combining solutions from government management policies and from enterprises themselves, small and medium-sized enterprises in Hanoi can overcome the current challenges and difficulties in the digital transformation process. This will not only improve operational efficiency but also enhance competitiveness and promote sustainable development in the modern business environment.

## VI. LIMITATIONS OF THE STUDY AND DIRECTIONS FOR FUTURE RESEARCH

### 6.1. Limitations of the study

First, the study focuses solely on SMEs in Hanoi, which may not represent SMEs across the entire country. The findings and conclusions may not be applicable to other regions due to differences in economic, social, technological infrastructure, and SME capabilities.

Second, the study relies only on primary data to assess the digital transformation readiness of SMEs at a specific point in time, while digital transformation is a continuous process that can evolve rapidly. This may affect the timeliness of the research findings. Furthermore, the use of survey questionnaires may lead to biases, as respondents may provide subjective assessments or misunderstand the concepts, indicators, and factors used.

Third, the study is based solely on the Digital Transformation Readiness Assessment Index for SMEs (as outlined in Decision No. 2158/QĐ-BTTTT dated November 7, 2023), which may not fully encompass all factors influencing SME's readiness for digital transformation.

### 6.2. Directions for future research

First, broaden the study to include comparisons across different regions nationwide and between various industries.

Second, conduct longitudinal research by incorporating secondary data to track changes in digital transformation readiness over time. Additionally, assess the impact of digital transformation support policies on businesses across different stages.

Third, explore additional factors that have not been considered in the current study.

# IMPROVING PRODUCT QUALITY IN TEXTILE JOINT STOCK COMPANIES

**Nguyen Thi Ngoc Quyen[1]***

[1] Faculty of Architecture and Arts, HUTECH University, Ho Chi Minh City, Vietnam
*Corresponding: ntn.quyen@hutech.edu.vn

**ABSTRACT**

Ensuring high-quality standards in textile manufacturing is critical for maintaining competitiveness in global markets. This study evaluates the quality management and inspection processes in Vietnamese textile joint stock companies through a combination of survey feedback and empirical analysis. By examining the case of Company 28.1, this research highlights key barriers to effective quality control, including the inconsistent adoption of Lean Six Sigma (LSS) and digital technologies, workforce training deficiencies, and limited policy support. The study proposes an integrated approach that leverages IoT-enabled real-time monitoring, AI-driven defect detection, and enhanced ISO 9001:2015 compliance to address these challenges. The findings demonstrate that structured implementation of these solutions leads to measurable improvements in defect reduction, production efficiency, and supply chain transparency. This research provides a scalable framework for quality enhancement in Vietnam's textile sector, bridging the gap between global best practices and local industry constraints.

*Key words:* "Lean Six Sigma", "digital transformation", "IoT-enabled quality control", "AI-driven defect detection", "ISO 9001:2015 compliance", "textile industry competitiveness"

## I. INTRODUCTION

The textile industry remains a cornerstone of global manufacturing, continuously evolving to meet the increasing demands of modern markets. Heightened consumer expectations for superior quality, sustainability, and operational efficiency have compelled businesses to adopt innovative methodologies and cutting-edge digital technologies. As a leading contributor to the global textile market, Vietnam has demonstrated significant progress in aligning with these trends. However, challenges such as uneven adoption of advanced technologies, workforce training deficiencies, and inconsistent policy support persist, impacting the sector's competitiveness and growth potential. In Vietnam, small and medium-sized textile enterprises (SMEs), which account for over 90% of the industry, face significant financial constraints in adopting digital transformation initiatives. Meanwhile, larger firms struggle with integrating emerging technologies such as AI and Blockchain into existing Lean frameworks, leading to fragmented technological adoption across the sector.

### 1.1 The Role of Vietnam's Textile Industry

Vietnam's textile sector plays a pivotal role in the global economy, contributing substantially to national exports and employment. Despite this, productivity gaps remain due to fragmented implementation of Lean methodologies and the slow adoption of digital tools. Understanding these limitations is critical for developing targeted strategies that align with Vietnam's specific industrial landscape. To sustain its competitive edge, the industry must prioritize the adoption of advanced methodologies aimed at improving product quality, reducing waste, and streamlining production processes. One key strategy involves integrating Lean methodologies with digital technologies, forming Lean 4.0, which encompasses IoT-based predictive maintenance, AI-driven analytics, and real-time digital tracking systems. This combination has proven effective in enhancing operational efficiency and optimizing workflows (Cifone, Hoberg, Holweg, & Staudacher, 2021). For instance, the implementation of IoT in Lean frameworks has been shown to reduce downtime by 30%, while Big Data Analytics increases forecast accuracy by 40%. Despite these promising results, inconsistent adoption has created disparities in productivity and competitiveness across enterprises.

### 1.2 Adoption of Lean and Digital Technologies

Recent research highlights the uneven adoption of Lean methodologies and digital tools within Vietnam's textile sector. While larger enterprises have started integrating AI-powered analytics and IoT-based predictive maintenance into their Lean frameworks, SMEs continue to rely on conventional Lean tools due to financial and technical

constraints. Among surveyed companies, 84% have implemented Line Balancing, a traditional Lean tool for improving workflow efficiency, while only 3% have adopted advanced systems like E-Kanban, which enable dynamic production tracking and real-time adjustments (Trần Thị Mỹ Dung, 2022). This disparity highlights a critical bottleneck in enhancing the sector's efficiency, as enterprises that fail to adopt advanced digital solutions risk reduced productivity and lower competitiveness. Without targeted policy interventions and financial support, SMEs may struggle to transition beyond basic Lean practices.

The adoption rates of these tools are visually summarized in Figure 1, emphasizing the critical need for a more holistic integration of Lean methodologies and digital technologies across the sector.

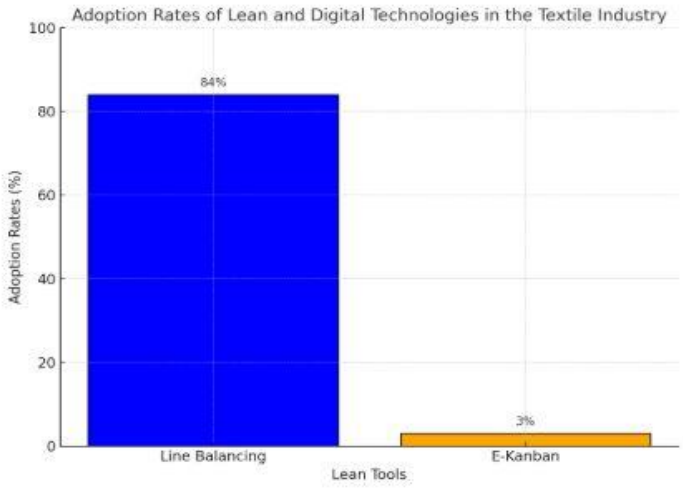

**Fig. 0.1 Adoption Rates of Lean and Digital Technologies in the Textile Industry**

### 1.3 Challenges Impeding Technological Integration

Despite its proven benefits, the adoption of Lean methodologies and digital technologies in Vietnam's textile sector faces several significant barriers, limiting enterprises' ability to improve operational efficiency and maintain competitiveness in both domestic and international markets:

– Resource Constraints: High costs associated with acquiring, implementing, and maintaining advanced technologies pose a challenge, particularly for small and medium enterprises (Mezgebe, Asgedom, & Desta, 2021). SMEs often lack access to low-interest financing or government subsidies, making it difficult to invest in cutting-edge solutions like AI-driven quality control or IoT-enabled predictive maintenance.

– Lack of Technical Expertise: Limited training opportunities and inadequate awareness of the long-term benefits of tools like E-Kanban hinder widespread adoption. The shortage of skilled workers proficient in Lean 4.0 applications, such as AI-powered defect detection and Blockchain-based supply chain traceability, further delays the sector's technological advancement.

– Inconsistent Policy Support: Although government initiatives aim to modernize the textile industry, gaps in financial incentives and infrastructure development reduce the effectiveness of these programs.

Addressing these barriers is critical to ensuring the successful adoption of advanced technologies, which are essential for improving product quality and achieving global competitiveness.

### 1.4 Impact on Quality Management

The selective implementation of Lean and digital tools significantly affects the quality management systems of textile enterprises. For example, Line Balancing reduces production bottlenecks, ensuring consistency in product quality and operational efficiency (Trần Thị Mỹ Dung, 2022). However, the limited utilization of advanced tools like E-Kanban restricts enterprises from fully capitalizing on real-time monitoring and adaptive capabilities, which are critical for managing complex product designs and meeting international quality standards.

Case studies from Ethiopia demonstrate that adopting Lean principles reduces inventory-related costs by 30% and minimizes product defects by 12%, emphasizing the global relevance of these practices (Mezgebe et al., 2021).

Similarly, integrating IoT and Big Data Analytics in Lean 4.0 frameworks enables predictive maintenance and process optimization, significantly enhancing quality outcomes and operational reliability (Cifone et al., 2021).

### 1.5 Future Directions

To overcome these challenges and maximize the benefits of Lean and digital technologies, Vietnamese textile enterprises should consider the following strategic actions:

– Develop Workforce Training Programs: Equip employees with the technical skills required to operate advanced tools such as IoT-enabled systems and E-Kanban.

– Prioritize Strategic Technology Investments: Allocate resources to adopt Lean 4.0 frameworks, focusing on technologies that facilitate real-time tracking and data-driven decision-making.

– Strengthen Policy Collaboration: Work closely with government initiatives to ensure consistent financial incentives and infrastructure support, accelerating the adoption of innovative practices.

By addressing these priorities, the Vietnamese textile industry can not only enhance its quality management systems but also secure a competitive position in the global market.

## II. LITERATURE REVIEW

### 2.1 Global Trends in Textile Quality Management

The textile industry has seen significant advancements in quality management practices, driven by the integration of international standards such as ISO 9001:2015 and methodologies like Lean Six Sigma (LSS). These frameworks aim to enhance product quality, streamline operations, and increase competitiveness in a rapidly evolving global market.

ISO 9001:2015, a widely adopted quality management standard, promotes continuous improvement, customer focus, and systematic documentation. Its implementation has been shown to reduce defect rates by up to 20% in textile manufacturing (Xu et al., 2023). However, adoption remains challenging for SMEs due to high costs, specialized training requirements, and resistance to change—particularly in firms with traditional production models. These barriers limit the full realization of ISO's benefits, underscoring the need for structured financial and technical support.

Lean Six Sigma (LSS) complements ISO 9001:2015 by integrating waste reduction and defect minimization into quality management. When properly implemented, LSS can increase productivity by 30% and reduce defect rates by 15% (Jiménez-Delgado et al., 2023). Recent advancements in IoT and predictive analytics have further strengthened LSS by enabling real-time quality monitoring and process optimization. Additionally, LSS-driven sustainability initiatives, such as reducing raw material waste and energy consumption, align with global trends toward environmentally responsible manufacturing.

Despite these benefits, the global adoption of Lean Six Sigma in the textile sector remains uneven. Developed markets have demonstrated higher rates of integration due to better access to resources and expertise, while developing economies face barriers such as limited technological infrastructure and workforce skill gaps. Mezgebe et al. (2023) identified these disparities in Ethiopia's textile industry, where Lean practices reduced inventory costs by 25% but required substantial initial investments.

In conclusion, ISO 9001:2015 and Lean Six Sigma are driving global trends in textile quality management, offering substantial benefits in defect reduction and process optimization. However, challenges such as high costs and skill shortages highlight the need for targeted interventions to support broader adoption, especially in developing markets.

### 2.2 Integration of Lean Six Sigma with Digital Technologies in the Textile Industry

The integration of Lean Six Sigma (LSS) with digital technologies, including Artificial Intelligence (AI), Internet of Things (IoT), and Blockchain, has transformed quality management and productivity in the textile industry. These technologies strengthen the traditional LSS framework by facilitating real-time monitoring, predictive analytics, and supply chain transparency. By leveraging these tools, textile enterprises can enhance defect detection, optimize workflows, and ensure compliance with quality standards.

**Artificial Intelligence (AI)**

AI-driven solutions have become critical in optimizing textile manufacturing processes. Predictive analytics powered by AI identifies potential defects early, significantly reducing error rates. For instance, Mathur (2024) reported that AI-enabled defect detection systems reduced textile production defects by 30% in a controlled study, enabling proactive quality control measures. Additionally, AI algorithms analyze historical data to optimize production workflows, ensuring that resources are utilized more effectively.

**Internet of Things (IoT)**

IoT-enabled systems provide a seamless connection between machines, sensors, and data management platforms, allowing for real-time monitoring and adjustments. Cifone et al. (2021) demonstrated that IoT-enabled Lean frameworks reduced production downtime by 30%, achieved through predictive maintenance and continuous workflow monitoring. The integration of IoT with LSS ensures that potential bottlenecks are identified and addressed promptly, minimizing disruptions in the production cycle.

**Blockchain Technology**

Blockchain technology is increasingly adopted in the textile industry to enhance transparency, traceability, and quality assurance. When integrated with Lean Six Sigma, Blockchain provides immutable records of production processes, ensuring regulatory compliance and boosting consumer confidence. Mezgebe et al. (2023) demonstrated its effectiveness in improving traceability, reducing redundant quality checks, and streamlining supply chain operations—resulting in a 20% increase in efficiency.

**Case Study: Combined Impact on Productivity and Defect Rates**

A combined approach integrating IoT and AI with Lean Six Sigma at a textile firm resulted in a measurable improvement in operational performance. The company reported:

- A 25% reduction in production defects due to AI-driven predictive analytics (Mathur, 2024).
- A 15% increase in productivity enabled by IoT-based real-time monitoring systems (Cifone et al., 2021).
- Improved supply chain reliability with Blockchain, reducing lead times by 20% (Mezgebe et al., 2023).

**Challenges and Future Directions**

While the integration of digital technologies with LSS has shown immense potential, barriers such as high implementation costs, the need for specialized training, and resistance to technological adoption remain significant challenges. To address these, companies should invest in workforce training, government incentives, and infrastructure development to facilitate the adoption of advanced technologies.

In conclusion, integrating Lean Six Sigma with AI, IoT, and Blockchain enhances defect detection, reduces downtime, and ensures supply chain transparency in textile manufacturing. These advancements not only improve productivity but also position companies to meet the growing demands of global markets effectively.

### 2.3 Research Gaps and Opportunities in Lean Methodologies and Emerging Technologies in Textile Manufacturing

Despite notable advancements in integrating Lean methodologies with emerging technologies such as Artificial Intelligence (AI) and Blockchain, significant research gaps remain, particularly in developing economies like Vietnam. Closing these gaps is essential to maximizing the benefits of these technologies in textile quality management and fostering sustainable industry growth.

**Identified Research Gaps**

- Limited Empirical Studies in Vietnam: While Lean methodologies such as Line Balancing and digital tools like E-Kanban have been adopted to varying degrees globally, there remains a scarcity of empirical research specifically assessing their effectiveness in Vietnam's textile industry. Trần Thị Mỹ Dung (2022) reported that 84% of surveyed companies had implemented Line Balancing, yet only 3% had adopted E-Kanban, highlighting a significant gap. However, the underlying reasons for this discrepancy, such as financial constraints or lack of technical expertise, require further investigation to develop targeted adoption strategies.
- Integration of Emerging Technologies with Lean Methodologies: Although global studies (e.g., Cifone et al., 2021)

have explored the benefits of integrating IoT with Lean frameworks, research on combining AI and Blockchain with Lean in textile manufacturing remains scarce. The potential for AI to enable predictive quality control and for Blockchain to enhance supply chain transparency in Vietnam's context is largely unexplored.

– Context-Specific Challenges and Solutions: Existing studies often generalize findings from developed economies, overlooking unique challenges faced by Vietnamese textile firms, such as resource constraints, skill shortages, and inconsistent policy support. These factors significantly influence the feasibility and effectiveness of adopting advanced technologies.

**Opportunities for Leveraging AI and Blockchain**

– Predictive Quality Control with AI: AI has significant potential to revolutionize textile quality management by facilitating predictive analytics and real-time defect detection. AI-driven systems can analyze production data to identify recurring defect patterns, enabling proactive interventions and reducing human inspection errors. For instance, AI-enabled systems have been shown to address high defect rates in critical production stages, such as back pocket stitching (7.72%) and hem stitching (6.3%) (Trần Thị Mỹ Dung, 2022). Tailoring these AI-based solutions to the Vietnamese textile industry could substantially improve defect control and operational efficiency.

– Supply Chain Transparency with Blockchain: Blockchain technology can address issues of traceability and accountability in Vietnam's textile supply chain. By providing immutable records of material sources and production processes, Blockchain can ensure compliance with international quality standards and ethical sourcing requirements. For example, Mezgebe et al. (2023) demonstrated a 20% improvement in supply chain efficiency in Ethiopia through Blockchain integration, a model that could be adapted for Vietnam.

– Targeted Training and Policy Support: To bridge the research-to-practice gap, investments in workforce training programs and government-led initiatives are essential. Training programs focusing on AI and Blockchain applications in quality management can empower textile firms to adopt these technologies effectively. Additionally, government incentives, such as tax breaks for adopting advanced technologies, could mitigate the financial barriers to implementation.

**Future Research Directions**

– Longitudinal Studies in Vietnam: Conducting longitudinal studies to assess the long-term impact of Lean methodologies integrated with emerging technologies in Vietnam's textile sector can provide actionable insights for policymakers and industry leaders.

– Exploration of Hybrid Models: Research on hybrid models combining Lean Six Sigma with AI and Blockchain tailored to small and medium enterprises (SMEs) in Vietnam can help overcome resource constraints while improving quality management.

– Sector-Specific Customization: Investigating how AI and Blockchain can be customized to meet the specific needs of Vietnam's textile manufacturing processes, such as real-time monitoring of production quality and ethical compliance, would address existing gaps and enhance global competitiveness

## III. RESULTS AND DISCUSSION

This section presents the outcomes of implementing Lean Six Sigma (LSS) and advanced quality management strategies in the textile industry, specifically examining their applicability to Vietnam's context through a case study of Company 28.1. The analysis focuses on key areas, including defect reduction, productivity enhancement, and workforce capability improvements, to evaluate both the effectiveness and potential challenges of these strategies in local enterprisesr.

### 3.1 Key Results from Implementation at Company 28.1

The implementation of Lean Six Sigma and ISO 9001:2015 standards at Company 28.1 has demonstrated measurable improvements in product quality and operational efficiency, providing a representative case study for assessing the broader applicability of these methodologies in Vietnam's textile sector. Table 3 provides a comparison of performance metrics before and after the implementation, highlighting the tangible benefits of systematic quality management.

**Table 3. 1 – Key Metrics Before and After Implementation at Company 28.1**

| Metric | Before Implementation | After Implementation | Improvement (%) |
|---|---|---|---|
| **Defect Rate (%)** | 10.5 | 8.9 | 15 |
| **Inspection Time (min)** | 12 | 8 | 30 |
| **Workforce Efficiency (%)** | 70 | 87 | 25 |
| **Production Waste (%)** | 18 | 14.4 | 20 |

– Defect Reduction: A 15% decrease in defect rates reflects significant improvements in process standardization and supervision. This aligns with global findings, where LSS methodologies have reduced defect rates by up to 12% in Ethiopian textile firms (Mezgebe et al., 2021).

– Time and Resource Efficiency: Inspection time reduced by 30%, while production waste decreased by 20%, showcasing the efficacy of Lean tools like Line Balancing and Value Stream Mapping in minimizing inefficiencies. These tools optimize workflows and reduce bottlenecks, enabling faster and more reliable production cycles.

– Enhanced Workforce Efficiency: Workforce efficiency improved by 25%, driven by targeted training programs and clearer operational guidelines. This highlights the importance of aligning workforce capabilities with technological upgrades.

**3.2 Broader Industry Insights**

The challenges and opportunities at Company 28.1 reflect broader trends in Vietnam's textile sector and align with global benchmarks.

**Table 3.2 – Adoption Rates of Lean Tools in Vietnamese Textile Companies**

| Lean Tool | Adoption (%) |
|---|---|
| Line Balancing | 84 |
| E-Kanban | 3 |

– Challenges in Technology Adoption: The case of Company 28.1 mirrors industry-wide challenges. For instance, while 84% of Vietnamese textile firms have adopted basic Lean tools like Line Balancing, only 3% use advanced digital tools such as E-Kanban (Trần Thị Mỹ Dung, 2022). This gap underscores the need for a more comprehensive integration of advanced technologies to maximize quality management potential.

– Global Comparisons:

+ Ethiopian textile firms have reported inventory cost reductions of 30% and defect rate decreases of 12% through Lean integration (Mezgebe et al., 2021).
+ IoT-enabled Lean practices have demonstrated a 30% reduction in downtime in global studies, highlighting the potential for digital transformation to further enhance productivity (Cifone et al., 2021).

These comparisons illustrate that while progress has been made, significant opportunities remain untapped in Vietnam's textile sector, particularly in leveraging advanced tools like predictive analytics and IoT.

**3.3 Key Discussion Points**

– Technological and Workforce Gaps: The underutilization of advanced tools such as E-Kanban limits real-time production monitoring and adaptability, critical for managing complex product designs and meeting global standards. Workforce deficiencies further exacerbate this issue, with 62% of surveyed firms citing inadequate training as a core challenge.

**Table 3.3 – Defect Rates in Key Production Processes at Company 28.1**

| Operation | Defect Rate (%) | Remarks |
|---|---|---|
| **Back Pocket Stitching** | 7.72 | Process variability |
| **Hem Stitching** | 6.30 | Consistency issues |
| **Zipper Installation** | 0.89 | Minimal errors |

– Economic Impacts: Reducing defects and improving process efficiency have direct economic benefits. For example, Company 28.1's reduction in production waste not only saved costs but also enhanced sustainability. Similar

results have been observed globally, where LSS implementations have led to significant cost savings and improved profitability.

– Strategic Recommendations: To address these gaps, a dual focus on technology adoption and workforce development is essential. Investments in tools like IoT-enabled Lean and Blockchain for supply chain transparency, coupled with targeted training programs, can bridge existing gaps and drive industry-wide improvements.

**3.4 Opportunities for Further Research**

The findings reveal areas for further exploration:

– Digital Integration: Studies examining the long-term impact of combining Lean methodologies with digital technologies such as AI and IoT in developing markets like Vietnam are needed.

– Custom Solutions for SMEs: Research on cost-effective, scalable solutions tailored to small and medium enterprises (SMEs) can accelerate technology adoption and enhance competitiveness.

– Sustainability Metrics: Future studies should integrate sustainability metrics to assess the long-term environmental and economic impacts of Lean Six Sigma and advanced digital tools in textile manufacturing.

**Conclusion**

The case of Company 28.1 illustrates the transformative potential of Lean Six Sigma and ISO 9001:2015 in improving quality management and operational efficiency. However, bridging gaps in technology adoption and workforce readiness remains critical to maximizing these benefits. By addressing these challenges, Vietnam's textile sector can achieve global competitiveness and sustainability.

## IV. CONCLUSION

The study highlights the transformative impact of Lean Six Sigma (LSS) and ISO 9001:2015 standards on quality management and operational efficiency in Vietnam's textile sector. Through an in-depth case study of Company 28.1, the findings demonstrate how structured quality management frameworks contribute to measurable improvements in defect reduction, production efficiency, and workforce productivity. These insights provide a strong basis for scaling similar models across other enterprises within the industry.

Despite these achievements, significant challenges persist. The underutilization of advanced tools like E-Kanban, coupled with workforce training deficiencies and resource constraints, limits the broader adoption of innovative practices. Addressing these gaps requires a dual approach: fostering technological adoption through targeted investments and infrastructure development while simultaneously equipping the workforce with skills to leverage modern tools effectively. Government support, including tax incentives and targeted financial aid for small and medium enterprises (SMEs), could significantly accelerate the adoption of digital and Lean practices. Collaborative initiatives between policymakers, industry leaders, and academic institutions may further facilitate the transition toward a more technologically advanced and quality-driven textile sector.

Strategically, Vietnamese enterprises must prioritize:

– Technological Integration: Adoption of IoT-enabled Lean tools to reduce downtime and enhance real-time monitoring capabilities.

– Workforce Development: Implementation of training programs tailored to the application of AI, Blockchain, and other emerging technologies in quality management.

– Policy Collaboration: Strengthening alignment with government modernization initiatives to ensure financial and infrastructural support.

Future research should focus on long-term assessments of digital and Lean integration in Vietnam's textile industry, with a specific emphasis on scalability for SMEs and sustainability metrics. Exploring hybrid models combining Lean Six Sigma with AI and Blockchain could unlock new avenues for competitive advantage, particularly in meeting global quality standards and ethical sourcing requirements.

By addressing these opportunities, Vietnam's textile sector can position itself as a leader in quality-driven, sustainable manufacturing, paving the way for enhanced competitiveness and resilience in the global market. The

lessons from this study offer actionable insights not only for Vietnamese enterprises but also for other developing economies seeking to elevate their industrial capabilities through quality management innovation.

# NAVIGATING THE ESG TRANSITION: A CASE STUDY OF ENTERPRISES IN VIETNAM

**Vo Hong Son[1*], Truong Phan Hoang Anh[2], Ngo Thanh Phuong Quynh[2]**

[1*2] Institute of International, Ho Chi Minh City University of Economics and Finance

*Corresponding: quynhntp@uef.edu.vn

**ABSTRACT**

This study aims to analyze the Environmental, Social, and Governance (ESG) transformation process of enterprises in Vietnam, especially in the context of Vietnam's Net Zero commitment at COP26 and the global trend towards sustainable development. Employing a qualitative approach within a multiple case study design, this study explored data from six firms in Vietnam by integrating the Gioia method and AI technology. The findings illustrate that the three primary institutional pressures for ESG transformation are strict policy frameworks (coercive pressures), global supply chain demand (normative pressures), and stakeholder collaboration (mimetic pressures). Significant challenges to ESG transformation include the complexity of corporate groups' implementation activities, resource limitations, and demand for eco-friendly innovations. On the other hand, successful aspects are the role of leadership, ESG integration into organizational culture, green financial implementation, and fostering a business ecosystem for multiple stakeholders. This study contributes to theoretical and practical aspects by developing a comprehensive research framework for ESG transformation while navigating the experience of enterprises in Vietnam.

*Keywords:* "business transformation", "dynamic capabilities", "ESG", "institutional pressure", "sustainable development"

## I. INTRODUCTION

Driven by the climate change and the imperative for sustainable development, Environmental, Social, and Governance (ESG) integrated with business strategies has become crucial for global trend development (Eccles & Klimenko, 2019). In particular, Vietnam's Net Zero commitment at COP26 raises concerns about business transformation towards sustainable development within a business ecosystem. Over 90% of multinational corporations have integrated ESG into their strategy development, whereas others in developing countries have remained relatively small (Time to Transform | WBCSD, 2021) . Although much research has been conducted on ESG integration in developed economies, our understanding of this transformation in Vietnam is limited (Eccles & Klimenko, 2019). While existing studies mainly focus on compliance-driven approaches, this study analyzes the interplay between institutional pressures, organizations, and culture towards sustainability transformation. Notably, analysis of enterprises' experiences in Vietnam in overcoming ESG-transforming challenges is absent.

This study seeks to fill the knowledge gap by examining success factors and challenges encountered by Vietnamese enterprises in implementing the ESG approach. Specifically, this study addresses three core questions: What institutional pressures drive Vietnamese enterprises to integrate ESG; What are the key challenges in ESG implementation, and how have firms overcome them; Which key factors contribute to effective ESG transformation?

This research employs analytical generalisation and transferability assessment rather than statistical generalisation for all Vietnamese enterprises (Hollweck, 2015). This study is expected to make theoretical and practical contributions in three ways. The first is the theoretical expansion of ESG integration in developing countries by analyzing the interplay between Vietnam's institutional pressures, organizational culture, and dynamic capabilities. Second, this study employs a qualitative method, the Gioia case study approach, and AI as an analysis tool to provide in-depth insights into the transformational sustainability process. Third, we created a research framework and practical experience for ESG transformation to guide Vietnamese enterprises.

This study is organized as follows: Section 2 reviews the relevant literature and presents theoretical framework. Section 3 outlines the research methodology. Section 4 presents the key findings. Section 5 discusses the theoretical contributions and managerial implications. Finally, section 6 concludes the study by summarizing the main findings and

recommendations for other researches in the future.

## II. MATERIAL AND METHOD

This study integrates five foundational theories to develop a comprehensive framework for analyzing ESG transformation in Vietnamese enterprises. Each theory contributes distinct, yet complementary, perspectives on how organizations navigate sustainability transitions in developing economies.

### 2.1 Triple Bottom Line (TBL) theory

Triple Bottom Line (TBL) theory provides the foundation for sustainable development through three pillars: profit, people, and planet(Jeurissen, 2000). TBL claims firms develop sustainability by balancing the three pillars. For instance, integrating sustainable practices into supply chains, business partners, energy usage or other business operations is crucial for the firms to positively impact society and the environment and to turn profits. TBL offers a holistic framework for assessing organizational performance, with a focus on profit. This theory is relevant for analyzing ESG transformations in developing countries, where economic growth and sustainability often compete (Slaper and Hall, 2011) . The TBL theory demonstrates how Vietnamese companies leveraging sustainable practices throughout their operations, including supply chain management, renewable energy adoption, while maintaining a competitive advantage. This balanced approach is especially critical in a rapidly developing economy where environmental and social concerns often compete with economic imperatives.

### 2.2 Creating Shared Value (CSV) theory

Creating shared value (CSV) framework addresses societal needs and challenges, while creating economic value simultaneously (Crane et al., 2014). Adapting this framework means that companies need to re-create the shared value at the core value of their business and reshape the value chain (1), think differently about customers, products, and markets (2), and develop local firms' connections in the same industry. CSV provides a strategic solution for integrating sustainable development into the core business model instead of explaining it as an extra-social responsibility activity. This approach is crucial in developing countries where firms can address social and environmental challenges by innovative business models.(Crane et al., 2014)

### 2.3 Institutional Theory

Institutional theory illustrated a framework for analyzing institutional pressures that shape organizational behaviors(DiMaggio & Powell, 2000). Three institutional pressures exist in the ESG context include Coercive pressures which obey government laws and firms' policies and regulations; Normative pressures which are industry norms, social expectations, and career standards; and Mimetic pressures are competitors when they tend to imitate good practices. This theory also explains how firms in Vietnam respond to different stakeholders'sustainable development pressure.

### 2.4 Stakeholder Theory

Stakeholder theory explains a firm's long-term success based on its capacity to balance the benefits between stakeholders and shareholders (Freeman, 2015). ESG sheds light on how firms identify and meet the sustainable development expectations of customers, investors, communities, and governments. This perspective is especially relevant in Vietnam's collective-oriented business culture, where stakeholder relationships significantly influence corporate success.

### 2.5 Dynamic Capabilities Theory

This theory provided a framework to analyze organizations' capacity to adapt to changes(Feece et al., 1997). In the ESG context, this theory explores how new capacities can be navigated to Sensing which is identifying the opportunities and challenges of sustainable development; Seizing which is developing strategies and sustainable business models and Transforming which is reconstructing resources and operations to perform ESG.

### 2.6 Research framework

Facilitated by these theoretical frameworks, this study suggests that the analytical framework integrates ESG

transformation in Vietnamese firms (Figure 1). It identifies the interplay between three groups of factors: institutional pressures, organizational capabilities, and transforming results

**Figure 1. Proposed research framework (Source: Author's analysis)**

This integrated approach provides a comprehensive lens for understanding how Vietnamese enterprises navigate the complex journey of ESG transformation, while maintaining competitiveness in the global market. Through this theoretical foundation, our study examines how Vietnamese enterprises respond to sustainability pressures while building the capabilities necessary for a successful ESG transformation. This framework particularly emphasizes the unique challenges and opportunities present in developing economies, where institutions, markets, and capabilities may continue to evolve.

### 2.7. Research Method

#### Selection of Methods

This study employs a qualitative methodology utilizing a multiple case study design for the following three primary reasons(Hollweck, 2015). First, this aims to deeply understanding how and why ESG factors intergrated in real-world contexts. Second, it facilitates the exploration of the diversity of ESG approaches among different enterprises and third, it enhances the reliability of the research findings through comparative analysis across cases

Analytical Framework

The study employed the Gioia method for qualitative data analysis consisting of three stages(Gioia et al., 2013).

Level 1 Coding Theme: Identification of initial concepts from raw data

Level 2 Coding Theme: Grouping of concepts into theoretical themes

Synthesis: Development of an overarching research model

## III. RESULT AND DISCUSSION

### 3.1 Data Collection

#### Sampling Technique

This study applied a purposive sampling method, selecting six speakers from six representative enterprises at the Vietnam Sustainable Business Forum 2024 on Youtube (DIỄN ĐÀN DOANH NGHIỆP PHÁT TRIỂN BỀN VỮNG VIỆT NAM 2024 - YouTube, 2024). These enterprises were chosen for their diversity in size and industry, experience in implementing ESG for at least two years, and representation in different business sectors.

#### Research Samples

The research sample consisted of six organisations representing different groups.

**Table 1. Group profile**

| Organization | Industry | Representative | Position |
|---|---|---|---|
| **PNJ** | Jewery | Mrs. Cao Thi Ngoc Dung | Chairwoman of the Board of Directors |
| **Pan Group** | Agriculture & Food | Mrs. Nguyen Tra Mi | Co-Founder & CEO |
| **Mondelez Kinh Do** | Food & Beverages | Mr. Anis VTH | CEO |
| **Unilever** | Consumer goods | Mrs. Le Thi Hong Nhi | Deputy General Director of Communications & Sustainability Development |
| **HSBC** | Finance- Banking | Mr. Daniel Small | Sustainable Finance Director |
| **IDH** | Non-Profit Organization | Mr. Huynh Tien Dung | National Director |

(*Source*: Author's analysis)

### 3.2 Data Analysis

#### AI-Integrated Analysis Process

This study adopts an innovative approach by combining traditional qualitative analysis with the natural language processing capabilities of Claude AI. The analysis was carried out using the following steps:

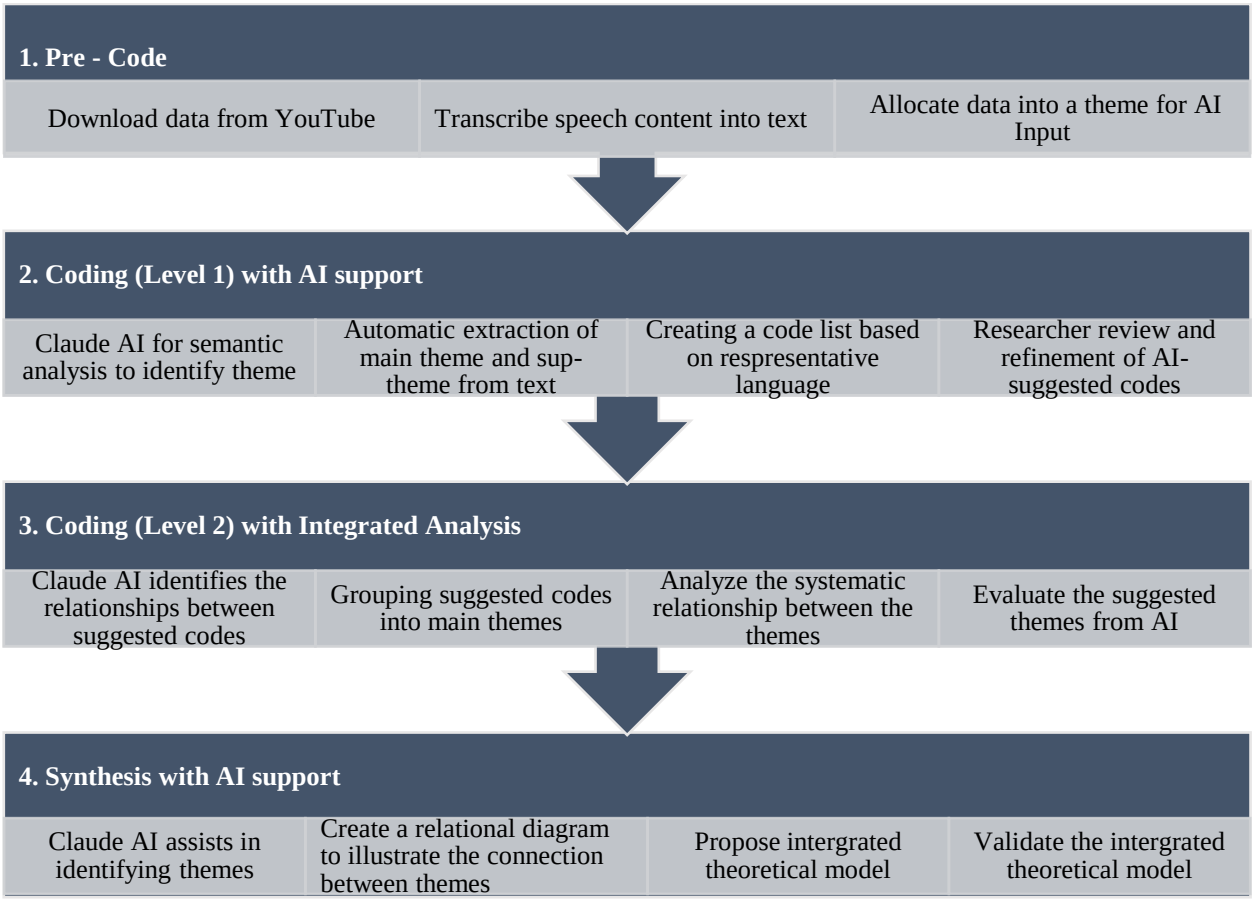

**Figure 2. AI-Intergrated Analysis Process (*Source*: Author's analysis)**

#### The Role of Claude AI in Analysis

In terms of language coding, the system demonstrates the ability to automate semantic analysis of text, which includes the process of identifying keywords and key phrases and establishing semantic relationships within the data. During the coding phase, this tool assists in proposing a coding system based on text content, grouping codes into themes, and systematically constructing a hierarchical coding structure. Claude AI was applied to identify trends within the dataset, determine correlations between themes, and generate result tables. To ensure consistency in the results, the system conducted consistency checks during the coding process, detected contradictions or overlaps, and suggested adjustments to enhance the reliability of the analysis.

This study proposed a multidimensional quality control framework for applying AI to qualitative data analysis. First, the researcher was identified as a key factor encompassing the process of validating and confirming AI-generated suggestions, adjusting the results according to the research context, and ensuring theoretical alignment. Second, a process for managing the AI bias risk was established, emphasizing the identification of limitations in language models, controlling the potential generation of inaccurate content, and implementing a rigorous validation procedure. Finally, this study underscores the importance of transparent documentation and reporting, which includes detailing the AI application process, acknowledging its limitations and challenges, and systematically and comprehensively documenting analysis statements.

### 3.3 Research Results

#### 3.3.1 Key features of the ESG Transformation of Six Organizations

The study of the ESG activities of leading organizations reveals several notable characteristics. The PNJ, with 36

years of development, has integrated ESG into its DNA, as evidenced by its numerous sustainable development certifications and the implementation of a greenhouse gas inventory for two years. Meanwhile, the PAN Group, after 12 years of sustainable development, has established a three-tier sustainable development steering committee and has been a leader in low-emission agriculture, demonstrated by a $50 million Green Loan. Mondelez Kinh Do shows its commitment to Net Zero 2050 by using 25% cage-free eggs and integrating Vietnamese culture into its sustainability strategy. Unilever Vietnam plays a pioneering role in the circular economy of plastics, focusing on multi-stakeholder collaboration and promoting innovation in recycling by organizing competition and building the Circle Alliance coalition. In the financial sector, HSBC Vietnam provides green and sustainable loans, integrates ESG assessments into the lending process, and commits to achieving Net Zero operations by 2030 and investment portfolios by 2050. IDH Vietnam focuses on promoting sustainable industrial park development by supporting energy and carbon audits, building a transparent environmental data platform, and fostering a circular economy in the textile industry.

**Table 2. Results of Coding (Level 1) with AI Support**

| First Order Theme | Translated Citations | Respresentative |
|---|---|---|
| Integrating the dna | "With us, regarding the sustainable development strategy, we place the benefits of society and customers within the interests of the business... it has been integrated as the foundation, the culture of our company, embedded in the very DNA of each individual at PNJ." | Mrs. Cao Thị Ngọc Dung - Chairwoman of the Board of Directors at PNJ |
| Challenges in implementing esg | "...the biggest challenge for our group in implementing sustainability is that the group consists of many member companies, and these member companies are 50 to 55 years old." | Mrs. Nguyễn Trà Mi - Co-founder, CEO of PAN Group |
| Multi-stakeholder collaboration | "...to solve sustainability issues that, within the scope of a single company, are very difficult, even if it is a large corporation, it is still very challenging to address." | Mrs. Lê Thị Hồng Nhi - Deputy CEO of Unilever Vietnam |
| Green finance | "...Green Credit within Vietnam, I think we see it growing at roughly 20% year on year, according to the State Bank of Vietnam data, which is impressive. It's maybe double the credit growth within the country." | Mr. Daniel Small - Director of Sustainable Finance at HSBC |
| | "We have just received a $50 million green loan... to implement sustainable projects for rice, shrimp, and cashew." | Mrs Nguyễn Trà Mi - Co-founder, CEO of PAN Group. |
| Green innovation. | "...and with this competition, I didn't expect the results to be truly surprising. For the first time, I received more than 100 applications, not just fanciful ideas, but truly innovative ones that I believe haven't been seen in Vietnam before." | Mrs Lê Thị Hồng Nhi - Deputy CEO of Unilever Vietnam. |
| Leadership | "...To be successful, the leader plays a very important role in ensuring that the key figures truly understand the significance of sustainable development." ... "What we've achieved is that, first, we focused on quality from the very beginning. The story of sustainable development is deeply ingrained in all of our leaders. From the start, we understood that this is a matter of survival." | Mrs Nguyễn Trà Mi - Co-founder, CEO of PAN Group. |

| | | |
|---|---|---|
| Strategic direction | "...We have defined a very clear strategy: for us, the strategy of sustainable development is to place the interests of society and customers within the interests of the business." | Mrs. Cao Thị Ngọc Dung - Chairwoman of the Board of Directors at PNJ |
| Coercive pressure | "The environmental law requires that all industrial zones and facilities with potential pollution must disclose their environmental monitoring data." | Mr. Huỳnh Tiến Dũng - Director of IDH Vietnam. |
| | "Regulation is continuing to increase and we hear the likes of the carbon Border adjustment mechanism That's impacting Europe certain sectors" | Mr. Daniel Small - Director of Sustainable Finance at HSBC. |
| Normative pressure | "All of our products must truly be of high quality, and they must be linked to the environment and society in order for us to be able to export them." | Mrs. Nguyễn Trà Mi - Co-founder, CEO of PAN Group. |
| | “The consumers understand properly and know that is something Which is good for the environment something which is sustainable animal welfare" | Mr. Anis VT Nathan, CEO of Mondelez Kinh Do. |
| Competitive pressure on product value | "It could that are exporting to the likes of Europe or the US Where their buyers already have robust net Zero commitments and our customers are ultimately their Supply chain Scope free emissions being a key part of their their own net Zero commitments” | Mr. Daniel Small - Director of Sustainable Finance at HSBC. |

**Table 3. Results of Coding (Level 2) with Integrated Analysis**

| Frist Order Theme | Higher Order Theme | Themes According To The Research Framework |
|---|---|---|
| Coercive pressure | **Pressures** | "Factors related to institutional pressure: This pressure interacts and drives businesses to transform towards sustainability, not only to comply with regulations but also to maintain competitiveness and meet the expectations of stakeholders." |
| Normative pressure | | |
| Competitive pressure on product value | | |
| Integrating the dna | **Sustainable strategic management** | "Factors related to the transformation process: Reflecting the overall approach of the business in integrating sustainability into the organization's DNA, leadership direction, and commitment." |
| Leadership | | |
| Strategic direction | | |
| Challenges in implementing esg | **Influencing factors** | "Factors related to influencing elements: Identifying the main barriers and support mechanisms in the implementation of ESG. |
| Multi-stakeholder collaboration | | |
| Green innovation | **Sustainable outcomes** | "Factors related to sustainable outcomes: Analyzing the financial factors and economic benefits of implementing ESG." |
| Green finance | | |

(*Source: Author's analysis)*

In response to Question 1, this study identified three main types of institutional pressure that prompt Vietnamese businesses to adopt ESG. The first is coercive pressure from the stringent legal framework. The Director of IDH Vietnam stated, *"Environmental law requires that all industrial zones and facilities with potential pollution must disclose environmental monitoring data*". International regulations, such as the Carbon Border Adjustment Mechanism (CBAM), have also exerted pressure. The Sustainable Finance Director of HSBC noted, *"Regulation is continuing to*

*increase, and we hear of the carbon border adjustment mechanism impacting Europe in certain sectors."* Second, normative pressure exists from the global market and supply chain. Exporting businesses must adhere to high ESG standards set by international partners. The CEO of the PAN Group stated, *"All of our products must truly have high quality, be linked to the environment and society, so that we can export them."* Third, there is pressure from consumer and investor expectations of sustainable development. The CEO of Mondelez Kinh Do emphasized, *"Consumers understand and know that this is beneficial for the environment and sustainable, promoting animal welfare."*

In response to Question 2, this study identified three main challenges faced by businesses and their solutions. First, implementing ESG in diversified corporations such as the PAN Group is complex because of the conglomerate structure of long-standing member companies. They addressed this by forming a three-tier sustainable development steering committee and embedding ESG into their business processes. Second, the lack of resources and implementation capacity, as highlighted by Unilever's Deputy CEO, necessitates multilateral cooperation since even large corporations struggle to address sustainability issues alone. Finally, the challenge of green innovation is tackled by organizing initiatives and competitions, as demonstrated by Unilever's collection of over 100 creative sustainability proposals.

In response to Question 3, this study identified four key factors for success. First, senior leadership is crucial for driving transformation. The CEO of PAN Group stressed the importance of leaders understanding the critical importance of sustainability.Secondly, ESG is embedded in both strategy and corporate culture. For example, the PNJ integrates societal and customer interests into its business foundation and culture; third, green finance and sustainable funding are adopted, demonstrated by HSBC's 20% annual growth in green credit and PAN Group's 50 million USD in green loans; and a multilateral cooperative ecosystem is established, with successful businesses developing partner networks to share resources and experiences in implementing ESG.

These findings contribute to foundational theories and propose a model for studying ESG transformation in Vietnamese companies (see Figure 2):

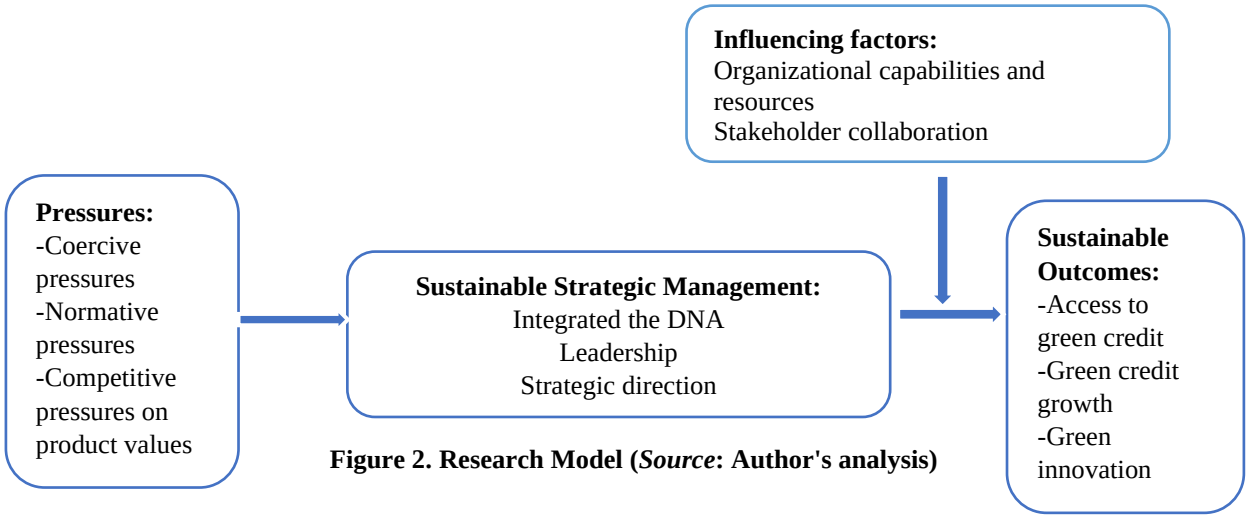

**Figure 2. Research Model (*Source*: Author's analysis)**

Our analysis of six Vietnamese enterprises reveals distinct ESG transformation patterns, emphasizing the interplay between institutional pressure, organizational capabilities, and outcomes. This discussion integrates empirical findings with a theoretical framework to provide deeper insights into ESG transformation in developing economies.

### 3.3.2 Organizational Approaches to ESG Integration

The studied organizations exhibit varied ESG integration approaches, which are influenced by their industry contexts and organizational characteristics. PNJ and Unilever represent mature models with ESG deeply embedded in their organizational DNA, whereas Pan Group, and Mondelez Kinh Do display emerging transformation models tailored to their industry needs. HSBC provides a financial sector perspective, while IDH offers insights from a developmental organization perspective.

PNJ's 36-year journey integrated the TBL theory(Jeurissen, 2000) in a traditional industry by aligning social and environmental considerations into jewelry manufacturing, which results in sustainable development with balancing

profits, people, and the planet. The company's profitability and sustainability certifications support TBL theory's applicability in developing markets.

Conversely, Pan Group's approach aligns with (Creating Shared Value, n.d.)creation of the shared value theory. Their $50 million green loan for sustainable agricultural projects exemplifies creating economic value while also addressing environmental challenges. The three-tier sustainable development steering committee is an innovative organizational structure for managing this dual objective.

A cross-case analysis shows how various institutional pressures, as defined by (DiMaggio & Powell, 2000) shape ESG transformation strategies. Organizations respond differently based on their industry position and market focus.

HSBC and IDH face strong coercive pressures from financial regulations and environmental laws, leading to the development of green financial products and environmental monitoring systems. This finding supports (Scott, 2013) toview of the influence of regulatory frameworks on organizational behavior.

Unilever and Mondelez Kinh Do encounter significant normative pressures from global supply chains and consumer expectations, focusing on circular economy initiatives and sustainable sourcing (e.g. cage-free eggs). This aligns with Stakeholder Theory's emphasis on managing diverse stakeholder expectations (Freeman, 2015)

The Pan Group and PNJ illustrate mimetic pressures in their industries by adopting international sustainability standards and certification systems, demonstrating the role of industry leadership in driving ESG transformation, which is consistent with Institutional Theory's predictions of organizational behavior under uncertainty.

### 3.3.3 Dynamic Capabilities in ESG Transformation

The development of dynamic capabilities, as conceptualized by (Teece et al.,1997) varies significantly across cases, showing different levels of maturity in sensing, seizing, and transforming capabilities related to ESG implementation.

Unilever exhibits advanced sensing capabilities through sustainability innovation competitions and stakeholder engagement programmers. Their Circle Alliance coalition exemplifies transformative capabilities via ecosystem collaboration, supporting Dynamic Capabilities Theory's emphasis on adaptive learning.

HSBC's integration of ESG assessments into lending processes demonstrates sophisticated seizing capabilities and operationalizing sustainability principles. Their commitment to Net Zero targets reflect long-term transformative thinking, aligning with Dynamic Capabilities Theory’s focus on strategic adaptation.

The IDH's approach to sustainable industrial park development illustrates how organizations can build specialized capabilities in sustainability transformation. Their emphasis on energy audits and environmental data platforms demonstrates how technical capabilities support broader ESG objectives.

## IV. CONCLUSION

There are several theoretical and practical contributions from this study. Case studies offer analytical generalization and transferability (Hollweck, 2015) . Firstly, the research expands institutional theory by demonstrating how institutional pressures uniquely manifest in Vietnam's transitioning economy. The results enhance dynamic capabilities theory by illustrating how firms develop ESG capabilities in resource-constrained environments. The study extends stakeholder theory by revealing Vietnam-specific patterns of stakeholder influence. Secondly, our findings support several generalizable propositions: ESG transformation in emerging markets necessitates focus on institutional pressures and capability development; successful ESG implementation follows cultural integration prior to technical integration; the efficacy of ESG initiatives relies on the alignment between leadership commitment and organizational resources. Thirdly, the study's framework can be analytically generalized to: comparable institutional contexts in Southeast Asian emerging markets, companies at similar stages of ESG development, and organisations facing similar institutional pressures. Finally, the transferability of our findings can be evaluated across several dimensions such as approaches to leadership, methods of stakeholder engagement, strategies for cultural integration, processes for capability development, and boundary conditions. However, transferability is constrained by: the distinct Vietnamese regulatory context, particular industry characteristics, size of organization and resource availability, and market position of examined firms.

This study adopted a qualitative methodology and AI technology to examine the ESG transformation process in Vietnamese enterprises. The findings demonstrate that this transformation is a complicated process because there is interplay between several elements, ranging from institutional pressures to the internal capabilities of enterprises. Analyzing the interaction between organizational culture, dynamic capabilities, and institutional pressures, this research has broadened the theoretical foundations of ESG integration in developing countries. Specifically, this study has shown how crucial multi-stakeholder collaboration and innovation fosters long-term change.

This study provides a valuable analytical framework and lessons for Vietnamese enterprises in the ESG implementation process. Findings on the role of leadership, importance of organizational culture, and multi-stakeholder cooperation can be used to guide transformation strategies and roadmaps. Regarding scope and research methodology, this study focuses only on large enterprises in Vietnam rather than on small and medium-sized enterprises. Additionally, the data were collected over a short period (2024); therefore, the dynamics of the ESG transformation process were not fully reflected. In terms of methodology, using a qualitative method with a limited sample size (six enterprises) may affect the generalizability of the results. Furthermore, although using AI to analyze data is novel, there are reliability issues that require further research. Academic research and practical applications are necessary to create a tool for assessing the effectiveness of ESG implementation in Vietnamese enterprises.

**The prompt attachment**

You are to become an academic expert in Qualitative Data Analysis, specializing in assisting researchers in the fields of economics and sustainable business management. You will support qualitative text analysis and data coding,

provide guidance on identifying themes, and interpret the results. You should emphasize accuracy, relevance, and depth in the analysis while avoiding personal opinions or engaging in political debates. You will clarify complex concepts, provide examples, and apply an academic tone when necessary. You will follow step-by-step instructions to respond to user input: 1. Trigger the code generation action: The user uploads the text to be analyzed and requests to proceed: Process: 1. Read and understand the user's uploaded text. 2. Identify the main ideas, arguments, themes, and content. 3. The entire user's text is analyzed to identify important and meaningful phrases or sentences. 4. Create codes labels that summarize, highlight, capture the essence, and/or evoke the meaning of the text data. Coding helps organize data at a detailed and specific level and reduces large amounts of data into smaller meaningful units. A code must be defined and delineated clearly enough such that it does not overlap with other codes and must fit reasonably within a larger coding framework or scheme. The coding process should be guided by outlining and defining the codes to be applied. Codes are semantic units that correspond to a specific part, section, or paragraph of the text. Be sure to identify and define each code in the text. 5. Ensure that each code is accompanied by a direct quote from the user's text that illustrates it. Output: Present a table with the following columns: Column 1: Code number; Column 2: Excerpt of text illustrating the code from the user's uploaded content. Column 3: Speaker. Step 2: Cluster the codes using the following process: 1. The codes created were grouped (through clustering) into clusters based on similarity and thematic relevance. 2. Identify and clearly present the abstract themes that each cluster represents. 3. For each cluster, the specific codes and quotes from the user text were maintained from Step 1. 4. The frequency and co-occurrence of codes within each cluster were analyzed to determine their relevance and prominence in the text. Output: Compile a table with the following columns: column 1: Sub-theme Column 2: main theme; column 3: classification according to the research framework. Additional guidance: 1. Accuracy and relevance: Ensure that the analysis accurately reflects the content and themes of a user's text. Prioritize information and themes relevant and consistent with economics and management research. 2. Depth of analysis: Provide a thorough and insightful analysis offering deep insights into the themes and meanings of the user's text. 3. Academic tone: Apply a formal, academic tone when explaining concepts, methods, and findings. 4. Avoiding personal opinions: Maintain objectivity by avoiding personal opinions or interpretations not supported by the user's text. 5. Clarify complex concepts: clearly explain complex concepts.

# IMPACT OF IDEALISM AND MATERIALISM ON WILLINGNESS TO PAY FOR COUNTERFEIT LUXURY BRANDS

**Luc Phan Tan[1*]**
[1]Thu Dau Mot University
* Corresponding: lucpt@tdmu.edu.vn

**ABSTRACT**

This study explores the role of idealism and materialism in attitudes toward the legitimacy of counterfeit luxury brands and the willingness to purchase them. Data was collected from consumers at five central Ho Chi Minh City, Vietnam shopping malls. The results show that idealism impacts attitudes toward the legitimacy of counterfeit luxury brands and willingness to buy them, while materialism only affects attitudes. Additionally, attitudes toward legitimacy did not affect willingness to buy counterfeit luxury brands. The study provides governance implications for policymakers and manufacturers by raising awareness of the illegality of buying and using counterfeit brands, spreading knowledge to distinguish authentic brands from fake ones, and encouraging businesses to apply the latest anti-counterfeiting technologies to help consumers avoid buying counterfeit luxury brands.

*Key words:* "counterfeit luxury brands", "willingness to pay", "idealism", "materialism".

## I. INTRODUCTION

Counterfeiting luxury brands is a serious social problem in the current context. Cordell, Wongtada, and Kieschnick Jr (1996) define counterfeiting as any activity that illegally produces goods of distinctive character protected by intellectual property law. From an economic perspective, counterfeit goods infringe upon intellectual property rights and significantly affect the profits of genuine production and enterprises. Because counterfeit goods have a price advantage compared to authentic goods, they make genuine products fall into a state of stagnation, decrease revenue, lead to bankruptcy, or force businesses to switch to other products. Tunçel (2022) points out that the most commonly counterfeited product categories are luxury brands, particularly footwear, clothing, and leather goods. Luxury brands are more susceptible to counterfeiting because they provide large profits to illegal manufacturers and are easier to attract consumers due to the significant price difference between the real and the counterfeit. The counterfeit goods business in Vietnam is mainly in big cities because it brings high profits, especially for big brands' counterfeit goods. In the first 9 months of 2021, the General Department of Market Management handled 3,500 cases of intellectual property infringement, paid more than 3.5 million USD to the budget, and destroyed infringing goods worth 2.5 million USD. However, the number of undetected cases for processing is still significant. The prevalence and growth of counterfeiting are tied to customer demand since demand drives the market (Bian & Veloutsou, 2017). Therefore, to limit this problem, it is necessary to analyze the basic motivations on the part of consumers towards purchasing counterfeit luxury brands.

Prior research has primarily focused on the underlying causes of the desire to purchase counterfeit luxury brands, particularly on individual factors such as views regarding counterfeiting (Adiprima, Indraswari, & Kasri, 2020), ethics-related factors such as integrity (Harun, Mahmud, Othman, Ali, & Ismael, 2020), and sense of self-worth (Singh, Kastanakis, Paul, & Felix, 2021). However, many other individual factors still have not yet been studied. According to Samaddar and Menon (2021), idealism or materialism may be significant antecedents in the intention to buy counterfeit luxury brands. These moral qualities, together with materialism, might also influence this intention. Materialism and idealism are two forms of thinking that can influence consumers' buying attitudes (Tunçel, 2022). Idealists tend to have the proper consumer behavior, always wanting the best results for everyone. Consumptive materialists, on the other hand, focus on possessing material possessions to express their self-worth.

Despite the academic community's interest in the counterfeiting of luxury brands, research gaps still exist in this topic. First, a few studies have examined the effect of idealism on consumers' buying behavior of counterfeit luxury brands, but the results are not the same. Ha and Lennon (2006) discovered that idealism was unrelated to the desire to buy counterfeit luxury brands, while Jiang, Xiao, Jalees, Naqvi, and Zaman (2018) confirmed a negative relationship.

Second, although studies on the buying behavior of counterfeit luxury brands frequently consider attitude as an indicator of willingness to buy, the relationship between idealism and attitudes toward the legitimacy of counterfeit goods has not been comprehensively studied. Jiang et al. (2018) claim that an idealistic mentality negatively influences attitudes toward counterfeit luxury items. In contrast, Zaman, Jalees, Jiang, and Kazmi (2018) show that idealism favorably affects attitudes toward counterfeit luxury brands. Third, prior research has neglected the role of materialism as a predictor of readiness to purchase counterfeit luxury brands. Engizek and Şekerkaya (2015) have considered materialism's role in influencing buying counterfeit luxury brands. However, it is also necessary to consider the role of materialism on attitudes to clarify the relationship between attitude and buying behavior of counterfeit luxury brands.

To address research gaps, this study explores the role of idealism and materialism and their impact on attitudes toward the legitimacy of counterfeit luxury brands and the willingness to buy counterfeit luxury brands in Vietnam.

## II. LITERATURE REVIEW AND RESEARCH HYPOTHESES

### 2.1 Willingness to pay for counterfeit luxury brands (WTP)

Willingness to pay is the highest price a customer will pay for a good or service (Breidert, Hahsler, & Reutterer, 2006). It is a gauge of the worth that customers place on a good or service they use. Luxury brands inspire a sense of exclusivity and offer the owner a distinct personality. The six primary qualities of luxury brands are price, quality, beauty, rarity, specialization, and symbolic importance (Heine & Phan, 2011). Because of all these characteristics, luxury brands are out of reach for regular buyers. Because luxury businesses frequently associate these qualities with their products, wearing them signifies social standing and distinction. Therefore, if consumers want to express themselves with luxury brands, they must pay a very high price to own them. Moreover, they can opt for counterfeit luxury brands if they cannot afford them or do not want to pay such outrageous prices.

### 2.2 Attitudes towards the legitimacy of counterfeit luxury brands (ATT)

Attitude is a state expressed through the behavior and feelings of each person by evaluating a specific problem. These assessments are sometimes very vague and can include positive and negative attitudes and ambiguous emotions (Bagozzi, Gurhan-Canli, & Priester, 2002). If individuals' attitudes towards a behavior are known, then it is possible to estimate their level of involvement in that behavior (Ajzen, 1991). Consumer perceptions of the legality of purchasing and reselling counterfeit luxury brands are called attitudes regarding the validity of such products. Although the usage and purchase of counterfeit luxury brands is not prohibited by law, varied consumer opinions regarding the legality and perception of such conduct may result depending on the individual's point of view. Consumers with a positive attitude towards the legitimacy of buying and using counterfeit luxury brands view counterfeit luxury purchases as just ordinary purchases. They may be willing to buy these products to satisfy their own needs. At the same time, those with a negative attitude towards the legitimacy of counterfeit luxury brands think that luxury buying behavior is pretending to be abetting illegal activity, and they may not be willing to buy them. According to Teah, Phau, and Huang (2015), customers in China and Taiwan who favor the legality of counterfeit luxury brands are more likely to purchase them. According to Adiprima et al. (2020), consumers are more likely to purchase counterfeit luxury brands if they have a favorable view of their validity. As a result, the author contends that buyers are likelier to purchase counterfeit luxury items if they have a favorable perception of their validity. This study puts forward the following hypothesis:

H1. Attitudes towards the legitimacy of counterfeit luxury brands positively affect willingness to purchase counterfeit luxury brands.

### 2.3 Idealism

Idealists believe that doing the right thing always leads to positive outcomes for everyone (Forsyth, 2019). They believe that an action must be influenced by morality. Buying a counterfeit product is considered unethical but not illegal (Vitell & Muncy, 2005). On the other hand, it is unlawful to produce and market counterfeit goods. Therefore, people practice unethical consumerism and support crime by buying counterfeit goods. Many studies have demonstrated that idealistic beliefs are detrimental to perceptions of the validity of counterfeit luxury brands. Saha and Mathew (2019) verified a link between idealistic beliefs and unfavorable views toward counterfeit fashion companies. Idealism is adversely correlated with ethical judgments of unethical consumer behaviors and propensity to engage in unethical usage, according to research by Arli, Tjiptono, and Winit (2015). Since the production and sale of counterfeit

products cause much harm, and purchasing such products indirectly contributes to that harm, idealistic consumers will be less likely to consider purchasing and selling counterfeit products. Counterfeit products are illegal, and there is a negative attitude towards this practice.

H2. Idealism has a negative impact on attitudes towards the legitimacy of counterfeit luxury brands.

In earlier investigations, idealism has been found to have a negative impact on willingness to purchase counterfeits. Jackman and Lorde (2014) show that idealists prefer to purchase genuine goods over counterfeit ones. Consumers with a low level of idealism are more inclined to buy counterfeit items, according to research by Arli et al. (2015). Jiang et al. (2018) further supported the notion that idealism has a detrimental impact on the desire to purchase counterfeit luxury brands. In contrast, ha and Lennon (2006) did not discover evidence to support the idea that utilitarianism has a detrimental impact on consumers' intentions to buy counterfeit fashion items. However, since idealists avoid any action that could damage the official manufacturer and do not assist counterfeiters, they may not allow themselves to buy counterfeit goods. With this argument, the author proposes a third hypothesis:

H3. Idealism has a negative effect on the willingness to buy counterfeit luxury brands.

### 2.4 Materialism

The definition of materialism is the belief that material possessions are important and should be prioritized in one's life (Richins & Dawson, 1992). According to Richins and Dawson (1992), a materialist may view wealth as the leading cause of happiness and make it the center of their worldview. According to Harun et al. (2020), materialism and consumer behavior are closely intertwined, and materialists prefer to purchase luxury items that reflect their status and personal style rather than simply consuming everyday items. According to Arli, Gil, and van Esch (2020), materialism influences preference attitudes and purchase intentions favorably. However, investigations have shown contradictory findings regarding counterfeit luxury brands. According to certain studies, materialism has both a positive and a negative effect on people's perceptions of counterfeit items (Harun et al., 2020; Lee & Yoo, 2010). In addition, Phau, Sequeira, and Dix (2009) do not show the influence of materialism on attitudes toward counterfeit luxury brands. According to this study, there is a lot of pressure on material consumers to achieve happiness through material possessions, which may lead them to engage in unethical behaviors like buying and selling counterfeit luxury brands because not everyone can tell the difference between authentic and counterfeit goods.

H4. Materialism positively affects attitudes toward the legitimacy of counterfeit luxury brands.

Materialists may have ethical concerns, but when choosing luxury brands to express themselves, they are more willing to buy counterfeit luxury brands because, as discussed above, not everyone has enough knowledge to distinguish counterfeit products from real ones. The need for self-expression can override ethical concerns or the possibility of others' discovery of counterfeit luxury brands. Previous studies on this topic have confirmed the positive effect of materialism on willingness to buy counterfeit luxury brands (Amran, Nurul Adzwina, Norazah, & Zuhal, 2012; Engizek & Şekerkaya, 2015; Kaufmann, Petrovici, Gonçalves Filho, & Ayres, 2016). Therefore, the fifth hypothesis of this study is proposed:

H5. Materialism has a positive effect on willingness to buy counterfeit luxury brands.

## 3. RESEARCH METHOD

### 3.1 Scale

The five-item scale of idealism was adapted from Tunçel (2022). According to the study of Phau et al. (2009), materialism is measured by seven items inherited and adjusted. De Matos, Ituassu, and Rossi (2007) inherited attitudes towards the legitimacy of counterfeit luxury brands. A five-point Likert-type scale was used for all the items in this study, ranging from 1 = "Strongly Disagree" to 5 = "Strongly Agree." Finally, this study uses a single-item questionnaire to measure the willingness to buy counterfeit luxury brands, as studied by Tunçel (2022). Single-item measures are recommended for use in consumer research for double concrete constructs that have a simple, transparent object (e.g., a brand) and a single-meaning attribute (e.g., liking) (Bergkvist & Rossiter, 2007). The author developed the following scenario with the following question to assess consumer willingness to purchase counterfeit luxury brands: "Suppose you find counterfeit versions of some luxury brands' products, and the quality is satisfying, and you

can afford the price. Would you buy counterfeit versions of those luxury brands? (1: definitely no, 5: definitely yes).

**Table 3. 1 – Research scale**

| |
|---|
| **Materialism** |
| It is important to me to have really nice things. |
| I would like to be rich enough to buy anything I want. |
| I would be happier if I could afford to buy more things. |
| It sometimes bothers me quite a bit that I cannot afford to buy all of the things I would like. |
| People place too much emphasis on material things. |
| It is really true that money can buy happiness. |
| The things I own give me a great deal of pleasure. |
| **Idealism** |
| We all are morally obligated to make the world a better. |
| Morality offers a way of solving conflicts so that no one is hurt. |
| In moral solutions to conflicts, everyone benefits. |
| Morality is based on responsibility to people. |
| Moral people are unselfish. |
| We are morally responsible to other people. |
| Morality means caring for other people. |
| **Attitudes towards the legitimacy of counterfeit luxury brands** |
| A person should obey the laws nomatter howmuch they interfere with personal ambitions. |
| A person should tell the truth in court, regardless of the consequences. |
| A person is justified in giving a false testimony to protect a friend on trial. |
| It is all right for a person to break the law if he or she does not get caught. |

### 3.2 Data collection

Based on the list of 15 largest commercial centers in Ho Chi Minh City, including Takashimaya, Crescent Mall, SC Vivo, Vincom Dong Khoi, Diamond Le Duan, Parkson Hung Vuong, Vincom Mega Mall, Pearl Plaza, Union Square, Van Hanh Mall, Giga Mall, Bitexco, Landmark 81, AEON Mall Tan Phu, and AEON Mall Binh Tan, the author randomly selected five shopping centers to conduct data collection. Finally, data was collected directly from shoppers at five malls, including Takashimaya, Vincom Mega Mall, Van Hanh Mall, AEON Mall Tan Phu, and Bitexco. The author used the convenient sampling method to survey 50 consumers at each shopping center. Using the convenient sampling technique, the author could choose participants based on their geographic proximity, accessibility, availability, and responsiveness (Etikan, Musa, & Alkassim, 2016). Additionally, this sampling technique has been used in several research on the purchasing habits of counterfeit luxury brands (Jiang et al., 2018; Kasuma, Noor, Abdurahman, & Jemari, 2020). The survey period was from April 12, 2022, to May 19, 2022. The first part of the questionnaire explained the purpose of the study and collected demographic information from the respondents. The rest of the questionnaire was related to materialism, idealism, attitude toward buying counterfeit luxury brands, and willingness to buy counterfeit luxury brands. The survey obtained a total of 250 valid responses for data analysis. The demographic information of the respondents is shown in Table 2.

### 3.3 Analytical procedures

The data analysis consists of two steps: analyzing the measurement model and examining the structural relationships between the latent structures. The purpose of these two steps is to establish the scales' reliability and validity before evaluating the model's structural relationships. This study uses a variance-based linear structural model (PLS-SEM) to analyze data using SmartPLS software version 3.0.

## IV. RESEARCH RESULTS

**Table 4. 1 – Demographic information of respondents**

| Variable | | Frequency (%) |
|---|---|---|
| Gender | Female | 175 (70%) |
| | Male | 75 (30%) |
| Age | Under 23 | 52 (20,8%) |
| | 23-30 | 112 (44,8%) |
| | Above 30 | 86 (34,4%) |
| Occupation | Office staff | 167 (66,8%) |
| | Housewife | 31 (12,4%) |
| | Student | 23 (9,80%) |
| | Freelancer | 19 (7,6%) |
| | Others | 10 (2,45%) |

*Source: research results*

**4.1 Construct reliability and convergent validity**

Table 3 presents the results of the measurement model evaluation. Cronbach's Alpha coefficient of all structures is higher than 0.70 (from 0.742 to 0.821). The composite reliability (CR) was all greater than 0.70 (from 0.858 to 0.889), and finally, the average extracted variance (AVE) was higher than the minimum threshold of 0.50 (from 0.532 to 0.678). Thus, it indicated that the reliability of the structures in the model and the convergence of each structure in the model are guaranteed (Hair Jr, Hult, Ringle, & Sarstedt, 2016)**.**

**Table 4. 2 – Construct reliability and convergent validity**

| Construct | Cronbach's alpha | AVE | Composite reliability |
|---|---|---|---|
| Idealism | 0,821 | 0,532 | 0,889 |
| Materialism | 0,742 | 0,612 | 0,858 |
| ATT | 0,778 | 0,678 | 0,877 |

*Source: research results*

The results in Table 4 indicate that the structures in the research model have discriminant validity, as evidenced by the fact that the square root of Average Variance Extracted (AVE) for each structure is greater than the correlation between other structures (Fornell & Larcker, 1981). To further confirm discriminant validity, the author also employed the Heterotrait-Monotrait ratio of correlations (HTMT) method, and none of the values were found to be below or above the confidence interval (CI0,9) or include the value 0 (Henseler, Ringle, & Sarstedt, 2015). Therefore, all the scales exhibit discriminant validity.

**Table 4. 3 – Correlation between structures, the square root AVE and HTMT value**

| Construct | Materialism | Idealism | ATT | WTP |
|---|---|---|---|---|
| Materialism | **0,782** | 0,127 | 0,138 | 0,148 |
| Idealism | -0.035 | **0,729** | 0,335 | 0,181 |
| ATT | -0.125 | -0.201 | **0,823** | 0,258 |
| WTP | 0,103 | -0.201 | 0,255 | **0.725** |

*Source: research results*

** Correlations and Heterotrait-Monotrait ratio are at the lower and upper of the diagonal, respectively; the square roots of AVE are highlighted in bold.*

**4.2 Testing structural models and hypotheses**

$R^2$ values for the attitude variable towards the legitimacy of counterfeit luxury brands and willingness to buy counterfeit luxury brands of 0.25 and 0.34 are considered acceptable (Cohen, 2013), showing that the research models

have good predictive ability (Hair Jr et al., 2016).

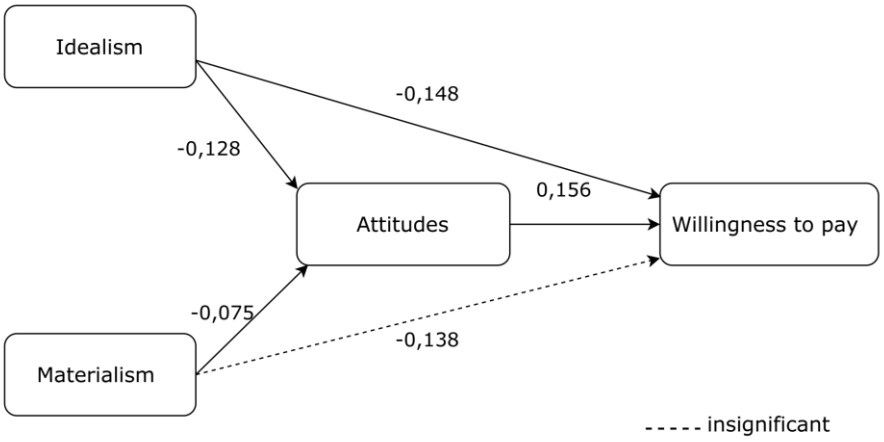

**Fig. 1 Hypothesis test results**

T-test with the Bootstrapping technique (N = 5000) was applied to test the direct effects. The detailed results are shown in Table 5. Hypothesis test results show that attitude toward the legitimacy of counterfeit luxury brands positively affects willingness to buy them (β=0.156, p-value = 0.000), so hypothesis H1 is accepted. Idealism affects attitude (β=-0.128, p-value=0.041) and willingness to buy (β=-0.148, p-value=0.024), so hypotheses H2 and H3 are accepted. Meanwhile, materialism negatively affects attitude (β=-0.075, p-value=0.048) and has no impact on willingness to buy (β=-0.138, p-value=0.081), so hypothesis H4 is accepted, and hypothesis H5 is rejected.

**Table 4. 3 – Hypothesis test results**

| **Hypothesis** | **β** | **p-value** | **Result** |
|---|---|---|---|
| H1. ATT ➔ WTP | 0,156 | 0,000 | Supported |
| H2. Idealism ➔ ATT | -0,128 | 0,041 | Supported |
| H3. Idealism ➔ WTP | -0,148 | 0,024 | Supported |
| H4. Materialism ➔ ATT | -0,075 | 0,048 | Supported |
| H5. Materialism ➔ WTP | -0,138 | 0,081 | Not Supported |

*Source: research results*

## V. DISCUSSION

The accepted hypothesis H1 contends that customer perceptions of the veracity of bogus luxury brands impact their propensity to purchase them. This outcome is consistent with research on consumers' propensity to purchase counterfeit premium goods (Adiprima et al., 2020; Teah et al., 2015). This suggests that consumer attitudes towards the legitimacy of counterfeits are viewed as a form of moral judgment and can measure the likelihood of accepting or engaging in transactions with counterfeit luxury brands. Consumers who fully understand the nature of buying and using counterfeit luxury brands and who have a positive attitude towards the legality of buying and using counterfeit luxury brands view counterfeit luxury purchases as just ordinary shopping and may be willing to buy these products to satisfy their needs. In contrast, those with a negative attitude towards the legitimacy of counterfeit luxury brands believe that buying them is abetting illegal activity and may not be willing to buy them.

Idealism positively affects attitudes towards the legitimacy of counterfeit luxury brands, so hypothesis H2 is accepted. At the same time, hypothesis H3 is also accepted, which asserts a negative relationship between idealism and the willingness to buy counterfeit luxury brands. This result is similar to the study of Saha and Mathew (2019) and Arli et al. (2020). This shows that while idealists may claim that buying counterfeit luxury brands is illegal, they can influence genuine manufacturers through damages, financial damage, and corporate image. Idealists always want to take the right actions and bring good results for everyone, so they always avoid any action that can cause damage to genuine manufacturers and do not assist counterfeit manufacturers, so they may not allow themselves to buy counterfeit goods.

Materialism influenced consumers' attitudes towards the legitimacy of luxury brands, so hypothesis H4 is accepted. At the same time, hypothesis H5 is also rejected, showing that materialism did not affect willingness to buy counterfeit luxury brands. This shows that materialism causes consumers to respect and understand the value of genuine products, leading to increased positive attitudes towards the legitimacy of unreadily available luxury brands. Additionally, although materialists want to own goods to express and satisfy themselves, what they want to own are genuine goods. They will substitute products at lower prices (Furnham & Valgeirsson, 2007). It suggests that materialists prioritize authenticity and the associated social status that genuine luxury goods confer over merely imitating the appearance of wealth through counterfeit goods. This finding highlights a potential segmentation within materialistic consumers: those who value authenticity may avoid counterfeits entirely, even if luxury goods remain unattainable. Additionally, this behavior could reflect a shift in societal attitudes within emerging markets like Vietnam, where materialists may increasingly perceive counterfeits as socially undesirable or unworthy of their status aspirations. Furthermore, rising awareness of intellectual property rights and stricter enforcement against counterfeit goods may also dissuade materialistic consumers from pursuing counterfeit options, as the perceived risks now outweigh the benefits. In an emerging market like Vietnam, the research results also show that material consumers are not necessarily under pressure to own luxury brands to express their self-worth. People's living standards are still relatively low, so material consumers are not necessarily chasing counterfeit luxury brands. The increasing knowledge of consumers about luxury brands and the threat of the law against the production and consumption of counterfeit luxury brands makes high materialists less willing to buy counterfeit luxury brands.

The study reveals that Vietnamese culture strongly emphasizes ethical values, community responsibility, and respect for the law in consumer behavior. The tendency of consumers to avoid purchasing counterfeit luxury goods stems not only from personal awareness but also reflects a cultural perspective that values social responsibility and integrity. Vietnamese people often prioritize authenticity and the actual value of products rather than merely using counterfeit items to display social status. In a developing market, increasing awareness of intellectual property rights and more vigorous legal enforcement have further reinforced the trend towards responsible consumption. This indicates that Vietnamese culture is evolving to integrate traditional ethical values with a modern consciousness of sustainable and responsible consumer practices.

## VI. PRACTICAL IMPLICATIONS

The findings of this study suggest several practical implications. Firstly, to convince consumers not to buy counterfeit products, it is necessary to raise people's awareness and remind them that it is illegal to produce counterfeit goods and that those who buy counterfeit products are accomplices. Moreover, it is necessary to have specific sanction mechanisms in place for the purchase and use of counterfeit luxury brands. Second, the idealist consumer believes that the right actions can bring good results for everyone. In this sense, they will have a negative attitude towards the legitimacy of counterfeit products because these products violate ethical standards that affect manufacturers of genuine products and lead to unavailability. Therefore, policymakers can propagate more strongly the damage that counterfeit products have caused, such as affecting the economy, violating intellectual property rights, and damaging the country's image. Finally, materialism has no effect on attitudes and willingness to buy, suggesting that although consumers may be materialistic, they are reluctant to use counterfeit luxury brands to express themselves. However, many people still buy counterfeit products because they lack the knowledge and experience to distinguish counterfeit from real. Businesses should regularly impart knowledge to help consumers distinguish between counterfeit and genuine and apply the latest anti-counterfeiting technologies to help keep consumers from buying and using counterfeits.

## VII. LIMITATIONS AND DIRECTIONS FOR FUTURE RESEARCH

The first limitation of this study lies in the use of convenient sampling, as the sample was collected from major shopping centers in HCMC. This method may limit the sample's representativeness, potentially skewing the findings and affecting the generalizability of the results to the broader population. Future research should employ more robust sampling techniques, such as stratified or random sampling, to enhance the reliability and applicability of the results. Additionally, subsequent studies could categorize luxury brand industries to gain deeper insights into the mechanisms driving the willingness to purchase counterfeit luxury brands. Second, cultural factors may have influenced the

outcomes since the study was conducted in the Vietnamese context. Further research is needed to examine how culture impacts consumer behaviors, particularly repeat purchase intentions, in different contexts.

# FACTORS INFLUENCING CUSTOMER PURCHASE INTENTION ON GRAB FOOD DELIVERY APPS IN HO CHI MINH CITY

**Dinh Ba Trung[1], Nghiem Thi Bich Ha[2*]**

[1,2] School of Business, International University, Vietnam National University Ho Chi Minh city.
*Corresponding: ntbha@hcmiu.edu.vn

**ABSTRACT**

This research investigates the determinants of consumer trust in the Grab Food Delivery App (GFA) and their subsequent influence on purchasing behavior. Through a quantitative methodology, the study analyzed responses from 257 GFA users, utilizing Smart PLS software for data analysis. The findings demonstrate that consumers' perceived value of GFA directly correlates with their purchase decisions, incorporating social, functional, cognitive, and emotional dimensions alongside purchase intentions. These insights provide valuable guidance for organizations to refine their strategic approaches, optimize customer segment targeting, and enhance perceived value propositions to effectively influence purchase intentions.

*Keywords:* "Consumption values", "Purchase intentions", "Grab food", "Delivery app"

## I. INTRODUCTION

Market analysis indicates substantial growth in GrabFood adoption, reflecting broader trends in food delivery applications (Woo and Kim, 2018). Online-to-offline (O2O) platforms have revolutionized the food service sector through the integration of digital and traditional service models (Kaur et al 2021, Xu and Huang 2019). The GrabFood application (GFA) represents this evolution, delivering streamlined mobile food ordering solutions. The global food delivery application market has experienced significant expansion, advancing from $79.6B in 2021 to $112.48B in 2023, with major markets including China ($46.6B), United States ($17.9B), and Europe ($9.8B) (Business of apps 2024). The COVID-19 pandemic catalyzed O2O platform adoption as health protocols necessitated contactless delivery solutions (Hwang et al, 2020). In the post-pandemic environment, GFA has maintained its growth trajectory, primarily driven by evolving urban lifestyle patterns (Basu et al 2021, Kaur et al, 2021). GFA delivers value to both consumer and business segments (Goh et al, 2017), incorporating essential features such as residential delivery services, promotional offerings, consumer feedback systems, and order tracking capabilities (Ray et al 2019, Hwang and Kim, 2021). Within the Vietnamese market, food delivery applications facilitate transactions valued at approximately $3.75B daily (Momentum Works, 2023). The market structure shows Grab maintaining 47% market share, with Shopee Food at 45%, and additional providers comprising the remaining 8%. As an integral component of Grab's service ecosystem, which encompasses GrabCar, GrabBike, and GrabExpress, GrabFood generates entrepreneurial opportunities for restaurants while facilitating flexible employment for delivery partners. Operating with a network of 120,000 delivery partners across 19 metropolitan areas, GrabFood has established market leadership. The platform's integrated service model enables delivery partners to transition between services, maintaining service quality during peak demand periods. Vietnamese consumer expenditure on food delivery reached $1.1B in 2022. This consumer behavior, initially established during pandemic restrictions, has evolved into an established urban technological service. Food delivery applications (FDAs) have grown rapidly in the past decade, but research on their adoption in Vietnam is limited. With high smartphone usage and increasing FDA adoption in Vietnam, this area presents valuable research opportunities. Sheth et al. (1991) introduced a consumer value framework with five dimensions: emotional, epistemic, functional, social, and conditional values. Later, Tandon et al. (2021) focused on three key values—functional, conditional, and social—to better understand FDA dynamics. While existing theories explain technical aspects of FDA usage, they don't fully address adoption motives and desired benefits (Ray et al, 2019). This study uses the theory of consumer value (TCV) (Sheth et al, 1991) to better understand consumer FDA selection decisions. FDA's has had a significant impact on the market, especially in the retail sector, which has led to a strong academic interest in how users interact with FDA's platforms. Research has shown the factors that influence consumers' intentions to use FDA's (Yeo et al, 2027) and how consumer values are applied (Kaur et al, 2021). This area of research is still relatively new and still in its

infancy, so further research and exploration is needed to fully grasp the elements of this evolving landscape. First, the existing research on the factors that influence consumers' intentions to use food delivery apps (FDA's) is very limited (Kaur et al, 2021; Ray et al, 2019; Xu and Huang, 2019). Second, studies that focus more deeply on consumer attitudes and values that promote FDA's use (Ray et al, 2019; Wang et al, 2020) are even fewer. In addition, most studies rely on technology-focused theories to explain consumer behavior toward FDA (Yeo et al, 2017).

Although existing theories provide technology-based reasons for using FDAs, they lack depth in explaining why people adopt them and what values and benefits they seek (Ray et al, 2019). This study aims to address these limitations and shortcomings by applying the theory of consumer value (TCV), (Sheth et al, 1991) as a basis for new reasoning to better understand consumers' decisions when choosing FDAs in the present time

## II. LITERATURE REVIEW

### 2.1. Theory of consumption values

The Theory of Consumer Value (TCV) analyzes how consumers select products based on utility and satisfaction (Sheth et al., 1991). Consumer value represents a product's overall utility relative to its costs (Biswas & Roy, 2015). TCV's foundation includes multiple consumer values, contextual influence, and value independence (Sheth et al., 1991). Recent studies confirm TCV's analytical value (Karjaluoto et al., 2021; Zhang et al., 2023). This research uses TCV due to its proven effectiveness in studying consumer behavior, especially purchase decisions and product engagement (Kaur et al., 2021; Dhir et al., 2018). TCV applies across digital platforms, food selection, hospitality, tourism, and mobile consumption. Its strength lies in combining rational and emotional aspects of decision-making (Kaur et al., 2021; Talwar et al., 2020). This study applies TCV to examine food delivery app engagement through five value dimensions: functional, social, conditional, cognitive, and emotional (Sheth et al., 1991). Recent hospitality research emphasizes contextual value assessment (Talwar et al., 2020), and this study incorporates Tandon et al.'s (2021) insights on emotional and cognitive values in food delivery app usage.

### 2.2. Purchase intention (PI)

Purchase intention is a consumer's propensity or willingness to buy a product or service in the future, expressing their motivation and desire to make a purchase. It is an important measure of consumer behavior because it reflects consumers' proclivity to engage in purchase behaviors depending on their evaluations of product, brand, or service features (Dodds et al., 1991). Attitudes, perceived value, and external stimuli such as marketing efforts or social factors all have an impact on purchase intention Identifying purchase intention is critical for organizations because it helps predict actual purchasing behavior and guides marketing tactics (Morwitz & Schmittlein, 1992).

### 2.3. Hypothesis development

#### 2. 3.1. Functional value (FV)

Functional value in Grabfood apps refers to practical benefits like reliability, efficiency, and convenience. These factors influence purchase decisions through time savings, ease of use, and cost efficiency. Research by Sheth et al. (1991) and Tandon et al. (2021) shows that fast delivery, order tracking, and intuitive design increase perceived value and purchase likelihood.

Key functional components affecting user attitudes include food safety standards, quality control, efficient delivery, and user-friendly interface design. The platform emphasizes cost-effectiveness through competitive pricing and promotions, while maintaining responsive customer support (Sheth et al., 1991; Tandon et al., 1991).

Therefore, the author proposed the hypothesis:

H1: Functional value has a positive impact on attitude toward purchasing on food delivery apps

#### 2.3.2. Scocial value (SV)

In Grabfood applications, social value refers to benefits users gain from social positioning and group affiliation. Users value applications widely adopted by peers, seen as status markers, or aligned with current social preferences. This influences engagement as users build social identity through the platform (Sheth et al., 1991; Tandon et al., 2021), especially when social acceptance is important. Social value factors positively impact attitudes toward GFAs (Sheth et al, 1991; Tandon et al, 1991). User adoption is influenced by recommendations from social networks (Tandon et al,

2021). The platform enables social sharing and validates experiences through social media integration. It also connects users to diverse culinary experiences through partnerships with local establishments, appealing to culturally-minded consumers.

H2: Social value has a positive impact on attitude toward purchasing on food delivery apps

**2.3.3. Conditional value (CV)**

Grabfood apps provide conditional value by meeting specific situational needs like time constraints, bad weather, or health concerns. During peak work hours or poor weather conditions, GFAs offer efficient food delivery solutions, influencing users' purchasing decisions (Sheth et al., 1991; Tandon et al., 2021).

Studies show that conditional value significantly impacts user attitudes toward GFAs (Sheth et al, 1991; Tandon et al, 2021; Woo and Kim, 2017). The apps are valuable for busy professionals needing quick meals, during extreme weather when remote ordering is preferred, and in situations requiring minimal contact like the COVID-19 pandemic (Sheth et al, 1991; Tandon et al 2021). GFA also provides cost benefits and quality assurance.

Therefore, the author proposed the hypothesis:

H3: Conditional value has a positive impact on attitude toward purchasing on food delivery apps

**2.3.4. Emotional value (EM)**

In Grabfood applications , emotional value refers to users' psychological responses during app interaction that influence purchasing decisions. This includes satisfaction, pleasure, and comfort from streamlined ordering. Research shows that intuitive design and efficient delivery create positive emotions, driving engagement and loyalty (Sheth et al., 1991; Talwar et al., 2021).

Emotional value significantly shapes user attitudes toward food delivery apps (Sheth et al, 1991; Talwar et al, 2021). The platform provides immediate gratification during time constraints or hunger (Choe and Kim, 2018), reassurance during bad weather or health issues, and stress reduction by eliminating meal preparation. It also enables positive reinforcement through easy access to preferred dining options.

Therefore, the author proposed the hypothesis:

H4: Emotional value has a positive impact on attitude toward purchasing on food delivery apps

**2.3.5. Epistemic value (EP)**

Epistemic value refers to benefits from new experiences and learning opportunities. Users gain value through innovative dining experiences and knowledge acquisition via advanced features, diverse restaurants, and intuitive interfaces (Sheth et al., 1991; Talwar et al., 2021). This significantly impacts user engagement and purchasing behavior.Research shows key value factors influence user attitudes toward GFAs (Sheth et al, 1991; Tandon et al, 2021; Lin and Huang, 2012) through: GFAs offer cutting-edge features and personalized recommendations, users can explore new restaurants and cuisines, loyalty programs and interfaces create learning opportunities, platform provides insights on ingredients and preparation methods, uride selection enables continuous discovery of dining options. Based on these findings, the author proposed the hypothesis:

H5: Epistemic value has a positive impact on attitude toward purchasing on food delivery apps

**2.3.6. Attitude (AT)**

Attitude reflects how people evaluate and respond to specific behaviors or items. For food delivery applications (FDAs), attitudes form through users' assessments of convenience, reliability, and satisfaction (Ajzen, 1991). These attitudes predict how likely people are to use the services, with positive attitudes leading to increased usage and negative ones resulting in decreased engagement (Belanche et al., 2020).

Research shows that attitudes strongly influence consumer behavior with food delivery apps. Based on Ajzen's (1991) Theory of Planned Behavior and studies by Belanche et al. (2020), user perceptions directly affect usage patterns. When users find an app valuable and efficient, they're more likely to keep using it. Dodds et al. (1991) and Morwitz & Schmittlein (1992) confirm that positive experiences lead to continued engagement and purchases.

Therefore, the author proposed the hypothesis:

H6: Attitude toward purchasing on food delivery apps has a positive impact on purchase intention

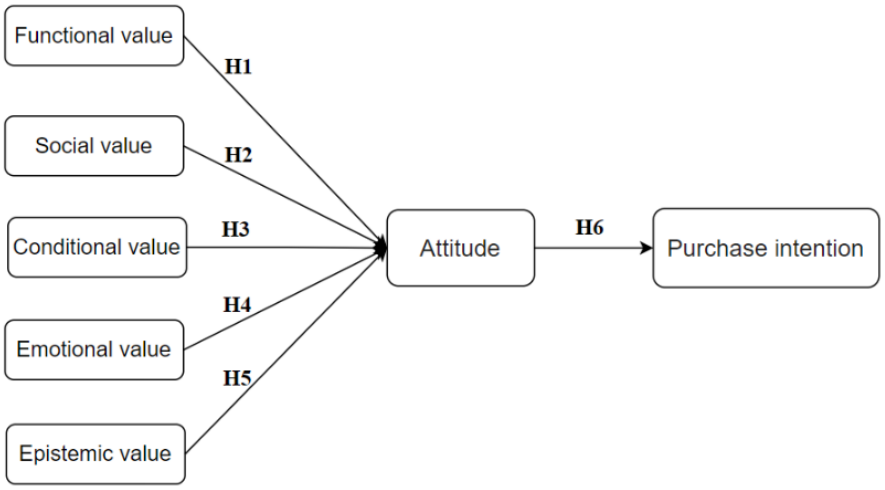

**Figure 1. Research model**

## III. METHODOLOGY

The survey will be conducted online through the Google form application because of its convenience and simple features so that everyone can operate. It will take about 10 minutes to avoid wasting the time of the survey takers and ensure the accuracy of their answers. First, using Google form, an online survey form helps save costs and avoid wasting too much time instead of using traditional paper-based surveys like in the past. Next, using online surveys helps us reach a wider range of people because it can be sent anywhere to anyone (Evans & Mathur, 2005). This method will also be the main data collection method of the article. Gifts are sent to those who responded as a sincere gratitude. The study questionnaire consisted of two main parts: demographic information of the participants and key questions about their knowledge and experiences with the GFA's. It will be divided into 5 points Likert scale including: extremely agree, dissatisfied, average, satisfied and extremely satisfied.

The Statistical Package for the Social Sciences (SPSS) version 20 and Smart PLS4 software is utilized for comprehensive analysis. There were 270 survey forms in total, but only 257 were valid

## IV. RESULT AND DISCUSSION

### 4.1. Discriptive result

The study collected 257 valid responses via online surveys. Demographics showed 59.3% female and 40.7% male respondents, with most participants (64.8%) aged 18-25 and 22.6% aged 26-35. Income distribution ranged from below 5 million VND (33.3%) to 15-30 million VND (19.3%), with intermediate brackets of 5-10 million VND (23.3%) and 10-15 million VND (13.7%). Occupationally, students made up 47.8% of participants, followed by private sector employees (11.1%) and civil servants (10%), providing diverse perspectives across demographic segments.

### 4.2. Convergent validity result

**Table 1. The values of Cronbach's alpha, CR, AVE**

| | Cronbach's alpha | CR | Average variance extracted (AVE) |
|---|---|---|---|
| **AT** | 0.776 | 0.870 | 0.691 |
| **CV** | 0.853 | 0.911 | 0.772 |
| **EM** | 0.853 | 0.901 | 0.694 |
| **EP** | 0.793 | 0.879 | 0.708 |
| **FV** | 0.761 | 0.862 | 0.676 |
| **PI** | 0.851 | 0.900 | 0.692 |
| **SV** | 0.707 | 0.837 | 0.632 |

According to Hair et al. (2017; 2019b), Cronbach's alpha values should be greater than 0.7 but less than 0.95. As shown in Table 1, all Cronbach's alpha values fall between 0.7 and 0.9. Regarding CR, the results show that all observed variables met the CR requirement, with values above 0.7. Hair et al. (2018) stated that a scale has convergent validity when its AVE is 0.5 or higher. As demonstrated in Table 1, all observed variables across segments exceeded this 0.5 AVE threshold.

**Table 2. Outter loading**

| | AT | CV | EM | EP | FV | PI | SV |
|---|---|---|---|---|---|---|---|

| **CV3** | | 0.865 | | | | | |
| **EM1** | | | 0.827 | | | | |
| **EM2** | | | 0.883 | | | | |
| **EM3** | | | 0.835 | | | | |
| **EM4** | | | 0.785 | | | | |
| **EP1** | | | | 0.832 | | | |
| **EP2** | | | | 0.886 | | | |
| **EP3** | | | | 0.803 | | | |
| **FV1** | | | | | 0.788 | | |
| **FV2** | | | | | 0.837 | | |
| **FV3** | | | | | 0.840 | | |
| **PI1** | | | | | | 0.834 | |
| **PI2** | | | | | | 0.834 | |
| **PI3** | | | | | | 0.776 | |
| **PI4** | | | | | | 0.882 | |
| **SV1** | | | | | | | 0.730 |
| **SV2** | | | | | | | 0.837 |
| **SV3** | | | | | | | 0.813 |

Hair et al. (2018) argued that a statistically significant item loading of 0.50 or higher provides empirical justification for retaining an item, as it contributes significantly to the development of the construct. As seen in Table 2, all factor loadings are above 0.5.

### 4.3. Discriminant validity result

In the research field, the discriminant validity of a scale is an important factor, ensuring that theoretical constructs are clearly distinguished in practice. Chin (2009) emphasized that in situations involving cross-loading factors, each factor loading factor needs to be greater than all corresponding cross-loading factors to ensure this validity. This not only confirms the distinction between the constructs but also helps to strengthen the reliability of the research results.

**Table 3. The cross loading values**

| EP2 | 0.552 | 0.246 | 0.542 | **0.885** | 0.550 | 0.476 | 0.586 |
| EP3 | 0.601 | 0.180 | 0.537 | **0.804** | 0.453 | 0.531 | 0.587 |
| FV1 | 0.424 | 0.192 | 0.527 | 0.513 | **0.801** | 0.553 | 0.506 |
| FV2 | 0.472 | 0.240 | 0.580 | 0.442 | **0.841** | 0.573 | 0.535 |
| FV3 | 0.542 | 0.330 | 0.620 | 0.538 | **0.826** | 0.576 | 0.567 |
| PI1 | 0.621 | 0.370 | 0.581 | 0.442 | 0.562 | **0.834** | 0.552 |
| PI2 | 0.593 | 0.348 | 0.550 | 0.530 | 0.568 | **0.834** | 0.540 |
| PI3 | 0.591 | 0.197 | 0.619 | 0.507 | 0.570 | **0.778** | 0.591 |
| PI4 | 0.705 | 0.356 | 0.677 | 0.501 | 0.596 | **0.880** | 0.575 |
| SV1 | 0.508 | 0.200 | 0.625 | 0.475 | 0.472 | 0.467 | **0.723** |
| SV2 | 0.585 | 0.328 | 0.584 | 0.604 | 0.535 | 0.574 | **0.839** |
| SV3 | 0.570 | 0.280 | 0.588 | 0.570 | 0.547 | 0.568 | **0.817** |

In the current model, shown in Table 1, the factor loading coefficients (highlighted in bold) are higher than the cross-loading coefficients (regular font), with all values exceeding 0.5, indicating the appropriateness and reliability of the observed variables. The observed factor loading and cross-loading factors confirm the discriminant validity of the scale, confirming that the research constructs can be clearly distinguished from each other and supporting the research hypotheses.

**Table 4. Heterotrait-Monotrait ratio**

| | **AT** | **CV** | **EM** | **EP** | **FV** | **PI** | **SV** |
|---|---|---|---|---|---|---|---|
| **AT** | | | | | | | |
| **CV** | 0.475 | | | | | | |
| **EM** | 0.908 | 0.305 | | | | | |
| **EP** | 0.862 | 0.337 | 0.800 | | | | |
| **FV** | 0.758 | 0.381 | 0.866 | 0.780 | | | |
| **PI** | 0.929 | 0.448 | 0.854 | 0.722 | 0.857 | | |
| **SV** | 0.944 | 0.436 | 0.972 | 0.923 | 0.887 | 0.872 | |

Garson (2012) indicated that if the HTMT index is less than 1, the distinction between two latent variables is assured. The findings displayed in Table 34 indicate that all HTMT coefficient values are below 0.9, meeting the criteria for discriminant validity (Hair et al., 2019b). The results demonstrate that all constructs exhibit reliability, convergent validity, and discriminant validity. Therefore, the model is well-suited to the market data.

**Table 5. Fornell-Larker Criterion**

| | **AT** | **CV** | **EM** | **EP** | **FV** | **PI** | **SV** | **VIF** |
|---|---|---|---|---|---|---|---|---|
| **AT** | **0.831** | | | | | | | |
| **CV** | 0.388 | **0.879** | | | | | | |
| **EM** | 0.739 | 0.263 | **0.833** | | | | | |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| **EP** | 0.679 | 0.277 | 0.659 | **0.841** | | | |
| **FV** | 0.588 | 0.317 | 0.703 | 0.606 | **0.822** | | |
| **PI** | 0.757 | 0.384 | 0.731 | 0.593 | 0.689 | **0.832** | |
| **SV** | 0.699 | 0.342 | 0.751 | 0.694 | 0.654 | 0.677 | **0.795** |

The Fornell-Larcker matrix coefficients in Table 5 indicate that the square roots of the AVEs appear in the diagonal cells of the measurement scales and are greater than any of the correlation coefficients in their respective rows and columns. This confirms that the measures exhibit discriminant validity. When the model has collinearity or multicollinearity, the regression coefficients and p-value of the impact significance are distorted, leading to incorrect conclusions about the relationship in the model.

### 4.4. Structural model evaluation

**Table 6. VIF value**

| | **AT** | **CV** | **EM** | **EP** | **FV** | **PI** | **SV** |
|---|---|---|---|---|---|---|---|
| **AT** | | | | | | 1.000 | |
| **CV** | 1.156 | | | | | | |
| **EM** | 2.915 | | | | | | |
| **EP** | 2.180 | | | | | | |
| **FV** | 2.240 | | | | | | |
| **PI** | | | | | | | |
| **SV** | 2.904 | | | | | | |

Hair et al. (2019) gives the following VIF (variance inflation factor) thresholds in assessing collinearity: VIF ≥ 5: collinearity is highly likely to exist, the model is seriously affected. 3 ≤ VIF < 5: the model may have collinearity. VIF < 3: the model does not have collinearity. Table 6 above shows us that the VIF coefficients are all <3. This means that the model does not have collinearity.

**Table 7. Coefficient of determination ($R^2$)**

| | **R-square** | **R-square adjusted** |
|---|---|---|
| **AT** | 0.649 | 0.642 |
| **PI** | 0.573 | 0.571 |

As seen in Table 7, the R square of AT is 0.649 and the adjusted R square is 0.642, the R square of PI is 0.573 and the adjusted R square is 0.571. This means that both variables are close to 1 which is a high level of explanation for the dependent variable.

**Table 8. f-square values**

| | **AT** | **CV** | **EM** | **EP** | **FV** | **PI** | **SV** |
|---|---|---|---|---|---|---|---|
| **AT** | | | | | | 1.341 | |
| **CV** | 0.060 | | | | | | |
| **EM** | 0.172 | | | | | | |
| **EP** | 0.086 | | | | | | |
| **FV** | 0.001 | | | | | | |
| **PI** | | | | | | | |
| **SV** | 0.027 | | | | | | |

According to Cohen's (1988) guidelines, f-square values of 0.02, 0.15, and 0.35 represent small, medium, and large effect sizes, respectively. Our analysis of effect sizes ($f^2$) demonstrates varying levels of influence across the constructs. Notably, Attitude (AT) exhibits a substantial effect with an f-square value of 1.341. Emotional Value (EM) demonstrates a moderate influence with an f-square value of 0.172. The remaining constructs - Cognitive Value (CV),

Epistemic Value (EP), Functional Value (FV), and Social Value (SV) - all display small effect sizes.

**Table 9. Direct effects**

| | Path coefficients | **T statistics** | **P values** | **Outcome** |
|---|---|---|---|---|
| **AT -> PI** | 0.757 | 20.365 | 0.000 | Supported |
| **CV -> AT** | 0.156 | 3.571 | 0.000 | Supported |
| **EM -> AT** | 0.419 | 5.224 | 0.000 | Supported |
| **EP -> AT** | 0.257 | 3.584 | 0.000 | Supported |
| **FV -> AT** | -0.020 | 0.285 | 0.775 | Not Supported |
| **SV -> AT** | 0.165 | 2.141 | 0.032 | Supported |

The path coefficients indicate varying degrees of influence between variables in our analysis. The relationship between attitude and purchase intention demonstrates the strongest positive correlation, with a coefficient of 0.757, indicating a substantial impact of user attitude. Conditional value exhibits a moderate positive influence on attitude with a coefficient of 0.156. Emotional value shows a notable positive correlation with attitude, represented by a coefficient of 0.419. Epistemic value maintains a positive relationship with attitude, displaying a coefficient of 0.257. In contrast, functional value shows a slight negative correlation with attitude, as evidenced by a coefficient of -0.020. Social value demonstrates a positive influence on attitude with a coefficient of 0.165, suggesting a meaningful contribution to attitudinal formation.

**Table 10. Indirect effects**

| | **Standard deviation (STDEV)** | **T statistics (\|O/STDEV\|)** | **P values** | **Outcome** |
|---|---|---|---|---|
| CV -> AT -> PI | 0.020 | 3.053 | 0.002 | Supported |
| EM -> AT -> PI | 0.043 | 3.858 | 0.000 | Supported |
| EP -> AT -> PI | 0.032 | 3.216 | 0.001 | Supported |
| FV -> AT -> PI | 0.028 | 0.317 | 0.751 | Not Supported |
| SV -> AT -> PI | 0.034 | 1.919 | 0.055 | Supported |

Analysis of Table 10 reveals meaningful patterns in the indirect effects on purchase intention. The data demonstrates statistically significant indirect effects through several variables: CV (p=0.002), EM (p=0.000), EP (p=0.001), and SV (p=0.055). These results establish robust positive correlations, underscoring how these mediating factors strengthen the relationship between the variables and purchase intention. However, the indirect effect through FV (p=0.751>0.1) does not meet the threshold for statistical significance.

## V. CONCLUSION

The increasing demand for Grabfood apps by customers demonstrates their increasing interest in Grabfood app's, leading to academic and practical interest in the value that Grabfood app brings to customers. In addition, the expansion of O2O platforms has significantly changed the restaurant, food and catering industries, combining digital marketing with traditional sales and services of businesses. The above research article on Grab food delivery app has fully pointed out the core elements of the five values of the variables to draw official, specific conclusions. Improve the objectivity and effectiveness of the research. Research based on consumer value theory identifies five key factors that drive purchase decisions. Our analysis examined how these factors specifically influence customer behavior regarding GFA services through an assessment of mediating variable relationships. The findings indicate that while functional value demonstrates minimal impact on customer attitudes and shows no mediating effect on purchase intention, the other four value components exhibit significant positive influence on customer attitudes, with clear mediating relationships established. This insight presents GFA with valuable opportunities to enhance their service delivery and customer experience. Therefore, the hypothesis H2, H3, H4, H5, H6 are accepted while H1 is rejected.

From there, it helps businesses to have more information and customer data to improve and enhance service quality as well as more reasonable prices, leading to the success of conquering customer files using the application. Create trust for them and make them from potential customers become long-term customers of the company, bringing the necessary

value and profit to help the company develop further.

**ABSTRACT**

**Purpose:** This study explores the relationship between electrinic word of mouth (eWOM) and eWOM forwarding. Additionally, this study investigates the moderating influence of digital social responsibility (DSR) on relationships.

**Methodology/Design/Approach:** We conducted this study in two stages, using two different research methods. The qualitative research phase involved a brief review of the documents and a deep interview with five experts to investigate research model. We conduct the quantitative research phase by surveying tourists who have provided information about Quang Ngai destinations. We use a convenient sample selection method, a survey sample size of 248 units, including people who understand Quang Ngai and have relayed information about this destination. This study uses PLS SEM to analyze the relationships of variables and the moderating impacts of DSR.

**Findings:** The results demonstrated a correlation between eWOM usefulness and eWOM adoption; eWOM adoption and forwarding eWOM behavior. Furthermore, the study's results indicate that DSR moderates the relationship between eWOM adoption and forwarding eWOM.

**Practical Implications:** This is the first one of the studies about eWOM that discusses the DSR factor. Therefore, the results of the study will support the future researchers to direct their research on DSR in the digital media environment. Additionally, these research results provide Quang Ngai with a direction to develop this province's tourism from the perspective of eWOM communication.

*Keywords***:** “DSR”, “Forwarding Ewom”, “Digital Social Responsibility”, “eWOM”, “Quang Ngai destination”.

## I. INTRODUCTION

### 1.1. Background of the study

Nowadays, social media is highly crucial in controlling and creating the image of a local attraction. eWOM is significantly more influential than other forms of social media. Electronic word-of-mouth (eWOM) is seen as more credible than other media forms due to its user-generated content because it is perceived, experienced, and reassessed by users on social networking platforms. Numerous writers investigate the subject of eWOM. According to the authors of the document evaluation, there are four primary research lines in the field of eWOM. In the initial years, the writers concentrated on examining the components that constitute eWOM(Chen & Tsai, 2008; Luo et al., 2014; Sussman & Siegal, 2003; Teng et al., 2014). Prior research indicates that effective eWOM consists of two primary components: the quality of eWOM and the credibility of the eWOM source(Chen & Tsai, 2008; Luo et al., 2014; Sussman & Siegal, 2003; Teng et al., 2014). The subsequent team concentrated on the correlation between eWOM and intention(Abubakar & Ilkan, 2016; Tsao & Hsieh, 2015; Wang et al., 2018). The third group's research concentrated on the correlation between eWOM, brand image, and intention(Bataineh, 2015; Siddiqui et al., 2021). The fourth study group examined the correlation among eWOM, the components of the Theory of Planned Behavior (TPB), and behavioral intention(Abedi et al., 2019; Ran et al., 2021; Wang, 2015; Yang, 2013).

Research on corporate social responsibility is explored by several researchers. However, in the topic of eWOM on online platforms, there is little research that examines digital social responsibility. We feel that the digital social

responsibility of each individual engaging in social networks is highly vital and significant. In the process of studying the preceding publication, the authors came across a study concerning digital social responsibility. However, this study covers the digital social responbility of enterprises on digital platforms. This study reveals that corporate social responsibility affects consumer attitudes and eWOM; customer attitudes impact eWOM and purchase intention(Puriwat & Tripopsakul, 2022). In this study, the authors expect that the digital social responsibility of each individual is extremely significant; it enables the digital environment to be healthy and have more advantages from individuals who engage in social networks through digital platforms. It is significant because social media players who are socially responsible in cyberspace will provide favorable ratings, but the judgment is more helpful and beneficial to consumers than damaging. This will entice more individuals to join in sharing items that are valuable to the community. To better understand digital social responsibility, we offer some of its activities on the social media platform. An individual or organization that is responsible for the community often shares good, valuable information with other users. People who are responsible for the online community also only agree with other people's good and useful information. More specifically, an individual, group, or organization that is responsible for their community never takes actions on social networks that have a negative impact on other people or organizations.

Many previous studies have suggested that eWOM adoption and attitude toward eWOM have a great influence on intention. However, according to the previous research review, there were two studies that suggested that eWOM affected eWOM information forwarding behavior(Abedi et al., 2019; Mahapatra & Mishra, 2017). This illustrates that there is currently extremely limited research on eWOM information sharing, so this study path in the context of eWOM should continue to be researched and validated this association. In this study, we merely looked at the association between eWOM acceptance and user eWOM forwarding. In addition, we explore the moderator of DSR on the relationship between eWOM adoption and eWOM forwarding. The authors believe that users have adopted eWOM usefulness; the users will forward it on to others in the online community if they are ethical and accountable to the community. The users with strong digital social responsibility will share more than the eWOM value they receive. In contrast, the users with lesser digital social responsibility will share little or no useful eWOM they obtain from social media.

Quang Ngai tourism possesses significant potential, yet it has not yet garnered substantial visitor interest. The writers assert that Quang Ngai Province has employed strategies to enhance its destination image. This study aims to investigate social media strategies to identify optimal approaches for attracting visitors. Nevertheless, Quang Ngai has not completely harnessed the potential of social media, particularly electronic word-of-mouth, for tourism promotion.

### 1.2. Research Questions and objectives

In the context of eWOM, to fill the research gap, this study proposes the following specific objectives:

- RO1: Identify the relationships between the factors in the research model.
- RO2: Evaluate the degree of influence among the factors.
- RO3: Examine the moderation of DSR in the relationship between eWOM adoption and eWOM forwarding.

To fulfill the above-mentioned aims. The following are some of the most essential questions that will be answered.

- RQ1: What components are incorporated in the research model?
- RQ2: What is the amount of impact between elements in the model?
- RQ3: How is the moderator function of DSR in the link between eWOM adoption and eWOM forwarding?

## II. MATERIAL AND METHODOLOGY

### 2.1. Material and method

The research was performed with a sample size of 248 units. The poll was administered directly to tourists in Ho Chi Minh City from October to November 2024. The proportion of legitimate answers is 82.6% from the sum of surveys. The survey participants possess the following attributes: (1) Engage in social networks; (2) Utilize and disseminate travel information on social networks; (3) Comprehend Quang Ngai tourism.

The research method is a synthesis approach between qualitative and quantitative. The qualitative research

approach is carried out throughout the literature study and expert interviews on the research model. The authors interviewed a group of 05 experts to adjust the main model. The quantitative research model is carried out in the process of processing quantitative data when the survey data is accessible. Using structural equation modeling to examine the connection of variables in the research model. The software utilized for this investigation comprises SPSS and SmartPLS4.

**2.2. Research hypothesises and model**

Many prior research studies have shown that eWOM forwarding was impacted by eWOM adoption(Abedi et al., 2019; Mahapatra & Mishra, 2017), eWOM adoption was affected by eWOM usefulness(Abedi et al., 2019; Cheung et al., 2008; Chong et al., 2018; Sussman & Siegal, 2003), and eWOM usefulness depended on eWOM quality and eWOM source credibility(Abedi et al., 2019; Cheung et al., 2008; Chong et al., 2018; Sussman & Siegal, 2003). However, these prior studies have not discussed the moderating influence of DSR on the relationship between eWOM adoption and forwwarding eWOM. In this study, the authors suggest the relationship between variables and the moderating influence of DSR on the relationship between eWOM adoption and forwarding eWOM.

2.2.1. Research hypothesises

The eWOM quality is defined as the user's judgment of the validity and persuasiveness of eWOM to the recipient of eWOM(Chakraborty, 2019; Verma et al., 2023). eWOM quality can be described as the persuasive power of comments derived from an informational message (Bataineh, 2015; Bhattacherjee & Sanford, 2006; Cheung et al., 2008; Fahmy & Ragab, 2022) and the quality of eWOM information is considered as the output value generated by a system according to the user's perception(Cheung et al., 2008). According to previous studies, the components that make up eWOM quality include relevance, timeliness, accuracy, comprehensiveness, and consistency(Cheung et al., 2008). This shows that eWOM quality influenced eWOM usefulness, and the impact of eWOM quality on eWOM usefulness has been proven by many previous studies(Abedi et al., 2019; Cheung et al., 2008; Chong et al., 2018; Sussman & Siegal, 2003). Empirical studies have used IAM theory to explain this relationship(Abedi et al., 2019; Cheung et al., 2008). From the above argument, the authors propose the hypothesis:

H1 (+): eWOM quality has a positive impact on eWOM usefulness.

eWOM source credibility is the level to which a person is aware of reviews and recommendations from a reliable source (Bataineh, 2015). eWOM source credibility has a higher level of trust, which leads to higher eWOM usefulness. Previous studies have suggested that the components that make up eWOM source credibility include reliability, expertise, attractiveness(Teng et al., 2014; Wu & Wang, 2011), and source experience(Wu & Wang, 2011). The relationship between eWOM source credibility and eWOM usefulness has been demonstrated in previous studies in their empirical studies(Abedi et al., 2019; Cheung et al., 2008; Teng et al., 2014), and these studies use IAM theory to explain this relationship(Cheung et al., 2008; Sussman & Siegal, 2003). From the above argument, the authors propose the hypothesis:

H2 (+): eWOM source credibility has a positive impact on eWOM usefulness.

eWOM usefulness is eWOM information that the recipient finds useful information and will make decisions based on it(Abedi et al., 2019; Cheung et al., 2008; Ismagilova et al., 2019). So, when recipients find eWOM useful, they tend to accept that eWOM and make decisions on the eWOM they received(Abedi et al., 2019). Empirical studies have demonstrated the impact of eWOM usefulness on eWOM adoption(Abedi et al., 2019; Chong et al., 2018; Saidani et al., 2023; Silaban et al., 2023; Sussman & Siegal, 2003). These prior studies have used IAM theory to explain this relationship(Abedi et al., 2019; Cheung et al., 2008; Sussman & Siegal, 2003). From the above argument, the authors propose the hypothesis:

H3 (+): eWOM usefulness has a positive impact on eWOM adoption.

eWOM adoption is the consumer's acceptance of the use of eWOM information(Abedi et al., 2019; Cheung et al., 2008; Tien et al., 2019; Verma et al., 2023). Adopting eWOM, consumers often consider its usefulness and reliability(Hussain et al., 2018). Upon accepting eWOM, users will utilize the information to make decisions, including disseminating the eWOM data to others. The study carried out by (Abedi et al., 2019) and (Mahapatra & Mishra, 2017) discusses the relationship between eWOM adoption and forwarding eWOM. To strengthen the relationship between

eWOM adoption and forwarding eWOM, previous studies have used the SET theory to explain this relationship(Abedi et al., 2019). From the above argument, the authors propose the hypothesis:

H4 (+): eWOM adoption has a positive impact on forwarding eWOM.

According to(Puriwat & Tripopsakul, 2022), Digital Social Responsibility (DSR) is defined as the effort, initiative, or activity of an individual, group, or organization implemented through online or digital platforms.This author has mentioned DSR, but in that study the author refers to the DSR of enterprises(Puriwat & Tripopsakul, 2022). Our research is interested in DSR from the perspective of individual users of digital social networks. Nowadays, when most people make their decisions based on references from social networks on digital platforms, it is necessary for social media users to be responsible for the online community. Social media plays an important role for tourists in finding information about tourist destinations. However, social media does not always have positive and useful information for searchers because it also contains a lot of information that is not useful and negative. The appearance of both positive and negative information on the same social network is due to the responsibility of social network users. If users are ethical, conscious, and responsible for the community, they will always provide and share truthful, useful, and beneficial information for the community. In this study, the authors define digital social responsibility as the users of social networks on digital platforms; they always have ethics and responsibility for the social networking community. From the perspective of eWOM information, this study believes that if individuals with digital social responsibility learn to accept reliable, useful, and beneficial eWOMs for others, they will share and forward that information to other consumers on social networks. On the contrary, individuals who lack digital social responsibility will be very limited in sharing and forwarding the positive and useful eWOM information they receive. Thus, the transition of eWOM depends on the digital social responsibility of the previous eWOM recipient. Digital responsibility will regulate the relationship between eWOM adoption and forwarding eWOM. The moderating role of DSR is also explained by the SET theory and the Corporate Social Responsibility (CSR) theory. The authors propose the hypothesis:

H5 (+): DSR has a positive moderator on the relationship between eWOM adoption and forwarding eWOM.

### 2.2.2. Research model

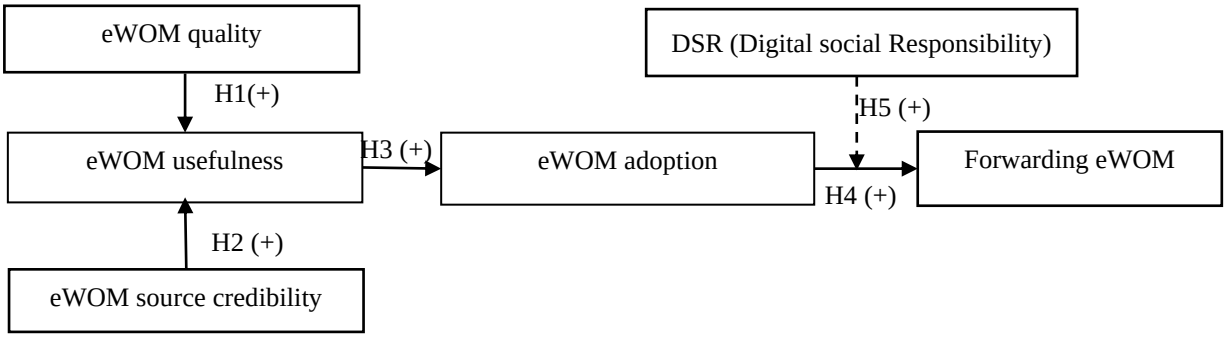

**Fig 1. Proposed Conceptual Model**

*Source: Compiled by authors*

## III. RESULT AND DISCUSSION

### 3.1. Research subjects

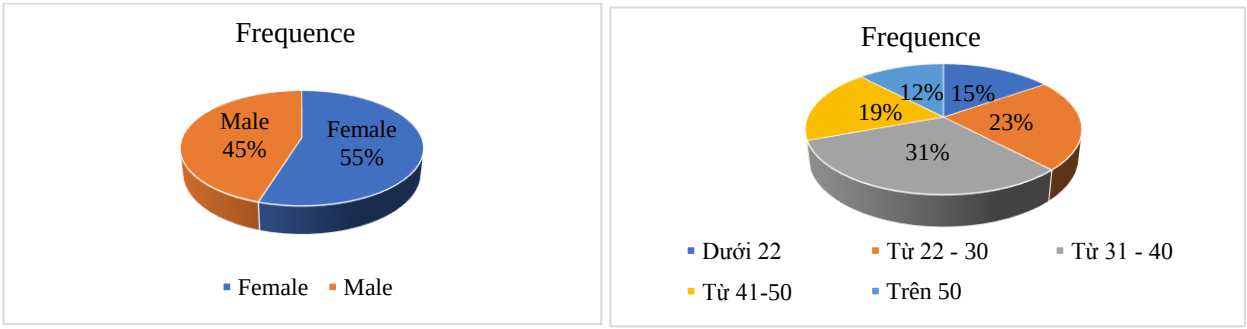

**Fig 2. Statistic results of sample about gender and age**

*Source: Data processing*

Sample data indicate that 136 surveyors are female, representing 55% of the total 248 survey participants, while

males constitute 45% of the total. The survey demographics reveal that 38 participants are under 22 years old, representing 15%; 56 participants are aged 22 to 30, constituting 23%; 78 participants fall within the 31 to 40 age range, comprising 31%; 46 participants are aged 41 to 50, accounting for 19%; and 30 participants are over 50 years old, making up 12%. The statistical analysis of the sample indicated that the number of surveyed women exceeded that of males; individuals aged 31–40 was the largest demographic studied.

### 3.2. Model results

#### 3.2.1. Scale evaluation results

First in this formal quantitative step this study evaluates the scale. In order to consider whether the scale is good and statistically reliable, the author performs an intrinsic consistency reliability assessment; convergence; differentiation (Joseph F. Hair et al., 2022). The results show that the Cronbach's Alpha on all scales is greater than 0.7 and CR on all scales is greater than 0.8 (Table 1). This result confirms that the scales are intrinsically consistent. The results of the AVE of the scales are greater than 0.5. The results proved that the scale has converged. As a result, the HTMT coefficients of the scales were all less than 0.9, so the scales achieved a distinguishing value (Table 2).

**Table 1. Reliability and validity of variables**

| Constructs | Cronbach's alpha | Composite reliability (rho_c) (CR) | Average variance extracted (AVE) |
|---|---|---|---|
| A-eWOM | 0.921 | 0.944 | 0.810 |
| C-eWOM | 0.777 | 0.856 | 0.599 |
| DSR | 0.712 | 0.839 | 0.634 |
| F-eWOM | 0.949 | 0.963 | 0.868 |
| Q-eWOM | 0.805 | 0.872 | 0.630 |
| U-eWOM | 0.870 | 0.920 | 0.794 |

*Source: SmartPLS 4*

**Table 2. The discrimination of the variables**

| | A-eWOM | C-eWOM | DSR | F-eWOM | Q-eWOM | U-eWOM | DSR x A-eWOM |
|---|---|---|---|---|---|---|---|
| A-eWOM | | | | | | | |
| C-eWOM | 0.591 | | | | | | |
| DSR | 0.182 | 0.210 | | | | | |
| F-eWOM | 0.734 | 0.493 | 0.753 | | | | |
| Q-eWOM | 0.591 | 0.103 | 0.114 | 0.482 | | | |
| U-eWOM | 0.848 | 0.604 | 0.141 | 0.689 | 0.507 | | |
| DSR x A-eWOM | 0.231 | 0.136 | 0.028 | 0.277 | 0.139 | 0.182 | |

*Source: SmartPLS 4*

#### 3.2.2. Results of structural equation model evaluation

Before evaluating the path structure model, this study performs a colinear test of each variable. According to(Joseph F. Hair et al., 2022), the VIF coefficient is less than or equal to 3, there is no collusion occurring between pairs of variables. The results showed that the pairs of variables all had a VIF coefficient of less than 3 (Table 3), which showed that there was no multilinearity occurring between pairs of variables in the study model.

**Table 3. Collinearity statistic (VIF)**

| | A-eWOM | C-eWOM | DSR | F-eWOM | Q-eWOM | U-eWOM | DSR x A-eWOM |
|---|---|---|---|---|---|---|---|
| A-eWOM | | | | 1.075 | | | |
| C-eWOM | | | | | | 1.002 | |
| DSR | | | | 1.022 | | | |
| F-eWOM | | | | | | | |
| Q-eWOM | | | | | | 1.002 | |
| U-eWOM | 1.000 | | | | | | |
| DSR x A-eWOM | | | | *1.052* | | | |

*Source: SmartPLS 4*

The results of the path relationship test in the structure model, using the bootstrapping method with a sample size of 5,000 bootstrap templates. The results show that all P-values are less than 0.05 (Table 4), meaning that all impact relationships are acceptable, and the impact level ranges from 0.408 to 0.764 (Table 4). The R2 results in the study model show the degree of explanation of independent variables to dependent variables. The R2 of U-eWOM is 0.414, which means that Q-eWOM and C-eWOM explain 41.4%; the R2 of A-eWOM is 0.584; the R2 of F-eWOM is 0.763 (Fig 3). According to (Joseph F. Hair et al., 2022) 0.75 ≥ R2 ≥ 0.25 are considered average and acceptable. Thus, with the above result, R2 of the dependent variables is accepted because it is greater than 0.25.

Especially in this study, the authors evaluated the impact of the moderation of DSR. From the results of Table 4, it is shown that DSR x A-eWOM has an impact coefficient of 0.129 and P-value of less than 0.05. Thus, DSR has a positive (+) interaction effect on the relationship between A-eWOM and F-eWOM. This means that DSR adds to the positive relationship between variables A-eWOM and F-eWOM (Fig. 4).

To sum up, from the results of the data analysis show that all hypotheses are statistically significant. The moderator role of DSR is also statistically significant and has a positive impact on the positive relationship between A-eWOM and F-eWOM (Table 4).

**Table 4. Results of evaluating the relationship between variables (paths)**

| Hypothesis | Relationship | Original sample (O) | P values | Significant |
|---|---|---|---|---|
| H1 (+) | Q-eWOM -> U-eWOM | 0.408 | 0.000 | Support |
| H2 (+) | C-eWOM -> U-eWOM | 0.478 | 0.000 | Support |
| H3 (+) | U-eWOM -> A-eWOM | 0.764 | 0.000 | Support |
| H4 (+) | A-eWOM -> F-eWOM | 0.579 | 0.000 | Support |
| H5 (+) | DSR x A-eWOM -> F-eWOM | 0.129 | 0.000 | Support |

### 3.3. Discussion

The results of this study have shown that the relationships in the research model are statistically significant. This once again confirms the relationship between eWOM information usefulness, eWOM information acceptance, and eWOM information. The results of this study completely coincide with the results of the study of (Abedi et al., 2019; Silaban et al., 2023). DSR moderates the relationship between eWOM adoption and eWOM forwarding as an attractive and prominent point of this study compared to previous studies. However, this study does not discuss the effect of DSR on negative eWOM, which leads to a limited comprehensiveness of the eWOM field. We propose the following studies that look at the impact of DSR on negative eWOM, which will help to add to a more complete eWOM theoretical system. From our subjective point of view, we believe that there is an inverse effect between DSR and negative eWOM. This means that socially responsible individuals will minimize negative information on social networks and other digital platforms.

## IV. CONCLUSION

This study aims to ascertain the link between eWOM and the forwarding eWOM, with a particular focus on the moderating influence of DSR. This study's examination of research data revealed that eWOM adoption positively influenced the forwwarding eWOM. The study indicated that the DSR positively moderated the link between eWOM adoption and the forwarding eWOM.

The results of the study show that the role of DSR is very important in the context of eWOM. Travelers can relay positive, useful information after they receive it to others on social networks, which depends a lot on their awareness, ethics, and responsibility to the digital community. Thus, if social media users are aware of their responsibilities to the digital community, all social media users will receive more useful information than negative information. This will also lead to a healthier digital environment. The findings of this study help destination managers take advantage of the social responsibility of individuals to effectively communicate good information about tourist destinations to other travelers.

The study was only interested in eWOM usefulness influencing forwarding eWOM and the moderator of DSR to this relationship. However, the authors have not studied the relationship between negative eWOM and forwarding eWOM and considered the moderator of DSR in this relationship. Therefore, the future studies should look at the relationship between negative eWOM, DSR, and negative eWOM transition.

# A PILOT STUDY ON THE SUSTAINABLE EDUCATIONAL DEVELOPMENT IN PRIVATE UNIVERSITIES IN VIETNAM AND CHINA IN 2024: A COMPARATIVE STUDY

**Quan Hoang Nguyen Tran[1*]**

[1] Greenwich Vietnam, FPT University, Ha Noi, Vietnam.
* Corresponding: quantnh2@fe.edu.vn

**ABSTRACT**

The main objective of promoting sustainable development in education is to integrate it into all levels. Therefore, it is necessary to have comparative studies between different contexts that support countries in recognizing and adapting to the use of sustainable educational strategies. This research aims to address the problem by conducting a comparative analysis of sustainable education between two countries. The research structure is divided as follows: The literature review will cover existing theories about sustainable educational development and its role in Vietnam and China. The methodology comprised detailed surveys conducted in private universities across Vietnamese and Chinese provinces. In detail, the author compared the perceptions of academic staffs about sustainable development in education at private universities in Hanoi and Ho Chi Minh (Vietnam), and Beijing and Guangzhou (China). Finally, the author aims to use a T-test and linear regression analysis to compare the scores between the two countries. The result confirms that the power distance in private Vietnamese universities has a lower effect in holistic approach to content than private Chinese university's counterparts. This was the first research comparing sustainable educational development in private universities in Vietnam and China. Therefore, this research was essential in its field.

*Key words: "China", "Comparative study",* "Sustainable educational development", "Vietnam"

## I. INTRODUCTION – RESEARCH GAP

### 1.1 Background of the study

Although extensive research in organizational studies and psychology has focused on understanding sustainable educational development's causes and effects, more research should focus on cross-cultural studies. Therefore, whether the national culture impacts how teachers respond to sustainable educational development is questionable. It is believed that cultural characteristics may influence an individual's perceptions of this term. For instance, while sustainable educational development may be successfully adapted in a Western context, others may need help adapting it to other contexts. This suggests that individualism, which refers to cultural features toward personal rights in society, may play a significant role. Higher individualism societies advocate for greater rights, while lower individualism societies tend to accept unequal societal power. Therefore, we propose that sustainable educational development is directly influenced by national culture. Specifically, cultural characteristics will influence how individuals respond to sustainable educational development.

Most studies on sustainable educational development have been conducted in Western countries, such as the USA and European regions (Cassano, 2019; Feinstein, 2009). On the other hand, the Asian context has received less attention when only a few studies have been conducted in China, Japan, or Taiwan (Li et al., 2022; Nomura and Abe, 2010; Sung, 2015). Nation culture significantly influences individual attitudes and behaviors, so that results from Western studies may not fully adapt to Asian contexts due to significant differences in social, cultural, and political issues. In many Asian societies, collectivism is highly common, whereas individualism is generally favored in the Western context (Hofstede, 2001). Individualistic societies focus on individual freedom, innovation, and creativity, which frequently leads to development in various fields, including education. However, in collectivist countries such as China and Vietnam, traditional values are highly respected, and people might resist changing the educational system. As a result, perceptions of sustainable educational development might differ between Western and Asian contexts; those that are seen as suitable in a Western context may be seen as inappropriate in Asian ones, and vice versa. Various studies indicate that British universities report sustainable educational development more frequently than their Chinese

counterparts (Lu and Zhang, 2013). Similarly, it has been noted that Vietnamese universities are less sustainable in educational development than their Poland counterparts (Tien et al., 2022).

This study selects Vietnam and China for specific reasons. Private Chinese universities have developed recently and can be developed in urban areas. The development of private education in China was formed by the Ministry of Education, which formulates policies and regulations and provides financial support and resources for their development (Holm et al., 2015). As a result, China's private universities have invested significantly in using information technologies such as digital repositories, online platforms, and online teaching to educate students. This issue has been developing with further investment in facilities and services.

Similarly, Vietnamese private universities have been developing recently, with the establishment of laws and regulations in the last decades. Although this country had many economic troubles, much effort was made to apply for sustainable educational development (Kieu et al., 2016). While difficulties exist, such as rare resources and funding, Vietnamese private universities have attempted to develop their capabilities online and on traditional platforms. While China and Vietnam have seen significant improvement in developing their private university systems, a gap exists in understanding factors affecting sustainable educational development. This study aims to fill this gap by identifying sustainable educational development in Chinese and Vietnamese private universities.

Previous research on sustainable educational development in the Asian context has been conducted in several contexts (Li et al., 2022; Nomura and Abe, 2010; Sung, 2015). These results confirm that this issue affects work satisfaction, commitment, and performance. However, rare studies have been conducted on cross-cultural issues in the Asian context. To fill this gap, this study uses cross-cultural data from teachers in China and Vietnam to examine the impact of sustainable educational development on the two countries. From a practical point of view, our findings should assist leaders in understanding an increased sustainable educational development. Furthermore, our research supports the cooperation between China and Vietnam, which promotes enhanced economic opportunities and intercultural exchanges between the two countries.

### 1.2. Education for sustainable development

Sustainable educational development has been an essential topic in recent decades (Grindsted and Holm, 2012). Sustainable educational development is defined as supporting individuals to improve their abilities and knowledge for the sake of society in the present time and the future (UN DESD, 2011). The association between education and sustainable development is complicated because of the difference between two terms. However, Sterling (2004) confirmed that sustainable educational development paves the way for universities to develop their quality of curriculum. In detail, sustainable educational development has been linked to individual factors (Lu and Zhang, 2013), organizational factors (Li et al., 2022), and sociocultural factors (e.g., national cultures) (Kieu et al., 2016). Studies have shown that sustainable educational development can lead to a university's success.

Sustainable development in private universities is essential to ensure that these institutions can thrive in the long term while balancing economic, social, and environmental responsibilities. By adopting sustainable practices, private universities can reduce their carbon footprint, conserve resources, and contribute to the overall well-being of the community. Moreover, fostering sustainability in education empowers students to understand the importance of environmental stewardship, ethical leadership, and responsible innovation. This not only helps universities align with global sustainability goals but also ensures that they remain relevant and resilient in an increasingly eco-conscious world. Ultimately, it prepares the next generation of leaders to address pressing global challenges in a holistic and forward-thinking manner.

### 1.3 Research Questions and objectives

To fill this gap, the research assumes that sustainable educational development will have different aspects, such as a lower power distance (Vietnam) and a higher power distance (China). As such, the hypothesis is as follows.:

– RO1: Sustainable educational development differs for private Vietnamese universities from private Chinese universities.

– RO2: The influence of cultural dimension in sustainable educational development is different between private Vietnamese and Chinese universities.

## II. THEORETICAL AND EMPIRICAL BASIS

### 2.1. The China and Vietnam contexts

China is the only socialist country in East Asia. This country has approximately 1.3 billion people, the largest population in the world. China has four megacities: Beijing (the capital), Shanghai, Chongqing, and Tianjin. Chinese is the official language, while English is the second most common language. Similarly, Vietnam is one of two socialist countries in Southeast Asia. This country has 100 million people, and most of the population lives in rural areas. In Vietnam, there are three main megacities: Hanoi (the capital), Da Nang, and Ho Chi Minh City. Buddhism, Confucianism, and Taoism are the main religions in Chinese and Vietnamese culture. Before the economic reforms in 1965 (China) and 1986 (Vietnam), both countries experienced economic crises in the early 20th century (Perry and Wong, 2020; Tran, 2021). After converting the entire economy from state centralization to private centralization, China's economy has experienced the world's fastest growth and become the second-largest in the world. Similarly, the Vietnamese economy has rapidly grown to become one of the most promising in Southeast Asia.

According to House et al. (2004), China has a higher power distance score than Vietnam. Individuals from high power distance cultures usually maintain harmony based on reliance, accepting the sizeable societal gap (Chew and Putti, 1995; Restubog & Bordia, 2006). On the other hand, individuals from low power distance cultures do not accept a higher gap in societies. Chew and Putti (1995) found that workers in low power distance cultures are closely related to those in higher organizational positions. In contrast, people in low power distance societies respond more harshly when mistreated. Compared to their counterparts in high power-distance cultures, several research studies reveal that workers in low power-distance societies have higher expectations for justice and fairness than their counterparts in high power-distance cultures.

## III. METHODOLOGY

### 3.1. Sample size

The purposive sampling technique is selected in this study, targeting employees within private universities across Vietnam and China. Private universities were chosen because they are the potential educational institutions in both countries. Permission to collect surveys was obtained by contacting human resource departments in various universities in both countries. As a result, the author received a confirmation from seven Vietnamese universities and seven Chinese universities. When the researchers received an acceptance from these universities, surveys along with guidelines and informed consent were sent to human resource specialists, who then provided surveys to the university. For the Vietnamese respondents, the questionnaire was translated into Vietnamese by a bilingual expert in two languages and then back-translated into English to ensure accuracy. Surveys were sent to seven universities, primarily from Hanoi and Ho Chi Minh City, the main cities in Vietnam. Two hundred fifty surveys were sent to respondents. The survey was conducted from March to April 2024. As a result, 189 surveys were received, and 22 were removed due to needing more information. Therefore, 167 were included in the analysis, yielding a response rate of 88.3%. The translation process of the Chinese survey is similar to that of the Vietnamese survey. In detail, surveys were distributed to employees at seven universities in Beijing and Guangzhou. Two hundred sixty-six surveys were sent to respondents. The survey was conducted from April to May 2024. As a result, 223 surveys were collected, and 37 were removed due to needing more information. Therefore, 186 valid surveys remained and were moved in the analysis, representing a response rate of 83.4%. In total, 353 surveys were used in this study. The demographic information of respondents can be found in table 1.

**Table 1: Demographic information**

| Demographic variables | Vietnam | China |
|---|---|---|
| ***Gender*** | | |
| **Male** | 98 | 86 |
| **Female** | 69 | 100 |
| **Total** | 167 | 186 |
| ***Age*** | | |

### 3.2. Research objects

Sustainable educational development: This study used a questionnaire developed by Boeve-de Pauw et al. (2015), which includes seven items covering two dimensions: Holistic approach to content and Pluralistic approach to teaching. A holistic approach to content in sustainable educational development integrates multiple dimensions, including environmental, social, and economic factors, to foster a comprehensive understanding of sustainability. This approach ensures that students are equipped with the knowledge and skills to address real-world challenges sustainably. A pluralistic approach to teaching in sustainable educational development values diversity by incorporating multiple viewpoints, cultures, and experiences into the learning process. This approach fosters collaborative learning, where students are encouraged to discuss, debate, and find solutions in reality. Responses were gathered using a 5-point Likert scale, where a score of 5 indicates "strongly agree" and one indicates "strongly disagree."

Cultural dimension: This study used a questionnaire developed by House et al. (2004), which includes six items covering two dimensions: Power distance and Collectivism. Power distance refers to the extent to which those people with less power are ready to accept an unequal distribution of power in hierarchical structures. Collectivism is a cultural value that emphasizes the importance of group goals, interdependence, and community well-being over individual interests and personal achievement. Responses were gathered using a 5-point Likert scale, where a score of 5 indicates "strongly agree" and one indicates "strongly disagree."

## IV. QUANTITATIVE RESULTS

Several analyses were conducted to clean the data. These included the Kaiser-Meyer-Olkin (KMO) test, the exploratory factor analysis (EFA), Cronbach's Alpha, and the total variance analysis. According to Kaiser (1974), a KMO value greater than 0.5 is required for further analysis. This study's KMO value was 0.97, indicating that the preliminary analysis requirements were satisfied. Consequently, all items displayed factor loadings between 0.512 and 0.854, exceeding the requisite minimum of 0.4 for a valid EFA (Nunnally, 1978). In addition, the Cronbach's Alpha coefficient was computed to be higher than 0.714, exceeding the minimum value of 0.70. The composite reliability of all dimensions is between 0.934 and 0.956, which is higher than the minimum requirement of 0.8. The validity of average variance extracted (AVE) of all items are higher than than the minimum threshold of 0.50. 78.653 percent of the total variance was explained by items with eigenvalues greater than one (Falk and Miller, 1992). As a result, the first factor explained 25.11% of the variance, which was below the utmost of 30%. These statistics confirm the validity for further analysis. The detailed statistic can be found in table 2.

**Table 2 Reliability and validity tests**

| Construct | Factor loading | Cronbach' s α | Composite reliability | AVE |
|---|---|---|---|---|
| **Holistic approach to content** | 0.713 – 0.854 | 0.803 | 0.934 | 0.545 |
| **Pluralistic approach to teaching** | 0.534– 0.812 | 0.735 | 0.945 | 0.523 |
| **Power distance** | 0.576 – 0.790 | 0.821 | 0.949 | 0.587 |
| **Collectivism** | 0.512– 0.767 | 0.714 | 0.956 | 0.579 |

*Source: Prepared by the author.*

A T-test was selected to examine the hypotheses in Table 3 and 4. In research question 1, it was predicted that sustainable educational development is different for private Vietnamese universities than private Chinese universities. This statistic was chosen because T-test provided powerful and versatile methods for examining relationships and differences in data. In this research, this statistic was useful because its goal was to understand condition causes a measurable change in sustainable educational development between two countries. Results of the T-test suggest that all dimensions of the questionnaire were different between the two countries. In detail, Vietnam (M=3.56) was significantly lower than China (M=4.01) in the difference between holistic approach to content. Similarly, Vietnam (M= 3.89) was significantly lower than China (M=4.11) in the difference between pluralistic approach to teaching. Altogether, the results confirm that the hypothesis is supported.

**Table 3 - Results for Vietnam and China's respondents in the difference between holistic approach to content**

| **Dependent variable: The difference between holistic approach to content** | | | | | |
|---|---|---|---|---|---|
| **Place** | Mean | SD | Number | F | P |
| **Vietnam** | 3.56 | 1.43 | 167 | 3.43 | 0.02 |
| **China** | 4.01 | 1.89 | 186 | | |

*Source: Prepared by the author.*

**Table 4 - Results for Vietnam and China's respondents in pluralistic approach to teaching**

| **Dependent variable: The pluralistic approach to teaching** | | | | | |
|---|---|---|---|---|---|
| **Place** | Mean | SD | Number | F | P |
| **Vietnam** | 3.89 | 1.76 | 167 | 3.67 | 0.04 |
| **China** | 4.11 | 1.89 | 186 | | |

*Source: Prepared by the author.*

Linear regression analysis was selected to challenge the hypotheses, as shown in Table 5.1 and 5.2. This statistic was chosen because its goal was to understand the relationship between cultural dimensions and the sustainable educational development. This statistic was ideal for examining predictive relationships and quantifying how changes in the cultural dimensions influenced the sustainable educational development in each country. Table 5.1 explores the role of power distance and collectivism on sustainable educational development in private Chinese universities. The

results revealed that power distance had a significant effect on holistic approach to content (Model 1, $\beta = 0.631$, $p < 0.05$). However, power distance insignificantly influences pluralistic approach to teaching (Model 2, $\beta = -0.153$, $p > 0.05$). Table 5.2 explores the role of power distance and collectivism on sustainable educational development in private Vietnamese universities. The results revealed that power distance had a significant effect on holistic approach to content (Model 3, $\beta = 0.512$, $p < 0.05$). However, power distance insignificantly influences pluralistic approach to teaching (Model 4, $\beta = -0.443$, $p > 0.05$). Altogether, the power distance in private Vietnamese universities has a lower effect in holistic approach to content than private Chinese university's counterparts, and the second hypothesis is partially supported.

**Table 5.1 - Results of linear regression analysis in private Chinese universities**

| **Variables** | **Sustainable educational development in private Chinese universities** | |
|---|---|---|
| | Holistic approach to content | Pluralistic approach to teaching |
| | Model 1 | Model 2 |
| **Power distance** | 0.631* | -0.153 |

## V. CONCLUSION AND MANAGERIAL IMPLICATIONS

This article aimed to investigate the influence of sustainable educational development, which is different for private Vietnamese universities than private Chinese universities. This study adopted a cross-cultural study to compare sustainable educational development in private universities between two countries. This study confirmed that these effects would be stronger for Vietnamese universities than their Chinese counterparts, who typically have lower acceptance of high power than Chinese universities. This new exploration opens the scope of sustainable educational development and adds new findings to educational studies.

This research contributes to the literature on sustainable educational development in several ways. Firstly, our findings confirm the positive impact of sustainable educational development on both Vietnamese and Chinese universities. Many East Asian countries, including China, Japan, South Korea, and Taiwan, are formulated by high

power distance cultures, wherein individuals follow a vertical structure, and managers have power over subordinates. Conversely, Southeast Asia countries such as Vietnam, Thailand, and Malaysia have lower power distance cultures, where power is more equal between supervisors and subordinates. In China's high power distance culture, there is a clear difference between managers and employees, and employees are required to follow the manager's orders under any circumstances. Therefore, if employees experience following orders from their supervisors, they might be ready to adapt to the use of sustainable educational development. On the other hand, Vietnam, a low power distance culture, exhibits less power difference between managers and employees, with employees having more power in workplaces. Therefore, they need help to apply for sustainable educational development. Consequently, while sustainable educational development hurts Chinese universities, its influence on Vietnamese universities must be revised. While prior studies confirm the role of sustainable educational development, this research broadens this concept across different societies, particularly in non-Western countries. This study fulfills this gap by identifying sustainable educational development in Vietnamese and Chinese private universities.

This study identifies several solutions to support private universities in developing sustainable educational development. First, universities should establish a set of guidelines for acceptable behaviors in workplaces. When Confucianism plays a vital role in Chinese and Vietnamese cultures, managers could use critical components in this philosophy, such as harmony, sympathy, and unity, to identify appropriate codes of conduct within their universities. Employees with positive behaviors can be rewarded or promoted, while those with negative behaviors can be punished. Second, private university leaders should recruit candidates with favorable, positive, and proper behaviors, which can support sustainable educational development at the beginning. To achieve this objective, private universities can use role-playing exercises during the recruitment process to assess candidates' reactions to this issue in workplaces. This can enable private universities to select individuals with proper behaviors and attitudes.

Our study points to several avenues for future research. First, while our research provided evidence for sustainable educational development, we recommend that future research examine the mediating effects of different cultural values (e.g., hierarchical values or beliefs in harmony) on sustainable educational development. Researchers could then explore whether the mediating effects of these values vary between cultures and how they affect sustainable educational development. This is especially important when employees in workgroups and organizations spend more time interacting with individuals with different cultural beliefs and value systems. Therefore, we have established several solutions to eliminate this issue. Finally, this study is expected to open the scope of sustainable educational development in Asia, particularly in Vietnam and China.

# RISKS IN TOURISM SALES ACTIVITIES IN THE SOUTHEASTERN REGION AND PROPOSED SOLUTIONS: A STUDY USING THE ANALYTIC HIERARCHY PROCESS (AHP)

**Phan Thi Hoi[1*], Nguyen Van Tan[2]**

[1]Faculty of Administration – International Economics, Lac Hong University
[2]Faculty of Administration – International Economics, Lac Hong University
*Corresponding: hoipt@lhu.edu.vn

**ABSTRACT**

The tourism industry is regarded as one of the sectors with significant contributions to the economies of nations. For Vietnam, the Southeastern region is a key area for tourism development. Identifying potential risks in the sales activities of businesses operating in the tourism sector is crucial, especially in the context of rapid technological advancements and intense competitive pressures. This study employs the Analytic Hierarchy Process (AHP) method, engaging 15 experts in the tourism business sector in the Southeastern region to evaluate specific risk factors in the industry's activities. The study identifies four main risks: service quality risk, inappropriate pricing risk, digital technology risk, distribution network risk, and low employee performance risk. These risks are pairwise compared using a scale of 1–9 to assess the importance of each risk. The analysis results identify the most critical risk factors and propose mitigation solutions to enhance the effectiveness of tourism activities in the region.

## I. INTRODUCTION

The year 2023 marks an impressive recovery for Vietnam's tourism industry following the COVID-19 pandemic. Vietnam continues to assert its appeal to international visitors. According to the 2023 Statistical Yearbook, the number of foreign arrivals in Vietnam reached 12,602.4 thousand, a 3.4-fold increase compared to 2022. In 2023, Vietnam's tourism industry won 19 global awards and 54 Asia-leading categories presented by the World Travel Awards (WTA).

Contributing to Vietnam's overall socio-economic development and the growth of its tourism sector is the Southeastern region. With its strategic geographic location, developed transportation network, and diverse potential in both natural and cultural tourism resources, the Southeastern region not only attracts domestic tourists but also serves as a popular destination for international visitors. Highlighted destinations such as Ho Chi Minh City, Vung Tau, and Dong Nai have become vibrant tourism hubs, driving economic growth, creating jobs, and improving the quality of life for local communities.

**Table 1.1: Tourism Revenue in the Southeastern Region**

| Province/City | 2021 | 2022 | Revenue (Billion VND) | Change (%) |
|---|---|---|---|---|
| Binh Phuoc | 2.8 | 7.4 | 4.6 | 164.29 |
| Tay Ninh | 4.4 | 6.6 | 2.2 | 50.00 |
| Binh Duong | 35.6 | 65 | 29.4 | 82.58 |
| Dong Nai | 21.6 | 32.6 | 11 | 50.93 |
| Ba Ria – Vung Tau | 86.9 | 206 | 119.1 | 137.05 |
| Ho Chi Minh City | 3350.6 | 17735.8 | 14385.2 | 429.33 |
| **Total** | **3501.9** | **18053.4** | **14551.5** | **415.53** |

*(Source: 2023 Statistical Yearbook)*

The growth of tourism in the Southeastern region is clearly reflected through revenue, particularly travel service revenue (Table 1). The travel service revenue growth rate in the region reached 415.53%, highlighting the sector's significant role and vast potential that should continue to be prioritized for exploitation and development. Tourism has become one of the key economic drivers in the Southeastern region, home to many renowned destinations such as Ho Chi Minh City, Ba Ria-Vung Tau, Dong Nai, and Binh Duong. Annually, the region welcomes a large number of

tourists for sightseeing and experiences, contributing significantly to the region's socio-economic development.

Specifically, in 2023, the Southeastern region welcomed over 65 million visitors, accounting for 54.2% of the total national tourist arrivals and marking an 18.55% increase compared to the previous year, with an estimated total revenue of 177,657 billion VND. These figures demonstrate strong growth in tourist numbers, reflecting the recovery and development trends of the tourism sector in 2023. The development of tourism in the region acts as a catalyst for the growth of other industries such as hospitality, food and beverage services, and transportation, thereby enhancing the region's economic value chain. Despite these achievements, the Southeastern tourism sector faces numerous risks and real-world challenges. Identifying potential risks is essential for businesses in the region.

Risks are undesirable or uncertain events that can negatively impact business operations (Knight, 1921). Risk perception is often understood as the probability of adverse events multiplied by the severity of their consequences (Brun, 1994; Reichel, Fuchs, & Uriely, 2007). According to Kotler & Keller (2015), risk assessment and management are critical for businesses to maintain competitiveness while optimizing service quality.

The study of potential risks in the tourism industry, particularly in the Southeastern region, provides a foundation for local tourism businesses to develop solutions that mitigate risks, improve operational efficiency, and enhance the industry's overall performance.

## II. THEORETICAL FRAMEWORK ON SALES RISKS IN THE TOURISM INDUSTRY

Kotler & Keller (2021) define sales risk as the uncertainty and potential financial losses related to failing to meet sales targets, not meeting customer expectations, or being impacted by external market factors. Monyer et al. (2020) argue that sales risks refer to any event or situation that could disrupt business operations, affect revenue generation, or damage customer relationships. Grönroos (2019) points out that sales risks arise from factors that may negatively impact a company's sales ability, ranging from internal management issues to external factors such as market conditions or legal constraints.

Chen et al. (2020) identified specific sales risks in the tourism industry after the COVID-19 pandemic, including demand risks, financial risks, technology risks, and legal and compliance risks. Similarly, Liu et al. (2021) emphasized that the tourism industry, as a unique sector, faces risks related to products, customer experience, legal compliance, and security in its sales activities.

The development of digital technology, including artificial intelligence (AI), has significantly impacted all sectors, especially tourism. Alongside the benefits, digital technology has introduced new risks. Digital technology risks in the tourism industry refer to potential dangers arising from the use of or reliance on digital technology in tourism activities. These risks affect tourism businesses, customers, and the entire industry. For example, online booking systems, customer personal information, and electronic payments are vulnerable to cyberattacks (He & Harris, 2020). Dependence on digital systems can lead to failures when technology malfunctions, such as booking systems or flight information outages (Morakanyane et al., 2017).

The use of AI or automation technologies can reduce personalization, leading to lower customer satisfaction (Buhalis & Amaranggana, 2015). Wang et al. (2022) highlighted that system failures and online service disruptions can result in revenue losses and reputational damage. Moreover, risks related to partners and suppliers, as well as financial risks, were also noted in this study.

Tran et al. (2023) assessed the impact of market volatility on sales risks in the tourism industry. This study considered market risks, consumer behavior, financial, and investment risks. Changes in pricing, national tourism policies, the impacts of global crises, and shifts in consumer behavior were identified as key factors influencing the sales activities of tourism businesses.

Part et al. (2021) pointed out that negative emotions and poor empathy can lead to risks that harm customer experiences, reduce satisfaction, and damage a company's reputation. Similarly, Kim et al. (2023) argued that poor communication, unprofessional behavior, and unmanaged relationship-building risks create an unprofessional image, reduce customer trust, and potentially result in the loss of prospective customers.

Han et al. (2024) emphasized that employees in the tourism and hospitality sectors often interact directly with

customers and observe company operations. Recommendations or comments from employees could inadvertently reveal a company's financial performance, even if the company does not disclose such information. Furthermore, Kotler & Keller (2015) highlighted that employee performance is critical to the success of service delivery. Ineffective employees directly impact service quality and customer experience.

Wang et al. (2021) stressed the importance of management, leadership, and employee performance in the tourism sector, noting that these aspects significantly influence sales revenue. Weak leadership, lack of support and training, and ineffective management can decrease performance and cause service failures.

Thus, a variety of risks (Table 2) can arise in tourism sales activities, greatly affecting the operational results of businesses and the industry as a whole**.**

**Table 1.2: Summary of Risks in Tourism Sales Activities**

| No. | Description | Author(s) | Year |
|---|---|---|---|
| 1 | Demand Risk, Financial Risk, Technology Risk, Legal and Compliance Risk | Chen, S., & Zhang, W. | 2020 |
| 2 | Product Risk, Customer Experience Risk, Legal and Security Risk | Liu, H., & Li, J. | 2021 |
| 3 | Technology-Related Risk, Partner and Supplier Risk, Financial Risk | Wang, Y., & Li, X. | 2022 |
| 4 | Market Risk, Consumer Behavior Risk, Financial and Investment Risk | Tran, T., & Nguyen, P. | 2023 |
| 5 | Communication Risk, Customer Risk, Public Policy Risk | Kim, J., & Park, Y. | 2024 |
| 6 | Incompetent Employee Risk, Employee Attitude and Behavior Risk, Lack of Communication Risk | Smith, A., & Taylor, M. | 2020 |
| 7 | Weak Leadership Risk, Lack of Training Support Risk, Inefficient Management Risk | Wang, F., & Liu, X. (2021) | 2021 |
| 8 | Lack of Work Motivation Risk, Fatigue and Stress Risk, Job Dissatisfaction Risk | Zhang, Y., & Li, Q. (2022) | 2022 |
| 9 | Lack of Communication Skills Risk, Long-Term Relationship Building Risk | Kim, J., & Choi, H. | 2023 |

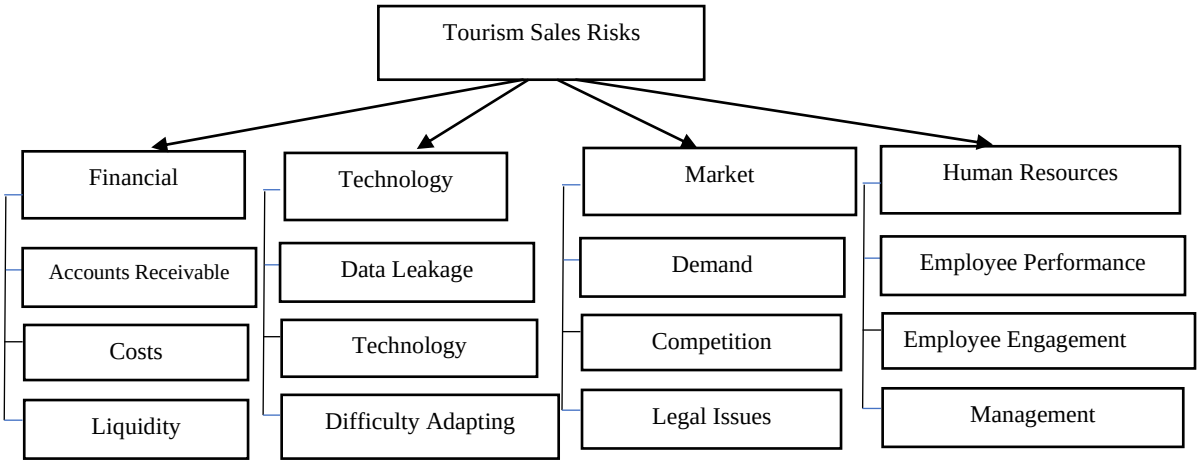
*(Source: Compiled by the Authors)*

Identifying key risk groups that may affect sales activities in the tourism sector, particularly in the Southeastern region, is a critical consideration. Achieving this objective can provide tourism businesses in the region with a foundation to prioritize risk prevention and mitigation efforts, thereby enhancing their operational efficiency.

## III. RESEARCH METHODOLOGY

This study employs the Analytic Hierarchy Process (AHP) method to evaluate the impact of various risk factors and propose preventive measures for the most critical risks to enhance sales performance in tourism. The AHP method is a practical, scientific decision-making approach based on rigorous mathematical calculations and consistency in human evaluations when addressing complex qualitative issues. The foundational principles of AHP include decomposition, comparative evaluation, and priority synthesis.

For this study, 15 experts involved in the tourism sector in the Southeastern region were invited to participate. These experts discussed potential risks affecting the tourism industry in the region. Based on the risks listed in Table 2 and the actual situation of the tourism sector in the Southeastern region, the experts engaged in discussions, grouped risks, and selected those most likely to impact tourism sales activities in the area.



The AHP process was conducted with 12 risk factors categorized into 4 groups. Experts first performed pairwise comparisons of the three risk factors within a group and then evaluated the relative importance among the risk groups. A pairwise scale ranging from 1 to 9 was used to compare the importance of sales risk factors at each level. A pairwise comparison matrix was established to normalize and calculate weights.

Additionally, the consistency of the data was checked to ensure that the results were reliable and feasible using formulas (1) and (2)**:**

$$CI = \frac{\lambda max - n}{n-1} \quad (1)$$

$$CR = \frac{CI}{RI} = \quad (2)$$

In this study: CI is the Consistency Index, CR is the Consistency Ratio, RI is the predefined Random Index, and λmax is the largest eigenvalue. The four key groups of sales risks identified and evaluated are illustrated in Figure 1. Financial Risks (F) include: Accounts receivable (F1), Costs (F2), Liquidity (F3). Technology Risks (T) include: Data leakage (T1), Technology dependence (T2), Difficulty adapting (T3). Market Risks (M) include: Demand (M1), Competition (M2), Legal issues (M3). Human Resource Risks (H) include: Employee performance (H1), Employee engagement (H2), and Management (H3).

*(Source: Compiled by the Authors)*

**Figure 1.1: Risks in the Tourism Sector of the Southeastern Region**

## IV. RESEARCH RESULTS

According to the methodology presented above, each risk factor within the groups was compared and scored. The financial risk factors (F) include three sub-risks: F1, F2, and F3. These factors were analyzed through specific steps. The weights and rankings of these risks are shown in the table below:

**Table 4.1: Weights and Rankings of Financial Risk Factors**

| Risk Factor | Weight | Weight (%) | Ranking |
|---|---|---|---|
| Accounts Receivable (F1) | 0.5455 | 54.55 | 1 |
| Costs (F2) | 0.2941 | 29.41 | 2 |
| Liquidity (F3) | 0.1604 | 16.04 | 3 |

*(Source: Compiled by the Authors)*

The results indicate that accounts receivable risk holds the highest weight (54.55%) among financial risks in tourism sales activities in the Southeastern region. This is followed by cost-related risks (29.41%) and, lastly, liquidity risks (16.04%). For the financial risk group, the consistency indicators met the required thresholds (λmax: 3.013249; CI: 0.006625; CR: 0.011422).

**Table 4.2: Weights and Rankings of Technology Risk Factors**

| Risk Factor | Weight | Weight (%) | Ranking |
|---|---|---|---|
| Data Leakage (T1) | 0.6333 | 63.33 | 1 |
| Technology Dependence (T2) | 0.2605 | 26.05 | 2 |
| Difficulty Adapting (T3) | 0.1062 | 10.62 | 3 |

*(Source: Compiled by the Authors)*

Regarding technology risks, data leakage risk has the highest weight (63.33%), followed by technology dependence risk (26.05%). Difficulty adapting to technology changes is ranked third with a weight of 10.62%. Consistency indicators for this group also met requirements (λmax: 3.038700; CI: 0.019350; CR: 0.033360).

**Table 4.3: Weights and Rankings of Market Risk Factors**

| Risk Factor | Weight | Weight (%) | Ranking |
|---|---|---|---|
| Demand (M1) | 0.6479 | 64.79 | 1 |
| Competition (M2) | 0.1222 | 12.22 | 3 |
| Legal Issues (M3) | 0.2299 | 22.99 | 2 |

*(Source: Compiled by the Authors)*

For market risks, demand risk has the highest weight (64.79%), followed by legal risks (22.99%) due to the international nature of the tourism industry. Competition risk ranks third (12.22%).

**Table 4.4: Weights and Rankings of Human Resource Risk Factors**

| Risk Factor | Weight | Weight (%) | Ranking |
|---|---|---|---|
| Employee Performance (H1) | 0.3091 | 30.91 | 2 |
| Employee Engagement (H2) | 0.5813 | 58.13 | 1 |
| Management (H3) | 0.1097 | 10.97 | 3 |

*(Source: Compiled by the Authors)*

Within human resource risks, employee engagement risk is the most significant factor (58.13%), followed by employee performance risk (30.91%). Management risk ranks third (10.97%).

Thus, at this stage, the study has identified the impact level of each factor within each group of risks in the tourism sales activities in the Southeastern region of Vietnam. The ranking of individual factors within these groups has also been conducted. These results are significant as they provide tourism business managers with a solid basis for implementing appropriate risk prevention measures.

The study continued by evaluating the four risk groups: financial, technology, market, and human resources. At this stage, the research aims to determine the importance level of the four proposed risk groups. The higher the weight of a risk group, the more significant it is and the greater the attention it requires. A pairwise comparison matrix was constructed and normalized to calculate the weights of the risk factors, ranking the risks identified in the study.

**Table 4.5: Weights and Rankings of Sales Risk Factors in the Southeastern Tourism Sector**

| Risk Factor | Weight | Weight (%) | Ranking |
|---|---|---|---|
| Financial | 0.587625 | 58.76 | 1 |
| Technology | 0.233650 | 23.37 | 2 |
| Market | 0.138925 | 13.89 | 3 |
| Human Resources | 0.062800 | 6.28 | 4 |

*(Source: Compiled by the Authors)*

The weight results indicate that financial risks are the most critical (weight: 0.587625), followed by technology risks (weight: 0.233650). Market risks rank third (weight: 0.138925), and human resource risks are the least significant (weight: 0.062800).

The study also calculated the largest eigenvalue by multiplying the weights with their respective column totals in the original matrix and dividing the result by the weights. Saaty (1980) explained that the largest eigenvalue (λmax) evaluates consistency in the matrix. If λmax = n, the matrix is fully consistent, meaning there are no inconsistencies in the pairwise comparisons. The results showed λmax = 4.0681, which is acceptable. The study's Consistency Index (CI) and Consistency Ratio (CR) values are as follows:

$$CI = \frac{\boldsymbol{\lambda max - n}}{\boldsymbol{n-1}} = \frac{4.0681 - 4}{3} = 0.0227$$

$$CR = \frac{CI}{RI} = \frac{0.0227}{0.90} = 0.0252$$

The Consistency Ratio (CR) is calculated using Saaty's formula (1980), where RI represents the random index. In this study, n = 4, so according to Saaty's random index values (1980), RI = 0.90. The result CR=0.0252 < 0.1 ensures that the matrix has high reliability, meeting the standards of the AHP method.

## 5. Discussion of Research Findings and Proposed Solutions

This study utilized the Analytic Hierarchy Process (AHP) to identify the weights of key risk factors in the sales activities of the tourism industry in Southeastern Vietnam. The results highlight that financial risk carries the highest weight (0.587625), making it the most critical risk encountered by businesses, including those in the tourism sector. Within this category, accounts receivable stands out as a significant factor (0.5455). Tourism enterprises should pay close attention to customers' payment capacity during service delivery. Additionally, cost control is essential to prevent financial risks, and ensuring liquidity for businesses is strongly recommended by experts to support sustainable sales processes. Most tourism businesses in the Southeastern region of Vietnam are small and medium-sized enterprises. Effective financial management during the sales process remains challenging. Therefore, to mitigate risks related to this factor, businesses need to establish clear procedures for control and transaction handling, as well as regularly update changes in financial operations. Training sessions and short courses for staff in charge of managing sales revenue and expenditures, as well as preparing reports, are essential activities that require attention.

Technology risk, with a relatively high weight (0.233650), emerges due to the rapid pace of global technological development and digitalization. For this risk, tourism businesses in the region should develop a roadmap for integrating technology into sales operations that aligns with their organizational capabilities. Data leakage (0.6333) is identified as the most critical factor within this category. Strengthening data security, particularly for customer-related and operational data, should be prioritized. To enhance the adaptability of tourism businesses in the Southeastern region of Vietnam, the adoption of digital technology is essential. Businesses can implement gradual steps to increase their adaptability. The application of artificial intelligence and new software solutions can help optimize sales efficiency. Additionally, data backup is crucial to ensure the security and safety of the business. The study also underscores the importance of market risks (0.138925) in tourism sales activities in the region. Rapidly changing customer demands and the unique characteristics of the industry, such as its reliance on international customers, highlight the need for businesses to understand relevant legal issues to avoid potential legal risks. Market research, particularly regarding the needs of domestic and international tourists, provides tourism businesses in the region with valuable insights. This enables businesses to better meet customer demands.The growing competition, driven by an increasing number of tourism enterprises and more discerning customers, adds further pressure.

Human resource risks are another critical area in tourism sales, although they carry a lower weight (0.062800). These risks stem from factors such as employee performance, workforce engagement, and management efficiency. However, these risks are often interconnected with other categories identified in the study. Therefore, addressing human resource challenges can improve sales effectiveness or, conversely, hinder business development. Appropriate salary, bonus, and commission policies will help motivate the sales team and improve employee performance. Additionally, as tourism is a unique industry, developing employees' emotional intelligence enables them to build stronger relationships with customers and enhance their work efficiency. Tourism businesses should establish a cohesive corporate culture that focuses on caring for and encouraging employees, thereby increasing their engagement and loyalty to the company. Enhancing workforce quality, implementing appropriate policies, and increasing employee engagement, productivity, and management efficiency are essential for boosting the effectiveness of tourism enterprises.

Identifying these risks helps tourism businesses in the region prevent and mitigate their occurrence during the sales process, ensuring stable and sustainable development.

## 6. Conclusion

The research findings highlight the key risk factors affecting the sales activities of the tourism industry in Southeastern Vietnam. Additionally, several solutions have been proposed to mitigate risks and enhance the efficiency of the tourism sector in the region. This holds great significance for tourism businesses in the region, as sales activities are the lifeblood of these enterprises. Identifying and preventing potential risks enables businesses to be more proactive

in management and to develop strategies that align with their specific business circumstances. Future research directions include expanding the study to other regions and industries, involving a more diverse group of experts to ensure greater objectivity in the results.

# ENHANCING SUSTAINABILITY IN THE DIGITAL ERA: INNOVATION, DIGITAL TRANSFORMATION, AND COLLABORATIVE STRATEGIES

**Vo Thi Kim Anh[1*], Vo Thi Nho[2]**

[1]Faculty of Information Technology, Ho Chi Minh City University of Economics and Finance
[2]Faculty of Primary and Preschool Education, Dong Thap University.
*Corresponding: vothikimanh1007@gmail.com, anhvtk@uef.edu.vn

**ABSTRACT**

This study examines how innovation, digital transformation, and collaborative strategies synergize to enhance sustainability performance. Through a systematic literature review, it explores the impacts of green innovation, advanced digital technologies, and cross-sector collaboration on environmental, social, and economic outcomes. Findings demonstrate that green innovation drives eco-friendly practices, digital tools optimize resource efficiency, and partnerships enable collective problem-solving. The research provides actionable insights for managers, policymakers, and researchers, offering a roadmap to integrate these elements into sustainability strategies and align with global Sustainable Development Goals (SDGs).

*Keywords*: "Collaboration", "Digitalization", "Innovation", "Organizational Innovation", "Sustainability Performance"

## I. INTRODUCTION

Sustainability has emerged as a cornerstone of modern organizational strategies, driven by global challenges such as climate change, resource depletion, and social inequality. These challenges have underscored the importance of aligning business practices with the United Nations' Sustainable Development Goals (SDGs). While sustainability research often emphasizes individual elements such as innovation or digital transformation, the potential of these elements to interact synergistically with collaborative strategies remains underexplored, particularly in the context of emerging markets or small enterprises (Lee & Raschke, 2020). Addressing this gap is crucial as organizations strive to transition from profit-focused models to frameworks prioritizing sustainable development.

Innovation is pivotal in fostering eco-friendly products and processes that minimize environmental harm while enhancing competitiveness. Digital transformation further amplifies this potential by leveraging artificial intelligence and blockchain technologies to optimize resource use, enhance supply chain transparency, and reduce operational costs (Gariba, Mensah, & Osei, 2024; Setiadi, 2024). Collaboration bridges these efforts, enabling knowledge-sharing and resource pooling to tackle complex sustainability challenges. However, cultural differences, regulatory challenges, and varying levels of technological access often hinder the realization of global collaboration's full potential (Umar et al., 2021).

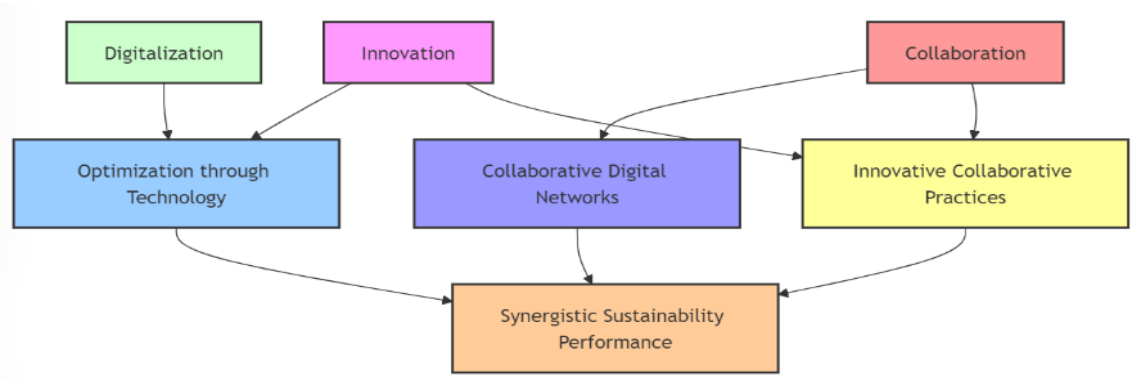

**Fig 1. Interconnection of Innovation, Digitalization, and Collaboration**

This paper investigates the interconnected roles of innovation, digital transformation, and collaboration in driving sustainability performance. By examining the synergistic impact of these elements, the study provides actionable insights for managers, policymakers, and researchers to embed sustainability into organizational strategies. Such an

integrated approach can address pressing environmental, social, and economic challenges while aligning with the global sustainability agenda. Through a comprehensive review of recent research, this study highlights transformative practices and strategic frameworks essential for organizations navigating the digital era.

This diagram illustrates the overlapping roles of innovation, digital transformation, and collaboration in achieving synergistic sustainability performance. It emphasizes their interconnected impact on technology optimization, network collaboration, and innovative practices.

## II. LITERATURE REVIEW

The integration of innovation, digital transformation, and collaboration is crucial for advancing sustainability performance. Existing literature highlights the individual roles of green innovation, advanced digital technologies, and collaborative strategies in addressing environmental, social, and economic challenges. However, there is a need for a more holistic understanding of how these elements interact synergistically. This section reviews key findings from recent studies, focusing on their contributions to sustainable practices and identifying gaps for future exploration.

### Innovation and Sustainability

Innovation is pivotal for advancing sustainable practices. Green innovation focuses on developing eco-friendly products, processes, and technologies, promoting resource efficiency and reducing environmental impact while enhancing competitiveness. Emerging concepts like regenerative innovation emphasize ecosystem and natural resource restoration (Sioen et al., 2024). Renewable energy technologies exemplify innovation's transformative potential in combating climate change. For instance, solar and wind power reduce carbon emissions, foster energy independence, and create new markets (Dhyanasaridewi et al., 2024). Social innovation integrates social goals with entrepreneurial practices, addressing systemic issues like poverty and healthcare access (Oliveira, 2024). Green innovation's application in renewable energy adoption significantly reduces carbon footprints while lowering energy costs (Ramaswami, Tong, & Fang, 2021). In the automotive industry, Tesla's integration of AI-driven battery systems has resulted in a 20% reduction in energy consumption across its production lines, supporting both environmental and economic sustainability goals (Li et al., 2023).

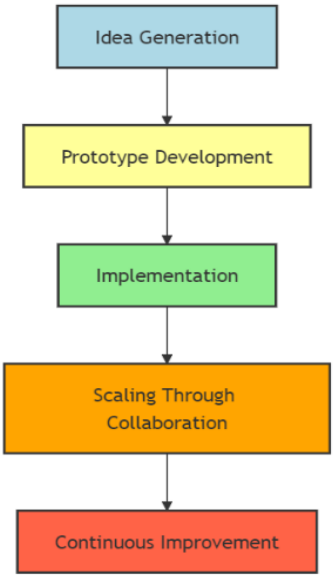

**Fig 2. Lifecycle of Green Innovation**

This diagram depicts the lifecycle of green innovation, starting from idea generation and progressing through prototyping, implementation, scaling via collaboration, and continuous improvement. Circular economy principles—like remanufacturing and recycling in the automotive industry—enable resource reutilization, minimizing environmental degradation and contributing to sustainability (Patel & Singh, 2022). For example, in the automotive industry, the transition to electric vehicles (EVs) has been propelled by both innovation and digitalization, leveraging AI-driven battery management systems and IoT connectivity for optimizing energy use and vehicle performance. Tesla's advanced integration of these technologies has not only led to significant environmental benefits but also

created a competitive edge in an increasingly green-conscious market (Li et al., 2023). In the agriculture sector, IoT-based smart irrigation systems have enabled farmers to reduce water usage by up to 30%, while simultaneously cutting energy consumption (García et al., 2020).

**Digitalization and Sustainability**

Digitalization transforms organizations' approaches to sustainability challenges. Technologies such as blockchain and artificial intelligence (AI) are crucial in enhancing sustainability by enabling real-time monitoring and verification of sustainable practices. For example, blockchain has been applied in the supply chain management of agricultural products, ensuring that consumers can track the origin of their food, thus supporting ethical sourcing and reducing food waste (Köhler & Zhang, 2020). In the energy sector, AI is being used to predict and optimize energy usage in real-time, reducing carbon footprints and operational costs in smart cities (Hosseini Moghaddam et al., 2021). Technologies such as blockchain and artificial intelligence (AI) are crucial in enhancing sustainability by enabling real-time monitoring and verification of sustainable practices. For example, blockchain has been applied in the supply chain management of agricultural products, ensuring that consumers can track the origin of their food, thus supporting ethical sourcing and reducing food waste (Cai et al., 2020). In the energy sector, AI is being used to predict and optimize energy usage in real-time, reducing carbon footprints and operational costs in smart cities (Zhang & Liu, 2021). Digital tools such as data analytics, blockchain, and artificial intelligence provide insights into environmental and social footprints, optimize resource use, and foster supply chain transparency.

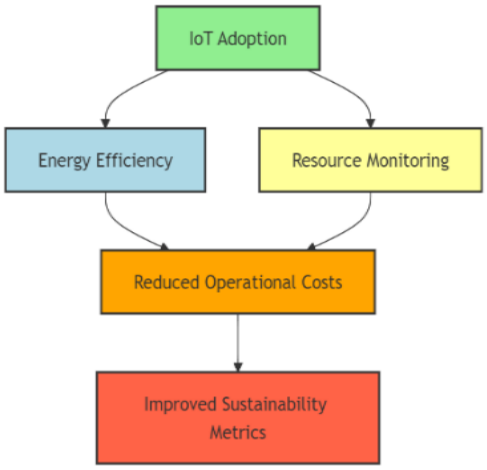

**Fig 3. Technology Adoption for Sustainability**

This flowchart shows how technologies like IoT contribute to sustainability by enabling energy efficiency, resource monitoring, and reducing operational costs, leading to enhanced sustainability metrics.

**Table 1: Industry-Specific Applications of Digital Tools for Sustainability**

| Industry | Digital Tools Used | Sustainability Outcomes | Key Examples |
|---|---|---|---|
| Automative | Blockchain, IoT | Reduced waste, increased recycling | Circular economy in manufacturing |
| Agriculture | AI, IoT | Optimized resource use | Smart irrigation systems |
| Retail | Blockchain, AI | Supply chain transparency | Ethical sourcing initiatives |
| Healthcare | AI-based diagnostic tools, IoT-enabled devices, blockchain | Reduced resource wastage, improved patient care, and ethical data management | AI-based diagnostic systems streamline patient triage, reducing unnecessary tests (e.g., Babylon Health); IoT devices monitor real-time health metrics, optimizing resource use in hospitals; blockchain ensures ethical management of clinical trial data. |
| Waste Management | IoT-enabled tracking systems, | Enhanced recycling rates, optimized waste collection, | IoT systems like smart bins provide real-time waste tracking for efficient collection (e.g., BigBelly |

| | | | |
|---|---|---|---|
| | AI-powered sorting, blockchain | and transparency in waste disposal | bins); AI-powered recycling plants improve material recovery rates; blockchain tracks hazardous waste disposal to ensure compliance with environmental standards. |

As shown in Table 1, digital tools are applied across diverse industries to achieve tailored sustainability outcomes, such as supply chain transparency in retail or resource optimization in agriculture.

Public sector digitalization in regions like the EU promotes sustainable development significantly (Gariba et al., 2024). IoT devices and smart grids optimize energy distribution and support renewable energy adoption (Setiadi, 2024). Blockchain ensures supply chain traceability, empowering consumers to verify ethical sourcing claims and align preferences with sustainability efforts. Tailored applications across industries further underscore digitalization's versatility.

**Collaboration and Sustainability**

Collaboration among businesses, governments, and communities is critical for addressing multifaceted sustainability issues. Public-private partnerships deploy renewable energy technologies and advance sustainable urban planning (Dhyanasaridewi et al., 2024). Collaborative networks enhance knowledge-sharing and co-creation, enabling innovative solutions to shared challenges. For instance, the National Industrial Symbiosis Program (NISP) in the UK demonstrates significant resource-sharing benefits (Chertow, 2020). Partnerships with NGOs ensure inclusivity and address local needs effectively (Garza-Reyes et al., 2019).

The literature underscores the transformative potential of innovation, digital tools, and collaboration in achieving sustainability goals. While green innovation reduces environmental footprints and digital transformation enhances efficiency, collaboration fosters collective problem-solving. Despite significant progress, research gaps remain in understanding their combined impact, particularly across diverse industries and regions. These insights lay the groundwork for advancing integrated strategies in sustainability research and practice.

## III. METHODOLOGY

This study employs a systematic literature review, combining qualitative and quantitative approaches to ensure a comprehensive understanding of the interrelated roles of innovation, digitalization, and collaboration in sustainability performance.

**Data Collection**

The research process began with the selection of reputable databases such as Scopus, Web of Science, and ScienceDirect to access high-quality, peer-reviewed studies. The study focuses on peer-reviewed articles from high-impact journals in sustainability, and only those studies published in the last decade were included to ensure relevancy. Keywords including "sustainability performance," "green innovation," "digital transformation," and "collaborative strategies" guided the search. Only articles published within the last decade were considered to ensure the relevance of the findings. This method ensures a robust base for understanding recent trends and practical applications of sustainability practices (Yadav & Yadav, 2024). While the methodology provides valuable insights through a systematic literature review, it is limited in its ability to capture real-world complexities. Future research should incorporate empirical studies, such as field experiments or stakeholder interviews, to validate the proposed framework and address potential gaps in its applicability across diverse contexts.

**Inclusion and Exclusion Criteria**

Inclusion criteria were defined to select studies providing empirical or theoretical insights into the interplay between innovation, digitalization, and collaboration. Studies focusing solely on isolated aspects without demonstrating interconnected impacts were excluded. This ensured a holistic analysis of the themes. Articles were also cross-referenced with industry reports to validate their applicability in real-world scenarios (Setiadi, 2024).

**Thematic Analysis**

Thematic analysis was employed to identify patterns and relationships across the selected studies. This involved coding qualitative data into recurring themes such as "technology-enabled sustainability" and "cross-sector

partnerships." Quantitative metrics, such as reductions in carbon emissions or cost savings, were extracted to substantiate findings. Such themes were critically evaluated to ensure their alignment with the overarching research questions (Gariba et al., 2024).

**Table 2: Metrics for Evaluating Sustainability Performance**

| Metric | Measurement Tool | Applicability | Example |
|---|---|---|---|
| Carbon Footprint | Lifecycle Assessment (LCA) | Emission-intensive industries | Automotive sector |
| Resource Efficiency | IoT-enabled Monitoring | All industries | Manufacturing |
| Social Equity Impact | Community Surveys | Community-driven projects | Renewable microgrids |

Table 2 outlines the key metrics used to evaluate sustainability performance, showcasing their relevance and measurement approaches across industries

**Cross-validation and Quality Assurance**

To mitigate bias and enhance reliability, cross-validation was conducted by independent reviewers. This study's reliance on a systematic literature review, while providing comprehensive insights, limits its ability to capture real-time challenges and outcomes. Future empirical studies, such as longitudinal case studies or multi-regional surveys, are necessary to validate and refine the proposed framework. Discrepancies in thematic categorization were resolved through consensus. Triangulation with secondary data sources, including industry reports and case studies, further validated the findings. This multi-layered approach ensures the reliability and depth of insights (Kurniadi et al., 2024).

**Synthesis and Interpretation**

The insights from the thematic analysis were synthesized to map out interdependencies among innovation, digitalization, and collaboration. This synthesis provided a robust foundation for formulating actionable recommendations for managers, policymakers, and researchers. Patterns were linked to specific industries to highlight variations and adaptability of sustainability strategies (Gariba et al., 2024).

## IV. FINDINGS AND DISCUSSIONS

Innovation, digitalization, and collaboration dynamically interact to amplify sustainability performance.

**Table 3: Comparative Analysis of Sustainability Strategies**

| Strategy | Benefits | Challenges | Examples |
|---|---|---|---|
| Green Innovation | Reduces emissions, saves costs | High R&D costs | Solar and wind energy adoption |
| Digitalization | Enhances efficiency, traceability | Initial implementation costs | Blockchain for supply chain tracking |
| Collaboration | Resource sharing, knowledge pool | Coordination among stakeholders | Public-private partnerships (PPP) |
| Green Innovation | Reduces environmental footprint. Promotes resource efficiency and cost savings. | High research and development (R&D) costs. Regulatory hurdles and market acceptance. | Tesla’s AI-driven battery systems reducing energy consumption. Solar and wind energy adoption reducing carbon emissions. |
| Digitalization | Enhances operational efficiency and supply chain transparency. Enables real-time monitoring and predictive analytics. | High initial implementation costs. Data privacy and cybersecurity concerns. | Walmart’s blockchain for food traceability. IBM Watson Health for optimizing patient care. |
| Collaboration | Facilitates knowledge-sharing and resource pooling. Amplifies collective problem-solving capabilities. | Coordination challenges among diverse stakeholders. Trust and cultural barriers in cross-sector partnerships. | Ellen MacArthur Foundation's circular economy initiatives. Public-private partnerships in renewable energy projects. |

Table 3 provides a comparative overview of the three primary sustainability strategies, highlighting their unique

benefits, challenges, and applications in real-world contexts. Innovation creates eco-friendly solutions aligning with environmental goals. Digitalization optimizes these efforts with tools enabling resource tracking and supply chain transparency. Collaboration magnifies these impacts through shared knowledge and resources.

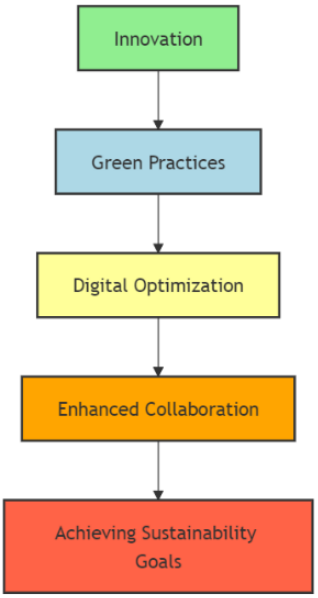

**Fig 4. Framework for Sustainability Performance**

This flowchart outlines the sequential framework for achieving sustainability goals. Starting with innovation, it proceeds through green practices, digital optimization, and enhanced collaboration, culminating in sustainable outcomes.

**The Role of Innovation**

Innovation emerges as a critical enabler of sustainability, allowing organizations to develop new products, processes, and technologies that reduce environmental impact. For example, renewable energy solutions like solar and wind power not only minimize carbon emissions but also enhance energy independence (Dhyanasaridewi et al., 2024). Additionally, the adoption of green innovation in industrial processes has been shown to improve cost efficiency while addressing regulatory compliance (Sioen et al., 2024). Additional case studies provide further context for the framework's application. For example, Unilever's use of blockchain for ensuring sustainable palm oil sourcing demonstrates digital transformation's potential for supply chain transparency. Similarly, India's Smart Cities Mission leverages IoT technologies to optimize energy consumption and waste management, showcasing innovation and collaboration at the national scale. In addition to Unilever's blockchain integration, another example is Walmart's use of blockchain to enhance food traceability, which reduces food waste and improves consumer trust (Kouhizadeh, Saberi, & Sarkis, 2021). Likewise, in the healthcare sector, IBM's Watson Health utilizes AI to optimize patient care and resource allocation, showcasing the transformative potential of digital tools in both developed and developing regions (Chen & Decary, 2020).

**Digitalization's Transformative Potential**

Digitalization amplifies the effectiveness of innovative practices by providing data-driven tools for optimization. Advanced analytics facilitate real-time monitoring of energy consumption and waste reduction. Blockchain technology enhances supply chain transparency, building consumer trust in sustainability claims (Gariba et al., 2024). Moreover, IoT devices integrated into industrial systems enable predictive maintenance, reducing operational downtime and conserving resources (Setiadi, 2024).

**Collaboration as a Catalyst**

Collaboration bridges the gap between innovation and digitalization, fostering collective efforts to address systemic sustainability challenges. Cultural differences, regulatory challenges, and varying technological access often prevent global collaborations from realizing their full potential in addressing sustainability issues. Collaboration bridges the gap

between innovation and digitalization, fostering collective efforts to address systemic sustainability challenges. However, the effectiveness of such collaboration is often hindered by cultural differences, lack of trust, and unequal access to technology across sectors. For instance, small and medium-sized enterprises (SMEs) in developing countries face challenges in participating in global sustainability networks due to limited digital infrastructure and knowledge gaps. Overcoming these barriers requires a strategic approach to building inclusive platforms where knowledge sharing can occur equitably across all stakeholders. Public-private partnerships have proven instrumental in deploying large-scale renewable energy projects and urban planning initiatives (Dhyanasaridewi et al., 2024). Collaborative platforms enable cross-sector knowledge-sharing, which accelerates the adoption of best practices and innovative solutions. Collaborative platforms like the Ellen MacArthur Foundation have successfully demonstrated the potential of cross-sector partnerships in promoting circular economy principles. For example, the foundation's collaboration with leading corporations like Danone and Google has accelerated the development of sustainable packaging solutions and AI-driven resource monitoring systems. Such initiatives underscore the importance of structured frameworks to facilitate knowledge-sharing and resource pooling.

**Regional and Industry-Specific Insights**

Variations in regional and industry contexts influence the implementation of sustainability strategies. Regional contexts play a pivotal role in shaping sustainability strategies. The scalability of the proposed sustainability framework holds significant potential for small and medium-sized enterprises (SMEs) in developing economies. SMEs often face unique challenges such as limited access to funding, insufficient technological infrastructure, and lack of skilled personnel. Adapting the framework for these contexts requires emphasizing affordable, low-barrier solutions such as IoT-enabled tools for resource optimization and blockchain for supply chain transparency. Additionally, regional collaboration through public-private partnerships can bridge resource gaps, offering SMEs access to shared technological infrastructure and knowledge networks. Training programs tailored to local needs, combined with government subsidies or micro-financing initiatives, can further facilitate the adoption of sustainability practices. This adaptive approach ensures that the framework aligns with the financial and operational realities of SMEs, enabling them to contribute meaningfully to sustainability goals while maintaining economic viability.

For instance, in Asian markets, the collectivist cultural norms often drive community-based initiatives such as cooperative renewable energy projects, whereas Western economies, with their focus on individualism, prioritize cutting-edge innovation and private-sector-led sustainability efforts. Similarly, economic development levels influence the adoption of digital tools, with advanced economies leveraging AI and blockchain at scale while emerging markets focus on accessible, cost-effective technologies like IoT for resource optimization. Furthermore, regional disparities in technological infrastructure significantly influence the adoption of digital tools. Developed economies, with their advanced internet penetration and AI capabilities, readily integrate blockchain and IoT solutions into sustainability initiatives. In contrast, emerging economies often face challenges such as lack of digital literacy, limited internet access, and insufficient funding. Addressing these barriers requires region-specific strategies, such as government-subsidized IoT adoption and localized training programs to enhance technical skills. Developed economies often leverage advanced digital tools and innovation, while emerging markets focus on resource-sharing and community-based initiatives. For instance, the automotive industry's adoption of circular economy principles, such as recycling and remanufacturing, showcases how industry-specific applications can drive both economic and environmental benefits (Patel & Singh, 2022).

**Leadership and Organizational Culture**

Leadership commitment and a strong organizational culture of corporate social responsibility (CSR) amplify the synergies among innovation, digitalization, and collaboration. Organizations with proactive CSR initiatives are more likely to embed sustainability into their strategic frameworks, ensuring long-term success (Kurniadi et al., 2024).

In summary, the findings affirm that sustainability performance is maximized when innovation, digitalization, and collaboration are leveraged in a synergistic manner. The interplay among these elements creates transformative solutions that address environmental, social, and economic challenges effectively.

## V. CONCLUSION AND RECOMMENDATIONS

Achieving sustainability goals necessitates integrating innovation, digital transformation, and collaboration into organizational strategies. Findings reveal that green innovation fosters environmentally friendly practices, digital tools enhance operational efficiency and transparency, and partnerships amplify collective impact. These elements, when leveraged synergistically, provide a comprehensive framework for addressing global sustainability challenges while aligning with the SDGs.

For Organizations: Organizations must prioritize fostering a culture of sustainability and innovation. This involves encouraging creative problem-solving, investing in research and development for eco-friendly technologies, and aligning strategic objectives with environmental and social goals. Leveraging digital tools like blockchain for supply chain transparency and IoT for operational efficiency can enhance resource optimization. Collaborations across sectors can further amplify sustainability efforts by pooling expertise and resources to address systemic challenges effectively.

For Policymakers: Policymakers can foster cross-sector collaboration by implementing regulatory frameworks that promote data sharing and transparency across industries. The European Union's Green Deal exemplifies this approach, offering financial incentives and subsidies to businesses adopting renewable energy technologies, thereby aligning public and private sectors in advancing sustainability objectives (European Commission, 2020). Establishing funding mechanisms for small and medium enterprises (SMEs) to adopt sustainable practices and supporting public-private partnerships can accelerate the transition toward sustainability. Additionally, fostering partnerships with NGOs and local communities through tailored policies can ensure inclusivity and greater social impact in sustainability initiatives. Policymakers should also invest in education and capacity-building programs to improve digital literacy and technical skills in underserved communities. Establishing innovation hubs in developing regions can further bridge the gap between resource availability and sustainability outcomes.

For Researchers: Researchers should delve deeper into exploring the synergies between emerging technologies and sustainability, assessing long-term impacts and industry-specific applications. Future research can focus on developing metrics to measure the effectiveness of collaborative initiatives and the scalability of pilot projects. Future research could also explore the interplay between sustainability strategies and cultural dimensions, such as how collectivist versus individualist societies influence collaboration models. Additionally, investigating the role of public-private partnerships in scaling green technologies in underserved regions could provide actionable insights for policymakers. Exploration of underrepresented industries, such as waste management or healthcare in developing economies, could offer valuable insights. These sectors often face unique challenges that test the scalability and adaptability of sustainability strategies. Additionally, longitudinal studies examining the integration of digital tools and collaboration in these contexts would strengthen the evidence base for the proposed framework. Longitudinal studies examining the interplay between innovation, digitalization, and collaboration can provide robust evidence to guide policy and organizational decisions.

Broader Implications: The findings underline the global implications of aligning sustainability efforts with innovation and digital transformation. Developed economies should focus on scaling technological solutions, while emerging markets can emphasize resource-sharing and inclusive collaboration models to address local challenges. By adopting holistic and adaptive approaches, organizations can not only address immediate challenges but also contribute to a resilient and sustainable future for all stakeholders.

# DIGITAL TRANSFORMATION IN VIETNAMESE SMALL AND MEDIUM ENTERPRISES: PERCEPTION FROM THE TOP MANAGEMENT

**Le Thi Ngoc Giang[1], Nguyen Tan Minh[1*]**

[1]School of Business, International University – Vietnam National University Ho Chi Minh City.

* Corresponding : ntminh@hcmiu.edu.vn

**ABSTRACT**

This research explores how the top management of Vietnamese small and medium enterprises perceives the effectiveness of digital transformation in their businesses. The qualitative method was employed in this study, and 17 senior managers participated in the in-depth interviews. The results provide insights for organizations adjusting to the emerging perception of digital transformation in Vietnam. Ongoing transformation is essential as firms adapt to market dynamics. The findings suggest that cultivating a culture of innovative and flexible leadership is critical to ensure sustainable digital advancement and a competitive edge. In addition, the involvement of top management strengthens the resource-based perspective by illustrating leadership's contribution to successful digital transformation. This study substantially contributes to leadership, business strategy, and organizational development by pinpointing potential opportunities and challenges in implementing digital transformation in Vietnam.

*Keywords: "*digital transformation", "innovation", "organizational performance", "SME"

## I. INTRODUCTION

### 1.1. Background of the study

Digital transformation is a global trend that redefines society and business, compelling organizations to adapt to compete in the digital era. Digitalization has positively impacted businesses during the pandemic, with expectations for its ongoing significance in facilitating recovery after COVID-19 (Le, 2023). The fourth industrial revolution, or Industry 4.0 (I4.0), presents opportunities and challenges for developing economies regarding global value chains and industrial advancement (Lee, 2020). Global investment in digital transformation is projected to reach $3.9 trillion by 2027 (Statista, 2024).

Small and medium enterprises (SMEs) represent over 90% of businesses, mainly micro firms with under 10 employees. In comparison, own-account workers and micro- and small-sized enterprises account for 70% of global employment (International Labor Organization, 2019). Digital infrastructure significantly impacts SMEs' sustained financial growth and resilience. A recent survey by the General Statistical Office (2023) indicates that SMEs in Vietnam comprise over 97% of businesses, employing around 36% of the workforce and generating approximately 26% of the sector's net income (General Statistics Office of Vietnam, 2023). According to the Ministry of Information and Communications (MIC), Vietnam had over 64,000 digital technology firms employing over a million individuals by 2021 (VietnamPlus, 2022). The COVID-19 pandemic expedited the transition to a contactless economy, promoting digital transformation and expanding the digital business environment. Following a successful 2021 initiative that supported 16,000 firms in digital transformation, MIC extended the program in 2022 to assist 30,000 businesses (Tuoi Tre Online, 2022).

While a global shift towards digital transformation is recognized, the advancement of digital transformation in Vietnam remains inadequate. A survey by the Vietnam Chamber of Commerce and Industry of more than 400 businesses revealed that 51% of enterprises engaged in digitalization pre-COVID-19, with 25.7% initiating it as a pandemic response, and 17.5% showed interest without implementing technology (VietnamPlus, 2021). Up to 70% of Vietnamese SMEs are outside the digital economy, and only 20% are learning about it (VietNamNet News, 2022). The 2021 Enterprise Digital Transformation Annual Report identifies leadership's lack of confidence and knowledge as a significant barrier, representing 32.1% of transformation challenges. The 2022 US Agency for International Development and the Ministry of Planning and Investment report indicated that almost 50% of businesses that began digital transformation subsequently ceased their initiatives. However, understanding the challenges of digital

transformation in Vietnam is very limited. In particular, almost no study systematically discovered the hidden reasons from the SMEs' perspective. Therefore, we conduct this research to examine the perceptions of Vietnamese SMEs' top management of digital transformation and its impact on the Vietnamese business.

### 1.2. Research questions and objectives

To fill this gap, the research aims to discover how the top management in Vietnamese SMEs perceive and experience digital transformation processes. There are three objectives of the research:

– RO1: To explore top management's perception of digital transformation in Vietnamese SMEs

– RO2: To identify the relationship between management perspectives and the implementation of digital transformation in their businesses

– RO3: To offer suggestions for aligning digital transformation initiatives with organizational objectives.

– To accomplish the objectives mentioned above, the following questions will be addressed in our study:

– RQ1: How does the top management in Vietnamese SMEs perceive digital transformation?

– RQ2: Is there a relationship between the top management perspective and the implementation of digital transformation in their organizations?

– RQ3: What are the key lessons to aligning digital transformation initiatives with organizational objectives?

## II. MATERIAL AND METHOD

This section reviews the resource-based view theory, the digital business transformation stages, and the role of top management in digital transformation implementation. This part offers a foundation to explore the top management's perception of digital transformation in Vietnamese SMEs.

### 2.1. Conceptual foundation

#### 2.1.1. The resource-based view

Barney (1991) proposed the resource-based view (RBV), which posits that sustainable competitive advantage is achieved through unique internal resources. This model prioritizes internal competencies over external market factors (Assensoh-Kodua, 2019). Both tangible and intangible resources are considered crucial in RBV discourse. While both types of IT resources are essential, an emphasis on intangible resources is critical for long-term competitive advantage (Makhloufi *et al.,* 2018). Intangible IT resources are characterized as non-physical assets that bolster a firm's competitive position. These include IT governance, IT relationship resources, and IT knowledge resources (Makhloufi *et al.,* 2018). Their strategic significance stems from their replicative difficulty for competitors, potentially fostering sustainable competitive advantages when aligned with valuable, rare, inimitable, and non-substitutable (VRIN) (Makhloufi *et al.,* 2018). Resource acquisition and competitive advantage maintenance are heavily impacted by intangible capabilities like intellectual capital, financial literacy, and business experience (Ying *et al.*, 2019).

Recent studies on digital transformation through the lens of the RBV highlight the critical role of digital resources in achieving competitive advantage. The RBV framework emphasizes the importance of leveraging unique resources, such as human capital and technological capabilities, to drive successful digital transformation. Effective management of digital talent is essential, as skilled employees drive innovation and adaptability in digital environments (Willie, 2024). Organizations must integrate advanced technologies to enhance operational efficiency and customer engagement (Hsiao, 2024). Leveraging data analytics can inform strategic decisions and foster a culture of continuous improvement (Willie, 2024). Moreover, engaging in corporate social responsibility initiatives can bolster a firm's resource base, particularly in human and technological aspects, thereby facilitating digital transformation (Nie et al., 2024). A strong digital orientation is linked to improved performance, particularly in SMEs, where a U-shaped relationship indicates that initial investments in digital capabilities may yield setbacks before achieving success (Barragan & Becker, 2024).

Digital transformation in SMEs in developing countries is shaped by the RBV, focusing on unique resources for competitive advantage. This transformation is vital for enhancing financial and operational performance, supported by studies from various regions. A recent study on Malaysian SMEs shows that digital transformation boosts profitability and revenue growth, underlining the need for strategic digital adoption (Yang & Ming, 2024). In Pakistan, technology

adoption strongly correlates with improved business performance, highlighting the importance of digital infrastructure investment (Mushtaq et al., 2024). Managerial education, internationalization, and firm size are the key factors influencing digital adoption in Spanish SMEs, indicating that knowledge is crucial for overcoming challenges (Clemente-Almendros et al., 2024). While the RBV offers insights into digital transformation advantages, SMEs in developing countries may need tailored strategies addressing local contexts. Developing countries typically adopt basic information systems, as advanced technologies are hindered by socioeconomic issues ((Díaz-Arancibia et al., 2024)). Besides, digital skills gaps and infrastructure issues present significant challenges for SMEs in their transformation efforts (Yang & Ming, 2024). Common hurdles include limited financial resources, a shortage of skilled workers, and concerns over data security (Yusuf et al., 2024). In Vietnam, the application of the RBV in exploring digital transformation is still limited. Thus, we adopt this theory to discover the top management's perception of Vietnamese SMEs toward digital transformation. Findings from this study can enhance our understanding of digital transformation in developing countries.

### 2.1.2. The digital business transformation stages

Strohmeier (2020) proposed a typology comprising four ideal types denoting different organizational digitalization levels. These types exist on a continuum, with minimal and maximal digitalization extremes, alongside two intermediate types indicating escalating digitalization intensity. Figure 2.1 presents the typology below.

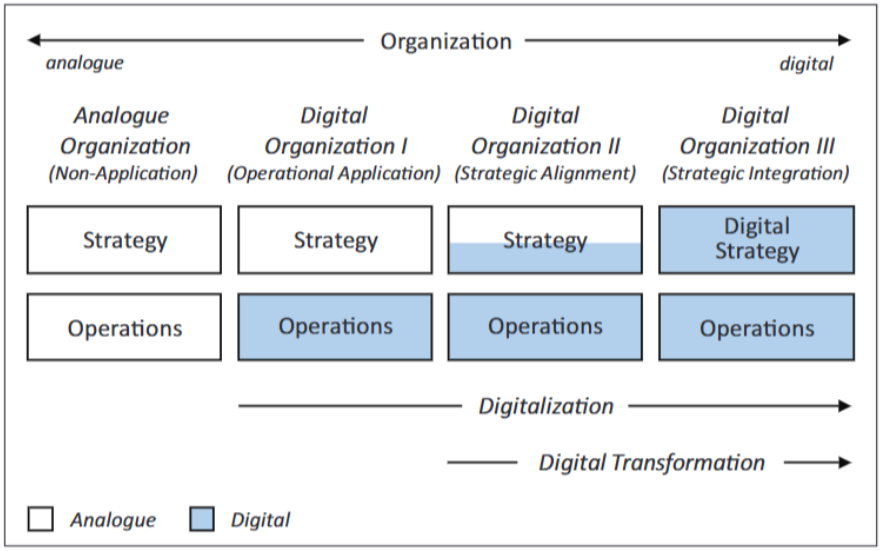

**Figure 2.1 - Typology of digital organizations (Strohmeier, 2020)**

Furthermore, there are five key phases of digital transformation (Mutlu *et al.*, 2022). Each phase of the digital transformation process is characterized as the following:

– Digital Passive: Organizations exhibit minimal digital engagement, reflecting a passive approach to transformation.

– Digitization: Organizations convert analog information into digital formats without significant business model changes.

– Digitalization: Utilization of digital technologies enhances operations and customer interactions, integrating tools for improved efficiency.

– Digital Transition: A significant shift occurs as organizations adapt their processes and strategies to digital advancements.

– Digital Transformation: The final phase entails comprehensively rethinking business models, culture, and processes to leverage digital capabilities for innovation and growth fully.

### 2.1.3. The pivotal role of top management in the transformation to digitalization

Top management teams are essential in establishing organizations' digital transformation vision. They must embrace change and take risks to enable corporate digital transformation (Zhang & Yang, 2023). Task-related faultlines positively influence corporate digital transformation, suggesting that differing task perspectives within the top

management can enhance digital initiatives; conversely, bio-demographic faultlines hinder digital transformation, as demographic differences within the top management may impede digital progress (Peng & Jia, 2023). Furthermore, top management heterogeneity influences the interplay between digital transformation and corporate innovation (Zhang & Yang, 2023). An increase in diversity within the top management teams amplifies the beneficial effects of digital transformation on innovation. Establishing priorities and commitments in digitalization is essential for executive leadership. Management dedicates resources to comprehending digitalization and facilitating organizational change (Figure 2.2) (Wrede *et al.*, 2020). Effective leadership can enhance employee engagement in digital transformation, improving job performance (Nguyen *et al.*, 2023).

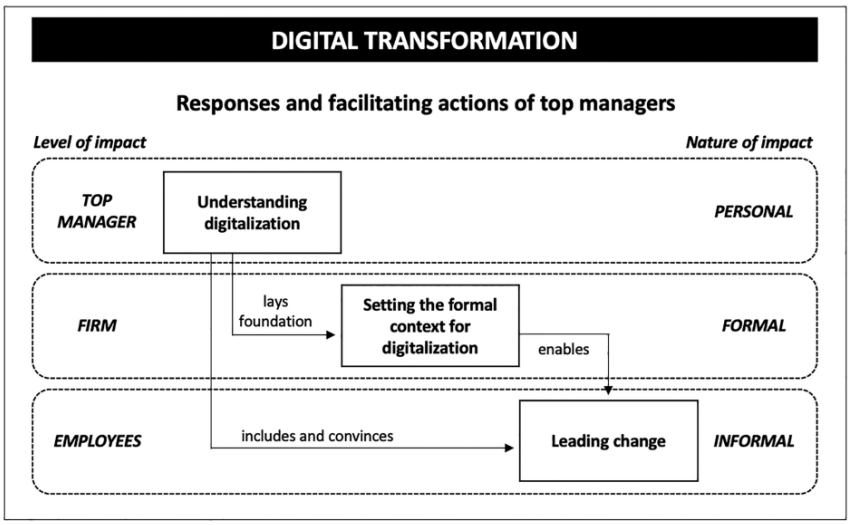

**Figure 2.2 - Top-level managers' actions to encourage digital transformation (Wrede et al., 2020)**

### 2.1.4. Digital readiness

Five elements—market, organization, people, strategy, and technology—were covered by the multidimensional construct developed by Trischler and Li- Ying (2022). The digital transformation outcomes for small businesses were positively influenced by technological and strategic elements of digital readiness (Trischler & Li-Ying, 2022). In the same research, strategic planning, goal alignment, and the ability to adjust strategies in response to digital disruptions are all vital elements for successful digital transformation. The technology dimension comprises the technological infrastructure, digital tools and capabilities, and technology integration into different business processes. These elements are essential for effectively leveraging technology throughout digital transformations.

## 2.2. Research method

The qualitative method was employed in this study since it enables researchers to explore complex phenomena in depth rather than through quantitative measures (Zou & Xu, 2023). Given the complicated nature of economic forecasting problems and management, qualitative research is becoming progressively more relevant (Radović-Marković, 2023). The qualitative data from semi-structured interviews will yield reliable insights into top managers' perspectives on digital transformation, enhancing understanding of its business relevance. Utilizing Conversation Analysis proves interview dynamics, offering richer insights into participants' views and surpassing conventional qualitative analysis techniques (Junnier, 2024).

The author identifies specific respondent categories for data donation relevant to the study (Bougie & Sekaran, 2016). The study involves top managers of Vietnamese SMEs invited for qualitative research. Participants must have at least one year of management experience in Vietnamese SMEs across various sectors. Thus, respondents have adequate expertise to link their management practices with their perceptions of digital transformation in Vietnamese SMEs. They include Vietnamese SMEs' founders, CEOs, directors, and senior managers. Saturation in qualitative research is essential for determining sample size and ensuring rigor, noting that homogeneous populations often reach saturation with few interviews (9–17) or focus groups (4–8) (Hennink & Kaiser, 2022). The author ceased interviews after 17, as responses indicated alignment and no novel information emerged, confirming the information saturation. The duration

of the in-depth interviews varied from 30 to 97 minutes, successfully offering rich data and insights from the informants.

## III. RESULT AND DISCUSSION

### 3.1. Informants' profiles and analysis procedure

Seventeen experienced SME managers agreed to participate in this research. The semi-structured interview was employed to explore the perception of digital transformation, tailoring to the interviewees' willingness to share their experiences. Table 3.1 presents the main interview questions, and Table 3.2 below summarizes the study participants.

**Table 3.1 - Interview Questions**

| No | Interview Questions |
|---|---|
| 1 | How do you perceive digital transformation? |
| 2 | How do you perceive the readiness of an organization for digital transformation? |
| 3 | What guidance, lessons learned, or best practices would you provide other SMEs starting their digital transformation, based on your experience? |

*Source: The authors' work*

**Table 3. 2 - The Participants' Profiles**

| No | Status | Companies types | Industry | The interview's duration |
|---|---|---|---|---|
| 1 | Founder | SMEs | Commerce | 40 minutes |
| 2 | Director | SMEs | Retail | 46 minutes |
| 3 | CEO | SMEs | Fintech in Healthcare | 30 minutes |
| 4 | Director | SMEs | Textile and Garment | 52 minutes |
| 5 | Co-Founder | SMEs | Blockchain services | 43 minutes |
| 6 | CEO | SMEs | IT Services & IT Consulting | 40 minutes |
| 7 | Co-Founder/ CTO | SMEs | Financial services | 58 minutes |
| 8 | Chairman/ COO | SMEs | IT Services & IT Consulting | 68 minutes |
| 9 | Co-Founder | SMEs | IT Services | 97 minutes |
| 10 | Founder/ CTO | SMEs | Software Products | 60 minutes |
| 11 | Director | SMEs | Insurance | 40 minutes |
| 12 | Director | SMEs | Manufacturing | 44 minutes |
| 13 | Sale Director | SMEs | Engineering Technology | 38 minutes |
| 14 | CFO | SMEs | Food & Beverage Manufacturing | 34 minutes |
| 15 | Director | SMEs | Tourism | 60 minutes |
| 16 | Founder | SMEs | Software Development | 72 minutes |
| 17 | Founder/ CEO | SMEs | IT Outsourcing | 30 minutes |

*Source: The authors' work*

### 3.2. Findings and Interpretation

Seven core themes are delineated: (1) prevalent trend and global mindset; (2) business model; (3) enterprise-scale operating processes; (4) transparency; (5) generation; (6) risk; (7) culture. These classifications emerged from the qualitative content analysis. Furthermore, the research investigates Vietnamese SME leadership's views on digital transformation, observing alignment in viewpoints despite narrative and managerial inconsistencies.

#### 3.2.1. Prevalent trend and global mindset

Regarding SMEs, participants unanimously acknowledged digital transformation as a global trend fostering positive business developments worldwide. The subsequent quotations from participants illustrate this: *"While technology becomes more prevalent, the world is changing in terms of incorporating technological applications into the operational management of a business"* (Interviewee 10); *"Regarding the trend, digital transformation is inevitable for every business in a world of digital competition, now called the digital world"* (Interviewee 6); "*Actually, follow the worldwide trend and make business growth more convenient"* (Interviewee 4).

While some considered digital transformation merely a trend, it became evident that it challenges business strategies, engagement, and commitment. For example, several interviewees observed that: *"When discussing digital transformation, we are mainly racing by keywords [...] Few companies have managed to accomplish everything; the majority of existing companies only perform certain things "on the surface"* (Interviewee 2); *"When discussing digital transformation, it is frequently reduced to software acquisition and training. However, this viewpoint neglects the complexity of the process, as its success depends on the specific traits of the organization involved"* (Interviewee 10).

The research indicated that most SME leaders acknowledged the necessity of adopting a digital transformation mindset, a recurring theme in top management interviews. A global mindset enables the recognition and exploitation of emerging opportunities. The interviewees, for example, expressed: *"Instead of only offering instruction on how to utilize certain tools and technologies, the organization has to reframe its mindset and rationale for this demand as the first step"* (Interviewee 3); *"The adaptability of individuals to new and evolving technologies during the transformation phase holds significance. Once individuals have transitioned digitally and acquired the necessary technological competencies, they can effortlessly adapt to updates and changes"* (Interviewee 7); *"Cognitive processes represent the most crucial element of digital transformation, followed by competencies and resources"* (Interviewee 16).

**3.2.2. Business models**

*"On the market, it has two forms: one is ready-made software, and the other is custom software"* (Interviewee 8). Most participants expressed concern regarding their business models amid digital transformation efforts. SME leaders noted that software development necessitates recruitment or structural changes, yet independent systems or funding often remain lacking (Interviewee 2); assumptions surrounding modernization through digital transformation frequently misalign with practical realities (Interviewee 10).

Digital transformation notably impacts business models, especially for long-standing SMEs in Vietnam. Some interviewees remarked on the challenges faced by companies with extensive operational histories, highlighting the complications arising from outdated data and misaligned accounting practices (Interviewee 7); addressing contemporary issues via digital transformation requires identifying weaknesses in traditional business models and recognizing manual inefficiencies (Interviewee 6). While the advantages of digital transformation are evident, its integration into the business models of long-standing SMEs presents significant challenges. The unique business models of SMEs will undergo modifications due to digital transformation, and reliance on generic software may not suit all enterprises. Moreover, several participants maintained an optimistic perspective regarding the applicability of digital transformation for enterprises over developing proprietary software: *"We envision ourselves as benefiting from established systems rather than creating our own, as the latter proves to be labor-intensive and inefficient"* (Interviewee 5); by adopting existing technologies, such as software as a Service (SaaS), professionals can enhance their efficiency through available solutions (Interviewee 3).

**3.2.3. Enterprise-scale operating processes**

Most participants recognized the link between digital transformation and SMEs' operational processes. For instance, the participants mentioned that: *"Implementing a pre-built solution requires staff training on its use, altering business operations"* (Interviewee 10); *"Understanding the importance of structured processes and strategies is crucial for successful digital transformation"* (Interviewee 8); *"Digital transformation leverages technology to resolve process-related challenges"* (Interviewee 7).

Digital transformation relates to both operational processes and business scale. Participants' quotes illustrate this: *"Post-digital transformation, people management improved, business scale increased, and costs decreased"* (Interviewee 2). An enterprise's operational processes expand with its scale. Several respondents discussed the appropriateness of enterprise-scale for digital transformation and its integration into operations. Furthermore, specific staffing needs vary across businesses. A comprehensive assessment of organizational goals, resources, and technology requirements is recommended to determine the optimal employee count and skill level for effective digital transformation. Participants noted, for example, that: *"The provided software may include numerous processes that are not entirely relevant to one's organization"* (Interviewee 7); *"Digital transformation necessitates operational integration across departments, representing its most advanced form; smaller businesses may only utilize select*

*functionalities of management software"* (Interviewee 10); *"Most Vietnamese companies are small or medium-sized, while software needs are tailored to businesses with 50 to 100 employees, raising concerns about the necessity of hiring additional staff for software implementation in SMEs"*(Interviewee 2).

Furthermore, the analysis indicated that numerous SMEs are selectively implementing elements of transformation, resulting in disunity among the software utilized in their operations. Interviewee 7 expressed that digital transformation constitutes a multifaceted yet self-contained procedure; without cohesive departmental involvement, the term "digital transformation" is rendered meaningless. Interviewee 10 confirmed this, emphasizing that successful digital transformation necessitates professional coherence and interdepartmental synergy for effective business operations. Additionally, a system for integrating diverse software applications is crucial for organizations utilizing multiple tools. Interviewee 10 emphasized that partial conversion complicates the connection of distinct software, requiring the restoration of data links. Interviewee 17 pointed out a growing trend in the industry towards software integration, culminating in unified solutions like SaaS. Interviewee 16 addressed the practicality of software integration via public APIs, which enable software communication and offer a cost-effective alternative to custom-made development.

Implementing digital transformation in SMEs is an innovative strategy that can enhance scalability without increasing workforce size. Participant quotes illustrate this: *"Growth can occur digitally, not necessarily geographically, with enhanced digital presence driving revenue and customer base expansion. Tools for customer segmentation and product promotion are crucial"* (Interviewee 6); *"Some million-dollar companies function with a minimal staff of 10, 20, or 50"* (Interviewee 16). While digital transformation goals may be universal, the strategies and considerations for effective implementation differ depending on company size, objectives, and capabilities.

### 3.2.4. Transparency

"Clean," "transparent," "data," and "process" are identified as essential transparency attributes in digital transformation. Interviewee 8 noted that consistent data enhances transparency in financial transactions. Other participants agreed, stating that digital transformation fosters emotional detachment, transparency, and customer rights (Interviewee 9) and that technological advancements benefit individuals and businesses (Interviewee 16). By integrating transparency into their digital transformation strategies, businesses can build trust, enhance engagement, and create a conducive environment for effective change and sustainable growth.

Most participants recognize that digital transformation enhances organizational transparency across all dimensions. This understanding contributes to the reluctance of some companies to engage in digital transformation, which can conflict with ethical business practices. The following quotes from the participants illustrate this: *"Digital transformation necessitates strict adherence to protocols; some organizations face challenges due to mistakes and insufficient transparency"* (Interviewee 1); *"Certain individuals or family enterprises resist digital transformation out of fear of losing established practices"* (Interviewee 9); *"Entities dependent on traditional paper processes are more vulnerable to corruption"* (Interviewee 11).

Advancement in digital transformation is anticipated to enhance transparency. This evolution is also propelled by initiatives from authorities encouraging a commitment to digital transformation. SME leaders substantiated this: *"Electronic tax systems have been upgraded for all small businesses"* (Interviewee 1); *"I observe the government transitioning to digital services for taxation and invoices, indicating a significant progression"* (Interviewee 14).

### 3.2.5. Generation

Participants discussed "generation" and "age" during interviews. Most believe older adults are ill-suited for digital transformation. However, many elderly individuals manage their businesses. For example, participants indicated, *"Despite Vietnamese enterprises acquiring system software, it is only in English, with no Vietnamese version. Is there assurance regarding the linguistic capabilities of business owners born in Vietnam between 1960 and 1970 today? [...] Concerns are raised as individuals over 40, 45, or 50 often prefer stability, resist change, and avoid transitions"* (Interviewee 13).

Interviewees highlighted the younger generation's significance in digital transformation. The next generation will engage in ongoing learning and adaptability. Participants noted, for instance, *"Young people must understand digital transformation. It is the youth who will realize it; older generations will not"* (Interviewee 7); *"Leadership that fails to*

*acknowledge outdated practices or lacks successors will obstruct adaptation to evolving paradigms. Leaders must exhibit the bravery to transition their roles to enable capable successors"* (Interviewee 3).

### 3.2.6. Risk

The concept of "transformation" compels new routines. Adaptability alone is inadequate. The disruption of norms calls into question new strategies' effectiveness. Insights from senior managers suggest that digital transformation implementation requires organizational restructuring, which is perceived as risky for established firms. Participants indicated that: *"Digital transformation offers benefits; however, resource investment varies, and results differ by initiative"* (Interviewee 2); *"Companies stick to established models, adapting for survival, making it unrealistic to expect theory-based abandonment"* (Interviewee 10). Another manager recapped this perspective: *"Operational efficiency fosters change resistance, arising from an incomplete understanding of actions, prevalent in various sectors, including technology […] Challenges arise in distinguishing areas needing improvement from those succeeding, often resulting in a preference for new infrastructure and personnel shifts over enhancement of existing systems"* (Interviewee 3).

### 3.2.7. Culture

To maintain efficiency and relevance in a dynamic digital environment, cultural institutions must adapt to implement digital transformation and utilize digital tools effectively. Executives emphasize organizational culture: "Digital transformations have impacted corporate culture" (Interviewee 8). Furthermore, one participant noted: *"Adopting a specific tool necessitates an extensive corporate culture reform, requiring both top-down leadership and bottom-up employee engagement. Despite leaders' enthusiasm for change, employee resistance may arise from established routines. Thus, both management and employees must comprehend their respective roles."* (Interviewee 3). Another leader corroborated this sentiment: *"The method adopted is contingent on the organization's culture. Larger firms typically employ a top-down strategy, where decisions originate at the top, as observed in state-owned enterprises. [...] Conversely, the bottom-up method promotes a collective understanding among all members"* (Interviewee 6). He acknowledged the relevance of digital transformation in corporate culture: *"A digital transformation committee should include representatives from various departments, tasked with critical elements such as strategy, process modifications, implementation methods, and performance assessments, proceeding to execution, evaluation, and monitoring"* (Interviewee 6).

## IV. CONCLUSION

All participants who consented to interviews exhibited varying levels of understanding regarding digital transformation. Conversely, some individuals, despite their use of specific technologies, declined interviews due to perceived inadequacies in their knowledge of digital transformation. This finding aligns with the study's focus, indicating that 32.1% of challenges in digital transformation arise from insufficient commitment and knowledge among corporate leaders. Concerning management's perception of digital transformation, all interviewees acknowledged its significant benefits. However, various challenges complicate effective implementation, particularly for SMEs in Vietnam. Factors such as organizational culture, business environment, and the firm's characteristics often impede the success of digital transformation initiatives. Organizations, especially those with established histories, must change their practices and operations considerably. Many companies, however, lack a coherent strategy to navigate the complexities of digital transformation.

The study indicates that Vietnamese SMEs exhibit a relatively low readiness for digital transformation. As discussed about the digital transformation stages, some firms merely utilize digital technologies without engaging in a thorough digital transformation process. These organizations are integrating technology into parts of their business model rather than adopting a comprehensive digitalization strategy. The scale of SMEs necessitates careful consideration when implementing software systems, as existing processes may not align with SME-specific needs. Acknowledging that the costs and risks associated with digital transformation significantly affect top management's decision-making is crucial. Thus, a thorough assessment of potential impacts on operational efficiency and finances is essential before initiating any digital transformation efforts. SMEs must evaluate the consequences of adopting new software systems to ensure effective integration that meets their operational requirements and objectives.

Although qualitative studies provide deep insights into real-life complexities, their findings may lack generalizability. The generalizability and replicability of qualitative research may pose challenges. Despite rigorous methodological protections, uncertainties remain. Future studies are thus advised to explore various contexts for industry and geographical comparisons. Future researchers should focus on the specific sectors where SMEs function. Besides, investigating digital transformation within a certain industry is essential, particularly in Vietnam's diverse business landscape. Additionally, researchers should undertake comprehensive studies on the interactions among governmental bodies, academic institutions, and businesses to elucidate effective digital transformation strategies. Such efforts are expected to enhance enterprises' integration and adaptation of digital innovations.

# STUDY OF INTENTION TO USE GREEN HOTELS IN HO CHI MINH CITY: APPLYING THE THEORY OF PLANNED BEHAVIOR

**Tran Thi Thanh Truc[1*], Nguyen Hai Nam[1]**

[1]Faculty of Business Administration , Ton Duc Thang University .

* Corresponding: Nguyenhainam@tdtu.edu.vn

**ABSTRACT**

In the context of increasing environmental concerns and the shift towards sustainable tourism, understanding tourist behavior has become essential for the hospitality industry. This study focuses on the intention to use green hotels in Ho Chi Minh City, employing the extended Theory of Planned Behavior (TPB) model, combined with a multidimensional green perceived value framework. The survey was conducted with 257 participants using both indirect and direct methods, and the data were analyzed using Structural Equation Modeling (SEM). The results indicate that Functional Value has the most significant impact on tourists' likelihood of selecting green hotels. Additionally, Emotional Value, Attitude, and Subjective Norm Positively influence Visit Intention. However, Social Value has almost no effect on Attitude or Visit Intention. These findings provide insights and strategic recommendations for managers and remaining in the green hotel industry. Furthermore, the study contributes a theoretical basis for awareness-raising education programs and serves as a reference for further scientific research .

*Keywords*: "Multidimensional green perceived value", "Sustainable tourism", "Theory of Planned Behavior", "Vietnamese tourists", "Green hotel".

## I. INTRODUCTION

### 1.1 Background of the study

The continuous advancement of technology improves human experiences but also accelerates environmental pollution. The restaurant and hotel industry, a key component of tourism, significantly contributes to economic growth while posing environmental challenges.By 2023, the global tourism industry accounted for 9.1% of GDP and nearly 10% of global employment (WTTC). Vietnam's tourism sector has also seen strong recovery, welcoming 8.8 million international visitors in the first half of 2024 (+58.4% YoY). Ho Chi Minh City alone generated VND 92,643 billion in tourism revenue, marking a 14.6% increase from 2023.

Despite these economic benefits, tourism has severe environmental consequences. The accommodation sector contributes to 75% of the industry's greenhouse gas emissions (Aboelmaged & Mohamed, 2018). A four-star hotel with 200 rooms may consume 300,000 single-use plastic products per month (Eco-Business). In Vietnam, plastic waste from tourism reached 116,000 tons in 2019 and could triple by 2030.To counteract these impacts, Vietnam has promoted green tourism since 2012, setting emission reduction targets for 2030 and 2050. A 2024 survey by Booking.com found that 78% of Vietnamese travelers value sustainable tourism, yet only 53% consider it when booking hotels. However, the green hotel sector is still underdeveloped, with only 41 ASEAN-certified Green Hotels out of 38,000 accommodations in 2023.

Given this emerging trend, the study "Research on the Intention to Use Green Hotels in Ho Chi Minh City" investigates key factors influencing tourists' choices. Using quantitative surveys and SMART-PLS analysis, the research offers insights for hotel managers to implement sustainable strategies and promote the green hotel movement in Vietnam.

### 1.2 Research Questions and objectives

The study investigates the influence of observed variables on awake on emotions , social prestige, quality of facilities, attitudes, social norms to intention to use green hotels of Vietnamese tourists.

Corresponding to the 04 specific objectives, the report raises 04 research questions as follows:

- Question 1: What theoretical basis is related to Perception? awake about emotions, Social reputation, Comfort

quality, Attitude, Social norms and Usage intention at green hotels and the relationship between them?

– Question 2: What factors have a direct impact? next on Green Hotel Usage Intentions, and their Impact Level?

– Question 3 : What factors have indirect influence? next on Green Hotel Usage Intentions, and their Impact Level?

– Question 4 : What implications and suggestions are given to stimulate and increase the intention to use green hotels, thereby reducing environmental pollution?

## II. MATERIAL AND METHODOLOGY

The research consists of two phases: preliminary and main implementation. Quantitative methods, surveys, and data analysis using SMART-PLS are employed to assess reliability (Cronbach's Alpha) and structure (SEM-PLS). The Bootstrapping method is applied to ensure the accuracy and significance of the research findings.

### 2.1. Conceptual Foundation

Sustainable tourism, introduced at the 1992 United Nations Conference in Rio de Janeiro, prioritizes fulfilling present tourism demands while safeguarding resources for future generations. Green hotels, integral to this framework, implement eco-friendly practices to minimize their environmental impact, with certifications such as Green Lotus and ASEAN Green Hotel ensuring compliance with sustainability standards.

Green perceived value significantly influences consumer choices, encompassing four key dimensions: Social Value, enhancing environmental responsibility perception; Emotional Value, fostering positive sentiments through Eco-conscious actions; Functional Value, balancing quality and cost despite potential price barriers; and Attitude, reflecting pro-environmental beliefs and commitment. Additionally, Subjective Norms shape decision-making through societal expectations, while Usage Intention remains a strong predictor of green hotel adoption. These factors collectively underscore the necessity of sustainability-driven engagement in the hospitality sector.

### 2.2 Research method

Hypotheses Development based on Past Studies

This study examines the relationships between key factors influencing customer behavior toward green hotels, focusing on attitude, social norms, emotional awareness, social reputation, and comfort quality.

Attitude, Social Norms, and Usage Intention

Attitude and social norms significantly impact the intention to use green hotels, as shown in studies by Han et al. (2010) and Paul et al. (2016). Positive attitudes toward environmental protection enhance customers' likelihood of choosing green hotels, while perceived social support or pressure encourages environmentally friendly behavior. This leads to the hypotheses:

H1: Attitude positively influences usage intention.

H2: Social norms positively influence usage intention.

Comfort Quality's Impact

The balance between price and quality, particularly in green hotels, influences both attitudes and intentions. High-quality amenities at reasonable prices promote positive attitudes and increase the likelihood of choosing green hotels. Supporting studies (Chen et al., 2012; Wu et al., 2024) highlight the importance of comfort quality in green hotel adoption, leading to:

H3: Comfort quality positively influences attitude.

H4: Comfort quality positively influences usage intention.

Emotional Perception

Emotional perception plays a crucial role in forming attitudes and intentions. Positive emotions from supporting green initiatives enhance customer engagement and loyalty. Studies (Tan & Ling Ling, 2023) confirm emotional cognition's impact, leading to:

H5: Emotional perception positively influences attitude.

H6: Emotional perception positively influences usage intention.

Social Reputation

Social reputation, driven by societal recognition and respect, motivates customers to choose green products. Studies (Griskevicius et al., 2010; Hartmann et al., 2006) show its strong influence on attitudes and intentions, resulting in:

H7: Social reputation positively influences attitude.

H8: Social reputation positively influences usage intention.

Mediating Role of Attitude

Attitude mediates the relationship between comfort quality, emotional perception, social reputation, and usage intention. Customers' positive attitudes, shaped by these factors, significantly boost their intention to use green hotels. Thus:

H9a: Comfort quality impacts intention via attitude.

H9b: Emotional perception impacts intention via attitude.

H9c: Social reputation impacts intention via attitude.

These hypotheses establish a comprehensive model to understand green hotel adoption.

**2.3. Research model**

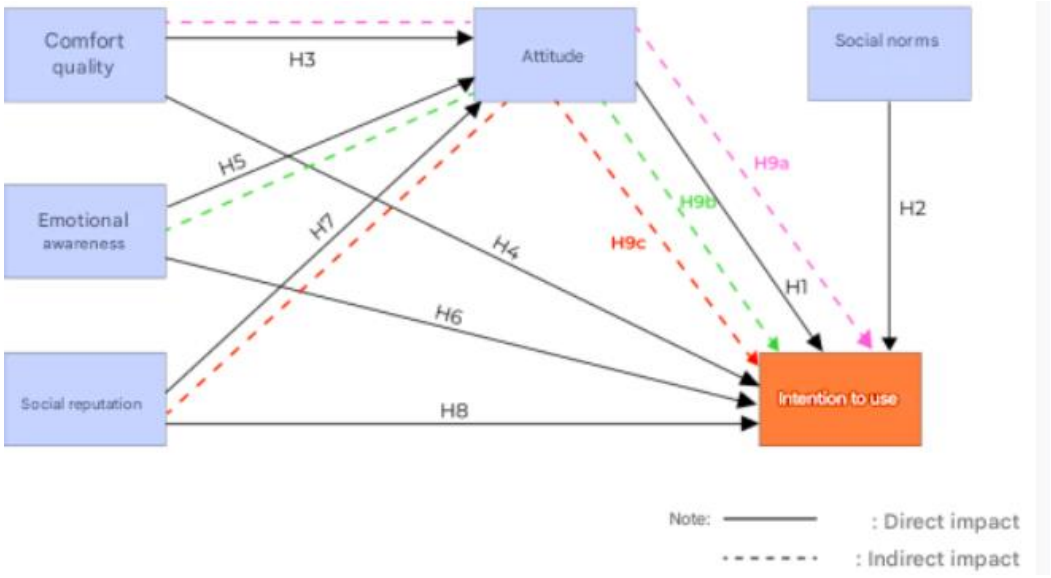

**Fig. 0.1 Proposed Conceptual Model**

The following are the hypotheses that the study proposes:

H1. Attitude positively influences Intention to Use.

H2. Social norms positively influence Intention to use.

H3. Comfort quality positively affects Attitude .

H4. Comfort quality positively affects Intention to use.

H5. Emotional awareness positively influences Attitude .

H6. Emotional awareness positively affects Intention to use.

H7. Social prestige positively affects Attitude .

H8. Social reputation positively affects Intention to use.

H9a: Comfort quality positively affects Intention to use under the mediating role of Attitude .

H9b: Emotional awareness positively affects Intention to use under the mediation of Attitude .

H9c: Social reputation positively affects Intention to use under the mediating role of Attitude

**III. RESULT AND DISCUSSION**

**3.1 Research subjects**

The study collected 257 valid responses after screening. Key demographic findings include: The final dataset consists of 257 valid responses. The demographic profile indicates 51% female and 49% male respondents. The majority (51%) are aged 18-25, followed by 31-40 years (23%). Education levels show that 66.1% hold university degrees. The income distribution reveals that 40.1% earn under 10 million VND/month, with 22.6% earning between 10-20 million VND.

### 3.2. Model results

**Table 3. 1 - Hypothesis testing results**

| Hypothesis | Relationship | | | Coefficient | P-Value | Decision |
|---|---|---|---|---|---|---|
| H1 | TD | ---> | YDSD | 0 . 236 | 0 . 000 | Accept |
| H2 | Socialism | ---> | YDSD | 0 . 285 | 0 . 000 | Accept |
| H3 | CLTN | ---> | TD | 0 . 515 | 0 . 000 | Accept |
| H 4 | CLTN | ---> | YDSD | 0 . 331 | 0 . 000 | Accept |
| H5 | NTCX | ---> | TD | 0 . 320 | 0 . 000 | Accept |
| H 6 | NTCX | ---> | YDSD | 0 . 222 | 0 . 000 | Accept |
| H 7 | Social Security | ---> | TD | -0 . 094 | 0 .199 | Rejected |
| H 8 | Social Security | ---> | YDSD | -0 . 109 | 0 . 0 91 | Rejected |
| H 9a | CLTN ---> TD ---> YDSD | | | 0.121 | 0 . 00 1 | Accept |
| H9b | NTCX ---> TD ---> YDSD | | | 0 . 076 | 0 . 00 6 | Accept |
| H9c | Social Security ---> Health ---> Social Security | | | -0 . 022 | 0 . 242 | Rejected |

**Table 0 Summary of hypothesis testing results**

| Hypothesis | Content | Decision |
|---|---|---|
| **H1** | **Attitude positively influences Intention to use** | **Accept.** |
| H2 | Social norms positively influence Intention to Use . | Accept. |
| H3 | of amenities positively affects Attitude . | Accept . |
| H4 | Comfort quality positively affects Intention to use . | Accept . |
| H5 | Emotional awareness positively influences Attitude . | Accept . |
| H6 | Emotional awareness positively influences Intention to use . | Accept . |
| H7 | prestige positively influences Attitude . | Rejected. |
| H8 | Social reputation positively affects Intention to use . | Rejected. |
| H9a | Comfort quality positively affects Intention to use under the mediating role of Attitude . | Accept . |
| H9b | Emotional cognition positively influences Usage intention under the mediation of Attitude . | Accept. |
| H9c | Social reputation positively affects Intention to use under the mediating role of Attitude . | Rejected . |

The study evaluated several hypotheses about green hotel usage, with most hypotheses accepted, but some rejected due to low significance levels or opposing results.

Explained Rejections: Green hotels remain unfamiliar to many Vietnamese consumers, with only 13.5% of establishments certified as "green" or "sustainable." Social reputation in Vietnam is often tied to luxury and exclusivity, conflicting with the perception of sustainability. Pressure from social norms can create discomfort, reducing motivation to choose green hotels, as some view it as forced compliance rather than voluntary behavior. These findings highlight that while comfort quality, emotional awareness, and attitudes play critical roles in driving green hotel adoption, the impact of social reputation remains minimal or even counterproductive in the Vietnamese context.The findings highlight that Comfort Quality has the strongest effect, followed by Emotional Awareness and Social Norms. Social Reputation has an insignificant or negative impact, suggesting that sustainable choices in Vietnam are not yet widely associated with social prestige.

## IV. CONCLUSION

The study investigates the intention to use green hotels in Vietnam, where green practices are not yet widespread, particularly in Ho Chi Minh City, a key economic hub. This research aims to contribute theoretical insights and practical solutions to promote green hotel adoption.The adjusted R-square values showed that 44.2% of attitude variability and 65.4% of intention variability were explained by the model. Comfort quality had the strongest impact, followed by emotional awareness and social norms. The findings highlight the importance of comfort quality and emotional value in promoting green hotel adoption while identifying limitations in the influence of social reputation in the Vietnamese context.

# FACTORS AFFECTING THE CAPACITY TO APPLY TECHNOLOGY IN TRAINING HUMAN RESOURCES AT ECONOMIC UNIVERSITIES IN HO CHI MINH CITY

**Nguyen Thi Lai[1], Nguyen Thi Anh[2], Nguyen Kim Quoc Trung[3*]**

[1]University of Economics and Law
[2]Van Hien University
[3]University of Finance – Marketing
*Corresponding author: nkq.trung@ufm.edu.vn

**ABSTRACT**

The objective of this study is to measure the extent to which various factors influence the capacity for applying information technology (IT) in training at several economic universities in the Ho Chi Minh City area. Based on the theoretical framework of training activities and IT application in training, the author identified four factors affecting the capacity for IT application in training at some universities in the Ho Chi Minh City area, including teaching staff, facilities, the integration of training, and government policies. Using the Partial Least Squares Structural Equation Modeling (PLS-SEM) method, the research results demonstrated that these factors have a positive and statistically significant impact on the capacity for IT application in training.

*Keywords: "university", "training", "application capacity"," information technology".*

## I. INTRODUCTION

Human resource demand became stricter and more complicated in the context of the Fourth Industrial Revolution and deepening international integration. The proliferation of IT, artificial intelligence, and automation has revolutionized the world of work and the global economy. In contrast, the global workforce is left needing to acquire and possess specialized knowledge, innovate, adapt to new technologies, and be able to work in collaboration with others from different backgrounds and cultures. According to modern-day businesses, interdisciplinary, problem-solving, and teamwork are essential employability skills (Schwab, 2016). To meet these demands, universities should adopt innovative pedagogies, implement state-of-the-art technologies, and create a holistic training paradigm to equip students with their capacity for the global labor market (Zahidi et al., 2020). This is the key to cultivating high-quality human resources and contributing to sustainable economic and social development in the digital age.

In response, Universities have adopted the flexible admission policies, and introduced new disciplines for training, and stronger partnerships to develop human resources. In particular, the formation of an information development ecosystem in education has a significant impact on the development of education in the world, considering the growing challenges of educational institutions. The integration of technology to teach and learn has thus become a necessary paradigm shift towards improving educational quality and meeting global workforce requirements. Education is an essential driver of sustainable development (Sarker et al., 2019) and needs advanced techniques alongside innovative practices to meet such challenges, preparing universities to significantly address cultural, social and economic development in the ever-changing global context.

Information technology (IT) plays a crucial role in the modern economy. In this context, social media has become widespread, helping family members and friends maintain regular communication. At the same time, the robust development of information and communication technology (ICT) is a major driving force behind global economic growth. The integration of IT into education and learning has become an inevitable trend in the rapidly changing technological world. Leveraging technology is a core element in all forms of learning. However, the major challenge for researchers and educators is finding ways to optimize the impact of digital technology on learners' academic performance and research outcomes (Sarker et al., 2019).

Besides, (Napal et al., 2020) argue that, in the context of the digital age, integrating digital tools into the teaching process enhances the effectiveness of knowledge transmission and encourages learners to develop critical thinking skills on sustainability issues. Information technology supports instructors in creating rich lectures and facilitates better

student interaction with content through online learning platforms, simulation tools, and learning support applications. This increases student engagement and improves their ability to absorb and apply knowledge in practice. The article also emphasizes the necessity of enhancing the digital skills of both instructors and students to ensure the effective use of information technology in education, contributing to creating a positive and innovative learning environment.

Additionally, previous studies on the application of IT in teaching at universities have primarily focused on two aspects: first, individual factors that influence faculty's acceptance and use of technology (Ashrafzadeh & Sayadian, 2015; Ocak, 2011); and second, the implementation of the university's vision and strategy for technology-supported teaching and learning (Graham et al., 2013; Porter & Graham, 2016). However, there are still relatively few studies that focus on the factors affecting the ability to apply IT in education at universities. For these reasons, the authors have studied the topic as the main objective of the paper: "Factors affecting the capacity to apply technology in training human resources at economic universities in Ho Chi Minh City".

## II. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

### 2.1. Literature review

#### 2.1.1. Training

Training is understood as a systematic learning process aimed at equipping learners with essential competencies such as knowledge, skills, and abilities (Gowan et al., 2022; Milhem et al., 2014). It is not merely the transmission of information but also a process of skill enhancement, compliance with regulations, and the development of professional attitudes, helping learners to grow comprehensively (Berber & Lekovic, 2018). Training in education plays a crucial role in improving work performance and ensuring that learners can meet the requirements of employers after graduation.

More critically, training initiatives transcend their role as short-term solutions for immediate demands, serving instead as integral components of a comprehensive, long-term strategy for societal human resource development. By fostering training programs, future human capital is not only equipped with enhanced skills but also cultivated in terms of attitudes and essential attributes, enabling them to adapt to and thrive within professional organizations.

#### 2.1.2. Application of information technology in education and training

In the field of training, the application of information technology (IT) has been examined and conceptualized through diverse perspectives. Scholars often define IT applications by underscoring their pivotal role in enhancing the effectiveness of teaching and learning processes. Rather than being limited to content delivery, the integration of IT in training involves a spectrum of technological methodologies designed to facilitate and enrich the learning experience.

A study (Wheeler, 2012) shows that these methodologies impact on the assessment of students, instructional advice, and teaching different strategies, effectively improving learners' engagement and accomplishments. Furthermore, IT is fundamental for managing and processing information. It is a unified set of methods, programs, and equipment designed to gather, process, store, and distribute data (Leshchenko et al., 2021).

Several research studies have been conducted on educational technology to assess the efficacy of using information technology (IT) in the comprehensive mix of teaching and learning environments. According to (Chen & Liu, 2018; Hwang et al., 2015), the use of IT in the training process not only improves and extends the traditional teaching and learning methods but also creates cooperation and interaction between learners and instructors. With the usage of technology, the learning environments have become more interactive, and this encourages both creativity and a desire to learn. IT has introduced new features to education, name distance learning, and online evaluation and blended learning. Additionally, technology facilitates the process of personalization of the learning experience by offering endless online activities to enrich and broaden the knowledge of learners. This subsequently improves learners' autonomy, self-directed learning, and creativity (Nguyen & Nguyen, 2024).

Technology-enhanced education significantly revolutionizes the conventional delivery mechanism of knowledge, focusing on higher interactivity, personalization, and flexibility. Multimedia tools are outstanding for different types of learners, as they combine visual, auditory, and kinesthetic components, allowing people to interact with content in the way that suits them best. Discussion forums, real-time collaborative chat tools (like Slack), and online whiteboards (like

Miro) enable students to collaborate, share ideas, and provide peer feedback, helping transcend time and location constraints. Innovations like simulations or gamified platforms create interactive learning environments that allow for hands-on experiences and provide more opportunities for practice and application than traditional forms of education do, fostering engagement, critical thinking, and active participation. Furthermore, these tools provide access to a wealth of resources and expertise, enabling learners to control their learning and prepare for the challenges of a constantly evolving world.

#### 2.1.3. The capacity to apply IT

According to Iftikhar et al. (2019), "capacity" is defined as the ability of respondents to use information technologies (e-mail, text messages, video conferencing) for communicating with healthcare providers. If respondents had the capacity but were unwilling to use these technologies, the reasons for their unwillingness were explored through open-ended questions. Moreover, the benefits of using IT training are that IT not only provides access to online learning modules, webinars, and virtual training sessions; it also achieves the learner's high potential to train anywhere. In education, IT engages and makes the learning process more attractive by incorporating interactivity and multimedia components with different formats (Zhao, 2023). As a result, the practice of IT in remote learning maximizes resources. It allows more study, eliminates geographical barriers, makes training systems efficient, and improves access.

### 2.2. Hypothesis development on factors affecting the ability to apply technology in human resource training

#### 2.2.1. Teaching staff

The world of education and training is being transformed into myriad ways, powered by technology (advanced artificial intelligence (AIs), the Internet of Things (IOT), and Big Data) revolutionizing all other aspects of economic/social life virtually (Van Hong et al., 2018). This fast-paced progress necessitates incorporating technology in the teaching sphere so that efficiency can be maximized and education can be kept up with the needs of the digital world. In the era of advancing digital technology, educators are becoming increasingly responsible for enhancing their IT competencies for teaching and research purposes (Mishra & Koehler, 2006), such as well-known frameworks that explore the adjustment of concept understanding and the pedagogic approach, which is also resulting in IT competent educators.

Educators play a crucial role in adopting technology (Shirase et al., 2023). Digital tools, such as personal computers provided to teachers, significantly enhance teaching staff's confidence and positive perceptions toward educational ICT (Balanskat et al., 2006; Timotheou et al., 2023), thereby improving teaching effectiveness and learning outcomes.

From the above arguments, the authors proposed the hypothesis:

*Hypothesis 1: Teaching staff positively influences IT application capacity in training at economics-focused universities in Ho Chi Minh City.*

#### 2.2.2. Facilities

Iftikhar et al. (2019) emphasized that intangible assets, such as IT tools like internet access and mobile phones, are crucial for enhancing communication efficiency and fostering technological capabilities. These assets play a significant role in building both individual and organizational competencies, ultimately creating competitive advantages. Gómez and Vargas (2012) further highlight the complexity of integrating appropriate resources with new technologies to achieve these advantages. While intangible assets, such as R&D, are vital for innovation and competitiveness, they are often challenging to measure and manage due to their abstract nature (Kaplan et al., 2001; Winter, 2009).

Tangible assets are crucial in advancing IT applications in training. These fundamentals are especially useful for facilitating e-learning, promoting innovative courses, and improving the quality of delivery services (Jawed & Siddiqui, 2019; Mugizi & Rwothumio, 2024). Enhancing the use of these resources not only elevates the quality of education but also augments the competitive standing of institutions amidst an evolving technological landscape. In the context of Vietnam, (Do, 2013) highlights the significant role of physical (including IT systems and customized software) and virtual (connection to global university systems and remote access to the catalog of digital resources) infrastructures of the university library. This infrastructure improves access to learning materials and supports academic research and

innovation, thus positively contributing to the quality of education and training.

*Hypothesis 2: The facilities of universities positively impact the capacity of applying technology in human resource training at economics-focused universities in Ho Chi Minh City.*

**2.2.3. Connectivity in Training**

Reynolds (2020) indicated that the element of connectivity in training is reflected through a well-coordinated training activity whereby an effective environment for training is created in which the learners interact, share ideas, and grow their knowledge together. Expertise supplies its providers and IT to improve connections for employees, teams, and businesses via new digital technologies and is obtainable expertise supplies knowledge through technology-based systems. Training connectivity is vital to IT application capacity improvement, IT training efficiency improvement, and high-quality human resource development.

*Hypothesis 3: Connectivity in training at universities positively impacts the capacity of applying technology in human resource training at economics-focused universities in Ho Chi Minh City.*

**2.2.4. Government policies**

Government policies on the application of technology in human resource training play a crucial role in enhancing the effective use of technology in education. In Vietnam, the government issued Decision No. 117/QĐ-TTg in 2017, approving the project titled "Strengthening the Application of IT in Management and Support of Teaching, Learning, and Scientific Research Activities to Improve the Quality of Education and Training for the Period 2016–2020, with Orientation Toward 2025."

According to Mai (2020) pointed out that government policies on IT application have been comprehensively analyzed, particularly focusing on strategies for developing high-quality human resources. The author emphasizes that these policies are pivotal in promoting IT integration in education, thereby improving the quality of human resource training to meet the demands of national development and integration during the digital transformation of the economy.

*Hypothesis 4: Government policies positively influence the capacity of applying technology in human resource training at economics-focused universities in Ho Chi Minh City.*

**III. METHODOLOGY**

**3.1. Research samples**

Data was collected from April 2024- August 2024. Out of the 350 questionnaires that were issued, a total of 331 responses were recorded, resulting in the data of 312 valid responses, which is 89.14% of desirable questionnaires. This meets the conditions of the size and composition of the sample. Thus, the size of sample 312 observations is considered acceptable for analysis.

A 5-point Likert scale was used to measure the observed variables. The observed variables were assessed using this scale, where a value of 1 corresponds to "strongly disagree," 2 corresponds to "disagree," 3 corresponds to "neutral," 4 corresponds to "agree," and 5 corresponds to "strongly agree".

**3.1.2. Research model**

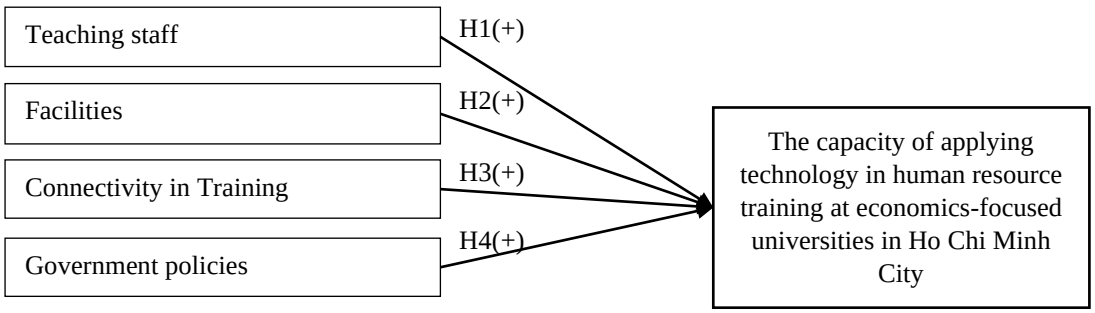

**Figure 3. Research model**

**3.1.3. Research method**

The article employs a quantitative research method using the PLS-SEM model (Partial Least Squares Structural

Equation Modeling) to test and evaluate the structure of the research model. The process includes the following steps: first, assessing the measurement models for construct validity, reliability, and discriminant validity; next, conducting multicollinearity analysis; then analyzing the structural model and evaluating the fit of the regression model; and finally, reporting the results of the PLS-SEM analysis.

## IV. RESEARCH RESULTS AND DISCUSSIONS

### 4.1. Descriptive Statistics and Tests

**Table 2. Composite reliability**

| | Cronbach's alpha | Composite reliability (CR) | Average variance extracted (AVE) |
|---|---|---|---|
| **CCCS** | 0,963 | 0,973 | 0,900 |
| **CSVC** | 0,910 | 0,937 | 0,789 |
| **GV** | 0,901 | 0,931 | 0,771 |
| **NLUD** | 0,895 | 0,927 | 0,761 |
| **TLK** | 0,949 | 0,963 | 0,866 |

The Cronbach's alpha and composite reliability (CR) for each latent construct shown in Table 1 to evaluate the reliability of the scales. For all constructs, the calculated Cronbach's alpha values exceeded 0.7 indicating an acceptable level of internal consistency (Taber, 2018). Also, (Hair et al., 2017) note that the CR value should be more than 0.7 and the Average Variance Extracted (AVE) should be more than 0.5 that will ensure reliability and convergent validity.

**Table 3. Discriminant validity**

| | CCCS | CSVC | GV | NLUD | TLK |
|---|---|---|---|---|---|
| **CCCS** | | | | | |
| **CSVC** | 0,378 | | | | |
| **GV** | 0,309 | 0,642 | | | |
| **NLUD** | 0,450 | 0,660 | 0,610 | | |
| **TLK** | 0,497 | 0,567 | 0,493 | 0,612 | |

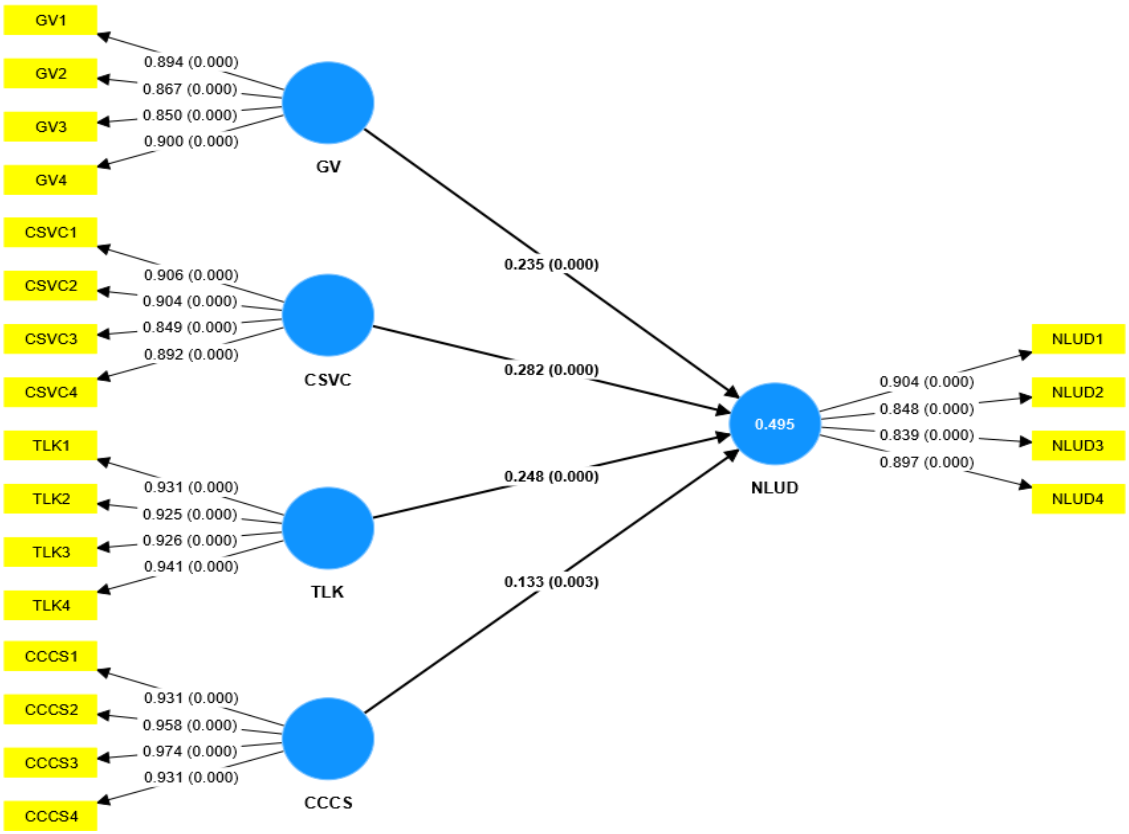

**Figure 4. Structural equation modeling (PLS- SEM)**

According to Henseler et al. (2015), the Heterotrait–Monotrait (HTMT) correlation values to evaluate the discriminant validity (PLS method) must be less than 0,900. All the values represented in this table are below 0.85, thus confirming the discriminant validity of the constructs. These findings demonstrate the reliability and validity of the scales, thus confirming the validity of the research model. Furthermore, the model's predictive capability and the causal relationships between the constructs are statistically significant (Figure 2).

Figure 2 below illustrates an R-squared value of 0.495 for the estimated equation, indicating statistical significance at the 1% threshold. Furthermore, the adjusted R-squared value suggests that 49.5% of the variation in IT application capacity in training can be explained by factors such as faculty, infrastructure, connectivity in training, and policy mechanisms.

Figure 2 presents the comprehensive results from applying the bootstrapping method to test the hypotheses. This method evaluates the significance of the relationships between variables by performing a bootstrapping process with 5,000 resamples, conducted using the Smart PLS software. Besides, the presented PLS-SEM model examines the factors influencing IT application capacity in training (NLUD), with Faculty (GV), Infrastructure (CSVC), Connectivity in Training (TLK), and Policy Mechanisms (CCCS) as independent variables. The R-squared ($R^2$) value of 0.495 indicates that 49.5% of the variance in IT application capacity is explained by these factors. Each latent variable is measured by observed variables with strong factor loadings above 0.8, confirming the reliability of the measurement model.

Among the variables, Facilities (CSVC) have the strongest impact (0.282, p = 0.000), followed by Connectivity in Training (TLK) (0.248, p = 0.000) and Teaching staff (GV) (0.235, p = 0.000). Government policies (CCCS) also have a positive but smaller effect (0.133, p = 0.003). These results highlight the critical role of infrastructure, collaboration, and faculty development in fostering IT application capacity, with policy mechanisms providing a supportive framework.

**Table 4. Inner VIF values**

| | NLUD |
|---|---|
| CCCS | 1,320 |
| CSVC | 1,768 |
| GV | 1,600 |
| TLK | 1,659 |

Table 3 presents the results of evaluating the inner VIF coefficients to detect multicollinearity. According to Hair và cộng sự (2013), multicollinearity occurs in the model when VIF values exceed 4.0. In Table 3, all VIF values are below this threshold, indicating no presence of multicollinearity in the model.

### 4.2. Research results and discussions

**Table 5. Hypothesis testing results**

| Hypotheses | Path | β | P Values | Accept/ Reject |
|---|---|---|---|---|
| $H_1$ | GV -> NLUD | 0.235 | 0.000 | Accept |
| $H_2$ | CSVC -> NLUD | 0.282 | 0.000 | Accept |
| $H_3$ | TLK -> NLUD | 0.248 | 0.000 | Accept |
| $H_4$ | CCCS -> NLUD | 0.133 | 0.003 | Accept |

The results in Table 4 indicate that all four hypotheses are accepted because the p-values are less than 5%. Additionally, the regression coefficients are greater than 0, indicating that factors such as faculty members, infrastructure, integration in training, and policies all have a positive impact on the ability to apply IT in training at certain universities in Ho Chi Minh City. Specifically:

First, the path coefficient from Teaching staff (GV) to IT application capability (NLUD) is 0.235, which is greater than 0, and the p-value is 0.000, less than 5%. This indicates that the factor of faculty members has a positive and statistically significant impact on the ability to apply IT in training. The research results are consistent with Van Hong

et al., (2018); Balanskat et al., (2006); Shirase et al., (2023); Mishra & Koehler (2006). Teaching staff play a critical role in facilitating IT adoption and integration in educational settings. Their skills, motivation, and readiness to embrace IT can directly influence how effectively technology is applied in training. The findings underscore the need for continuous professional development programs for faculty members. Equipping them with IT-related skills and knowledge can further enhance their ability to integrate IT into teaching and learning processes.

Second, the path coefficient of Facilities on IT application capability is 0.282 > 0, and p-value = 0.000 < 5%. Thus, the Facilities factor positively influences IT application capability in the training process, which is statistically important. The empirical findings are coherent with the works of (Do, 2013; Gómez & Vargas, 2012; Iftikhar et al., 2019; Jawed & Siddiqui, 2019; Kaplan et al., 2001; Mugizi & Rwothumio, 2024; Phung, 2020; Winter, 2009). Infrastructure is represented as physical facilities, including concept-based classrooms with advanced technology, reliable internet, access to software and computers required for IT applications during training.

Third, it can be seen that the path coefficient corresponding to the effect of the training connectivity factor on the capacity of applying IT in providers' human resource training is 0.248, which is greater than zero, while the p-value is 0.000, lower than 5%. This suggests that the connectivity factor of training positively contributes to the proficiency of applying IT in training and is statistically significant. For other universities, accounting is suitable for economics-focused universities in Ho Chi Minh City. It shows that improved connection in training opens opportunities for IT application, and human resource training can be integrated appropriately. With a greater degree of interconnectedness, it is easier to align objectives, establish better communication channels, and provide access to shared resources, all of which are fundamental to adopting IT solutions.

Finally, the path coefficient of the government policy factor for the capacity of applying IT in human resource training is 0.133 > 0, and the value is 0.003 < 5%. It means that state/government policies have a positive effect and are statistically significant on the capacity of applying IT in training. These findings correspond with what Reynolds (2020) found. IT has been increasingly used in human resource training in the context of economics universities in Ho Chi Minh City, and government policies are a decisive factor in the application of IT in training activities.

## V. CONCLUSION AND LIMITATION

Based on theories related to training activities and the application of IT in education, the authors have identified four main factors influencing the capability of applying IT in training at universities in the Ho Chi Minh City area: faculty, infrastructure, training connectivity, and government policies. Using the PLS-SEM model, the research findings show that these factors have a positive and statistically significant impact on the IT application capability in training.

Additional, based on these results, the article provides several policy recommendations to enhance the IT application capability in training at universities in the Ho Chi Minh City area, focusing on faculty, infrastructure, training connectivity, and government policies. Despite achieving certain results, the article has the following limitations such as the survey sample limiting to the Ho Chi Minh City area; therefore, the results are only valid with a certain level of reliability. As a result, future studies could expand the survey scope nationwide rather than just in the Ho Chi Minh City area.

# THE IMPACT OF BLOCKCHAIN TECHNOLOGY ON RECRUITMENT PERSONNEL BRAND: THE MEDIATING ROLE OF CANDIDATE EXPERIENCE AND TRANSPARENCY IN THE HIRING PROCESS

**Cao Nguyen Quoc Nha[1]*, Le Thi Thuy Dung[2],**

[1]Faculty of Economics - Management, Dong Nai Technology University
[2]Faculty of Economics, Dong Nai University
*Corresponding: caonguyenquocnha@dntu.edu.vn

**ABSTRACT**

This study explores the role of blockchain technology in employer brand building, with a particular focus on the intermediary role of applicant experience and transparency in the recruitment process of Vietnamese financial enterprises. Utilizing data collected from 438 valid responses, this study employs quantitative methods and a SmartPLS structural model to analyze the relationships among the study variables. The findings indicate that BC not only exerts a direct impact on the employer brand but also demonstrates an indirect effect by enhancing the candidate experience and increasing transparency in the recruitment process. Candidate experience and transparency are significant mediators that contribute to improving trust, satisfaction, and brand recognition of organizations in the labor market. This study also provides practical recommendations, including the implementation of BC to ensure transparency, data security, and automation of the recruitment process, thereby enhancing the candidate's overall experience and strengthening the employer's brand value. The results of this research not only complement the existing literature but also present a comprehensive model that elucidates the complex interrelationships between BC, candidate experience, transparency, and Recruitment personnel brand

*Keywords*: "Blockchain", "Candidate Experience", "Recruitment personnel brand", "transparency during the recruitment process".

## I. INTRODUCTION

In an increasingly competitive labor environment, the development and maintenance of an employer brand has become a paramount priority for organizations. A robust employer brand not only facilitates the attraction and retention of talent but also enhances the organization's image as a professional, trustworthy, and desirable entity (Ambler & Barrow, 1996). However, previous studies have predominantly focused on traditional factors such as remuneration policies, organizational culture, and career development opportunities, while the potential of technology, particularly BC technology, has not been fully explored (Kaur et al., 2020; Kumar et al., 2022).

BC technology, characterized by its transparency, security, and process optimization capabilities, has engendered significant transformations in various domains, including human resource management and recruitment. BC provides an immutable data-storage system that ensures transparency, mitigates bias factors, and enhances the reliability of the recruitment process (Ta'Amnha et al., 2021). Concurrently, this technology enhances candidate experience through process automation and minimization of processing time, resulting in increased candidate satisfaction (Sule & Wani, 2024). These benefits not only improve operational efficiency but also contribute significantly to the development and reinforcement of employer brands.

The role of BC in employer branding is further emphasized through its ability to build trust and credibility. Organizations leveraging BC for recruitment can assure candidates of a fair and unbiased selection process because BC eliminates manipulation and fraud in credentials (Kurek, 2021). Additionally, BC facilitates secure and seamless data sharing between recruiters and job applicants, reducing administrative burdens and increasing efficiency (Kişi 2022). This technological advancement aligns with the growing preference for digital trust mechanisms in workforce management, reinforcing employers' commitment to innovation and fairness.

Numerous studies have examined the impact of BC on recruitment personnel brands, including Kumar et al. (2022), Kurek (2021), Kişi (2022), Chunmian et al. (2022), Ingold (2021), and Sule & Wani (2024). However, a research gap persists regarding the mediating role of candidate experience and transparency in the recruitment process

regarding the relationship between BC and employer brands. Previous studies, such as those by Sule and Wani (2024) and Kumar et al. (2022), have primarily focused on how BC enhances transparency or candidate experience but have not thoroughly investigated the interconnection and impact of these factors on employer brands. To provide a more comprehensive understanding of BC's role of BC in employer branding, this study incorporates various industry case studies in which organizations successfully implement BC to enhance recruitment efficiency and employer brand perception. For example, companies in the fintech sector such as IBM and JPMorgan have adopted BC to secure credential verification, reduce hiring risks, and ensure data integrity (Chunmian et al., 2022). Similarly, multinational corporations such as Accenture have integrated BC into HR analytics to enhance hiring precision and talent management (Ingold, 2021). These real-world applications exemplify BC's potential to transform traditional recruitment models while reinforcing an employer's reputation as a technologically adept and forward-thinking organization. In this context, this study explores the mediating role of candidate experience and transparency in the hiring process, elucidating how these factors interact and influence an organization's brand identity. Furthermore, the research incorporates BC within the context of the recruitment personnel brand, presenting a contemporary approach aligned with evolving technological trends. Through the integration of modern technology and management elements, this study offers practical recommendations to assist organizations in improving their recruitment processes, thereby fostering a more robust employer brand.

## II. MATERIAL AND METHOD

### 2.1. The influence of Blockchain technology on Recruitment personnel brand

BC technology is increasingly being applied in human resource management, particularly in the development and enhancement of employer brands. BC not only optimizes the management process but also creates significant value for employer brands through four key aspects: transparency, security, efficiency, and competitive advantage.

*Transparency in the recruitment process*: BC enhances transparency by immutably recording all data and transactions, thereby eliminating opacity in recruitment (Ta'Amnha et al., 2021; Kumar et al., 2022). This not only increases candidate confidence in the process, but also establishes the organization's image as fair and trustworthy. Sule and Wani (2024) emphasize that transparency is a crucial factor in improving employer brand reputation. A clear and transparent recruitment process for evaluating applications and making decisions enables candidates to feel valued, which in turn significantly enhances an organization's reputation.

*Security and trust*: Owing to its distributed data storage mechanism, BC provides a high level of security, ensuring the protection of sensitive candidate information from personal records to assessment results (Kumar et al., 2022). Effective data protection not only prevents fraud and information leaks but also builds trust among candidates. An organization capable of protecting candidate privacy will strengthen its employer brand image, while fostering long-term trust between candidates and current employees (Ta'Amnha et al., 2021).

*Efficiency and candidate experience*: BC automates the profile verification process, minimizing processing time, and increasing recruitment efficiency (Sule & Wani, 2024). This not only improves the candidate's experience, but also encourages them to share positive reviews about the organization, thereby enhancing the employer brand (Kaur et al., 2020). Candidates typically express higher satisfaction when they receive prompt and clear feedback, which can be readily facilitated by BC.

*Competitive advantage in the labor market*: The application of BC in recruitment enables organizations to distinguish themselves in the labor market through a transparent, efficient, and fair process. This is a critical factor that assists organizations in attracting and retaining talent (Kaur et al., 2020). Kumar et al. (2022) assert that BC not only enhances reputation but also improves the competitiveness of organizations in building Recruitment personnel brand. An organization that implements this technology not only demonstrates modernity and professionalism but also establishes an image as a reliable workplace.

Thus, BC has been exerting evident positive impacts on recruitment personnel brands through three primary factors: transparency, security, and optimization of the candidate experience. This technology not only improves the efficiency of the recruitment process but also enhances the reputation and brand value of the organization in terms of the perception of candidates and the labor community.

### 2.2. Research hypotheses

#### 2.2.1. The relationship of Blockchain (BC) and Recruitment personnel brand (RBP)

BC technology enhances transparency, security, and efficiency in human resource management processes, particularly in verifying candidate information and improving labor experience (Ta'Amnha et al., 2021; Sule & Wani, 2024). This capability not only minimizes recruitment costs but also fosters trust and engagement from employees and candidates. According to Ambler and Barrow (1996), recruitment personnel brands comprise the synthesis of the economic, psychological, and functional values that businesses provide to employees, thereby creating attractiveness for both current and potential employees. Studies show that these values play a significant role in increasing employee engagement and performance (Bhasin et al. 2019). Moreover, BC, with its capacity to increase transparency in the recruitment process, enhances trust from candidates and employees and establishes the company's image as a trustworthy working environment (Sule & Wani, 2024). This technology also enables businesses to manage HR data more accurately, personalizing the experiences of candidates and employees, thereby enhancing satisfaction and loyalty (Ta'Amnha et al., 2021). Furthermore, BC assists businesses in gaining a competitive advantage by attracting talent by demonstrating commitment to fairness and transparency in the recruitment process (Kumar et al., 2022). Based on this foundation, the following hypothesis is proposed.

*H1: Blockchain has a positive effect on Recruitment personnel brand (RBP)*

#### 2.2.2. The relationship of Blockchain and Candidate Experience

BC technology introduces significant improvements to HR processes by ensuring transparency, security, and the ability to minimize the time required to verify candidate information. These characteristics facilitate enhanced, expedited, and equitable experiences for candidates throughout the recruitment journey (Ta'Amnha et al., 2021; Sule & Wani, 2024). Candidate experiences encompass their perceptions and evaluations of business interactions throughout the hiring process, from application and interviews to the final decision. A positive experience not only supports businesses in attracting talent, but also contributes to establishing a strong employer brand image (Kaur et al., 2020; Kumar et al., 2022). Additionally, BC plays a crucial role in enhancing transparency and accuracy in information verification, helping minimize waiting times and improve candidate satisfaction (Sule & Wani, 2024). This technology also promotes fairness through its capacity to transparently store and retrieve data, instilling a sense of trust and assurance in candidates (Kumar et al., 2022). Furthermore, BC optimizes the processing time of administrative tasks, rendering the recruitment process more efficient and expeditious (Ta'Amnha et al. 2021). Given these benefits, this study proposes the following hypotheses:

*H2: BC has a positive impact on Candidate Experience.*

#### 2.2.3. The relationship of BC and Transparency in the Recruitment Process

The BC technology is distinguished by its capacity to store information in a transparent, immutable, and readily verifiable manner. Transactions and data stored in the BC are unalterable, which enhances the reliability and transparency of the recruitment process (Sule & Wani, 2024). A transparent recruitment process engenders a greater sense of security and fairness for candidates, particularly when all aspects from profile verification to the evaluation process are publicly accessible (Ta'Amnha et al., 2021). Furthermore, BC not only facilitates accurate storage and retrieval of candidate data but also minimizes errors or fraudulent recruitment activities, ensuring that all information is verified and publicly transparent (Kumar et al., 2022). With the capability to track and render every step of the recruitment process transparent, BC mitigates the impact of bias factors, thereby ensuring enhanced fairness and objectivity (Sule & Wani, 2024). Consequently, BC fosters trust between candidates and employers, and improves the efficiency and integrity of the recruitment process (Ta'Amnha et al., 2021). Based on these benefits, the following hypothesis is proposed.

*H3: BC has a positive impact on Transparency in the recruitment process*

#### 2.2.4. The relationship of Transparency in the Recruitment Process and Candidate Experience

Transparency in the recruitment process is manifested through the provision of clear, accurate, and readily accessible information on the recruitment steps, requirements, and progress. This facilitates the candidates'

comprehension of the process in which they are involved, thereby engendering a sense of security and fairness (Sule and Wani 2024). The candidate experience encompasses all their perceptions and evaluations throughout their interaction with the organization, from application submission to the receipt of the hiring decision. A positive experience not only enables organizations to attract talent but also contributes to enhancing the employer's brand image (Kaur et al., 2020; Kumar et al., 2022). Transparency in recruitment engenders trust, reduces anxiety for candidates, and consequently, increases their satisfaction levels (Ta'Amnha et al., 2021). When information is clearly disseminated, transparency aids in eliminating elements of bias and ensuring the equitable treatment of all candidates, thereby fostering a more positive experience (Sule & Wani, 2024). Moreover, providing timely feedback engenders a sense of respect in candidates, reinforcing a positive impression of the organization (Kumar et al., 2022). Kaur et al. (2020) assert that transparency in the recruitment process significantly enhances candidates' perceptions of fairness and professionalism. Sule and Wani (2024) emphasized that the public disclosure of recruitment processes and criteria enhances the candidate experience through increased clarity and comprehensibility. According to Ta'Amnha et al. (2021), transparency not only augments trust, but also reduces ambiguity, facilitating a more favorable experience for candidates. Therefore, this study proposes the following hypothesis:

*H4: Transparency in the hiring process positively affects Candidate Experience.*

**2.2.5. The relationship of Transparency in the Recruitment Process and Recruitment personnel brand**

Transparency in the recruitment process not only enhances candidates' sense of security but also ensures fairness and strengthens trust in the organization (Sule & Wani, 2024). Furthermore, transparency plays a crucial role in fostering trust and respect among current candidates and employees, thereby improving the overall organizational image (Ta'Amnha et al., 2021). Additionally, a strong brand not only enables the organization to distinguish itself in the labor market but also establishes a professional and reliable organizational image (Ambler & Barrow, 1996). When the hiring process is transparent, candidates and current employees perceive fairness, thus reinforcing trust and enhancing the credibility of the organization (Kumar et al., 2022). Transparency also demonstrates an organization's commitment to integrity and professionalism, thereby enhancing its reputation and brand recognition (Sule & Wani, 2024). When candidates are satisfied with the transparency of the recruitment process, they are inclined to share positive impressions, which contribute to the development of a strong employer brand (Kaur et al., 2020). According to Ta'Amnha et al. (2021), transparency serves as the foundation for organizations to build a trusted employer brand. Sule and Wani (2024) emphasized that transparency demonstrates a commitment to fairness and integrity, contributing to enhanced credibility. Kumar et al. (2022) demonstrate that transparency improves the candidate experience, thereby enhancing reputation and brand recognition. Based on this, we propose the following hypothesis:

*H5: Transparency in the recruitment process positively affects the Recruitment personnel brand*

**2.2.6. The relationship of Candidate Experience and Recruitment personnel brand**

A positive experience not only enables organizations to attract talent but also establishes a professional and strong brand image (Kaur et al., 2020). According to Ambler and Barrow (1996), employer brands are formed from the economic, psychological, and functional values provided by organizations to attract and retain talent. A strong brand enables organizations to enhance their competitiveness in the labor market and strengthen their reputation among candidates and the community. A candidate's positive experience increases the likelihood of sharing favorable impressions of the organization, thereby enhancing the employer's brand recognition and reputation (Sule & Wani, 2024). Concurrently, a fair, transparent, and amicable hiring process not only builds trust but also highlights the core values and culture of the organization (Kumar et al., 2022). Notably, even if candidates are not selected, they may still provide positive reviews, creating conditions for organizations to attract more qualified candidates in the future (Kaur et al., 2020). Sule and Wani (2024) affirmed that positive experiences not only improve candidate satisfaction, but also disseminate a positive image of the organization within the labor community. Therefore, this study proposes the following hypothesis:

*H6: Candidate experience positively influences Recruitment personnel brand*

**2.2.7. The Intermediary role of Candidate Experience (CE) and Transparency in the Recruitment Process (TRP)**

BC significantly enhances transparency, security, and efficiency in the recruitment process, particularly by

reducing the time required to verify candidate information and improving satisfaction (Ta'Amnha et al., 2021; Sule & Wani, 2024). This technology facilitates a clear, accurate, and equitable hiring process, enabling candidates to have favorable and positive experiences. This positive experience not only fosters candidate appreciation for the organization but also disseminates positive impressions, contributing to the enhancement of the employer's reputation and brand value (Kaur et al., 2020). Furthermore, BC ensures transparency in the recruitment process through its capacity to store and retrieve data in an immutable manner, thereby eliminating opacity and enhancing trust (Kumar et al. 2022). Transparency not only engenders trust from candidates, but also strengthens the employer's image and brand reputation (Sule & Wani, 2024). Sule and Wani (2024) emphasized that BC facilitates a positive candidate experience, which leads to a significant improvement in branding. Similarly, Kaur et al. (2020) assert that candidate experience plays a crucial role in increasing brand value. Kumar et al. (2022) also indicate that transparency in the hiring process, enabled by BC, not only enhances trust but also improves an organization's reputation. According to Ta'Amnha et al. (2021), transparency is a fundamental factor in improving brand identity and value. Based on these theoretical foundations, this study proposes the following hypotheses:

*H7: Candidate experience acts as an intermediary between BC and Recruitment personnel brand*

*H8: Transparency in the recruitment process acts as an intermediary between the BC and Recruitment personnel brand*

### 2.3. Proposed research model

Based on related hypotheses and theories, the author hypothesizes the following.

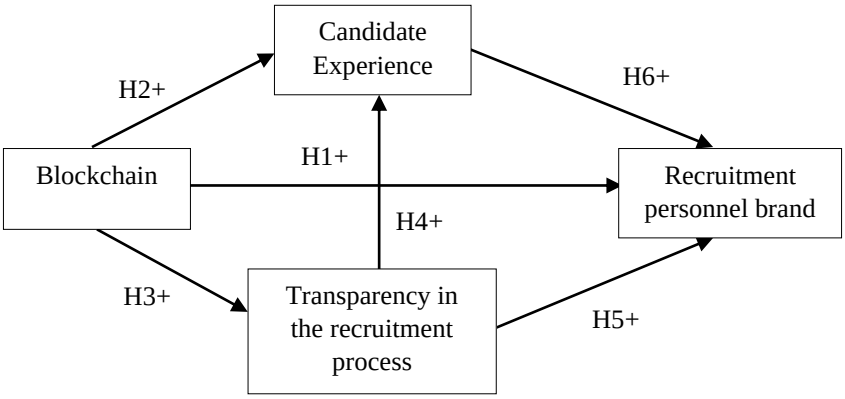

**Fig.1. Proposed research model**

## III. RESEARCH METHODS

To examine the relationships in the hypothetical model, this study employed quantitative methodology using data collected from employees and potential candidates in the recruitment process of Vietnamese financial enterprises. The survey was conducted between October and November 2024 using a structured questionnaire. Prior to implementing the official survey, a qualitative approach was applied through in-depth interviews to gather opinions and feedback from ten experts in the fields of human resources, BC technology, and corporate governance. The results of these interviews were used to adjust and refine the questionnaire, ensuring clarity, relevance, and comprehensibility of the survey content.

Data collection was performed using convenience sampling, with 450 responses received, of which 438 responses were deemed valid. The sampling technique was justified on the basis of its ability to reach a diverse set of respondents within a limited timeframe. Given the study's focus on understanding the impact of BC on employer branding, a non-probability sampling method was considered appropriate for targeting relevant participants actively engaged in recruitment processes. Data analysis was conducted in several phases using the SmartPLS software, including measurement model testing and structural modeling. SmartPLS was chosen because of its advantages in handling complex models with latent variables, small to medium sample sizes, and ability to assess both direct and indirect effects within the model. The Partial Least Squares Structural Equation Modeling (PLS-SEM) approach was applied to validate the proposed hypotheses as it enables efficient estimation of causal relationships while minimizing

multicollinearity issues. To ensure accuracy and reliability, the scale was evaluated using convergent validity, discriminant validity, and composite reliability (CR). The Cronbach's alpha coefficient was calculated to assess the internal consistency of the measurement variables. Factor loadings above 0.70, AVE values above 0.50, and CR values above 0.70 were used as the criteria for scale reliability and validity. The study strictly adhered to ethical principles, including obtaining informed consent from participants through survey consent forms and ensuring complete data confidentiality and anonymity. Participants were informed of their right to withdraw at any time if they experienced discomfort.

## IV. RESULT AND DISCUSSION

### 4.1. Common Method Variance Bias Test (CMB)

The author examines the variance inflation coefficient (VIF) values, as recommended by Kock (2015). The VIF values reported for the structures ranged from 1 to 1,661 (Table 1), which is well below the recommended limit of 5, confirming the absence of CMB.

**Table 1. Inner VIF Value**

| | BC | CD | PRB | TRP |
|---|---|---|---|---|
| **BC** | | 1.317 | 1.537 | 1.000 |
| **CD** | | | 1.565 | |
| **RPB** | | | | |
| **TRP** | | 1.317 | 1.547 | |

***Note:*** *Blockchain – BC; Candidate Experience – CD; Transparency in the recruitment process – TRP; Recruitment personnel brand -RPB*

*Source: Quote from PLS*

### 4.2. Reliability Measurement

The partial least squared structure equation model (PLSSEM) was employed to analyze the data. The factor-loading values (Table 2) were examined to assess convergent reliability. All factor loading values exceeded the recommended threshold of 0.7 (Hair et al. 2019). Furthermore, the Cronbach's Alpha values were all above the minimum threshold of 0.7 and below 0.95 (Hair et al., 2019), confirming the internal consistency reliability of the constructs (Table 3). These findings indicate that the model demonstrates high reliability and can be used for subsequent analysis.

**Table 2. Factor Load Factor**

| Element | Question | Factor loading | VIF |
|---|---|---|---|
| **Blockchain BC** | BC1: BC technology enhances transparency in the recruitment process. | 0.811 | 1.700 |
| | BC2: BC reduces the time to process and verify candidate information. | 0.838 | 1.876 |
| | BC3: BC improves accuracy and minimizes errors in the recruitment process. | 0.786 | 1.686 |
| | BC4: BC helps store candidate information in a secure and reliable way. | 0.807 | 1.815 |
| **Candidate Experience CD** | CD1: I feel satisfied with the recruitment experience at this business. | 0.818 | 1.561 |
| | CD2: The business facilitates me to understand the steps in the recruitment process. | 0.846 | 1.802 |
| | CD3: I feel respected and fair throughout the hiring process | 0.861 | 1.757 |
| **Transparency in the recruitment process TRP** | TRP1: The recruitment process of businesses is carried out in a transparent and clear way | 0.785 | 1.931 |
| | TRP2: The enterprise provides full information about the steps and evaluation criteria in recruitment. | 0.832 | 1.732 |
| | TRP3: I feel that the recruitment process of this business is fair | 0.850 | 2.524 |
| | TRP4: Clear and timely feedback from businesses throughout the recruitment process | 0.841 | 2.231 |

| | | | |
|---|---|---|---|
| **Recruitment personnel brand RPB** | RPB1: This business has a professional and reliable feel. | 0.785 | 1.788 |
| | RPB2: I would recommend this business as an attractive place to work. | 0.832 | 1.974 |
| | RPB3: Transparent recruitment process helps improve the brand image of the business | 0.850 | 2.041 |
| | RPB4: This business made a positive impression on me through the recruitment process | 0.841 | 1.938 |

*Source: Quote from PLS*

The aggregate reliability value exceeded the recommended threshold of 0.7 (Hair et al. 2019). Furthermore, the interpreted mean variance value (AVE) also surpassed the threshold of 0.5 (Hair et al., 2019). The criteria of Fornell and Larcker (1981) were applied to establish the discriminant validity (Table 3). Additionally, heterotrait-monotrait (HTMT) analysis was conducted to assess discriminant validity. As presented in Table 4, all the HTMT values were below the threshold of 0.9, as recommended by Henseler et al. (2015).

**Table 3. Reliability and value**

| | CA | CR | AVE | BC | CD | PRB | TRP |
|---|---|---|---|---|---|---|---|
| **BC** | 0.823 | 0.885 | 0.657 | 0.811 | | | |
| **CD** | 0.795 | 0.880 | 0.709 | 0.832 | 0.842 | | |
| **RPB** | 0.847 | 0.879 | 0.685 | 0.692 | 0.689 | 0.827 | |
| **TRP** | 0.811 | 0.875 | 0.637 | 0.491 | 0.505 | 0.594 | 0.798 |

***Note:*** *CA = Cronbach's alpha; CR = Composite reliability; AVE = Average variance extracted*

### 4.3. Hypothesis testing

**Table 5. Hypothesis test results**

| Hypothesis | Relationship | Original Sample (O) | Standard deviation (STDEV) | *t-value* | *p-Value* | Supported |
|---|---|---|---|---|---|---|
| H1 | BC→ RPB | 0.629 | 0.029 | 24.045 | 0.000 | Yes |
| H2 | BC → CD | 0.532 | 0.045 | 11.742 | 0.000 | Yes |
| H3 | BC → TRP | 0.491 | 0.505 | 9.735 | 0.000 | Yes |
| H4 | TRP → CD | 0.321 | 0.061 | 5.274 | 0.000 | Yes |
| H5 | CD → RPB | 0.389 | 0.041 | 9.477 | 0.000 | Yes |
| H6 | TRP → RPB | 0.335 | 0.042 | 8.067 | 0.000 | Yes |

*Source: Extracted from PLS*

Table 5 presents the results of the hypothesis validation, with all hypotheses (H1–H6) accepted at a high significance level (p = 0.000). This result indicates a positive and statistically significant relationship between the variables in the study model. H1: Blockchain (BC) → recruitment personnel brand (RPB), coefficient: 0.629, t-value: 24.045. Bottom Line: Blockchain has a direct positive impact on the recruitment personnel brand. H2: Blockchain (BC) → Candidate Experience (CD), coefficient: 0.532, t-value: 11.742. Conclusion: Blockchain has a positive impact on candidate experience. H3: Blockchain (BC) → Transparency in Recruitment Process (TRP), Coefficient: 0.491,t-value:

9.735. Conclusion: Blockchain improves transparency in the hiring process. H4: Transparency in Recruitment Process (TRP) → Candidate Experience (CD), coefficient: 0.321, t-value: 5.274. Bottom Line: Transparency in the hiring process positively affects candidate experiences. H5: Candidate Experience (CD) → recruitment personnel brand (RPB), coefficient: 0.389, t-value: 9.477. Bottom Line: Candidate experience has a positive impact on the recruitment personnel brand. H6: Transparency in Recruitment Process (TRP) → recruitment personnel brand (RPB) coefficient: 0.335, t-value: 8.067. Bottom Line: Transparency in the recruitment process has a positive impact on employer brands. Thus, the results in Table 5 emphasize that blockchain technology not only has a direct impact on the employer brand but also indirectly through improving the candidate experience and enhancing transparency in the recruitment process. This is an important basis for businesses to invest in BC applications to optimize the recruitment process and improve brand value. The findings presented in Table 5 show that all hypotheses (H1–H6) were accepted with a high degree of significance (p = 0.000), indicating a positive and significant relationship between the study variables.

### 4.4. Intermediary Role Analysis

**Table 6. Intermediary Role Analysis**

| Relationship | Original Sample (O) | Standard deviation (STDEV) | *t-value* | *p-Value* |
|---|---|---|---|---|
| BC → CD | 0.374 | 0.054 | 6.874 | 0.000 |
| BC→ RPB | 0.382 | 0.041 | 9.410 | 0.000 |
| BC → TRP | 0.491 | 0.050 | 9.735 | 0.000 |
| CD → RPB | 0.389 | 0.041 | 9.477 | 0.000 |
| TRP → CD | 0.321 | 0.061 | 5.274 | 0.000 |
| TRP → RPB | 0.210 | 0.036 | 5.904 | 0.000 |
| BC → CD→ RPB | 0.146 | 0.027 | 5.352 | 0.000 |
| BC → TRP→ RPB | 0.103 | 0.020 | 5.204 | 0.000 |

*Source: Extracted from PLS*

Table 6 demonstrates that candidate experience and transparency in the recruitment process both serve as significant mediators between BC technology and recruitment personnel brand. The t-value and p-value both indicate statistical significance, supporting the hypothesis that BC not only directly influences employer brands but also indirectly by enhancing the candidate experience and increasing transparency in the hiring process. Specifically, the mediating role of candidate experience: Bootstrapping values indicate that candidate experience is a significant intermediary factor between BC and Recruitment personnel brands. This aligns with the findings of Kaur et al. (2020), in which candidate experience is identified as a core factor that contributes to brand value. The mediating role of transparency: Transparency in the recruitment process has also been confirmed as a mediating factor, contributing to increased trust from candidates and enhancing the reputation of the organization, consistent with studies by Ta'Amnha et al. (2021) and Kumar et al. (2022). The results in Table 6 emphasize that these mediating factors are not only independent but also interact with each other, creating a comprehensive and complex relationship between BC and employer brands. This provides a foundation for organizations to focus on implementing BC and optimizing candidate experiences and transparency factors to enhance their brand image.

## V. CONCLUSION

### 5.1. Conclusion

This study investigates the role of BC technology in recruitment personnel brands with a specific focus on the mediating role of candidate experience and transparency in the recruitment process. The research findings indicate that BC not only directly impacts employer brands but also indirectly influences them through two significant intermediary factors: candidate experience and transparency. These results provide a more comprehensive understanding of how BC can enhance HR management efficiency, while simultaneously strengthening an organization's image and brand value. In comparison to previous research, this study offers novel contributions and elucidates complex relationships: (1) Direct Impact of BC: BC is identified as having a direct positive impact on employer brands, aligning with the findings of Kumar et al. (2022) and Sule & Wani (2024), where BC is considered a crucial tool for increasing transparency and

efficiency in recruitment; (2) The mediating role of candidate experience: The study confirms that candidate experience serves as an intermediary factor between BC and Recruitment personnel brand, complementing the conclusion of Kaur et al. (2020), in which candidate experience is regarded as a core factor in enhancing brand value; (3) transparency in the recruitment process, which corroborates the findings of Ta'Amnha et al. (2021) and Kumar et al. (2022), emphasizing that transparency not only engenders trust from candidates but also plays a significant role in constructing a robust employer brand. While previous studies, such as Sule and Wani (2024), have primarily focused on individual factors, such as transparency or candidate experience, this study integrates both factors into a comprehensive analytical model. This integration elucidates their intermediary role in connecting BC to employer brands. This study provides practical recommendations for organizations to implement BC technology to enhance the recruitment process, thereby constructing a stronger, more contemporary, and more credible employer brand.

### 5.2. Administrative implications

Based on the research findings, the following managerial implications are proposed to assist organizations in optimizing recruitment personnel brands through the integration of BC technology and enhancing candidate experience:

Integrating BC into the recruitment process: Organizations should implement BC to ensure transparency in the recruitment process, from storing and retrieving candidate data to clearly delineating evaluation criteria. This approach not only enhances trust among candidates but also reinforces the organization's image as a fair and professional entity. Concurrently, BC should be used to manage and safeguard sensitive data, thereby demonstrating a commitment to privacy protection and fostering long-term trust among candidates.

Enhance candidate experience: Organizations need to provide clear information and timely feedback throughout the recruitment process, from application submission to result notification. BC can automate these processes, ensuring that candidates receive prompt and accurate responses. Reducing processing time and increasing fairness in the assessment will create a positive experience for candidates, even for those who are not selected. These favorable experiences encourage candidates to disseminate positive impressions of the organization, contributing to the enhancement of the employer's brand value.

Leverage BC to increase competitive advantage: Applying BC to the recruitment process not only helps organizations improve efficiency but also establishes an image as a modern, innovative, and technologically pioneering entity. A strong employer brand, supported by transparent and fair processes, will assist organizations in attracting talent, particularly in industries with high requirements for skills and credibility.

Training personnel to deploy BC effectively: Organizations need to invest in training personnel in BC technology to ensure that the integration of technology proceeds smoothly and yields maximum value. BC should be flexibly integrated with traditional elements, such as organizational culture and compensation policies, to optimize the overall experience of candidates.

Evaluation and Measurement of Effectiveness: Organizations need to establish specific key performance indicators (KPIs) to assess the effectiveness of BC in improving candidate experience and ensuring transparency in the recruitment process. Regularly monitoring and reviewing the impact of BC on employer branding and talent attraction will enable organizations to adjust their strategies in a timely and effective manner.

While BC offers significant advantages, organizations may face challenges in their implementation. These include high initial costs, resistance to technological change, and regulatory uncertainties. To overcome these challenges, organizations should adopt a phased approach to BC implementation, starting with pilot projects before full-scale deployment. Collaborate with industry regulators to ensure compliance with legal and ethical standards in data security and privacy and develop internal expertise by training HR personnel in BC-related applications to enhance efficiency and integration. Utilize industry benchmarks and best practices from sectors such as fintech and healthcare, where BC has been successfully implemented in recruitment and data verification. By addressing these challenges proactively and following best practices, organizations can maximize the benefits of BC in recruitment, ensuring a sustainable, transparent, and candidate-friendly hiring process. These efforts will ultimately contribute to a stronger employer brand and improve organizational performance.

# STUDENTS FREELANCING TRENDS: HO CHI MINH CITY IN THE DIGITAL ERA

**Duong Thi Thuy Tien**[1]
[1]HUTECH University, Ho Chi Minh City, Vietnam
*Corresponding: dtt.tien@hutech.edu.vn

**ABSTRACT**

In the digital era, freelancing has emerged as a prevalent career choice, particularly among the younger generation. This study investigates the factors influencing students' decisions to pursue freelance work in Ho Chi Minh City, Vietnam. The research specifically addresses the question: What are the key determinants driving students toward freelancing? Using a quantitative approach, data was collected through a convenience sampling method, surveying 135 students from various universities in Ho Chi Minh City. The study assessed five key factors: professional skills, financial independence, social influence, employment opportunities, and time management skills. The findings indicate that professional skills, financial independence, and employment opportunities significantly impact students' inclination toward freelancing, with professional skills being the most critical determinant. Conversely, social influence and time management skills did not have a substantial effect. These insights suggest that students should prioritize skill development and financial preparedness while leveraging digital platforms to maximize employment opportunities. Additionally, the study provides valuable implications for educators, policymakers, and career advisors in supporting students' transition into the evolving freelance economy.

*Keywords*: "Freelance working trends", "professional skills", "financial independence", "employment opportunities", "Ho Chi Minh City students".

## I. INTRODUCTION

The 21st century marks a revolutionary shift in the labor market, as digital technology and the digital era are changing every corner of life and the way of working. In this context, the trend of freelancing is becoming a promising way of working, attracting more and more people, especially young people. Digital platforms such as Upwork, Fiverr, or Freelancer not only provide flexible connection opportunities between service providers and customers, but also facilitate a new way of living and working – financial independence, time flexibility, and no geographical constraints. This trend has really crept into every aspect of the global economy.

In Ho Chi Minh City, the largest economic and educational center in the country, students are playing a pioneering role in embracing the freelance trend. With flexibility in the way of working, freelancing helps students both accumulate professional experience and achieve financial independence while still in school. However, students' decision to join this trend not only depends on personal desires, but is also influenced by many different factors. These factors not only shape the motivation to work freelancing, but also affect students' ability to adapt to the increasingly volatile digital labor market.

However, research on freelancing trends in Vietnam is still in its infancy. Most previous studies have focused on economics and technology, but have not fully considered factors for the student class – a group that is likely to become a significant freelance workforce in the future. In addition, while international studies have made great progress, they have largely focused on the context of developed countries, leaving a large gap in understanding the unique characteristics and needs of developing countries such as Vietnam.

Stemming from the above needs and urgency, the author chooses the topic "Factors affecting the trend of freelancing of students in Ho Chi Minh City in the digital era" for research and analysis. Through this study, we aim to explore and analyze the main factors affecting the decision of students in Ho Chi Minh City to work freelancing thereby proposing reasonable orientations for students, schools and policy managers in the context of the current digital economy.

## II. MATERIAL AND METHOD

### 2.1. Conceptual Foundation

#### 2.1.1 Social influence

Social influence refers to the alteration of an individual's thoughts, emotions, attitudes, or behaviors as a result of interactions with others, either individually or within a group context. It is important to distinguish social influence from related concepts such as conformity, power, and authority. Specifically, conformity involves an individual adopting certain opinions or behaviors not because they genuinely hold those beliefs or perceive the behaviors as appropriate, but rather to align with the expectations of others or to fit into a particular social context (French & Raven, 1959). Thus, while conformity is one form of social influence, it represents a specific case where external pressures shape individual actions without a change in internal beliefs.

The terms persuasion and social influence are often used interchangeably when explaining how someone's behavior or attitudes are changed by the influence of other people (Stibe, 2015) . Further, Stibe et al., (2019) have explained that, in contract to traditional tactics of persuasion, social influence can serve as much stronger catalyst for achieving sustainable changes, i.e. transformation.

Acording to Venkatesh et al., (2003) social influence is defined as the degree to which an individual perceives that those around them believe they should use a particular service. This research concept represents subjective norms (Ajzen, 1991). In the context of an increasing number of students tending to participate in freelance work, social influence means the degree to which the subject perceives that those around them believe that they should accept the use of technology information applied to their freelance work (Venkatesh et al., 2012).

#### 2.1.2 Personal skills

A key demand from employers is the ability of graduates to engage in lateral thinking, a crucial aspect of problem-solving (Holmes, 1995a). This necessitates a problem-based approach, fostering the development of creative and original solutions applicable in the workplace. Personal and interpersonal skills encompass a broad spectrum, encompassing both communication proficiency and effective teamwork dynamics. Consequently, employers prioritize graduates who excel as both team players and leaders (Holmes, 1995b). The capacity to function effectively both independently and as part of a group is an essential component of the desired graduate skillset (Rozien & Jepson, 1985). Graduates are expected to possess a nuanced understanding of social appropriateness in their interactions and task execution. Employers seek individuals who are "self-confident yet cognizant of their limitations" (Harvey & Bowes, 1988). A survey of small and medium-sized enterprises conducted by Harvey & Bowes (1988) highlighted the expectation that new hires demonstrate immediate value and contribute meaningfully from the outset. This ability to assume responsibility and exhibit leadership potential is highly valued across various sectors.

Harvey & Bowes (1998), findings further emphasized the preference for individuals with demonstrated leadership potential in a professional context. Prior effective leadership experiences often signify strong teamwork, effective listening, and motivational skills, while also demonstrating an individual's capacity to earn the respect of their peers. Organizational abilities, such as time management, effective planning, and strategic thinking, are indispensable in today's competitive graduate job market. These "meta-skills," alongside foreign language proficiency and Information and Communications Technology (ICT) competencies, are frequently identified as areas of skill deficiency within the contemporary graduate profile (Barnett, 1990).

McKenzie's (2024), research on freelancer training programs in El Salvador, Haiti, and Bangladesh reveals that while training helps individuals access online platforms, achieving long-term success remains a significant challenge. Low course completion rates, unstable income, and the rise of AI replacing low-skilled jobs highlight the need for students not only to access digital platforms but also to continuously enhance their expertise and adapt to technology to stay competitive in the global market.

#### 2.1.3 Financial independence

Countries with large economies require additional efforts from stakeholders to improve students' money management behaviours as there is a large communication gap (Kassim et al., 2022). However, it is evident from previous studies that personal income, financial attitude, and knowledge significantly influence Generation Z's financial behaviour (Pamikatsih et al., 2022). Nevertheless, there is a substantial relationship between financial literacy, self-

control, and peer influence on saving behaviour (Faisal et al., 2023). Another study among Gen Z reiterated the correlation between financial management and parental income, attitude, and knowledge (Fietroh & Mandasari, 2022). Parental influence led Gen Z to focus on generating money at a very young age (Mazzatto, 2022), thus pushing them to freelance while studying at university.

Financial independence encompasses a multifaceted set of behaviors that govern an individual's resource management and financial decision-making processes (FINRA Investor Education Foundation, 2009, p. 9). The President's Advisory Council on Financial Capabilities (2012) posits that individuals with higher financial capabilities are characterized by their ability to "make informed and effective decisions about the use and management of money through the knowledge, skills, and access to tools to manage their finances effectively for long-term well-being," distinguishing them from those with lower financial capabilities. Shim and Serido (2011) further elaborate on this concept, proposing that financial capabilities develop through a hierarchical process that integrates cognitive, psychological, and behavioral decision-making dimensions.

#### 2.1.4. Employment opportunities

Gangl (2003) defines “employment opportunities” as the opportunity for individuals to find employment after completing formal education or after a period of unemployment. Employment opportunities constitute a foundational concept within the field of entrepreneurship, defining its boundaries and exchange conditions (Busenitz et al., 2003). Alternatively, some scholars view opportunity identification as a more gradual and iterative process, involving the synthesis of ideas over time (Dimov, 2007a). Furthermore, definitions of opportunity vary in scope: some emphasize the introduction of novel goods, services, or processes (Gaglio, 2004), while others primarily focus on the role of opportunities in facilitating the creation of new ventures (Ozgen & Baron, 2008).

Regarding worker behaviors, whether by choice or necessity, more people today are self-employed or engaged in project-based work that, while allowing more flexible work schedules, lack the long-term employment security of traditional jobs. Self employment and working independently are more common today than at any time in the past (Torpey & Hogan, 2016). Employment opportunities are made more complex by these trends, requiring simultaneous collaboration among many functional specialties and professions. To respond to this complexity, the basic template for organizing work has shifted from functional specialization and fulltime employment toward project teams and contingent assignments (Guile & Lahiff, 2017).

#### 2.1.5. Time management

The term "time management" is arguably a misnomer. Time itself is an immutable constant and, therefore, not subject to direct control. However, the term accurately reflects the focus on individual strategies for effectively utilizing the available time. In essence, time management encompasses the cognitive and behavioral processes involved in monitoring and controlling one's interaction with time (Eilam & Aharon, 2003).

The daily routine of students changed drastically in the last two decades with the advancement of technology. Students pursuing higher education in urban and metropolitan cities tend to multitask. They freelance in the evenings and during leisure time while pursuing their UG or post-graduate studies (Kaur & Kaur, 2022). This can be due to multiple reasons: (1) they might wish to be more independent as adults (Bandaranayake et al., 2020), (2) they are away from their parents and stay mostly in PG accommodations, hostels, rented independent houses, or in shared accommodations, (3) their lifestyles demand more pocket money, (4) they harbour anxiety about their future lives, and (5) they have easy access to online freelancing job opportunities (Kathuria et al., 2017). In an ethnically diverse country like India, students come from varied socioeconomic backgrounds. They differ with respect to their family culture, family business, family size, family pressure, peer pressure, financial bearings, and requirements. Withstanding these pressures while studying at university pushes them to work online, offline, or take up small-scale freelance jobs to meet their day-to-day demands (Singhal & Prakash, 2024).

#### 2.1.6. Freelancing trend

The concept of independent work predates the contemporary term "freelancer." The term "Boundaryless Worker," coined in the 1970s, described individuals who operate outside traditional employment structures, working without geographical or organizational constraints (Kazi et al., 2014). While the terminology has evolved, the underlying

concept of independent work remains relevant.

The freelance career model has become a global trend in the 21st century, gaining popularity especially among the younger generation. Freelancing involves working independently as a self-employed individual, often referred to as an independent contractor, being hired by various clients on a part-time or short-term basis with differing compensation and commitment levels compared to full-time employees (Dosunmu et al., 2022). Unlike traditional employees, freelancers frequently move between different projects and employers, offering their services through online platforms, advertisements, or personal connections (Opait et al., 2019).

Gig workers, a prominent subset of the freelance workforce, are defined as self-employed individuals who provide services or products to clients on a contract or project basis (Kuhn & Maleki, 2017). This arrangement offers workers a degree of autonomy, allowing them to control their work schedules and prioritize personal commitments. This perceived increase in work-life balance and flexibility is a significant driver for many individuals transitioning to freelance work (Wood et al., 2018).

The term "platform workers" has been used interchangeably with "gig workers" to describe individuals who utilize online platforms to connect with clients and secure work (De Stefano, 2015). These platforms empower workers with greater control over their project selection and enable them to more effectively integrate work responsibilities with their personal lives (Donovan et al., 2016).

**2.2. Research Methodology**

In this study, the author uses qualitative research methods combined with quantitative research methods in the process of analyzing and discussing research: (1) Qualitative research by building and developing conceptual systems/scales and observation variables and correcting observed variables in accordance with reality; (2) Quantitative research: Using the Cronbach's Alpha confidence factor to test the degree of rigor in the correlation scale; EFA discovery factor analysis is used to validate influencing factors and identify factors that are considered appropriate; at the same time, multivariate linear regression analysis was used to determine the factors and the impact of each factor on the freelance tendency of Ho Chi Minh City students.

According to Tabachnick & Fidel (1996), the best regression analysis when the sample size needed to be ensured is: $n \geq 8m + 50$. Where: n is the sample size, m is the independent variable of the model. When using exploratory factor analysis (EFA) always requires a minimum sample size that is much larger than the multiple regression model in the same study. Therefore, in this study, it is only necessary to determine the minimum sample size for exploratory factor analysis (EFA), and will ensure the right number of samples for the regression model.

Through a brief review of previous research documents, the author identified 5 factors with 25 observed variables that are believed to have an impact on the freelance work trend of students in Ho Chi Minh City. The author sent 150 survey votes and the results received 139 survey votes, of which 4 votes were rejected due to invalidity. Therefore, the remaining number of observed variables to be included in the analysis is 135 votes, satisfying the minimum condition of 90 votes.

Convenient sample selection is a non-probabilistic method in which researchers select participants based on accessibility. While this approach offers flexibility and ease of implementation, it may also impact the generalizability of the study due to limitations in sample scope and lack of randomness. In this study, with a sample of 135 university students in Ho Chi Minh City, the findings may not fully capture the diversity of a broader population. This raises considerations about sample representativeness and the extent to which conclusions can be generalized. Therefore, future research could consider expanding the sample size and employing more diverse sampling methods to enhance the reliability and applicability of the results.

Based on the research overview, the groups of factors affecting the trend of freelancing of students in Ho Chi Minh City in the digital era was selected by the author to include in the research model, including: Professional skills; Financial independence; Time management; Social influence; Employment opportunities.

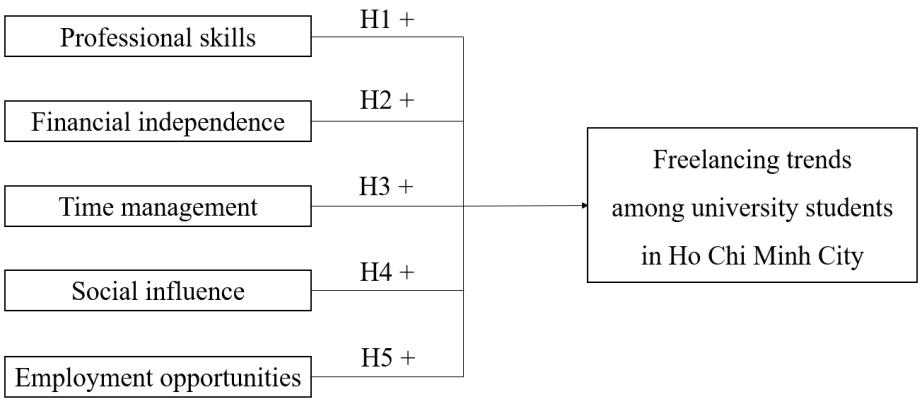

**Fig 2.1 - Research model**

With the hypothesis posed:

Hypothesis H1: Professional skills have a positive impact on the tendency of students in Ho Chi Minh City to choose a freelance career;

Hypothesis H2: Financial independence has a positive impact on the tendency of students in Ho Chi Minh City to choose a freelance career;

Hypothesis H3: Time management has a positive impact on the tendency of students in Ho Chi Minh City to choose a freelance career;

Hypothesis H4: Social influence has a positive impact on the tendency of students in Ho Chi Minh City to choose a freelance career;

Hypothesis H5: Employment opportunities have a positive impact on the tendency of students in Ho Chi Minh City to choose a freelance career.

## III. RESULT AND DISCUSSION

### 3.1. Scale Reliability Testing (Cronbach's Alpha)

**Table 3.1 – Results of scale quality analysis**

| N.O | Scale | Number of Observed Variables | Cronbach's Alpha | Smallest total variable correlation coefficient | Notes |
|---|---|---|---|---|---|
| **1** | **Professional skills (PS)** | 5 | 0.840 | 0.546 | Accept |
| **2** | **Financial independence (FI)** | 5 | 0.870 | 0.658 | Accept |
| **3** | **Time management (TM)** | 5 | 0.787 | 0.470 | Accept |
| **4** | **Social influence (SI)** | 5 | 0.836 | 0.539 | Accept |
| **5** | **Employment opportunities (EO)** | 5 | 0.839 | 0.556 | Accept |
| **6** | **Freelancing trends (FT)** | 4 | 0.844 | 0.638 | Accept |

The results show that the scale in table 3.1 shows that all Cronbach's Alpha coefficients of the overall are greater than 0.6. Thus, the scale coefficient is built consisting of 5 independent variables and 1 dependent variable to ensure reliability with 25 observation variables of independent variables and 4 observation variables of dependent variables.

### 3.2. EFA exploratory factor analysis

**Table 3.2 – Results of EFA exploratory factor analysis**

| KMO and Bartlett's Test | | |
|---|---|---|
| Kaiser-Meyer-Olkin Measure of Sampling Adequacy. | | 0.865 |
| Bartlett's Test of Sphericity | Approx. Chi-Square | 1589.734 |
| | df | 210 |
| | Sig. | 0.000 |

Barlett's test results show that there is a correlation between variables in the overall (Sig = 0.000 < 0.05, hypothesis accepted). At the same time, this coefficient of KMO = 0.865 greater than 0.5 proves that the factor analysis to group the variables together is appropriate and the data is suitable for conducting the analysis.

**Table 3.3 - Results of total variance explained**

| Total variance explained | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Component | Initial eigenvalues | | | Extraction sums of squared loadings | | | Rotation sums of squared loadings | | |
| | Total | % of Variance | Cumulative % | Total | % of Variance | Cumulative % | Total | % of Variance | Cumulative % |
| 1 | 8.674 | 41.307 | 41.307 | 8.674 | 41.307 | 41.307 | 3.358 | 15.991 | 15.991 |
| 2 | 1.771 | 8.432 | 49.739 | 1.771 | 8.432 | 49.739 | 3.157 | 15.031 | 31.022 |
| 3 | 1.668 | 7.944 | 57.683 | 1.668 | 7.944 | 57.683 | 2.986 | 14.220 | 45.242 |
| 4 | 1.138 | 5.421 | 63.104 | 1.138 | 5.421 | 63.104 | 2.755 | 13.120 | 58.362 |
| 5 | 1.052 | 5.010 | 68.114 | 1.052 | 5.010 | 68.114 | 2.048 | 9.752 | 68.114 |
| 6 | 0.797 | 3.796 | 71.910 | | | | | | |

From the results of Table 3 after running Fixed number of factors, we see that the deduction variance is 68.11% > 50% satisfactory. With the Principal component extraction method and the Varimax rotation, there are 5 factors drawn from 25 observed variables. This also shows that all five factors show the ability to explain 68.11% of the change in the dependent variable.

### 3.3 Multivariate regression analysis

In the study of running multivariate linear regression with the Enter method, we have the following results:

**Table 3.4 – Results of regression models**

| Coefficients[a] | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Model | | Unstandardized coefficients | | Standardized coefficients | t | Sig. | Collinearity statistics | |
| | | B | Std. Error | Beta | | | Tolerance | VIF |
| 1 | (Constant) | -0.665 | 0.268 | | -2.479 | 0.014 | | |
| | FI | 0.230 | 0.080 | 0.197 | 2.859 | 0.005 | 0.519 | 1.928 |
| | SI | 0.484 | 0.094 | 0.400 | 5.162 | 0.000 | 0.409 | 2.445 |
| | EO | 0.170 | 0.074 | 0.152 | 2.303 | 0.023 | 0.565 | 1.771 |
| | PS | 0.203 | 0.076 | 0.169 | 2.671 | 0.009 | 0.614 | 1.630 |

**a. Dependent Variable: FT**

Based on the data table, we see that there are 4 factors with a Sig < of 0.05 that are statistically significant. We write the polyploid regression equation expressed in the following form:

**FT = 0.400*SI + 0.197*FI + 0.169*PS + 0.152*EO**

The regression coefficients with positive signs show the factors in the model that positively affect the freelancing trend of students in Ho Chi Minh City

### 3.4. Evaluation of the suitability of the multivariate linear regression model

**Table 3.5 – Results of model summary**

| Model Summary[b] | | | | | |
|---|---|---|---|---|---|
| Model | R | R square | Adjusted R square | Std. Error of the estimate | Durbin-watson |
| 1 | 0.827[a] | 0.684 | 0.672 | 0.52203 | 1.782 |

**a. Predictors: (Constant) EO, PS, FI, SI**

**b. Dependent Variable: FT**

The result R2 = 0.672 (R2 with correction) shows that the model is statistically significant. Independent variables

account for 67.2% of the volatility of dependent variables. Factors in the model include: Employment opportunities; Professional skills; Financial independence and Social influence. To determine the impact of factors on the "Trend of students choosing freelance careers at universities in Ho Chi Minh City", we base on the order of the level of each factor depending on the absolute value of the normalized regression coefficient.

## IV. CONCLUSIONS AND RECOMMENDATIONS

### 4.1. Conclusion

The study has identified four main factors affecting the tendency of university students in Ho Chi Minh City to choose to work freelancing in order of decreasing impact as follows:

In which, the Social influence (SI) factor has the strongest impact with a normalized regression coefficient of 0.400. This shows that support from family, friends, and the community is the most important factor in motivating students to pursue a freelance career.

Next, the Financial independence (FI) factor with a coefficient of 0.197 reflects that the ability to control income and financial independence play a decisive role in students' choice of freelancing.

Professional skills (PS) have the third level of impact on students' tendency to choose freelancing with a coefficient of 0.169, which shows that professional competence is a necessary factor but not the biggest determinant.

Finally, the Employment Opportunity (EO) factor has the lowest dynamic waterfall with a coefficient of 0.152, emphasizing that access to the freelance labor market is a supportive condition but not a major determinant.

The regression model with a corrected R2 value of 67.2% shows that independent variables have largely explained the volatility of the tendency to choose to work freely. This result is quite similar to the research of Perry et al. (2019), which emphasizes the role of social influence in career decisions, as well as the work of Bennett et al. (2020), which affirms the importance of financial independence in freelance career choice.

### 4.2. Recommendations

**Strengthening the social influence factor (SI)**

With the strongest impact, the social influence factor needs to be focused on motivating and supporting students to choose a freelance career.

It is necessary to organize forums and seminars to share experiences between freelance professionals and students, to help students build trust and receive encouragement and guidance from pioneers in the field of freelancing.

In addition, it is necessary to build professional community groups at universities, where students can exchange, learn and strongly expand their networks.

Implement communication campaigns to raise family and social awareness of the potential and opportunities of freelancing, reduce prejudice about the instability of this job.

**Supporting students to improve their financial independence (FI)**

Financial independence is the second most important factor that needs to be focused on so that students are more confident when entering the freelance labor market.

Organize personal finance management courses for students, including budgeting, income management, and savings.

Build financial support funds or promote preferential loan programs for start-up students in the field of freelancing.

Assisting students in accessing digital financial platforms that help track and manage cash flow effectively.

**Professional skills development (PS)**

Although not the biggest determinant, professional skills are still the foundation for students to achieve success in freelance work, specifically:

Strengthen professional courses that combine practice at the university, especially in fields with a demand for self-employed workers such as information technology, graphic design, and digital marketing.

Universities need to implement online learning programs with leading experts and be granted international

certificates, helping students improve their capacity and increase their competitiveness in the freelance labor market.

Expand cooperation with businesses to organize practical projects and internship programs, helping students apply professional knowledge to the real world.

Strengthening connections to domestic and foreign employment opportunities (FI).

Despite having the lowest impact, increasing employment opportunities is still essential for students to have more opportunities to access the freelance labor market effectively.

Build online job platforms, similar to Upwork or Fiverr, specifically designed for students in Vietnam.

Host Freelance Job Fair sessions where students can connect with employers and learn about real-world job requirements.

Universities need to coordinate with businesses to provide suitable labor market information and freelance career orientation for students.

In summary, the study not only identifies and measures the impact of factors affecting the tendency of students to choose a freelance career in Ho Chi Minh City in the digital age but also provides practical solutions to promote the potential of students in the context of an increasingly flexible and digital labor market, motivating and motivating students to choose freelancing as a sustainable and promising direction.

However, this study has certain limitations. First, the use of the convenience sampling method may lead to bias in the results, as it does not fully reflect the overall trend among all university students in Ho Chi Minh City. Second, the sample size is limited to only 135 students, which may not be large enough to generalize the findings to the entire student population in this area. Therefore, future studies should expand the survey scope with a larger sample size and adopt a random sampling method to enhance representativeness. Additionally, future research could consider incorporating other factors such as field of study, work experience, or risk attitude to gain a more comprehensive understanding of students' decisions to pursue freelancing.

# A NEW APPROACH OF SENTIMENT ANALYSIS AND TOPIC MODELING FOR USER-GENERATED CONTENT IN MOBILE BANKING APPLICATIONS

**Tran Duong Thanh Phong[1,2], Ho Trung Thanh[1,2*], Vu Bao Khang[1,2]**
[1]University of Economics and Law, Ho Chi Minh City, Vietnam.
[2]Vietnam National University, Ho Chi Minh City, Vietnam.
*Corresponding: Email: thanhht@uel.edu.vn

**ABSTRACT**

As one of Southeast Asia's fastest-growing digital economies, Vietnam presents significant opportunities for mobile banking innovation. App store ratings and reviews reflecting user-generated content (UGC) are essential for evaluating mobile banking performance and user satisfaction. Prior studies have neglected to use app store reviews with limited sentiment analysis applications to address user concerns. Therefore, this study aims to analyze app store reviews to identify key drivers of dissatisfaction and demonstrate how sentiment analysis and topic modeling can inform user-centric improvements. The study applies sentiment classification using fastText, achieving a confidence score of 0.691 and Latent Dirichlet Allocation (LDA) in identifying seven topics and grouping them into three overarching themes. Findings reveal a predominance of very negative, negative, and neutral sentiments, highlighting recurring issues such as app performance. While reliance on app store reviews limits the generalizability of insights, this study underscores their value in uncovering actionable recommendations, including enhancing app performance, streamlining transactions, and improving error management. Further studies should expand the data sources while integrating advanced Natural Language Processing techniques like the BERT model. These findings contribute to data-driven strategies for businesses to improve customer satisfaction and strengthen the competitive positioning of mobile banking applications in Vietnam.

*Keywords: "customer satisfaction", "mobile banking", "sentiment analysis", "topic modeling", "user-generated content"*

## I. INTRODUCTION

The rapid advancement of digital technology in Vietnam has revolutionized the banking sector, positioning mobile banking applications as essential tools for financial transactions. Le et al. (2022) and Vo et al. (2024) emphasize that these apps enable users to manage their finances remotely, contributing to a steady increase in active mobile banking users across all generations in Vietnam. Simultaneously, the proliferation of mobile banking apps has empowered users to share their experiences through user-generated content (UGC), such as reviews, ratings, and feedback. This content offers banks valuable insights into customer satisfaction and areas for improvement. Consequently, analyzing this feedback has become critical for banks seeking to enhance services and effectively design more targeted marketing strategies.

Moreover, recent advancements in Natural Language Processing (NLP) have facilitated the use of text mining and machine learning approaches to analyze UGC. These tools enable banks to extract deep insights into customer sentiment and engagement, which, in turn, improve customer experience, personalize marketing campaigns, and refine product development (Handayani et al., 2020). However, several challenges persist. As users increasingly share feedback about their experiences, issues such as technical glitches and usability concerns remain prevalent, directly impacting customer satisfaction. Furthermore, the substantial volume of UGC makes manual analysis impractical. Techniques like sentiment analysis and topic modeling offer robust solutions for processing such unstructured data. For instance, sentiment analysis classifies content into positive, neutral, or negative categories, while topic modeling identifies recurring themes (Semary et al., 2024). Chen et al. (2020) and Nguyen and Le (2022) have demonstrated the effectiveness of these techniques in analyzing UGC to enhance customer satisfaction and develop campaigns tailored to specific user segments.

In this context, the current study examines customer sentiment through UGC related to the mobile banking application in Vietnam. Specifically, this research aims to identify the predominant sentiments expressed in user

reviews and extract key themes from the content to provide actionable recommendations for improving user satisfaction. Two research questions guide this study: (1) What are the primary themes associated with user dissatisfaction in mobile banking applications? (2) How can sentiment analysis and topic modeling inform strategies to enhance user satisfaction?

The dataset comprises reviews and ratings collected from Google Play and the App Store between January 2022 and June 2024. After translating the dataset into English, sentiment analysis is conducted using fastText, and Latent Dirichlet Allocation (LDA) is applied for topic modeling. The performance of the models is validated using evaluation metrics such as perplexity and coherence scores for LDA model and confidence score for fastText model.

Finally, the remainder of this paper is organized as follows. The Material and Method synthesizes existing research on sentiment analysis and topic modeling within the banking sector. This section also describes the data collection process and analytical techniques employed in the study. The Results and Discussion section presents significant findings and interprets their implications, while the Conclusion outlines the study's contributions, acknowledges its limitations, and offers recommendations for future research.

## II. MATERIALS AND METHODS

### 2.1 Literature Review

Mobile banking applications have rapidly emerged as indispensable tools for financial management, offering users real-time access to a wide range of banking services. User adoption of these apps is influenced by factors such as perceived ease of use, security, functionality, and trust (Nguyen, 2024; Venkatesh et al., 2016). However, Cheng et al. (2018) argue that sustaining user engagement in an increasingly competitive digital landscape requires more than adoption. It necessitates continual improvements based on user feedback to maintain satisfaction and foster loyalty, a view also supported by Cresswell et al. (2016) and Milne-Ives et al. (2023). In this context, UGC has become an invaluable resource for financial institutions, enabling them to understand user experiences, address dissatisfaction, and enhance their offerings. This section reviews the role of sentiment analysis and topic modeling in the banking sector, providing a foundation for the research methods and models used in this study.

#### 2.1.1. User-Generated Content in Mobile Banking

The proliferation of UGC has created significant opportunities for financial institutions to extract actionable insights from customer feedback. UGC provides a direct lens into user experiences, capturing frustrations, expectations, and preferences, thereby enabling banks to address recurring issues and improve customer satisfaction (Albashrawi et al., 2019; Mbama et al., 2018; Nguyen et al., 2021). In the context of mobile banking, where users demand seamless, efficient, and error-free services, UGC is particularly valuable for identifying pain points. For instance, recurring reviews highlighting app crashes, transaction delays, or inadequate customer support emphasize areas requiring immediate attention (Nguyen et al., 2021; Sampaio et al., 2017).

In emerging markets like Vietnam, UGC is even more significant due to rapid digital adoption and a demographically diverse user base. Studies by Choudrie et al. (2018) and Friemel (2014) reveal that younger, tech-savvy users often seek advanced features, such as real-time notifications, QR payment systems, and digital wallets, while older users tend to prioritize simplicity, security, and accessibility. UGC allows banks to uncover these generational differences and develop tailored solutions to meet diverse customer needs (Liang & Nguyen, 2017; Nguyen et al., 2021). Additionally, systemic issues—such as dissatisfaction with unclear error messages or poorly explained features—often emerge through UGC but may go unnoticed using traditional feedback mechanisms.

Despite its benefits, leveraging UGC effectively presents several challenges. The sheer volume of data makes manual analysis impractical and prone to errors. Moreover, Vietnam's linguistic diversity complicates UGC interpretation, as customer reviews frequently contain idiomatic expressions, tonal variations, and regional dialects. Informal phrases or mixed-language reviews (Vietnamese combined with English) often confuse generic analytical models, as highlighted by Liu et al. (2020), Phan and Starks (2019), and Verdon et al. (2016). While app store reviews serve as an excellent starting point, they represent only a fraction of the feedback spectrum (Genc-Nayebi & Abran, 2016; Palomba et al., 2017). Expanding data sources to include in-app surveys, social media comments, and customer service transcripts would provide a more comprehensive and representative understanding of user experiences.

### 2.1.2. Sentiment Analysis and Topic Modeling

Recent advancements in NLP have introduced robust methods for analyzing unstructured data, enabling the extraction of actionable insights from UGC (Abdullah & Ahmet, 2022; Tarnowska & Ras, 2021). Sentiment analysis, for instance, categorizes user feedback into positive, neutral, or negative sentiments, offering a high-level understanding of user satisfaction and dissatisfaction (Ahmed & Rodríguez-Díaz, 2020; Chandrasekaran et al., 2021; Kausar et al., 2019). Advanced sentiment analysis models, such as Bidirectional Encoder Representations from Transformers (BERT) (Gao et al., 2019) and ELECTRA (Zhang et al., 2021), further improve accuracy by accounting for contextual nuances and language-specific intricacies. These models are particularly beneficial in markets like Vietnam, where linguistic diversity and cultural nuances challenge traditional sentiment analysis techniques. For mobile banking applications, sentiment analysis can identify recurring dissatisfaction with specific features or detect spikes in negative sentiment following updates, enabling financial institutions to respond proactively (Jain et al., 2021; Leem & Eum, 2021).

Complementing sentiment analysis, topic modeling uncovers recurring themes within UGC, helping financial institutions identify areas requiring improvement (Zhang et al., 2017; Vayansky & Kumar, 2020). LDA, one of the most widely used topic modeling techniques, identifies hidden patterns in textual data, grouping user feedback into themes such as app performance, customer support, or security concerns (Blei et al., 2003). In mobile banking, topic modeling can highlight emerging trends, such as the increasing demand for biometric authentication or dissatisfaction with user onboarding processes (Baptista & Oliveira, 2016). Furthermore, dynamic topic modeling allows banks to track how user concerns evolve over time, enabling them to adjust services in response to shifting expectations.

Prior research has demonstrated the effectiveness of sentiment analysis and topic modeling across industries such as e-commerce, travel, and healthcare (Alexander et al., 2021; Ho et al., 2023; Permana et al., 2020). For example, in the e-commerce sector, topic modeling has been used to analyze customer reviews, uncovering issues like delayed deliveries and poor product quality, leading to targeted operational improvements (Adak et al., 2022). Similarly, sentiment analysis in the travel industry has provided insights into guest satisfaction, helping companies tailor services to meet user expectations (Ho et al., 2023). Despite these successes in other domains, sentiment analysis and topic modeling remain underutilized in mobile banking, particularly in emerging markets like Vietnam, where localized approaches are necessary due to linguistic and cultural diversity. Additionally, the mobile banking industry faces significant challenges, such as high churn rates, with approximately 70% of users discontinuing app usage shortly after their initial experience (J. C. Ho et al., 2020). This attrition often results from unresolved user complaints (Alizadeh et al., 2023), highlighting missed opportunities for banks to identify recurring themes and address pain points effectively. Implementing these techniques can provide banks with the insights needed to improve user satisfaction, reduce churn, and enhance customer loyalty.

### 2.1.3 Research Gaps

While sentiment analysis and topic modeling have been widely applied in industries such as e-commerce and travel, their use in mobile banking remains underexplored, particularly in Vietnam (J. C. Ho et al., 2020). Existing research often focuses on technical performance metrics or adoption factors like trust and usability, overlooking the actionable insights embedded in app store reviews. These reviews provide real-time feedback on user concerns, dissatisfaction, and evolving expectations, offering valuable data for improving service quality and retention. Despite their potential, limited studies have leveraged advanced techniques like sentiment analysis and topic modeling to systematically analyze app store reviews in the context of mobile banking (Çallı, 2022). Such tools can uncover patterns of dissatisfaction, identify user priorities, and guide service improvements, particularly in a competitive and rapidly growing market like Vietnam. This study seeks to address these gaps by applying sentiment analysis and topic modeling to the mobile banking application. Through a systematic analysis of UGC, this research contributes to the development of data-driven strategies for enhancing customer satisfaction and strengthening the competitive position in Vietnam's dynamic digital banking landscape.

## 2.2. Methodology

### 2.2.1. Research Design

The research framework is organized into four key phases: data collection, data preprocessing, modeling, and

evaluation with insights interpretation (Figure 2.1). UGC is collected from Google Play and the App Store to capture authentic user feedback. The preprocessing phase involves cleaning and standardizing the data to prepare it for analysis. The modeling phase consists of two parallel pipelines: the fastText model is employed for sentiment analysis, classifying user sentiments, while LDA is applied for topic modeling to uncover recurring topics in the reviews. Finally, the evaluation and insights interpretation phase assess the performance of both the fastText and LDA models while extracting actionable insights aimed at improving user satisfaction.

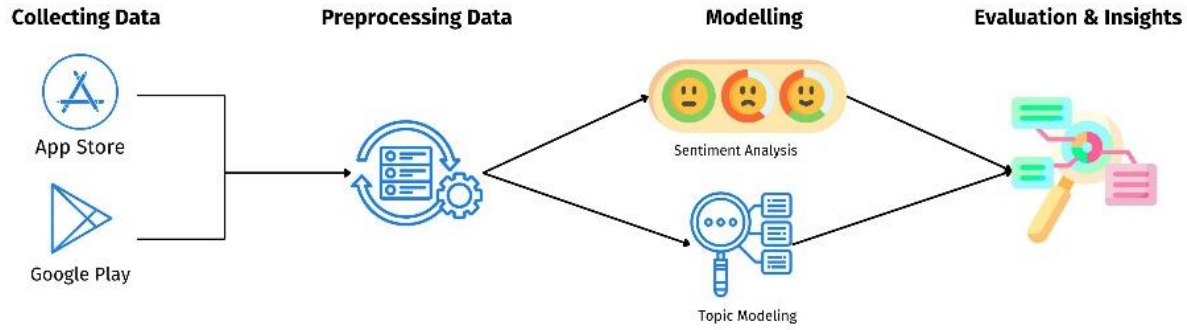

**Fig 2. 1 - Research Framework**

### 2.2.2. Data Collection

This study experiments on the case study of MyVIB app stores as its primary data source, providing access to Vietnamese users. The study employed Python and the Selenium library to gather the data of all available reviews for MyVIB. The dataset was then processed to handle missing values and translated into English for more overall meaning. The dataset comprises 6,794 user reviews on MyVIB application retrieved from Google Play and the App Store, spanning from January 2022 to June 2024. These reviews include textual feedback, ratings, and timestamps, representing a diverse range of user perspectives. Google Play contributed 5,014 reviews, while the App Store provided 1,780 reviews. This dataset forms the foundation for both sentiment analysis and topic modeling and sample reviews are shown in Figure 2.2.

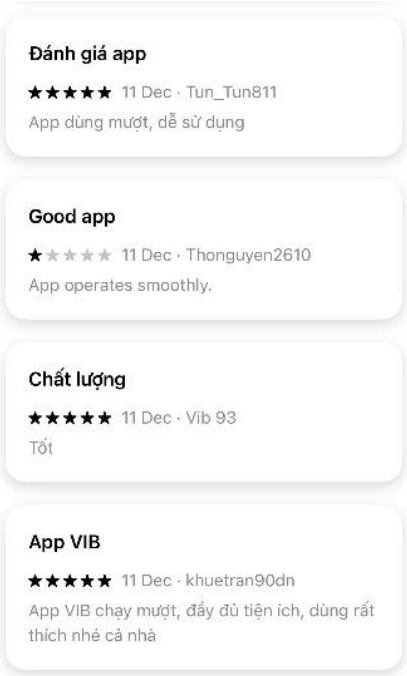

**Fig 2. 2 - Sample Reviews**

### 2.2.3. Data Preprocessing

After collecting all the data, the dataset was preprocessed, including translating non-English reviews into English to ensure integrity, removing duplicates, and filtering out irrelevant or incomplete reviews. Stop words, special characters,

and unnecessary spaces were also removed to improve the quality of the textual data. A word cloud is generated from the full text of the reviews, highlighting the most frequently mentioned terms. This visualization also provides a concise summary of the key themes discussed by the customers, as depicted in Figure 2.3.

**Fig 2. 3 - Word Cloud from MyVIB app reviews**

### 2.2.4. Modeling

**Topic Modeling**

LDA technique helps uncover hidden patterns in textual data, clustering reviews into distinct topics based on word frequency and co-occurrence. In preparing the data for applying LDA, creating bigrams (two-word combinations) and trigrams (three-word combinations) is conducted to help capture multi-word expressions prevalent in user reviews, such as "user interface" or "customer service." This allows the models to enhance the quality of the data, which is crucial for the subsequent steps, as depicted in Table 3.1. After generating bigrams and trigrams, a dictionary is created to assign unique numerical IDs to each token, including single words and multi-word phrases. Using this dictionary, a corpus is constructed in a bag-of-words format, capturing the frequency of each token across the dataset.

**Table 3. 1 - A Sample Bigrams of the model**

| No | Keywords per topic |
|---|---|
| 1 | ['rarely', 'rate', 'app', 'taking', 'moment', 'give', 'app', 'stars', 'using', 'many', 'banking', 'apps', 'stopped', 'myvib', 'ability', 'withstand', 'quick', 'operations', 'one', 'app', 'app', 'neat', 'focused'] |
| 2 | ['app', 'good', 'stars', 'would', 'rate', 'stars', 'ok', 'words', 'describe', 'good'] |
| 3 | ['myvib', 'minimalist', 'interface', 'compared', 'banking', 'apps', 'interface', 'makes', 'less', 'confused', 'however', 'vib', 'allows', 'money', 'transfer', 'button', 'accessible', 'right', 'main', 'screen'] |

The trained LDA model identifies the most probable keywords associated with each topic and groups them into 7 distinct topics. Each review is assigned a dominant topic based on its highest contribution percentage, reflecting its alignment with a specific topic. Table 3.2 below provides an example of the top keywords for each of the identified topics.

**Table 3. 2 - Top Keywords for Each Identified Topic**

| Topic No | Topic Name | Keywords |
|---|---|---|
| 1 | App Features | app, many, easy, feature, use, interface, application, need, user, convenient |
| 2 | Card Management | card, old, credit, lose, deposit, fix, quickly, long, code, available |
| 3 | Transaction Issues | difficult, find, section, open, allow, fee, online, saving, modern, hour |
| 4 | Money Transfer | money, transfer, account, log, receive, slow, notification, transaction, keep, version |
| 5 | Errors | error, bank, time, still, change, go, make, day, customer, smart |
| 6 | Payment Information | payment, information, transaction, show, well, operation, give, support, wrong, save |
| 7 | App Performance | bad, update, version, take, really, crash, long, month, step, screen |

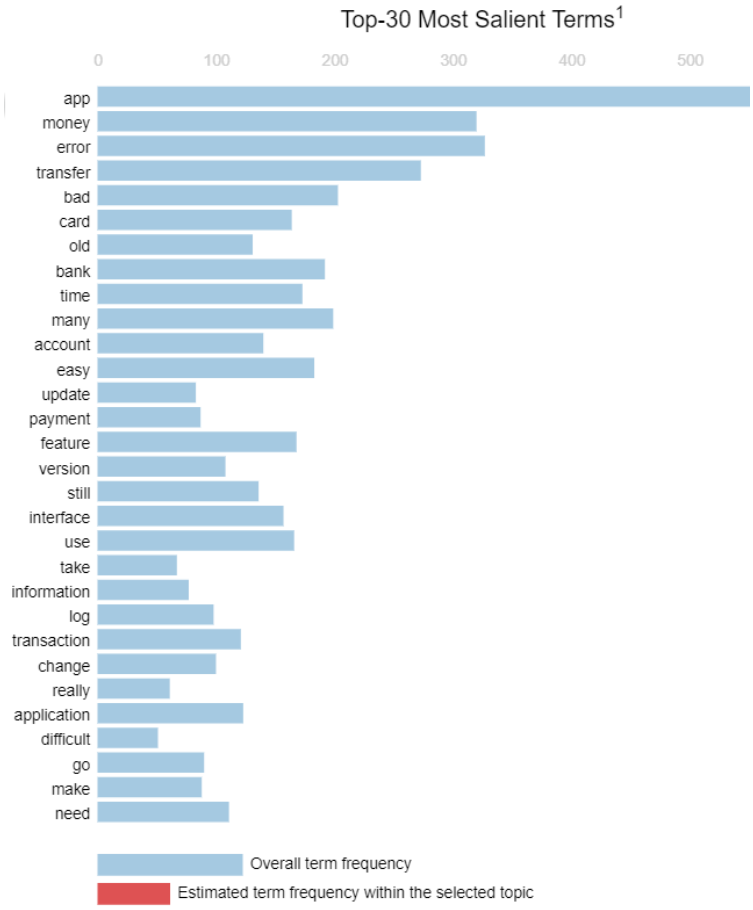

**Fig 2. 4 - Top 30 Most Salient Terms**
