In evaluating the LDA model, perplexity and coherence scores are employed to ensure the quality of topic extraction, aiding in the selection of the optimal number of topics and fine-tuning the LDA model for robust performance (Baimakhanbetov, 2023; Kim et al., 2023; Rosales et al., 2023). Perplexity assesses the model's ability to predict words in a document, with lower scores indicating better statistical fit. Coherence, on the other hand, evaluates the semantic similarity of top words within a topic, ensuring interpretability and relevance. As a result, a perplexity score of -0.660 indicates the models' strong capability to generalize and predict unseen data, while a coherence score of 0.514 reflects the semantic consistency of the identified topics. Besides, the top 30 most salient terms (Figure 2.4) further demonstrate the relevance of the extracted topics and this visual interpretation, along with further analysis, enables the study to group these topics into 3 overarching themes:

**Theme 1:** App Usability (Topics 1,3): This theme focuses on the user interface, app design, ease of navigation, and feature availability, suggesting user challenges related to app accessibility and navigation.

**Theme 2:** Technical Performance (Topics 5,7): This theme captures user frustrations related to app stability, and performance issues, highlighting the key drivers leading to user dissatisfaction.

**Theme 3:** Transaction Operations (Topics 2,4,6): This theme revolves around financial functionalities, including card management, money transfers, and payment processing issues, indicating user concerns regarding operational efficiency.

**Sentiment Analysis**

Sentiment analysis was conducted using fastText, an efficient text classification tool developed by Facebook AI Research Lab. Reviews were classified into five sentiment categories: very positive, positive, neutral, negative, and very negative. Its utilization of subword embeddings is particularly effective for handling out-of-vocabulary words and utilizing subword information makes it particularly adept at processing the diverse linguistic patterns found in user reviews (Lin et al., 2020). While this model delivers computational efficiency and effective classification, it exhibits limitations in handling contextually complex and linguistically nuanced UGC. Specifically, it sometimes struggles with

understanding sarcasm, mixed sentiments or indirect emotional tones. A phrase such as, for instance, “The app is functional, but not great” may be misclassified due to a lack of in-depth contextual understanding. As a result, BERT can offer a promising alternative for future research, in which its ability to process text bi-directionally makes it easy to capture the context of words more effectively than fastText, particularly adept at analyzing domain-specific language or idiomatic expressions in UGC (Gunduz, 2024). However, the potential benefits of BERT are also considered as it requires higher computational requirements and longer training times, making it unsuitable for the scope of the current study (Prottasha et al., 2022).

The fastText model is evaluated using confidence scores, which represents the model's estimated probability that a given input text belongs to a predicted label to indicate the level of certainty in its classification. A higher confidence score reflects greater certainty and reliability in classifying sentiments accurately (Table 2.3).

**Table 2. 3 - Example of Sentiment Predictions with Confidence Scores**

| Review Text | Predicted Sentiment | Confidence Score |
|---|---|---|
| I rarely rate an app, but now I'm taking a mom... | Positive | 0.568 |
| The app is so good, if there were 1000 stars, ... | Very Negative | 0.419 |
| MyVIB has a minimalist interface compared to o... | Positive | 0.615 |
| Good app that integrates many applications and... | Very Positive | 0.751 |
| The first impression is that the app is chosen... | Neutral | 0.477 |

## III. RESULT AND DISCUSSION

### 3.1 Experimental Results

**Table 3. 1 - Sentiment Classification Results with Confidence Scores**

| Prediction | Confidence Score |
|---|---|
| Negative | 0.589 |
| Neutral | 0.733 |
| Positive | 0.677 |
| Very Negative | 0.709 |
| Very Positive | 0.621 |
| Grand Total | 0.691 |

As can be seen from Table 3.1, the fastText model demonstrates strong performance in sentiment analysis, with an overall confidence score of 0.6910, indicating reliable classification across sentiment categories. It excels in identifying Neutral sentiment (0.7336) and Very Negative sentiment (0.7095), highlighting its effectiveness in capturing moderate and highly dissatisfied user feedback. These results validate the model's ability to effectively handle diverse emotions and underscore the potential benefits of employing a more advanced model, such as BERT, to capture the nuanced and context-dependent aspects of UGC. These results suggest a substantial portion of users remain indifferent or moderately dissatisfied, emphasizing the need for targeted improvements in app functionality and user engagement.

### 3.2. Discussion

The sentiment analysis reveals a significant prevalence of Neutral, Negative, and Very Negative sentiments, with an overall confidence score of 0.6909, indicating substantial user dissatisfaction with the app's functionality. Complementing these findings, topic modeling identifies critical themes such as App Usability, Technical Performance, and Transaction Operations, which align with sentiment trends and account for the majority of negative feedback (Topic 7: 50.74%; Topic 4: 16.97%; Topic 6: 13.88%). These themes underscore recurring frustrations related to app crashes, transaction delays, and inadequate error resolution, as demonstrated by user feedback patterns. The sentiment and topic analysis provide an integrated framework for interpreting user experiences, highlighting the urgent need for targeted interventions to address these issues and enhance customer satisfaction.

### 3.3. Managerial Implications

The study highlights the effectiveness of the fastText model in classifying UGC sentiments and effectively distinguishing five specific sentiment types, providing a more nuanced understanding of customer behaviors (Salur & Aydin, 2020). This granular sentiment analysis reveals recurring areas of dissatisfaction, including frustrations with app performance, transaction reliability, and technical handling. Topic modeling further enriches these findings by identifying seven key topics, with App Usability, Technical Performance, and Transaction Operations emerging as dominant themes. These themes underscore critical pain points, such as slow response times, failed transactions, and unresolved system bugs, providing actionable insights into specific user concerns (Marani & Baumer, 2023). The study offers a cohesive approach to understanding user dissatisfaction and guiding improvement strategies by integrating sentiment analysis and topic modeling. These findings emphasize the need for targeted interventions, such as optimizing app stability, enhancing customer support, and refining payment processing mechanisms, to address user concerns effectively.

## IV. CONCLUSION

This study presents a comprehensive approach to analyzing user feedback on mobile banking applications by leveraging fastText for sentiment classification and LDA for topic modeling. The findings reveal critical key drivers of dissatisfaction, particularly in app performance, transaction reliability, and error handling, while sentiment analysis underscores the predominance of negative and neutral sentiments in UGC. These results offer valuable insights into user experiences, highlighting the need for targeted improvements to enhance satisfaction.

However, the study is constrained by several limitations. The reliance on app store reviews may exclude perspectives from less vocal users, introducing potential selection bias. Additionally, while fastText performed effectively, cultural nuances and linguistic variability may still challenge sentiment accuracy in the Vietnamese context. The static nature of the LDA model further limits adaptability to evolving user feedback trends.

Future research should address these gaps by incorporating diverse data sources, such as social media feedback and in-app surveys, to comprehensively understand multiple customer touchpoints across various digital channels. This approach will ensure a more representative view of user experiences, reducing selection bias and capturing real-time user sentiment that can facilitate the decision-making process. Moreover, enhancing the sentiment model with advanced NLP techniques such as BERT model can significantly improve contextual understanding for sarcasm and mixed-sentiment expressions as BERT's transformer-based architecture allows for better comprehension of longer context and more nuanced reviews, leading to higher classification accuracy. There is also an essential need to adapt to evolving user concerns rather than relying on static LDA models by deploying dynamic topic models. A real-time topic clusters system can identify emerging trends in UGC, enabling banks to enhance decision-making efficiency and adjust strategies proactively. These advancements would enable deeper insights and more robust strategies for improving user satisfaction in mobile banking applications.

**ABSTRACT**

This study enhances the understanding of consumer animosity by addressing critical gaps in the existing literature. Unlike prior research that predominantly focuses on developed markets and relies on reflective measurement models, this study adopts an innovative formative approach to assess consumer animosity, incorporating pandemic-related animosity as a novel construct. Grounded in Social Identity Theory and Realistic Group Conflict Theory, the research examines Vietnamese consumers' perceptions of Chinese products using data from 827 respondents across Vietnam. The findings reveal that political, cultural, and pandemic-related animosities significantly influence consumer animosity, whereas war and economic animosities have diminished relevance in the contemporary Vietnamese context. Additionally, the study identifies the mediating role of product judgment, exposing a paradox where animosity simultaneously increases willingness to buy while negatively affecting product quality evaluations. This intricate dynamic highlights the evolving nature of consumer animosity and its implications for marketing strategies in developing markets. By focusing on Vietnam, a culturally unique and underexplored setting, this research provides valuable insights and contributes to the global discourse on consumer animosity and behavior.

*Keywords*: “formative animosity”, “pandemic animosity”, “product judgment”, “willingness to buy”.

## I. INTRODUCTION

In our increasingly globalized world, economic interdependencies and migration trends, several researchers are urged to explore different dimensions and the effects of consumer animosity on consumers' evaluations and willingness to purchase foreign products ((Farah & Mehdi, 2021; Farmaki, 2023; Nawaz et al., 2023) as understanding consumer behavior is crucial for crafting effective marketing strategies. Originally developed by Klein et al. (1998), and later extended by Kalliny et al. (2017) et al. (2017), the consumer animosity model comprises the following dimensions: war animosity, economic animosity, political animosity, and cultural and religious animosity. However, the Covid-19 pandemic has given rise to a new type of animosity (Carracedo et al., 2021; Nawaz et al., 2023). The animosity stemming from COVID-19 has led to significant geopolitical upheaval, reshaping international systems (Carracedo et al., 2021; Paul & Dhir, 2021; Sharma et al., 2020), thus accelerating de-globalization and de-regionalization while creating new trade and political alliances worldwide (Paul & Dhir, 2021). Consequently, pandemic-related animosity can be viewed as having an economic impact comparable to that of political, economic, wartime, and cultural animosities (Carracedo et al., 2021; Nawaz et al., 2023). However, limited research addresses and explores this emerging dimension: pandemic animosity, and incorporates this dimension into the animosity model of Klein et al. (1998).

Consumer animosity plays a crucial role in shaping digital market development and sustainable consumption practices, particularly in an era where e-commerce and global trade are increasingly intertwined (Garima et al., 2025). As digital platforms facilitate cross-border transactions, consumer animosity can influence purchasing decisions, brand perceptions, and online discourse, impacting market expansion and international business strategies. Moreover, in the context of sustainable consumption, animosity-driven boycotts or selective buying behavior may affect the adoption of environmentally responsible products, either reinforcing ethical consumption or limiting access to sustainable alternatives. Understanding these dynamics is essential for businesses and policymakers to navigate digital consumer behavior while promoting inclusive and sustainable market growth.

While measuring the animosity construct is essential for accurately assessing its behavioral impact on outcome

variables, the measurement models used by animosity researchers remain problematic (Diamantopoulos & Riefler, 2011; Hoffmann et al., 2011; Kalliny et al., 2017; Riefler & Diamantopoulos, 2007). Originally, Klein et al. (1998) created a measurement model with two constructs: war and economic animosities, plus a general animosity item. The model suggests that the second-order latent variable (animosity) influences first-order variables (war and economic animosities), which affect observable measures. Klein et al. (1998) describe this as a second-order reflective model. However, since animosity stems from specific historical events, the appropriateness of this model is questioned. This raises the possibility that a formative measurement model (Bollen & Lennox, 1991; Diamantopoulos & Riefler, 2011; Riefler & Diamantopoulos, 2007) may better fit the animosity definition. Klein et al. (1998) also proposed an alternative model that treats war and economic animosity as formative constructs affecting general animosity, though the observable measures remained reflective. According to several researchers (Kalliny et al., 2017; Riefler & Diamantopoulos, 2007), it's important to note that misspecification of measurement models can undermine reliability and validity assessments; high coefficient alphas do not guarantee a reflective model's suitability, so reliability estimates in animosity studies should be interpreted carefully. Additionally, misspecification can bias structural estimates between constructs (Riefler & Diamantopoulos, 2007), which is critical given the animosity construct's potential impact on outcomes like purchase intentions. As a result, several recent researchers (Diamantopoulos & Riefler, 2011; Kalliny et al., 2017; Riefler & Diamantopoulos, 2007) called for treating and using formative measures, and more research on investigating the effects of the (formative) animosity on purchase intentions.

The nature of situational animosity may vary among developed and developing countries, even among specific countries. Research has focused on developed nations, including the USA, Canada, Australia, Germany, New Zealand, and France (Amine, 2008; Bahaee & Pisani, 2009; Yu et al., 2020). Furthermore, animosity has increasingly attracted a few research attention of researchers in developing countries (Hoang et al., 2022). Furthermore, a growing body of literature explores how different dimensions of animosity and animosity influence consumer perceptions of foreign products in developed markets, research still remains scarce in developing markets.

The significance of this article is three fold. First, it enhances Klein et al. (1998) animosity model by incorporating the pandemic animosity construct and considering animosity as a formative construct. It investigates how consumer animosity influences judgment and willingness to purchase in the context of a developing country. Additionally, the present research sheds light on the consumer animosity literature and creates new opportunities for better understanding the application of animosity in Vietnam, a specific developing country.

## II. MATERIAL AND METHOD

### Consumer animosity

In the Country of Origin (COO) literature, the construct of "Consumer Animosity" is first examined by Klein et al. (1998). Animosity refers to the resentment individuals feel toward a foreign country (Klein et al., 1998) or the negative emotions associated with imported goods from that nation (Chaudhry et al., 2021). This consumer animosity model (Klein et al., 1998) encompasses measurements of war and economic animosity, as well as overall animosity toward a nation, and examines their effects on consumer willingness to purchase products from that country; consumer animosity serves as the primary focus of many COO studies.

Later, the comprehension of animosity is informed by research across diverse cultural, political, and demographic contexts, highlighting several distinct forms of animosity. Several researchers ((Farah & Mehdi, 2021; Kalliny et al., 2017; Yu et al., 2020) conducted a review of relevant literature and identified some types: war/military animosity which is characterized by hostile feelings arising from military actions between nations; economic animosity reflects sentiments of financial exploitation or dominance toward a country; political animosity which is stemming from conflicts at the national level driven by political ideologies or competition for resources; cultural animosity which is arising from aversion to a person or nation based on cultural disparities. Some other researchers categorize animosity into types (De Nisco et al., 2016; Fong et al., 2022). Situational animosity affects a specific moment, while stable animosity develops into a deeper, long-lasting aggression that accumulates over time. Cultural animosity is typically stable and challenging to eliminate or manage. In contrast, war, economic, and political animosities are often situational and can generally be resolved over time.

Pandemic-related animosity can be seen as having an economic impact similar to that of political, economic, wartime, and cultural conflicts. COVID-19 has significantly hindered companies' abilities to export products to various countries (Carracedo et al., 2021; Nawaz et al., 2023; Verschuur et al., 2021). COVID-19 sparked a wave of pandemic-related hate and dehumanization, particularly directed at immigrant communities of Chinese and East Asians globally (Hoang et al., 2022; Nawaz et al., 2023). These researchers also documented that the hostility stemming from the pandemic mirrors the consequences of war and economic strife, highlighting the need to understand its effects on foreign product purchasing intentions. However, little research incorporates pandemic animosity into animosity model, especially formative animosity measures and investigates the effects of these animosities on purchasing behaviour.

**The mediating role of product judgment**

Social Identity Theory (Tajfel & Turner, 1985) and Realistic Group Conflict Theory (Sherif, 1979) establish a foundational framework for understanding consumer animosity, directing this study's examination of its effects on product judgment and willingness to buy. These theories underpin the conceptualization of consumer animosity and are aligned with previous research findings (Cheah et al., 2016; Hoang et al., 2022). Social Identity Theory indicates that individuals who strongly identify with their own group are inclined to favor it over others. Research has demonstrated that variations in national identity and perceived threats can shape how people evaluate quality and their buying intentions, both positively and negatively (Cheah et al., 2016). Additionally, Realistic Group Conflict Theory posits that individuals who perceive they have lost something due to another group's gains may view that group as a threat, resulting in increased judgment against them. This bias can lead to negative stereotypes and prioritize loyalty to one's own group over objective quality judgment(Sherif and Sherif, 1979).

Consumer animosity, defined as a negative emotional response toward another country due to political, economic, or historical conflicts, has been shown to significantly impact product judgment, which refers to the overall assessment of a product's quality or attributes. Previous research supports the notion that animosity can skew consumers' perceptions of products from perceived adversaries (Huang et al., 2010). The "made in" effect (O'cass & McEwen, 2004) demonstrates how perceptions of a product's country of origin can significantly shape consumer attitudes, often exerting greater influence than the product's actual features.. For instance, studies by Hong and Wyer Jr (1989) found that a country's reputation can exert a greater influence on product judgment than the actual characteristics of the product. Moreover, research indicates that animosity can lead consumers to form negative evaluations of products from hostile nations, underscoring the critical role of emotional biases in product judgment, a perspective that Klein (2002) contests Shoham et al. (2006).

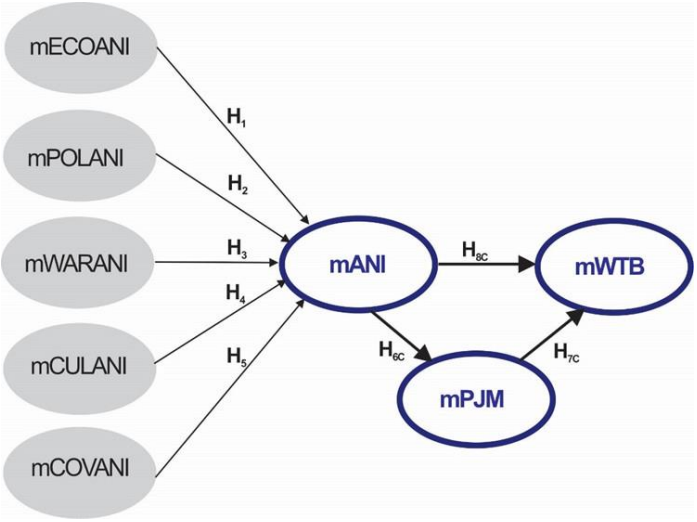

**Figure 5: The mediating role of product judgment in the relationship between consumer animosity and willingness to buy**

Animosity can significantly influence consumers' willingness to buy, which is defined as the likelihood or intent to purchase a product based on their perceptions of the product or its source. This animosity may prompt consumers to boycott goods from countries they dislike as a way to retaliate against perceived economic or political grievances and to protect their own economy from potential harm (Cui et al., 2012; Shoham et al., 2016). According to Cui et al. (2012),

animosity can negatively impact consumers' willingness to buy products from nations they view as hostile. Prior to this study, Papadopoulos et al. (1990) found that Japanese products ranked lowest on the “proud to own” question in the UK and France, largely due to animosity stemming from World War II. Additionally, consumer animosity can diminish the willingness to purchase imported goods, regardless of the product's jdgment (Klein et al., 1998). Shoham et al. (2006) noted that animosity affects both product judgment and purchase intention among Israeli consumers regarding Arab imports, highlighting the significant role of cultural symbolism in these dynamics.

Agreeing with the proposition that consumers who feel animosity towards a foreign country are likely to denigrate its products and refuse to purchase them, we advance the following three hypotheses:

H6c: Consumer animosity toward a country is likely to have a negative impact on their judgment of products from that country.

H7c: Consumers’ judgment of products from a country is likely to have a positive impact on their willingness to buy those products.

H8c: Consumer animosity toward a country is likely to have a negative impact on consumers’ willingness to buy products from that country.

**Method**

The study employed a mixed-method approach, integrating both qualitative and quantitative research methods to achieve a comprehensive understanding of the research objectives. This approach began with a qualitative phase, which informed the design of the subsequent quantitative survey. By combining these methodologies, the study leveraged the strengths of qualitative methods for exploratory insights and quantitative methods for statistical validation, ensuring robust and well-rounded results. First, a draft questionnaire was created, and then a semi-structured interview framework was developed based on the scale's components. Consumers were interviewed using this framework to identify themes and patterns, which informed the evaluation of the proposed questionnaire's suitability. The questionnaire was then revised accordingly. The quantitative phase involved a paper-based survey administered across various regions of Vietnam, from the North in Hanoi to the Central region in Quy Nhon, and the South in Ho Chi Minh City and Can Tho. The collected data were then analyzed using Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA), and Structural Equation Modeling (SEM) to test the hypotheses.

**Data collection**

The questionnaire, outlined in Table 1, was designed to ensure voluntary participation, confidentiality, and anonymity. To minimize common method variance (CMV), independent and dependent variables were separated (Podsakoff et al., 2003).

Definitions and measurements were adapted from established studies, with consumer animosity treated as a second-order construct comprising economic, war (Klein et al., 1998); political animosity (Witkowski, 2000); and cultural animosity (Kalliny et al., 2017);pandemic animosity Rojas-Méndez et al. (2022). Product judgment and willingness to buy followed Klein et al. (1998).Socio-demographic data (e.g., age, gender, education, income) were also collected, with questionnaires translated for semantic accuracy.

Table 1 summarizes demographic data from 827 participants: 45% male, 55% female, primarily from Ho Chi Minh and Ha Noi (25% each). The sample skews young (31% aged 18–27, 73% female), with 42% holding undergraduate degrees. Income data show 19% earn under 3 million VND, and many earn less than 10 million. These findings reveal demographic diversity and suggest a moderating role for product judgment in the link between consumer animosity and purchase willingness.

**Table 6: Sample characteristics (n=827)**

| | | **Gender** | | | | Total row | |
|---|---|---|---|---|---|---|---|
| | | **Male** | | **Female** | | | |
| | | n | Tỷ lệ % | n | Tỷ lệ % | n | Tỷ lệ % |
| City | Can Tho | 100 | 50% | 100 | 50% | 200 | 24% |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| | Ho Chi Minh | 84 | 42% | 123 | 62% | 207 | 25% |
| | Ha Noi | 91 | 46% | 120 | 60% | 211 | 26% |
| | Quy Nhon | 95 | 48% | 114 | 57% | 209 | 25% |
| Age | 18-27 | 110 | 55% | 145 | 73% | 255 | 31% |

| | 5-10 million | 83 | 42% | 110 | 55% | 193 | 23% |
| | 10-15 million | 83 | 42% | 96 | 48% | 179 | 22% |
| | 15-20 million | 36 | 18% | 39 | 20% | 75 | 9% |
| | >=20 million | 46 | 23% | 48 | 24% | 94 | 11% |
| **Total** | | **370** | **45%** | **457** | **55%** | **827** | **100%** |

**Data analysis**

The data was analyzed in several steps. First, exploratory factor analysis (EFA) was conducted for each unidimensional concept, using SPSS software. Next, the EFA of multidimensional constructs was performed to assess their discriminant validity. Following that, confirmatory factor analysis (CFA) was utilized for willingness to buy and the components of consumer animosity. Finally, a structural equation model (SEM) was tested. AMOS software was used for CFA and SEM testing.

Confirmatory factor analysis was conducted to verify the fit of the measurement model, as well as the reliability, convergent validity, and discriminant validity of the scales. This process consisted of three steps: (1) testing the measurement model for each individual concept, (2) testing the overall measurement models, and (3) testing the structural model of consumer animosity and its theoretical relationships.

The testing of the consumer animosity measurement model involves evaluating unidimensional measurement models, including components for consumer animosity, product judgment, and willingness to buy. The evaluation follows Hair, Black, Babin, and Anderson's (2019) standards, focusing on two main criteria: model fit and construct validity. Model fit is assessed through specific indices. For absolute fit, the normalized $\chi^2$ (CMIN/df) must be below 2.0, and RMSEA should be under 0.08. Incremental fit indices require both TLI and CFI to exceed 0.92. Construct validity includes additional checks. Unidimensionality ensures each observed variable relates to only one factor, eliminating variables linked to multiple factors, with zero error covariance required. Convergent validity is met if standardized loading coefficients are at least 0.5, with an average variance extracted (AVE) of 0.5 or higher and composite reliability (CR) of 0.6 or more. Once these criteria are met, the validated unidimensional components of the multidimensional concept of consumer animosity will be integrated into the measurement model. This model will then undergo confirmatory factor analysis (CFA) to reassess all relationships among the latent variables. Besides the previously mentioned model fit and conceptual value criteria, the study will also evaluate discriminant validity, ensuring that correlation coefficients between the components of consumer animosity differ from 1.0. Testing the Overall Measurement

Model

All components and unidimensional concepts are collectively tested within the overall measurement model, which illustrates all correlations among the latent variables. The model must meet the requirements for fit and conceptual

value as outlined in Step 1, and the correlation coefficients between the concepts must be significantly different from 1.0.

This step involves examining the structural model of consumer animosity and subsequently testing the relationships among consumer animosity (mANI), product judgment (mPJM), and willingness to buy (mWTB), as demonstrated in the theoretical model in Figure 1. These testing steps reaffirm the theoretical fit of the second-order causal structural model of the consumer animosity concept.

## III. RESULT

### Exploratory Factor Analysis – Assessing Discriminant Validity

#### Animosity

The results in Table 2 show that Cronbach's Alpha exceeds 0.7, corrected item-total correlation is above 0.3, Extraction Sums of Squared Loadings surpass 50%, and factor loadings are greater than 0.5. Thus, the measurement items for mECOANI are retained. For mPOLANI, political animosity is divided into two components: External Political Animosity (mPOLANI) with statements like "China asserts territorial claims aggressively" and "China poses a security threat," and Internal Political Animosity (mPOLANII) with statements such as "China mistreats its labor unions and workers" and "China is unfair to religions." As this study focuses on Vietnamese consumers' animosity toward China, the political animosity is analyzed as mPOLANI, comprising two items related to external political animosity. Measurement items for mWARANI (war animosity), mCULANI (cultural animosity), and mCOVANI (pandemic animosity) are also retained. Finally, mANI (consumer animosity) meets the required criteria.

**Table 7: Results of exploratory factor analysis**

| | mCULANI | mCOVANI | mWARANI | mECOANI<br>mPOLANI |
|---|---|---|---|---|
| China may harm Vietnam's economy. | | | | .727 |
| China has negative effects on Vietnam. | | | | .799 |
| China exploits Vietnam economically. | | | | .633 |
| China asserts territorial claims aggressively. | | | | .575 |
| China poses a security threat. | | | | .471 |
| China mistreats its labor unions and workers. | .427 | | | |
| China is unfair to religions. | .420 | | | |
| I cannot forget China's 1,000 years of rule. | | | .686 | |
| I am angry with China over conflicts with Vietnam. | | | .826 | |
| I cannot forgive China for its history of domination. | | | .789 | |
| I am outraged by China's invasions. | | | .736 | |
| I dislike the public behavior of Chinese people. | .483 | | | |
| I have issues with people from Chinese culture. | .880 | | | |
| I prefer not to associate with people from Chinese culture. | .886 | | | |
| Generally, people from Chinese culture are not good. | .836 | | | |
| China is deceptive about COVID-19. | | .772 | | |
| I cannot forgive China for COVID-19. | | .514 | | |
| COVID-19 makes me fearful of China. | | .677 | | |
| China should be responsible for COVID-19. | | .767 | | |
| China mishandled the pandemic. | | .777 | | |
| China erred in the COVID-19 outbreak. | | .735 | | |
| **Cronbach's Alpha** | **.862** | **.845** | **.856** | **0.790**<br>**0.721** |

*Product judgment and willingness to buy*

Product judgment is categorized into two components: Quality Judgment, referred to as PJMQ (including the first seven items), and Design Judgment, referred to as PJMD (including the two last items Products from China have

aesthetic appeal, Products from China feature smart designs). Both structures will undergo testing through Confirmatory Factor Analysis (CFA) as unidimensional components of a second-order structure, denoted as mPJM, in a reflective format.

**Table 8: Factor analysis of product judgment**

| | PJMQ | PJMD |
|---|---|---|
| Products from China are produced carefully. | .760 | |
| Products from China are crafted intricately. | .530 | |
| Products from China are made with advanced technology. | .570 | |
| Products from China have high durability. | .851 | |
| Products from China are improving. | .604 | |
| Products from China do not pose health risks. | .666 | |
| Products from China are reliable. | .623 | |
| Products from China have aesthetic appeal. | | .743 |
| Products from China feature smart designs. | | .845 |
| **Cronbach's Alpha** | **.864** | **.751** |

The measurement items for willingness to buy will be retained, comprising four statements: I am open to buying products from China; I have a high probability of purchasing products from China; I will buy products from China when I need something; and I will sample products from China. The Cronbach's Alpha for these items is 0.842, indicating good reliability.

**The formative structure of consumer animosity and hypothesis testing**

Similar to the CFA evaluation, a structural model is considered to fit the market data well when the following criteria are met (Hair et al., 2019; Hair et al., 2020; Kline, 2023): the normed chi-square (CMIN/df) is less than 5.0, the RMSEA (Root Mean Square Error of Approximation) is below 0.08, the TLI (Tucker-Lewis Index) exceeds 0.92, and the CFI (Comparative Fit Index) is greater than 0.92.

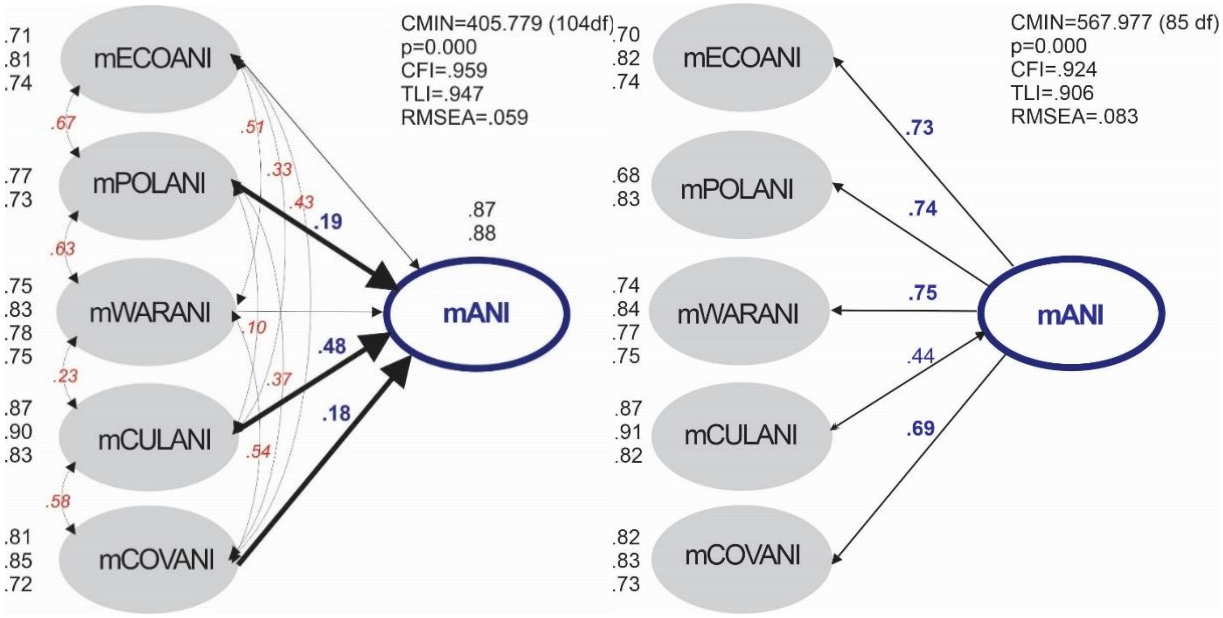

**Figure 6: (a) Formative structure and (b) Reflective structure of consumer animosity**

Figure 2 demonstrates that the formative model shows significantly better fit indices compared to the reflective model. Specifically, the CFI for the formative model is 0.950, which surpasses that of the reflective model (0.942). Similarly, the TLI for the formative model (0.947) is higher than that of the reflective model (0.906). In addition, the lower RMSEA in the formative model (0.059) suggests a better fit than the reflective model (0.083). Furthermore, the decrease in degrees of freedom without compensation indicates a significant difference in CMIN. As a result, the formative structure of consumer animosity has been selected, supporting both the theoretical and statistical validity of

this approach, thereby eliminating the need for reflective measurement of the construct.

Moreover, the results in Figure 2 (a) indicate that political, cultural, and pandemic factors contribute to Vietnamese consumer animosity toward China. However, war and economic factors do not appear to influence this animosity among Vietnamese consumers. Consequently, the next step is to investigate how consumer animosity significantly affects their willingness to buy Chinese-made products.

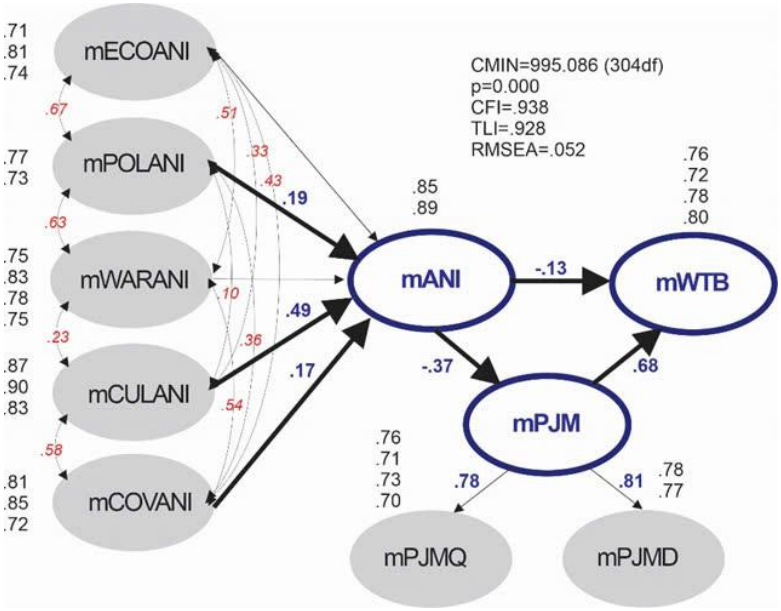

**Figure 7: Results of nomological validity and hypothesis testing**

Additionally, the results in Figure 3 confirm the nomological validity of the formative model of consumer animosity through product judgment and willingness to buy. The findings reveal that Vietnamese animosity toward China is influenced by various factors, including political, cultural, and pandemic-related elements, thereby confirming hypotheses H2, H4, and H5. This indicates that consumer animosity is dynamic, and shaped by contemporary events and cultural perceptions. In contrast, the lack of significant evidence for war and economic animosity suggests that these factors are less relevant in the present context, reflecting shifts in consumer sentiment.

Significantly, the findings show that product judgment mediates the relationship between consumer animosity and willingness to buy. While Vietnamese animosity toward China can enhance willingness to purchase Chinese products and positively impact product judgment, negative perceptions of product quality ultimately reduce purchase intent. This dual effect highlights the complexity of consumer behaviour, where emotional biases produce conflicting outcomes. These findings strongly support hypotheses H6c, H7c, and H8c, illustrating the intricate links between consumer animosity, product judgment, and purchasing decisions.

## IV. DISCUSSION AND CONCLUSION

This study enhances the existing literature on consumer animosity and product judgment by exploring the intricate interactions between these constructs, with a specific focus on how Vietnamese consumers perceive Chinese products. It underscores the significant impact of political, cultural, and pandemic-related factors in shaping consumer animosity, corroborating prior research that highlights the role of external influences on consumer sentiment. For example, studies by Cheah et al. (2016) and Hoang et al. (2022) emphasize that consumer animosity is a dynamic phenomenon, evolving with changes in geopolitical conditions and societal contexts. By addressing contemporary issues such as the COVID-19 pandemic (Nawaz et al., 2023), this research illuminates how major global events intensify or reshape consumer perceptions, adding layers of complexity to their purchasing behavior. These insights emphasize the necessity of understanding consumer animosity within a broader socio-political and cultural framework, as shifts in international relations, public health crises, and national sentiments profoundly influence consumer attitudes and behavior toward foreign products. Such understanding is crucial for businesses navigating markets affected by heightened animosity, as it highlights the need for adaptive, context-specific marketing strategies.

The study's findings that product judgment mediates the relationship between consumer animosity and willingness

to buy align with existing literature on consumer decision-making processes. Research by Shoham et al. (2006) and Shoham and Gavish (2016) suggests that negative emotions toward a country can bias evaluations of its products. This study reinforces those findings, demonstrating that animosity not only reduces willingness to buy but also contributes to negative product judgments, adding complexity to purchasing decisions. These results challenge earlier works by Klein et al. (1998) and Klein (2002), which did not account for the mediating role of product judgment. By reaffirming this mediation effect, the study provides a nuanced understanding of how consumer animosity influences buying behavior.

The findings also align with Huang et al. (2010), who highlighted that consumer animosity distorts product evaluations. The dual impact of animosity—where it can both deter purchasing while negatively influencing product perceptions—illustrates the interplay of emotional biases in consumer behavior. This complexity underscores the need for marketers to address both the emotional and rational dimensions of consumer decision-making to create more effective strategies.

Crucially, this study addresses gaps in the literature regarding the measurement of animosity by adopting a formative perspective. The findings demonstrate that a formative measurement model more accurately captures the multifaceted and context-dependent nature of animosity, particularly in the Vietnamese context regarding Chinese products. This supports arguments made by Diamantopoulos and Riefler (2011) and Riefler and Diamantopoulos (2007) that reflective models fail to account for the complexities of constructs like animosity. Additionally, the research corroborates concerns raised by Kalliny et al. (2017) and Riefler and Diamantopoulos (2007) regarding model misspecification, asserting that formative constructs provide a more robust framework for assessing animosity's impact on key outcomes such as purchase intentions. By validating the formative approach, the study addresses a call for more suitable measurement methodologies (Bollen & Lennox, 1991; Riefler & Diamantopoulos, 2007) and contributes empirical evidence that strengthens the theoretical and practical application of formative models in animosity research. This advancement ensures greater reliability and validity, minimizing biases in structural estimates while offering clearer insights into the behavioral implications of animosity.

The findings of this study offer valuable insights for marketers seeking to navigate consumer animosity in the digital era. Given that political, cultural, and pandemic-related animosities significantly shape consumer perceptions, businesses can leverage digital platforms to foster positive engagement and reshape brand narratives. Social media, influencer marketing, and data-driven personalization provide opportunities to address animosity-driven biases by highlighting quality, ethical sourcing, and cultural sensitivity. Additionally, e-commerce platforms can implement AI-driven recommendation systems to counteract negative biases by promoting product attributes over country-of-origin perceptions Tilahun et al. (2023). Interactive content, such as live-streaming, virtual product trials, and localized digital campaigns, can further enhance consumer trust and encourage purchase intent. By strategically using technology, companies can mitigate animosity-driven hesitations and create more favorable brand associations in competitive markets like Vietnam.

This study also identifies several areas for future research. Longitudinal studies are crucial for understanding how consumer animosity evolves in response to geopolitical, cultural, and pandemic-related changes, offering insights into its long-term impact on purchasing behaviors. Cross-cultural studies could deepen understanding of how regional and cultural factors influence consumer animosity, enabling the development of globally applicable theories. Additionally, investigating the psychological mechanisms that connect animosity, product perceptions, and purchase intentions could illuminate why negative sentiments sometimes coincide with positive buying behaviors.

The refinement of measurement models for animosity, including the exploration of formative frameworks, remains an important area of study to ensure robust and reliable constructs. Moreover, future research should assess the long-term effectiveness of targeted marketing strategies, such as age-specific or culturally sensitive campaigns, in reducing animosity and promoting brand engagement. These efforts will provide actionable insights for marketers and enrich the academic discourse on consumer behavior in an increasingly interconnected and dynamic global marketplace.

In conclusion, addressing consumer animosity requires a multi-faceted and deeply informed approach. By leveraging demographic insights, promoting cultural sensitivity, and maintaining adaptability through feedback, marketers can build meaningful connections with their target audiences. Future research will be instrumental in refining

these strategies, offering a more profound understanding of consumer animosity's dynamics and paving the way for more effective marketing practices in an evolving global context.

# A BIBLIOMETRIC ANALYSIS OF "DROP THE C" IN LOGISTICS: TOWARD SUSTAINABILITY IN SUPPLY CHAINS

**Bui Thi To Loan[1], Nguyen Huynh Thanh Dung[2]**

[1]Faculty of Commerce- University of Finance and Marketing

[2]APAC Supply chain Heineken Viet Nam

*Corresponding: builoan@ufm.edu.vn

**ABSTRACT**

The global logistics sector is undergoing a significant transformation to meet sustainability goals and reduce carbon emissions, often referred to as "Drop the C" in logistics. This study employs bibliometric analysis to examine scientific literature related to sustainable logistics, supply chain management, emission control, and emerging technologies. Using employing bibliometric tools in R, we analyze research trends, thematic clusters, and geographical contributions. The findings highlight a surge in green logistics research, driven by global environmental policies like Net Zero 2050. Key themes include sustainable development, decision-making, emission control, and alternative energy solutions. However, the study also identifies gaps, particularly in the limited adoption of advanced technologies (IoT, Blockchain) in developing economies; ineffective application of industry 4.0 technologies; low awareness of engagement among logistics service providers (LSPs). This research provides actionable insights for scholars and practitioners seeking to align logistics operations with sustainability objectives

*Key words:* “drop the C”, “green Logistics”, “net zero”, “sustainability supply chain”

## I. INTRODUCTION

Vietnam has demonstrated strong environmental commitments in recent years, including strict adherence to sustainability standards such as CO2 emissions reduction, green energy consumption, water conservation, and waste treatment. Policies issued by government like Decree 06/2022/ND-CP, which mandates establishments emitting over 3,000 tons of CO2 per year or consuming 1,000 tons of oil annually to report emissions, highlight the country’s pledge toward achieving Net Zero 205 (Dou et al., 2024) (Bell, Spinler, Winkenbach, & Müller, 2023). Despite these advancements in industrial sustainability, Vietnam's logistics sector behind, primarily relying on outdated diesel-powered trucks for road transport, the country's main mode of transportation. Other lower-emission modes, such as trains and vessels, remain underutilized for domestic logistics, despite Vietnam’s geographical advantages as a seafront country.

Globally, the concept of "Drop the C in Logistics" has gained momentum, emphasizing carbon reduction through innovative technologies, alternative fuels, efficient transportation methods, and collaborative supply chain management(Mao, Zhang, & Liu, 2024), (Zamboni, Scamardella, Gualeni, & Canepa, 2024). This study aims to explore the current state of research in sustainable logistics, identify critical gaps, and propose future directions to align Vietnam’s logistics operations with global sustainability trends.

Specifically, this research focuses on examining research trends in green logistics and carbon reduction; dentifying gaps in scaling green logistics in developing countries.

The organization of this paper is as follows: Part 1 serves as the introduction. Part 2 details the bibliometric methods and data used in the analysis. Part 3 presents a brief review of the literature on dropping the 'C' in logistics, summarizing previous findings to contextualize the results of the current study. It also presents the outcomes of citation-based bibliometric analysis, highlighting general trends and identifying key sources, documents, authors, and countries. Furthermore, it offers a thematic analysis of the research area surrounding the concept of dropping the C in logistics, exploring the evolution of research themes. Additionally, it discusses the study's findings and suggests potential trends for future research. Finally, Part 4 concludes the paper by emphasizing its contributions and addressing the study's limitations.

## II. MATERIAL AND METHODOLOGY

In this study, the author utilized the framework established by Tranfield, Denyer, and Smart (2003), which includes

three phases: planning, processing, and reporting. The initial phase involves selecting the database and researching keywords. To achieve the research goals, the author presents the process as follows:

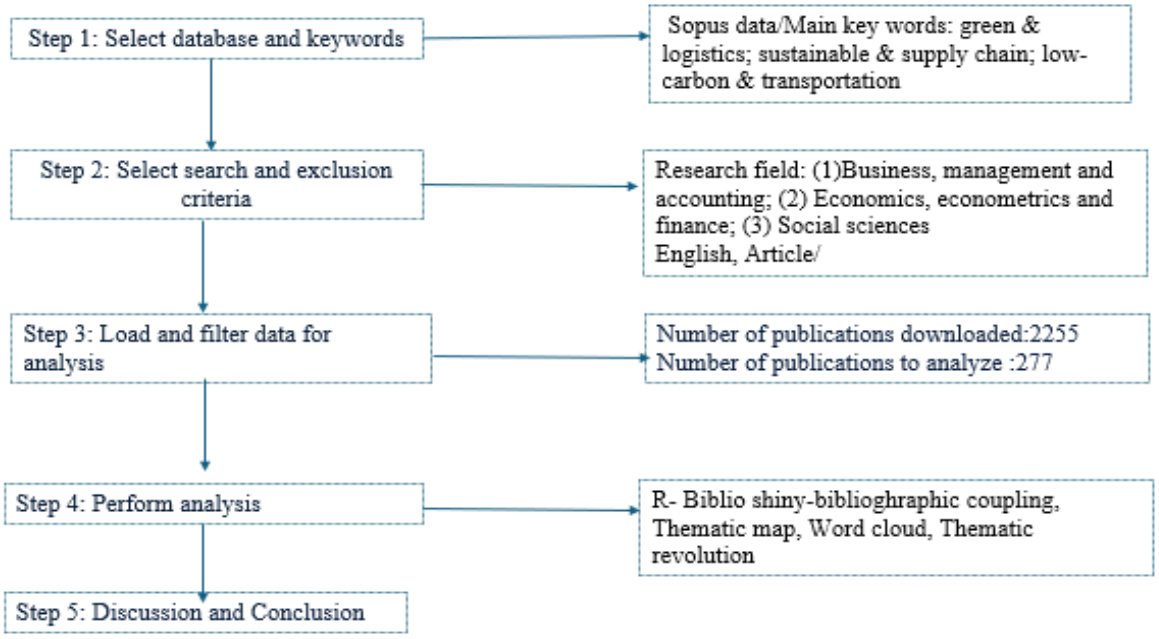

**Figure 1: Analysis process**

*Source: Author design*

To perform the bibliometric analysis, data were collected from two major academic databases Scopus, which are widely recognized for their comprehensive indexing of peer-reviewed literature. The time frame for data collection was set from 2006 to 2024, reflecting a period of heightened global focus on sustainability and logistics innovation, especially after milestones like the Paris Agreement in 2015. The search strategy was developed to capture relevant publications within the field of sustainable logistics and its associated themes. The following query was constructed to ensure a comprehensive yet targeted search: "ALL (drop AND the AND C) AND ALL (green AND logistics) AND TITLE-ABS-KEY (sustainable AND supply AND chain) OR ALL (low-carbon AND transportation) ) AND ( LIMIT-TO ( DOCTYPE , "or" ) ) AND ( LIMIT-TO ( LANGUAGE , "English" ).

**2.1. Data Analysis**

The collected bibliographic data were analyzed through a structured bibliometric approach to provide a detailed understanding of the research landscape in sustainable logistics. The analysis was divided into three key dimensions: Descriptive Analysis, Co-citation Analysis, and Thematic Mapping, enabling a comprehensive examination of publication trends, scholarly networks, and thematic developments over time.

The bibliometric analysis, conducted on research publications related to "Drop the C" in logistics, provided a detailed snapshot of scholarly contributions over a timespan from 2006 to 2025. The dataset contains 277 documents sourced from 169 unique outlets, showcasing a steady annual growth rate of 13.45%, reflecting increasing attention to sustainable logistics and carbon reduction. This consistent increase highlights a growing interest among researchers in sustainable logistics and carbon reduction, suggesting that these topics are becoming increasingly relevant in both academic and practical contexts. Such heightened focus can lead to the development of more innovative solutions and practices in the field. As more researchers contribute, the body of knowledge expands, facilitating a better understanding of the complexities and challenges associated with sustainable logistics. From that point, it is crucial for policymakers and industry practitioners to adopt more sustainable practices. Research findings can inform regulations and guidelines that promote carbon reduction efforts, leading to tangible environmental benefits. A total of 946 authors contributed to the research, with an average of 3.83 co-authors per document and an international co-authorship rate of 34.66%, indicating strong global collaboration in the field. A notable international co-authorship rate signifies that researchers from different countries and institutions are collaborating on projects. This collaborative approach fosters the exchange of diverse perspectives and expertise, which is crucial for tackling complex global challenges such as

sustainability in logistics. International collaborations often result in higher visibility for research findings, as they reach broader audiences across different regions and disciplines. This can enhance the impact of the research and encourage further studies in the area. Interestingly, only 16 single-author publications were recorded, emphasizing the collaborative nature of research in this domain. (Lin, Choy, Ho, Chung, & Lam, 2014);(Ghalehkhondabi, Maihami, Ahmadi, & Fallahtafti, 2024).

**Figure 2: Data sheet**

*Source: Authors collect data in R software*

– Top Contributors

Wang Y is the leading contributor with 6 documents, followed by Liu Y, Szklo A, and others, each contributing 4 documents. These authors predominantly address renewable energy systems, green logistics optimization, and emission control in transportation networks, as evidenced by their publication records.

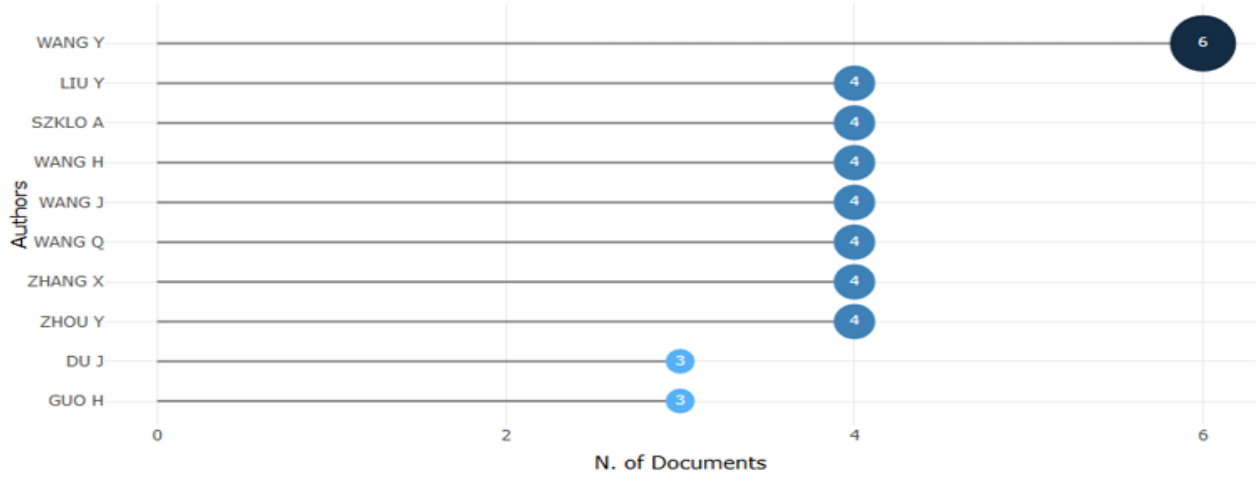

**Figure 3: Top authors**

*Source: Authors collect data in R software*

– Impact sources:

The documents amassed 22,134 references, with an average citation of 23.68 per document, highlighting the academic significance and relevance of the topic. The Journal of Cleaner Production and Sustainability (Switzerland) are the leading sources, each publishing 22 documents, underscoring their focus on environmental and sustainable topics (Jamali & Rasti-Barzoki, 2019); (Bell et al., 2023). Other prominent journals include Computers and Industrial Engineering (8 articles), International Journal of Production Research (5 articles). Renewable Energy and Energy (4 articles each); These journals reflect the interdisciplinary nature of the research, integrating sustainability, energy systems, and supply chain optimization.

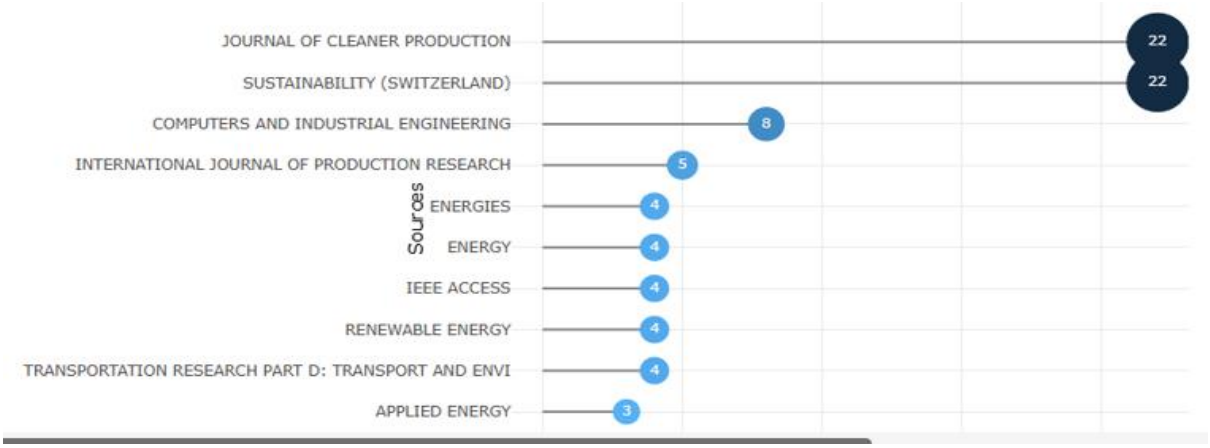

**Figure 4: The leading sources**

*Source: Authors collect data in R software*

### 2.2. Co-citation Analysis

This analysis explored the relationships between influential articles and authors, uncovering intellectual connections within the field of sustainable logistics. By examining co-cited articles, clusters of foundational and highly referenced works were identified, highlighting pivotal studies that have significantly shaped discussions on green logistics, low-carbon transportation, and circular supply chains. The results revealed a well-connected scholarly network with recurring themes, including emissions reduction, renewable energy adoption, and logistics optimization.

The co-citation networks pointed to foundational studies, such as those on sustainable fuels by (Al-Hamed & Dincer, 2021); (Verma et al., 2024); which advanced knowledge on renewable energy integration into logistics. Research on reverse logistics was also prominent, as exemplified by (Mukherjee, Sangal, Sarkar, Almaamari, & Alkadash, 2023);(Mao et al., 2024) emphasizing waste management and recycling practices. Additionally, works on emissions control and optimization models, including studies by (Kahalimoghadam, Thompson, & Rajabifard, 2024) ; (Wu, Xiao, Zhu, & Xiao, 2023) showcased the application of computational techniques to reduce carbon footprints and enhance logistics efficiency. These co-cited works form the backbone of scholarly contributions in the field, driving innovations and practical solutions in sustainable logistics.

### 2.3. Thematic Mapping

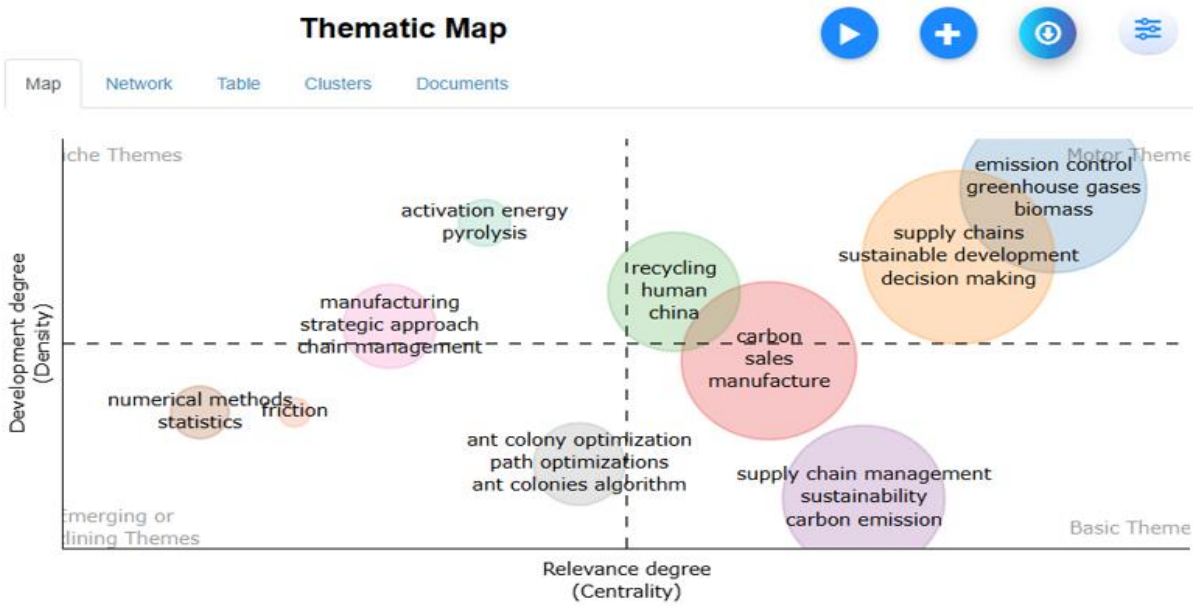

**Figure 5: The thematic Map**

*Source: Authors collect data in R software*

Thematic mapping was conducted to identify the evolution of research themes and emerging trends over time.

Using keyword co-occurrence and thematic clusters, primary themes were identified:

Sustainable Development – focusing on renewable energy and emissions reduction.

Supply Chain Management – emphasizing circular economy and green vehicle routing.

Decision-Making – integrating AI and multi-objective optimization in logistics.

Emission Control – exploring carbon pricing and alternative fuels like hydrogen and ammonia.

Recycling and Reverse Logistics – optimizing waste management systems.

Industry 4.0 – leveraging smart logistics, IoT, and blockchain technologies.

The thematic mapping not only revealed shifts in research priorities but also highlighted gaps, such as the limited focus on applying green logistics in developing economies and the scalability of new technologies. This comprehensive analysis lays the groundwork for understanding the current state of research and identifying avenues for future exploration in sustainable logistics.(Zhang et al., 2024)

The word cloud provides a visual representation of the dominant themes and key areas of focus in research related to sustainable logistics and "Drop the C" initiatives. The size and prominence of terms reflect their frequency and importance within the scholarly literature, offering valuable insights into current trends and priorities in this field.

**Figure 6: Word cloud**

*Source: Authors collect data in R software*

## III. RESULT AND DISCUSSION

### Dominant Themes

The most frequently occurring terms, such as Sustainable Development and Supply Chain Management, highlight the central role of sustainability in logistics practices (Kahalimoghadam et al., 2024). Research in this domain emphasizes the transition toward environmentally friendly supply chains, focusing on reducing greenhouse gas emissions, optimizing energy use, and adopting sustainable technologies. The integration of sustainable practices in supply chain management is seen as critical for achieving global targets like Net Zero 2050.

Another key term, Life Cycle Assessment, underscores the importance of evaluating the environmental impacts of logistics operations throughout their entire lifecycle, from resource extraction to product disposal. This approach ensures that all stages of the logistics process contribute to minimizing carbon emissions and energy consumption (Liu et al., 2022; Zamboni et al., 2024).

### Supporting Themes

Supporting terms such as Circular Economy and Closed-loop Supply Chain point to the growing emphasis on recycling, reusing (Al-Hamed & Dincer, 2021), and waste reduction in logistics networks. These concepts align with reverse logistics practices, where materials are repurposed to create a circular flow of resources, minimizing waste and

environmental impact (Verma et al., 2024).

Terms like Renewable Energy, Biofuels, and Energy Efficiency reflect the sector's efforts to transition away from traditional fossil fuels. The focus on renewable energy sources and alternative fuels demonstrates the increasing priority of reducing carbon footprints in logistics operations (Tountas, Ozin, & Sain, 2024).

**Emerging Trends**

Several terms highlight evolving areas of interest in logistics research:

Game Theory: Indicates studies exploring strategic decision-making and collaboration among supply chain stakeholders, particularly in reducing carbon emissions and improving efficiency (Ghalehkhondabi et al., 2024).

Blockchain Production and Information Sharing: These terms emphasize the role of digital technologies in enhancing transparency, traceability, and efficiency in logistics operations (Bell et al., 2023)

COVID-19: Highlights the temporary but significant impact of the pandemic on logistics systems, including disruptions to supply chains and the push for more resilient and sustainable logistics practices. (Lin et al., 2014);(Mukherjee et al., 2023)

The word cloud reveals that research in "Drop the C" in logistics is multifaceted, addressing global challenges like climate change and sustainability through diverse approaches. While dominant themes focus on sustainable development and supply chain optimization, emerging trends like blockchain and pandemic resilience indicate the dynamic evolution of this field. Future research must continue to explore innovative solutions, such as digital technologies and renewable energy systems, to drive the transition toward green logistics and achieve global sustainability goals.

**Niche Areas**

Specialized topics, such as Sustainable Aviation Fuel, reflect research into decarbonizing specific sectors like aviation. Meanwhile, terms like Location-routing Problem and Optimization suggest the application of advanced mathematical models and algorithms to design more efficient and environmentally friendly logistics systems.

This analysis provides a foundation for further exploration into these themes, ensuring alignment with both academic priorities and practical applications in the logistics industry

The thematic map illustrates the evolution of key research themes in logistics and sustainable supply chains over three distinct time periods: 2006–2018, 2019–2023, and 2024–2025. It highlights how research topics have developed, shifted, and expanded in focus over time.

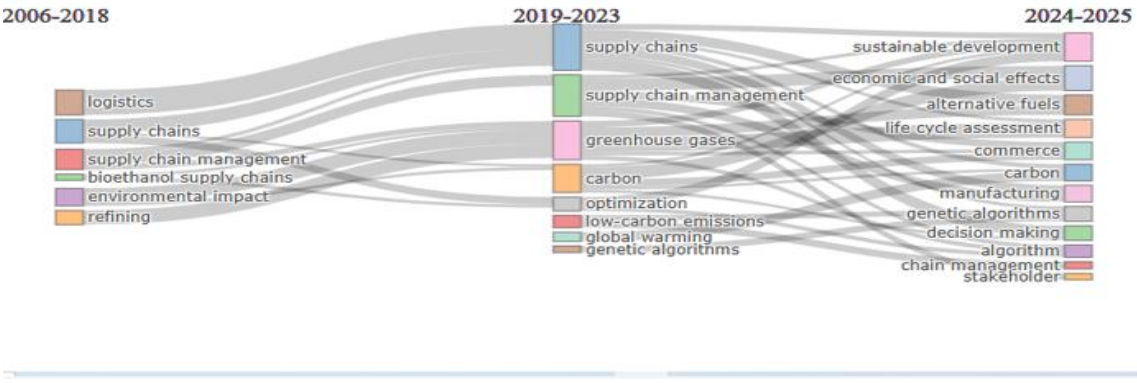

**Figure 7: Thematic revolution**

*Source: Authors collect data in R software*

During the period from 2006 to 2018, research in logistics and supply chain management primarily focused on foundational topics that laid the groundwork for future advancements in sustainability. Central themes such as Logistics and Supply Chains dominated the discourse, emphasizing improvements in traditional operational processes and the optimization of supply chain efficiency. Alongside these core areas, emerging topics began to gain traction, reflecting a growing interest in renewable energy and environmental sustainability. For instance, studies on Bioethanol Supply

Chains and Refining highlighted the early exploration of renewable energy sources within logistics, while the focus on Environmental Impact demonstrated an increasing awareness of the sector's role in contributing to climate change. This period was pivotal in establishing the conceptual and practical framework for integrating sustainability into logistics and supply chains, setting the stage for deeper investigations into biofuels and other environmentally conscious practices in subsequent years.

Between 2019 and 2023, research in logistics and supply chain management expanded significantly, shifting from foundational concepts to addressing urgent global challenges. Central themes such as Supply Chain Management and Supply Chains remained pivotal, but the focus broadened to include critical issues like Greenhouse Gases and Carbon emissions, reflecting a heightened emphasis on sustainability and climate action. Emerging areas of interest included Optimization, which showed the use of advanced mathematical and computational models to improve efficiency, and Low-carbon Emissions, highlighting the adoption of strategies to minimize the carbon footprint of logistics operations. Topics such as Global Warming emphasized the urgency of mitigating the sector's environmental impacts, while the incorporation of Genetic Algorithms demonstrated the application of innovative technologies to solve complex problems in logistics and supply chain systems. This period marked a transformative phase where sustainability became operationalized, integrating cutting-edge technologies and emissions reduction strategies to address global environmental concerns.

**Period: 2024–2025**

The period from 2024 to 2025 represents a forward-looking phase in logistics and supply chain research, with an emphasis on integrating sustainability across all dimensions of the field. Sustainable Development emerged as the dominant theme, reflecting the alignment of logistics practices with global environmental and economic goals, such as Net Zero 2050. Key topics during this period included Economic and Social Effects, which explored the broader impacts of sustainable logistics on society and economies, and Alternative Fuels, emphasizing the transition to renewable energy sources like hydrogen and biofuels. Life Cycle Assessment gained prominence as a tool to evaluate the environmental impacts of supply chain activities holistically, while topics such as Decision-Making and Stakeholders reflected the increasing complexity of collaborative efforts in achieving sustainability goals. Furthermore, themes like Manufacturing and Chain Management illustrated the integration of sustainable practices within production and supply chains, while advancements in Algorithms and Genetic Algorithms showcased the continued reliance on computational tools for solving complex challenges. This period represents a holistic and multidisciplinary approach to logistics and supply chain management, addressing environmental, social, and economic dimensions in a coordinated effort to achieve global sustainability targets

Each phase demonstrates a progressive evolution in research, transitioning from foundational studies to the integration of advanced technologies and multidimensional sustainability goals. This trend underscores the growing complexity and importance of logistics and supply chain management in the global push for sustainable development. Despite significant advancements in sustainable logistics research and practices, several gaps remain that hinder the effective implementation of emerging technologies for emission control. These gaps primarily revolve around technology adoption, effectiveness of emission control measures, and awareness among LSPs.

– Limited adoption of new technologies in emission control

While advanced technologies such as IoT, blockchain, and artificial intelligence have been widely discussed in the context of logistics, their actual implementation, particularly in emission monitoring and control, remains inadequate. Many logistics networks still rely on conventional methods for tracking emissions, which are less accurate and often fail to provide actionable insights in real-time. According to Verma et al. (2024), this technological lag is more pronounced in developing economies where the infrastructure for implementing Industry 4.0 technologies is either underdeveloped or prohibitively expensive.(Li, Tian, Li, Wu, & Liu, 2023). Furthermore, Ghalehkhondabi et al. (2024) highlight those tools such as game theory, which are crucial for fostering collaboration among stakeholders to optimize emissions, have seen limited practical application. This reflects a broader issue in translating theoretical frameworks into operational strategies. Certain technologies such as IoT, blockchain, and artificial intelligence are experiencing low adoption rates in logistics, particularly for emission monitoring and control, due to several interconnected factors. Firstly, in

developing economies, the necessary infrastructure for implementing Industry 4.0 technologies is often underdeveloped or prohibitively expensive Vial, G. (2019), (Verma et al., 2024). Additionally, the high costs associated with deploying these advanced technologies present significant barriers, especially for small and medium-sized enterprises that may lack the financial resources needed (Mathauer, M., & Hofmann, E. 2019). Furthermore, there is a notable lack of knowledge and skills within organizations, as many personnel are not adequately trained to implement these technologies effectively. Compounding these issues are challenges related to system interoperability, as technologies like blockchain and IoT require integration across multiple platforms, which can hinder their effective application. To address these challenges, it is essential to promote investments in IT infrastructure and provide financial support programs for smaller enterprises. Moreover, organizing training sessions can enhance employee skills and awareness regarding new technologies. Finally, encouraging research on integrating these technologies into existing processes, along with utilizing tools like game theory to foster collaboration among stakeholders, can optimize emissions and improve overall efficiency (Verhoef et al. 2021), (Ghalehkhondabi et al., 2024) (). To address the challenges associated with the low adoption rates of advanced technologies in logistics, several proposed solutions can be implemented. First, governments and organizations should promote investments in IT infrastructure to facilitate the deployment of new technologies. This infrastructure investment is crucial for enabling effective integration and utilization of systems like IoT and blockchain. Additionally, providing low-interest loans or financial assistance to small and medium enterprises can alleviate financial burdens and stimulate innovation, making it easier for these businesses to adopt advanced solutions. Furthermore, organizing training sessions and workshops can significantly enhance employee awareness and skills regarding these new technologies, ensuring that personnel are equipped to implement them effectively. Lastly, encouraging research on integrating these technologies into existing processes can lead to more practical applications, while tools like game theory can foster collaboration among stakeholders to optimize emissions (Ghalehkhondabi et al., 2024). Together, these solutions create a comprehensive approach to overcoming the barriers to technology adoption in logistics

- Low awareness and engagement among LSPs

Another critical gap is the lack of awareness and engagement among LSPs regarding the importance of emission control and sustainable practices. Many LSPs prioritize cost and time efficiency over environmental considerations. Tountas, Ozin, & Sain (2024) noted that while renewable energy and biofuel options are available, the adoption rates are low due to inadequate knowledge of their benefits and cost advantages in the long term. According to Mukherjee et al. (2023), the challenges faced during the COVID-19 pandemic further highlighted the need for resilient and sustainable logistics systems. However, this disruption also revealed that many LSPs lacked the readiness to integrate sustainable technologies into their operations effectively, even when the necessity was evident. While the necessity for sustainable practices became increasingly evident during this period, it was also revealed that many LSPs were unprepared to effectively integrate sustainable technologies into their operations (Cichosz, M., Wallenburg, C. M., & Knemeyer, A. M. 2017). This lack of readiness highlights a gap between recognizing the importance of sustainability and the actual implementation of sustainable solutions. As such, the pandemic served as both a catalyst for reevaluating logistics systems and a reminder of the challenges that remain in transitioning toward more sustainable practices. Addressing these challenges is crucial for building logistics systems that are not only resilient in the face of future disruptions but also aligned with sustainability goals.

- Ineffective application of industry 4.0 technologies

The limited use of Industry 4.0 technologies for real-time emission tracking and optimization is another major gap. While concepts like blockchain for transparency and IoT-enabled sensors for emission monitoring have been proposed (Bell et al., 2023), their practical deployment has been slow, particularly in regions where technological infrastructure is not robust. Liu et al. (2022) and Zamboni et al. (2024) suggest that a lack of standardized frameworks and regulations contributes to the inconsistent application of these technologies.

## V. CONCLUSION

The study underscores the critical role of sustainable logistics and supply chain management in achieving global environmental objectives such as Net Zero. Through bibliometric analysis, the research highlights the growing

prominence of green logistics, driven by the integration of renewable energy, circular economy principles, and advanced technologies such as AI, IoT, and blockchain. These findings reinforce the importance of interdisciplinary approaches and the adoption of innovative technologies to meet sustainability goals. However, the study also reveals several research gaps that warrant further exploration. For instance, there is a need to investigate the adoption of advanced technologies in developing economies, as well as the limited integration of Industry 4.0 technologies within existing logistics frameworks. Additionally, there is an opportunity to enhance awareness and understanding of new technologies among LSPs, which could facilitate more effective implementation. For researchers, this could involve proposing future studies focused on the barriers to technology adoption for emission reduction in various contexts. For practitioners, offering a detailed framework or checklist for implementing sustainable practices aimed at reducing emissions would greatly enhance the practicality of the research findings. Addressing these aspects will contribute to a more effective transition to sustainable logistics and supply chain management, ultimately leading to significant reductions in greenhouse gas emissions. Future research should focus on scaling these solutions, fostering cross-industry collaboration, and addressing region-specific challenges to ensure a comprehensive transition to sustainable logistics and supply chain management.

# CLOUD COMPUTING POWER TO REDUCE THE IMPACT OF LOGISTICS SUPPLY CHAIN ENVIRONMENT

**Nguyen Thanh Tam [1*]**

[1]Faculty of Economics - Management, Dong Nai Technology University, Bien Hoa City, Vietnam.
*Corresponding: nguyenthanhtam@dntu.edu.vn

**ABSTRACT**

In the context of globalization and the increasing pressure on sustainable development, this study examines the role of cloud computing in mitigating the environmental impact of logistics supply chains in Vietnam. Utilizing a structural equation model (SEM) and analyzing data from 465 survey samples, the study tested hypotheses regarding the relationship between cloud computing, GSCM, information transparency (IT), logistics operational efficiency (LOE), and reducing carbon emissions (RFC) The findings indicate that cloud computing not only exerts a direct impact but also operates through intermediary factors, such as GSCM and LOE, contributing to the reduction of carbon emissions and the enhancement of sustainable economic efficiency. LOE and GSCM are robust intermediaries, whereas IT plays a less significant supporting role. This study provides a scientific foundation and practical management implications that support logistics enterprises in the application of digital technology to achieve sustainable development goals and enhance competitiveness within the context of globalization.

*Keywords:* "Cloud computing", "Green supply chain", "Information transparency", "Logistics operational efficiency", "Sustainable development"

## I. INTRODUCTION

In the context of globalization and increasing pressure for sustainable development, the logistics industry plays a pivotal role in facilitating trade and interconnecting global supply chains. However, it is also one of the industries that generates substantial carbon emissions, consumes significant energy, and has adverse environmental impacts (McKinnon, 2014). With the emergence of environmental, social, and governance (ESG) standards, logistics enterprises face the imperative of mitigating their environmental impact and implementing sustainability initiatives to meet long-term development objectives (Sarkis et al., 2011). In this context, the transition to green and sustainable supply chains has become inevitable (Sbihi & Eglese, 2007). Digital Transformation (DT) plays a crucial role in providing tools such as the Internet of Things (IoT), artificial intelligence (AI), big data, and blockchain to optimize management and operations (Tan et al., 2020; Park et al., 2022).

Cloud computing has emerged as a transformative solution, providing an information management platform, optimizing operations, and supporting sustainability initiatives in logistics supply chains. Previous studies have confirmed that cloud computing not only enhances information transparency, but also supports green supply chain management (Tan et al. 2020). Applications such as Blockchain, IoT, and AI on this platform enable logistics enterprises to monitor and reduce their carbon footprints through transportation optimization and warehouse management (Zhu & Sarkis, 2004). Numerous studies have focused on the role of digital technology and cloud computing in sustainable supply chains. Iqbal et al. (2024) emphasized the application of digital technology in the green supply chain of the manufacturing industry, while McKinnon (2014) discussed the role of environmental sustainability in logistics management. Nureen et al. (2023) provide a novel perspective on digital transformation and ecological innovation, while Oubrahim et al. (2023) focus on the impact of supply chain integration and digital transformation in developing economies. Other studies such as those by Park et al. (2022), Song et al. (2022), and Tan et al. (2020) examined various aspects of green supply chains and logistics. However, most of these studies focus on the manufacturing sector or developed markets (Giannakis and Sarkis, 2004; Giannakis and Papadopoulos, 2016), while the logistics sector in emerging economies such as Vietnam has not been comprehensively explored.

Moreover, previous studies have primarily focused on the direct impact of digital technology without elucidating the mediating role of factors such as green supply chain management, formation transparency, and logistics operational efficiency in reducing carbon emissions. These factors can serve as significant intermediaries, enhancing the impact of

digital technology on sustainable economic efficiency (Tan et al. 2020; McKinnon 2014). The novel aspect of this study is its focus on evaluating the impact of cloud computing on green supply chains in the logistics sector of Vietnam, a developing country facing considerable pressure from international standards for sustainability and emission reduction. Through the application of a structural equation model (SEM), the study not only elucidates the direct impact of cloud computing but also investigates the mediating role of factors such as green supply chain management, information transparency, and logistics operational efficiency in reducing carbon emissions. The findings of this study not only provide a scientific foundation for logistics enterprises in Vietnam to develop strategies for implementing digital technology to achieve sustainable development goals but also contribute to enhancing the competitiveness of enterprises in the context of globalization.

## II. MATERIAL AND METHOD

### 2.1. Research hypothesis

#### 2.1.1. Green Supply Chain Management (GSCM)

According to Tan et al. (2020), the integration of cloud computing and blockchain technology has demonstrated efficacy in managing and monitoring carbon emissions in the supply chain, thereby contributing to the promotion of sustainable practices. Cloud computing not only provides a robust information management platform, but also supports the implementation of GSCM in the manufacturing and logistics sectors, expanding the potential for supply chain efficiency enhancement (Nureen et al., 2023). A salient feature of this technology is its capacity for real-time information sharing, which enhances transparency and improves coordination among stakeholders (Qiu et al., 2021). Blockchain, a key component of cloud computing, also facilitates traceability, enhances supply chain control, and promotes green initiatives (Giannakis and Papadopoulos, 2016). Furthermore, cloud computing has proven to be an essential tool for optimizing logistics processes and reducing delivery times, energy consumption, and operating costs. Through the utilization of solutions such as transportation management systems (TMS) and IoT technologies, cloud computing facilitates the optimization of transportation routes and smart warehouse management (Zhu & Sarkis, 2004; McKinnon, 2014). These improvements not only enhance operational efficiency, but also reduce energy consumption and carbon footprint (Tan et al., 2020). GSCM is defined as the integration of environmental factors into the stages of product design, procurement, production, distribution, and recycling with the objective of minimizing negative environmental impacts and optimizing economic efficiency (Srivastava, 2007; Sarkis et al., 2011). Studies indicate that GSCM, when combined with digital technologies such as blockchain and cloud computing, not only reduces emissions, but also enhances global logistics performance (McKinnon, 2014; Nureen et al., 2023). This study proposes three main hypotheses based on theoretical and empirical foundations:

**H1a: Cloud computing (CC) has a positive impact on Green Supply Chain Management (GSCM)**

**H1b: GSCM has a positive impact on reducing carbon emissions from logistics operations.**

**H1c: GSCM helps minimize the environmental impact of logistics activities**

#### 2.1.2. Transparency of information (IT)

IT is a fundamental factor in establishing trust, fostering collaboration, and enhancing operational efficiency among supply chain stakeholders. Giannakis and Papadopoulos (2016) asserted that information transparency facilitates data sharing, thereby improving coordination and supporting sustainability initiatives. In GSCM, information transparency enables parties to capture data on carbon emissions and operational activities, thereby contributing to the mitigation of environmental impacts. Cloud computing (CC) functions as a robust technology platform that facilitates the management and sharing of information in real-time. This technology not only supports efficient data storage and processing but also ensures traceability and reliability of information. According to Tan et al. (2020), the integration of blockchain technology with cloud computing platforms can enhance transparency by providing accurate and timely data on the origin and trajectory of products in the supply chain. Furthermore, Nureen et al. (2023) emphasize that information transparency, when supported by digital technologies such as cloud computing, can improve the efficiency of supply chain management, particularly in the field of logistics. McKinnon (2014) notes that information transparency not only assists logistics managers in tracking and reducing carbon emissions, but also optimizes operational processes, reduces energy costs, and enhances performance. Giannakis and Papadopoulos (2016) contended that transparency

allows stakeholders to evaluate operational efficiency, identify sources of waste, and implement innovative solutions, thereby reducing carbon emissions. Qiu et al. (2021) emphasized that information transparency promotes data sharing between logistics businesses and partners, facilitates the optimization of transportation routes, minimizes fuel consumption, and reduces greenhouse gas emissions. Through cloud computing technology, businesses can monitor and report their carbon emissions in real time and make decisions based on accurate and reliable data (Tan et al., 2020). Moreover, Sarkis et al. (2011) indicate that information transparency in green supply chain management not only improves environmental efficiency but also enhances economic efficiency, creating dual value. McKinnon (2014) further noted that the use of technologies such as blockchain and cloud computing facilitates the monitoring of emission indicators and the implementation of emission reduction strategies for logistics businesses. Based on the theoretical and empirical grounds, the following hypotheses are proposed:

**H2a: Cloud computing (CC) has a positive effect on Information Transparency (IT)**

**H2b: IT contributes to reducing logistics carbon emissions**

### 2.1.3. Logistics Operation Efficiency (LOE)

LOE is conceptualized as the capacity to optimize transportation activities, warehouse management, and the distribution of goods to reduce costs, conserve resources, and enhance productivity. In the contemporary context, the implementation of digital technology, particularly cloud computing, has emerged as a significant factor for improving logistics efficiency (Zhu & Sarkis, 2004). Cloud computing provides robust data analysis tools, optimizes shipping routes, and enables real-time tracking of goods. According to Tan et al. (2020), this technology not only reduces delivery time, but also enhances resource and fuel efficiency throughout the entire supply chain. Cloud-based integrated transportation management systems and IoT enable organizations to make expeditious decisions based on big data, thereby improving responsiveness and minimizing inefficiencies. Furthermore, Qiu et al. (2021) posited that the utilization of cloud computing in logistics facilitates route optimization and reduces transportation time and operating costs. In the warehousing domain, cloud-based solutions support the optimization of storage space, improvement of goods flow, and reduction of energy consumption (McKinnon, 2014). Through these applications, organizations not only enhance their competitiveness, but also adhere better to sustainable development standards. Logistics' operational efficiency also plays a crucial role in reducing carbon emissions (reduction of carbon footprint (RCF)). Measures such as route optimization, the utilization of environmentally friendly vehicles, and improved warehouse management collectively contribute to reducing greenhouse gas emissions. McKinnon (2014) emphasized that reducing transportation time and energy consumption are two critical factors in mitigating environmental impacts. Moreover, cloud computing provides real-time data, enabling organizations to identify waste sources and implement optimization solutions. According to Tan et al. (2020), the integration of blockchain technology into cloud computing not only facilitates the tracking of fuel consumption, but also significantly reduces carbon emissions in logistics. Qiu et al. (2021) further corroborated that cloud-based transportation management systems are highly effective in reducing emissions through resource optimization. Zhu and Sarkis (2004) add that initiatives such as smart warehouse management and sustainable distribution not only help to reduce environmental impacts but also improve economic performance. When logistics operations are optimized, carbon emissions are significantly reduced, contributing to the goal of sustainable development (Sarkis et al., 2011). Based on the theoretical and empirical grounds, the following hypotheses are proposed:

**H3a: Cloud computing (CC) has a positive impact on logistics operational efficiency (LOE)**

**H3b: The operational efficiency of logistics contributes to the reduction of carbon emissions**

### 2.1.4. Reducing of carbon Footprint

In the context of globalization and increasing pressure on sustainable development, reducing carbon emissions ($CO_2$) is not only an urgent requirement for the logistics industry, but also a factor that promotes operational efficiency. Carbon emissions are primarily generated by transportation, storage, and logistics management activities, causing negative impacts on the environment. Reducing emissions not only contributes to environmental protection but also improves operational efficiency through resource optimization and cost reduction. For example, Sarkis et al. (2011), GSCM not only focuses on reducing environmental impacts, but also improves operational efficiency through measures

such as route optimization, use of environmentally friendly vehicles, and operational process improvement. McKinnon (2014) emphasized that reducing carbon emissions can optimize energy consumption, reduce waste, and decrease costs, thereby improving operational efficiency in logistics. Evidence demonstrates that reducing emissions through transportation optimization not only yields economic benefits but also contributes to improving operational capacity. Tan et al. (2020) assert that the application of technologies such as blockchain and cloud computing supports the tracking and optimization of transportation, helps reduce fuel consumption and carbon emissions, and improves logistics efficiency. Zhu and Sarkis (2004) add that emission reduction solutions, particularly in warehousing, transportation, and distribution management, not only meet environmental standards but also optimize operations. Reducing carbon emissions from logistics yields three main benefits. First, reducing energy consumption helps optimize fuel costs and equipment maintenance (McKinnon, 2014). Second, businesses that reduce emissions often enhance their brand image and are highly regarded for their social responsibility, increasing trust among customers and partners (Nureen et al., 2023). Finally, through technologies such as the IoT and blockchain, operational management efficiency is significantly improved, helping to optimize logistics operations and minimize greenhouse gas emissions (Tan et al., 2020; Qiu et al., 2021). Based on the theoretical and empirical grounds, the following hypotheses are proposed:

**H4: Reduction of carbon footprint (RCF) has a positive impact on minimizing environmental impact**

### 2.1.5. Intermediary role

Cloud computing plays a significant role in supporting sustainable operations in the logistics supply chain, particularly through GSCM, information transparency, and improving logistics operational efficiency. These factors not only optimize operations, but also contribute to reducing carbon emissions by integrating advanced management processes, modern technology, and real-time information sharing. GSCM integrates environmentally friendly elements into the entire supply chain, including product design, procurement, production, and distribution (Sarkis et al., 2011). Cloud computing supports GSCM through tools such as data analysis, traceability, and operational process optimization. These initiatives not only RCF during transportation and storage but also enhance environmental efficiency (Zhu & Sarkis, 2004). Tan et al. (2020) emphasized that a cloud-based blockchain helps monitor and control carbon emissions in the supply chain, thereby improving operational efficiency. Information transparency is a core factor enabling supply chain stakeholders to make accurate data-driven decisions and coordinate more effectively (Giannakis & Papadopoulos, 2016). Cloud computing facilitates real-time information sharing, enhances traceability, and minimizes waste. McKinnon (2014) asserted that transparent information helps to optimize environmentally friendly transportation solutions, thereby significantly reducing carbon emissions. Tan et al. (2020) added that blockchain, combined with cloud computing, supports emission monitoring and enhances transparency in logistics operations. Cloud computing provides accurate data and modern management tools that help optimize transportation routes, reduce energy consumption, and reduce greenhouse gas emissions (Qiu et al., 2021).. Based on this theoretical and practical foundation, this study proposes the following hypothesis:

**H5: GSCM plays an intermediary role in the relationship between CC and RCF**

**H6: IT plays an intermediary role in the relationship between CC and the RCF**

**H7: LOE plays an intermediate role in the relationship between CC and RCF**

## 2.2. Proposed research model

Based on related hypotheses and theories, the author hypothesizes the following

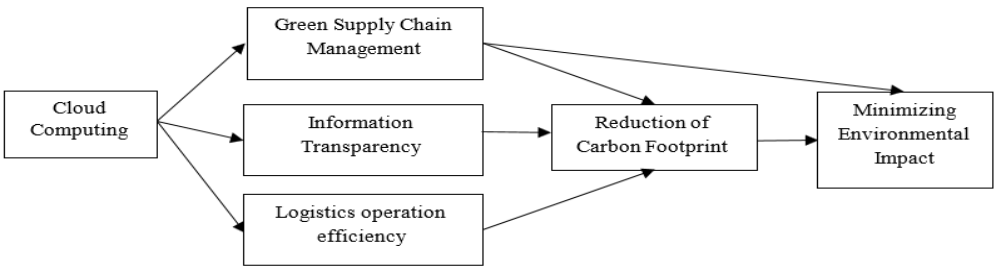

**Figure 1. Proposed research model**

### 2.3. Research methods

This study employs a quantitative approach to evaluate the impact of cloud computing, information transparency, and logistics operational efficiency on green supply chain management (GSCM) and the reduction of carbon emissions in the logistics sector. The methodology was implemented through data collection via surveys conducted between September and October 2024. The surveys were distributed to logistics enterprises, including transport companies, integrated logistics service providers, and warehouse storage units in key economic regions of Vietnam. A total of 465 valid samples were collected, ensuring high representation of the domestic logistics industry. The survey respondents comprised middle and senior managers, as well as employees directly involved in supply chain activities and digital technology applications. Each respondent provided an objective assessment of the level of cloud adoption, logistics operational efficiency, and sustainability initiatives within their respective organizations.

## III. RESULT AND DISCUSSION

### 3.1. Sample description results

A total of 600 questionnaires were distributed over a period of approximately two months, from early September to October 2024, at logistics enterprises across Vietnam, encompassing transport companies, warehouses, and integrated logistics service providers. The survey participants comprised middle and senior managers as well as employees directly responsible for supply chain management and the application of digital technology. Respondents were asked, "Have you ever participated in or directly managed activities related to the application of digital technology and green supply chain management?". Affirmative responses led to the continuation of the survey, whereas negative responses resulted in its termination. Participants' responses were subjective, focusing on assessing their awareness, experience, and level of understanding of the application of digital technology in logistics activities. The survey yielded 479 valid responses, corresponding to a response rate of 79.8% of the total number of surveys distributed. After eliminating cases that did not meet the requirements, such as incomplete responses or lack of information, the final number of responses was 465, accounting for 77.5% of the total number of questionnaires. This sample exceeded the minimum threshold of 200 participants, meeting the requirements to perform Structural Equation Modeling (SEM) analysis, as recommended by Hair et al. (2021).

### 3.2. Common Method Variance Bias Test (CMB)

The researcher analyzed the variance inflation factor (VIF) values as recommended by Kock (2015). The VIF values reported for the structures ranged from 1 to 1,526 (Table 1), substantially below the recommended threshold of 5, thus confirming the absence of common method bias (CMB).

**Table 1. Inner VIF Value**

| | CC | GSCN | IT | LOE | MEI | RCF |
|---|---|---|---|---|---|---|
| **CC** | | 1.000 | 1.000 | 1.000 | | |
| **GSCM** | | | | | 1.526 | 1.469 |
| **IT** | | | | | | 1.075 |
| **LOE** | | | | | | 1.437 |
| **MEI** | | | | | | |
| **RCF** | | | | | 1.526 | |

*Source: Extracted from PLS-SEM*

### 3.3. Results of scale assessment

A partial least squares structural equation (PLS-SEM) model was used to analyze the data. The factor load values (Table 2) were examined to assess convergence reliability. All factor load values exceeded the recommended threshold of 0.7 (Hair et al., 2019). Furthermore, the Cronbach Alpha values were both above the minimum threshold of 0.7 and below 0.95 (Hair et al., 2019), confirming the internal consistency reliability of the structures (Table 3). These findings indicate that the model demonstrates high reliability and can be applied in subsequent analyses.

**Table 2. The factor load values**

| Factor | Factor | Factor loading | VIF |
|---|---|---|---|

| | | | |
|---|---|---|---|
| **Cloud Computing = CC** | CC1 | 0.761 | 1.874 |
| | CC2 | 0.738 | 1.694 |
| | CC3 | 0.787 | 2.413 |
| | CC4 | 0.760 | 1.589 |
| | CC5 | 0.799 | 2.493 |
| **Logistics Operation Efficiency = LOE** | LOE1 | 0.808 | 1.684 |
| | LOE2 | 0.827 | 1.796 |
| | LOE3 | 0.782 | 1.650 |
| | LOE4 | 0.802 | 1.759 |
| **Green Supply Chain Management = GSCM** | GSCM1 | 0.848 | 1.457 |
| | GSCM2 | 0.733 | 1.338 |
| | GSCM3 | 0.799 | 1.381 |
| **Information Transparency = IT** | IT1 | 0.755 | 1.805 |
| | IT2 | 0.739 | 1.787 |
| | IT3 | 0.835 | 2.070 |
| | IT4 | 0.839 | 1.535 |
| **Reduction of Carbon Footprint (CO2): RCF** | RCF1 | 0.785 | 1.796 |
| | RCF2 | 0.813 | 1.957 |
| | RCF3 | 0.849 | 2.012 |
| | RCF4 | 0.829 | 1.825 |
| **Minimizing Environmental Impact = MEI** | MEI 1 | 0.816 | 1.553 |
| | MEI 2 | 0.843 | 1.799 |
| | MEI 3 | 0.863 | 1.756 |

*Source: Extracted from PLS-SEM*

The scale test table indicates that all loading factors exceeded 0.7, demonstrating a strong correlation between the observed variables and the latent variable. Cronbach's alpha and the composite reliability (CR) of the scales were all above 0.7, confirming high scale reliability. The median extracted variance (AVE) all surpassed the threshold of 0.5, suggesting good convergence of the scales and reflecting the robust interpretation of potential variables. In summary, the results of the confirmatory factor analysis demonstrated that the scales possessed high reliability and good convergence, meeting the requirements for quantitative research and enabling further research steps.

**Table 3. Reliability and value**

| | CA | CR | AVE | CC | GSCN | IT | LOE | MEI | RCF |
|---|---|---|---|---|---|---|---|---|---|
| **CC** | 0.828 | 0.879 | 0.592 | 0.769 | | | | | |
| **GSCM** | 0.710 | 0.837 | 0.631 | 0.650 | 0.795 | | | | |
| **IT** | 0.820 | 0.875 | 0.637 | 0.329 | 0.256 | 0.798 | | | |
| **LOE** | 0.819 | 0.880 | 0.648 | 0.517 | 0.550 | 0.206 | 0.805 | | |

### 3.4. Structural model

**Table 4. Impact Relationship Assessment**

| H | Relationship | Original Sample (O) | STDEV | t Statistics | P- Values |
|---|---|---|---|---|---|
| **H1a** | CC → GSCM | 0.650 | 0.033 | 19.878 | 0.000 |
| **H1b** | GSCM → RFC | 0.218 | 0.042 | 6.740 | 0.000 |
| **H1b** | GSCM → MEI | 0.272 | 0.270 | 4.941 | 0.000 |

| | | | | | |
|---|---|---|---|---|---|
| **H2a** | CC → IT | 0.329 | 0.041 | 8.036 | 0.000 |
| **H2b** | IT → RFC | 0.094 | 0.032 | 2.918 | 0.004 |
| **H3a** | CC → LOE | 0.817 | 0.047 | 10.921 | 0.000 |
| **H3b** | LOE → RFC | 0.517 | 0.040 | 12.815 | 0.000 |
| **H4** | RFC → MEI | 0.699 | 0.031 | 22.624 | 0.000 |
| **H5** | CC → GSCM→ RFC | 0.181 | 0.183 | 5.781 | 0.000 |
| **H6** | CC → IT→ RFC | 0.031 | 0.112 | 2.565 | 0.011 |
| **H7** | CC → LOE→ RFC | 0.268 | 0.270 | 7.426 | 0.000 |

*Source: Extracted from PLS-SEM*

The analysis results in Table 4 confirmed the hypothesized relationships in the study with high statistical significance ($p < 0.05$). Cloud computing (CC) was demonstrated to have a strong impact on GSCM with an impact coefficient of $\beta = 0.650$ ($p < 0.001$). GSCM not only contributed to the reduction of carbon emissions (RFC) ($\beta = 0.218$, $p < 0.001$) but also positively affected the mitigation of environmental impact (MEI) ($\beta = 0.272$, $p < 0.001$). Concurrently, CC has a substantial effect on logistics operation efficiency (LOE) ($\beta = 0.817$, $p < 0.001$), and LOE has a significant impact on reducing carbon emissions ($\beta = 0.517$, $p < 0.001$). Furthermore, CC was observed to enhance information transparency (IT) ($\beta = 0.329$, $p < 0.001$), which exhibited a less pronounced impact on reducing carbon emissions ($\beta = 0.094$, $p = 0.004$). Notably, the identified carbon emission reduction (RFC) demonstrated a substantial effect on the environmental impact reduction (MEI) ($\beta = 0.699$, $p < 0.001$). Intermediary factors, such as GSCM, LOE, and IT, play a crucial role in linking CC to the reduction of carbon emissions. GSCM served as a significant mediator with $\beta = 0.181$ ($p < 0.001$), while LOE was identified as the most influential mediator ($\beta = 0.268$, $p < 0.001$). Although IT also functioned as an intermediary, its impact was less pronounced, with $\beta = 0.031$ ($p = 0.011$). In conclusion, this research has demonstrated that cloud computing not only directly impacts but also operates through influential intermediaries, such as LOE and GSCM, to RCF, thereby significantly minimizing environmental impact. These findings underscore the critical role of digital technology in advancing sustainability initiatives in the logistics supply chain.

### 3.5. Analyzing the role of intermediate variables

**Table 5. Results of intermediate variable analysis**

| Relationship | Original Sample (O) | STDEV | t Statistics | P-Values |
|---|---|---|---|---|
| CC → GSCM | 0.650 | 0.031 | 21.102 | 0.000 |
| CC → IT | 0.329 | 0.043 | 7.690 | 0.000 |
| CC → LOE | 0.517 | 0.048 | 10.685 | 0.000 |
| CC → MEI | 0.336 | 0.031 | 10.824 | 0.000 |
| CC → RCF | 0.481 | 0.033 | 14.562 | 0.000 |
| GSCM → MEI | 0.197 | 0.031 | 6.279 | 0.000 |
| GSCM → RFC | 0.281 | 0.041 | 6.808 | 0.000 |
| IT → MEI | 0.065 | 0.023 | 2.832 | 0.005 |
| IT → RFC | 0.094 | 0.032 | 2.883 | 0.004 |
| MEI → LOE | 0.361 | 0.032 | 11.132 | 0.000 |
| LOE → RFC | 0.517 | 0.042 | 12.266 | 0.000 |
| RFC → MEI | 0.699 | 0.030 | 23.686 | 0.000 |

*Source: Extracted from PLS-SEM*

Based on the results from Table 5 of the intermediary role analysis, the authors employed the bootstrapping method with 2000 resamples and a 95% confidence interval, as recommended by Kumar et al. (2022). The analysis results indicate that intermediaries, including GSCM, information transparency (IT), and logistics operational efficiency (LOE), play a significant role in mediating the relationship between cloud computing (CC) and reducing carbon

footprint (RFC). GSCM demonstrates a substantial intermediary role, with an indirect impact coefficient of $\beta = 0.181$ and a high level of statistical significance ($p < 0.001$). The variance accounted for (VAF) value suggests that a considerable portion of the impact of CC on RFC can be explained through GSCM. Information transparency (IT) also functions as an intermediary, albeit with a less pronounced impact than GSCM and LOE, exhibiting an indirect impact coefficient of $\beta = 0.031$ ($p = 0.011$). The VAF value indicates that IT only partially elucidates the relationship between the CC and RFC. Conversely, logistics operational efficiency (LOE) emerged as the most robust intermediary, with an indirect impact coefficient of $\beta = 0.268$ ($p < 0.001$), suggesting that LOE plays the most critical role in linking CC to carbon emission reduction. The t-values and p-values both attained clear statistical significance ($t > 1.96$, $p < 0.05$), supporting the hypothesis that GSCM, IT, and LOE serve as important mediators in the relationship between cloud computing and carbon emission reduction.

## IV. CONCLUSIONS AND IMPLICATIONS OF GOVERNANCE

### 4.1. Conclusion

This study elucidated the significant role of cloud computing in facilitating GSCM and mitigating carbon emissions in the logistics industry in Vietnam. Through the application of a Structural Equation Model (SEM), the research has validated that cloud computing not only exerts a direct influence on factors such as green supply chain management, information transparency, and logistics operational efficiency but also plays a crucial role in reducing environmental impacts and enhancing sustainable economic efficiency. Compared to previous research, this outcome aligns with the findings of Tan et al. (2020) and Zhu and Sarkis (2004), as both studies affirmed that digital technologies, particularly blockchain and cloud computing, are essential tools for managing carbon emissions and optimizing green supply chains. However, the novel contribution of this study lies in elucidating the mediating role of factors, such as green supply chain management, information transparency, and logistics operational efficiency, in linking cloud computing with carbon emission reduction. While prior studies have predominantly focused on the direct impact of digital technology (Iqbal et al., 2024; McKinnon, 2014), this research extends this understanding by analyzing intermediary relationships in greater depth. Furthermore, this study contributes a new perspective in the context of emerging economies, specifically Vietnam, where the pressure from international ESG standards and emission reduction requirements is intensifying. Whereas previous studies have concentrated on the manufacturing sector or developed markets (Nureen et al., 2023; Giannakis & Papadopoulos, 2016), this research focuses on the logistics sector in a developing economy, where businesses encounter numerous challenges in integrating sustainability initiatives. The originality of the study is evident not only in its geographical and industry context but also in its methodological approach, employing SEM models to validate intermediary roles. The findings of this study provide a significant scientific foundation for logistics enterprises in Vietnam to implement digital technology, not only to optimize operations, but also to meet the requirements of sustainable development and enhance competitiveness in the context of globalization.

### 4.2. Administrative implications

Enterprises should prioritize investing in digital technology and cloud computing to optimize green supply chains. Cloud computing can enhance information management and improve operational processes, while technologies like blockchain, AI, and big data can boost information transparency, manage carbon emissions, and promote sustainability.

Increased transparency in the supply chain is key to reducing carbon emissions. Logistics companies should establish real-time information-sharing systems to enhance collaboration and enable informed decision-making, which helps reduce waste and emissions.

Improving logistics operational efficiency is essential for minimizing environmental impact. Tools like transportation management systems (TMS) and IoT can optimize routes, reduce fuel consumption, and increase delivery efficiency. Green supply chain management should be an integral part of logistics enterprises' sustainable development strategy. Implementing environmentally friendly transportation, sustainable warehouse management, and optimized transport routes can reduce emissions, enhance brand image, and increase competitiveness.

Logistics companies must engage in green initiatives to meet ESG requirements and adapt to global sustainability trends. Adhering to ESG standards mitigates legal risks and opens doors to international markets, building trust with

partners and customers. Lastly, to successfully implement digital solutions, companies should invest in training employees, particularly in digital technology and green supply chain management, to ensure the effective adoption and maintenance of sustainability initiatives.

*Corresponding: nguyenthithom@dntu.edu.vn

**ABSTRACT**

This study evaluated the impact of the digital technology ecosystem (DTE) on innovation and entrepreneurship (ISU), and analyzed the mediating role of digital capabilities (DC) and collaborative networks (CN). Against the backdrop of the thriving development of DTE in Vietnam, this study reveals that DTE not only has a direct impact, but also promotes innovation in startups through DC and CN. Based on experimental data from 455 survey samples, the PLS-SEM analysis method was applied to validate the hypothesis. The results indicate that DTE has a positive impact on ISU, with DC and CN being key intermediaries that help optimize the impact. This study brings theoretical and practical value, supporting Vietnamese startups and decision-makers to effectively utilize DTE for sustainable development and enhance competitiveness in the digital age.

*Keywords*: "Collaborative networks (CN)", "Digital Competency (DC)", "Digital Technology Ecosystem (DTE)", "Innovation Startup (ISU)", "Vietnam".

## I. INTRODUCTION

In the context of globalization and significant digital transformation, the Digital Technology Ecosystem (DTE) has emerged as a crucial factor in fostering the development of Innovative Startups. DTE not only provides a technological platform and establishes support networks and digital resources but also creates an environment conducive to promoting innovation (Rong et al., 2015). In Vietnam, the digital transformation process is being vigorously promoted, establishing urgent requirements for startups to leverage this ecosystem and develop innovative products and services.

However, startups frequently encounter numerous challenges including access to technology, financial resources, and support networks. DTE has emerged as a significant solution, offering a favorable environment for startups to overcome these difficulties and promote innovation (OECD, 2010; World Bank, 2020). In the context of the Fourth Industrial Revolution, digital technology has become a key driving force for socioeconomic development. Innovative startups (IE) are considered essential for promoting economic growth, creating employment opportunities, and enhancing national competitiveness (Ministry of Science and Technology, 2019). Although the role of the DTE in innovative startups has been emphasized by numerous studies, most of these studies focus on developed markets and have not thoroughly examined the mediating role of factors such as digital competencies and support and collaboration networks (Elia et al., 2020; Zahra et al., 2023). Cavallo et al. (2021) have demonstrated that DTE connects startups with strategic partners but have not elucidated the intermediary role of digital competencies and support networks in the context of emerging economies such as Vietnam. Zhang et al. (2023) and Zheng et al. (2024) also emphasize the significance of these two factors in improving innovation efficiency. However, integrating them into a comprehensive model for in-depth analysis of the relationship between DTE and innovation remains insufficient. In addition, previous studies (Rong et al., 2015; Yoo et al., 2010) asserted that DTE promotes innovation through the provision of technology platforms, data resources, and connections. However, these studies have not focused on emerging economies such as Vietnam, where DTE is thriving but still faces numerous challenges in terms of technology infrastructure and a startup support environment. Elia et al. (2020) and Khuan et al. (2023) emphasized that digital competency is a core factor for businesses to effectively exploit resources from DTE. Concurrently, Adner (2017) and Spigel (2017) posit that support networks not only facilitate connections between businesses and strategic partners, but also enable knowledge sharing and the development of innovative solutions. However, the mediating role of digital competencies and support networks in the relationship between DTE and innovation has not been investigated thoroughly.

This study addresses the aforementioned academic gap by analyzing the relationship between DTE and innovative

startups through the mediating roles of digital competencies, support, and collaboration networks. The novelty of this study lies in integrating these two intermediaries into a comprehensive model, elucidating their interconnections, and enhancing the impact of DTE on innovation. Furthermore, the research focuses on the context of Vietnam, an emerging economy with significant development potential that has not yet been fully explored in this field. This study not only illuminates the factors that promote innovation, but also provides a crucial theoretical and practical foundation, supporting startups in optimizing the benefits of the digital technology ecosystem, thereby contributing to economic growth and enhancing competitiveness in the current digital era.

## II. RESEARCH HYPOTHESES

### 2.1. Related concepts

*Innovative Startup (ISU):* According to Decision 844/QD-TTg of the Government of Vietnam, ISU is defined as "the process of realizing business ideas based on the application or commercialization of new products, services, and business models that are innovative, breakthrough, capable of rapid growth and create high added value." (Prime Minister, 2016). The OECD (2010) emphasizes that ISU not only focuses on starting a business but also emphasizes the utilization of advanced technologies and ideas to achieve competitive advantage. Consequently, ISU is defined as the process by which individuals or groups develop new products, services, or business models, with the objective of creating disruptive value and exploiting new opportunities in the market based on technological elements, creative ideas, or innovation in operational methodologies.

*Digital Technology Ecosystem (DTE):* According to Rong et al. (2015), DTE not only encompasses hardware and software, but also includes factors such as data, policies, culture, and collaborative relationships between stakeholders in the digital economy. DTE is also conceptualized as "an integrated network of technologies, services, platforms, and related organizations designed to work together, creating value for users through connecting, optimizing, and sharing data effectively in a digital environment." (World Economic Forum 2019).

### 2.2. Impact of the digital technology ecosystem (DTE) on Innovative startups (ISU)

DTE functions as a platform to facilitate ISU by providing resources, tools, and opportunities to enable startups to maximize the potential of technology for creating new products/services. According to Yoo et al. (2010), the development of digital technologies, including the Internet of Things (IoT), big data, and artificial intelligence (AI), has created opportunities for innovation in business models, enhancing the competitiveness of startups. Conversely, Adner (2017) emphasizes that an effective digital ecosystem fosters close interactions among stakeholders, including governments, startup support organizations, and businesses, thereby promoting innovation initiatives and supporting the startup process. In Vietnam, the Ministry of Science and Technology (2019) stated that "DTE is the foundation to help ISU enterprises access 4.0 technology, build innovative solutions to meet social needs and promote economic growth." According to World Bank research (2020), the development of DTE has "facilitated access to resources such as data, capital, and technological skills, thereby fostering creativity and innovation in startups." Consequently, DTE plays a significant role in promoting ISU as it provides a conducive environment, including technology platforms, support services, and networking between businesses, investors, and other organizations. These factors facilitate ISU access to cutting-edge technology, the optimization of business operations, and market expansion.

### 2.3. Entrepreneurial Ecosystem Theory

Isenberg (2010) introduced the entrepreneurial ecosystem theory, asserting that the success of startups is not solely dependent on individual efforts but rather on a comprehensive environment that includes policies, infrastructure, finance, education, networks, culture, and government support. This ecosystem consists of dynamic relationships between organizations and individuals, fostering the creation and development of new enterprises. The entrepreneurial ecosystem framework is widely used to examine factors influencing ISU within the digital ecosystem, alongside the supportive role of local governments. Isenberg (2010) highlights the interaction of key elements such as policy, education, culture, networks, markets, and finance. Mason and Brown (2014) emphasize that high-growth businesses often thrive within a strong entrepreneurial ecosystem, where supportive policies and affiliate networks are crucial. In the Southeast region, local government support acts as an intermediary factor, helping SMEs maximize the benefits of the DTE. Spigel (2017) underscores the importance of relationships within the entrepreneurial ecosystem, particularly

the connections among businesses, investors, governments, and other organizations. Local governments play a key role in fostering these relationships to build a sustainable innovation ecosystem. Additionally, the World Bank (2020) highlights that the DTE enhances access to resources and data, facilitating startup growth and scalability. In this study, local governments serve as enablers, helping SMEs leverage the DTE to develop innovative solutions.

### 2.4. Hypothesis development

#### 2.4.1. Digital Ecosystem (DTE)

According to Rong et al. (2015) and Yoo et al. (2010), DTE not only enables startups to leverage advanced technology to develop new products and services, but also facilitates their access to the market and scaling of operations. Cavallo et al. (2021) emphasized the role of DTE in enhancing collaboration between SMEs and innovative startups, thereby establishing a sustainable ecosystem. Furthermore, DTE not only provides technical infrastructure but also supports the development of digital capacity in startups through advanced technologies such as AI, Big Data, and IoT (World Economic Forum, 2019; Elia et al., 2020). These factors enable startups to optimize their operational processes and enhance innovation efficiency. Research by Tukiainen et al. (2019) indicates that digital competency is the core factor for success in the business ecosystem, while Assay (2021) emphasizes the necessity for digital upskilling in tech startups. In addition, DTE promotes the formation and development of Collaborative networks, facilitating connections between startups, investors, and supporting organizations. Adner (2017) and Spigel (2017) asserted that these networks enable startups to access resources, share knowledge, and expand partnerships. Pustovrh et al. (2020) found that DTE encourages open innovation through knowledge sharing and collaboration among stakeholders, whereas Primario et al. (2024) emphasized the role of DTE in balancing collaboration and competition among startups. Therefore, we propose the following hypothesis:

*H1: DTE has a positive impact on innovative start-ups.*

*H2: DTE has a positive impact on Digital Competencies*

*H3: DTE has a positive impact on Collaboration Network*

#### 2.4.2. Collaboration Networks (CN)

CN play a fundamental role in connecting startups with digital resources, such as knowledge, technology, and infrastructure, thereby enhancing their digital capabilities and fostering innovation. Spigel (2017) emphasizes that these networks provide an environment for businesses to access cutting-edge technology and share knowledge, while Pustovrh et al. (2020) highlight that collaboration and resource sharing within networks can promote open innovation and improve digital capabilities. Consequently, the support network serves not only as a conduit for sharing knowledge and experience in digital technology, but also creates conditions for startups to learn from partners, experts, and other supporting organizations. Through training, cooperation, and exchange activities, businesses can enhance their digital skills, access new technologies, and effectively apply them to business activities (Bărbulescu et al. 2021; Kamariotou and Kitsios 2022). Szakos (2023) affirmed that next-generation digital technology, when integrated into the collaboration network, can increase momentum and support the development of the startup ecosystem. Adner (2017) argues that network relationships help businesses capitalize on market opportunities, while Zheng et al. (2024) emphasize the role of collaborative networks in sharing information and resources to promote innovation. These networks also create synergy, enabling start-ups to expand their markets, reach new customers, and enhance their competitiveness. Cavallo et al. (2021) and Ojaghi et al. (2019) emphasize that network collaboration helps startups develop innovative solutions and adapt to market changes. Similarly, Zhang et al. (2023) and Marcon et al. (2024) asserted that collaborative networks can support startups in addressing random market factors and improving innovation performance. Therefore, we propose the following hypothesis:

*H4: CN have a positive impact on Digital Competencies.*

*H5: CN have a positive impact on Innovative start-ups.*

#### 2.4.3. Digital competencies (DC)

According to Elia et al. (2020), digital competencies encompass the ability to access, manage, and apply advanced technologies, such as AI, Big Data, and IoT, facilitating businesses in innovating processes, developing novel products

and services, and enhancing overall operational performance. Cavallo et al. (2021) emphasized that digital empowerment enables businesses to optimize their utilization of the digital ecosystem to gain a competitive advantage. Furthermore, digital capabilities enable startups to not only analyze data and automate processes but also engage customers online, create innovative business models, and adapt rapidly to market changes (Condom-Vilà, 2020; Zhavoronkova et al., 2021). Research by Khuan et al. (2023) also indicates that businesses with high digital capabilities often accelerate product launches, enhance customer satisfaction, and effectively expand markets. Similarly, Zahra et al. (2023) asserted that digital competencies serve as a bridging mechanism in integrating resources and knowledge to promote innovation. Additionally, empirical studies by Ruggieri et al. (2018) and Morande et al. (2020) have demonstrated that digital competencies not only influence business models, but also transform service ecosystems, generating innovative solutions in areas such as healthcare. Therefore, we propose the following hypothesis:

*H6: DC have a positive impact on Innovative start-ups.*

**2.4.4. The Intermediary role of Digital Competencies (DC) and Cooperation Networks (CN)**

Digital competency is a crucial factor for optimizing processes, developing innovative products, and increasing business efficiency (Elia et al. 2020; Zahra et al. 2023). Zhang et al. (2023) indicate that when startups possess high digital capabilities, they can effectively utilize resources from the digital ecosystem to drive innovation, rendering this capability an essential bridge to achieve business success. In addition to its direct impact, DTE indirectly promotes innovative start-ups through the formation of digital competencies. According to Cohen et al. (2017) and Zahra et al. (2023), DTE provides an environment and tools to assist businesses in developing digital capabilities, thereby enhancing their ability to capitalize on opportunities in the digital ecosystem. Elia et al. (2020) emphasize that digital technology and collective intelligence are reshaping business practices, with digital capabilities playing an intermediary role. Similarly, Thomas et al. (2019) asserted that digital competency is essential for startups to leverage opportunities from the ecosystem. Furthermore, DTE facilitates the formation and development of CN that connect startups with investors, strategic partners, and supporting organizations. These networks not only provide resources, but also create a conducive environment for businesses to share knowledge and develop innovative solutions (Adner, 2017; Spigel, 2017). Zheng et al. (2024) emphasized that network collaboration is a key factor for businesses to effectively exploit resources from DTE and promote innovation. Mason and Brown (2014) and Isenberg (2010) also argued that support and collaboration networks play a significant role in exchanging knowledge, sharing experiences, and encouraging innovative collaboration among startups. Cavallo et al. (2021) explore the relationship between SMEs and innovative startups in the business ecosystem, affirming the intermediary role of collaborative networks. Similarly, Ojaghi et al. (2019) synthesized a theoretical framework for the formation of an innovation ecosystem for startups, in which CN networks are considered important intermediaries. Therefore, we propose the following hypothesis:

*H7: Digital competencies play an intermediary role in the relationship between DTE and ISU*

*H8: Collaboration Network play an intermediary role in the relationship between the DTE and ISU*

**2.5. Proposed research model**

Based on related hypotheses and theories, the author hypotheses the research:

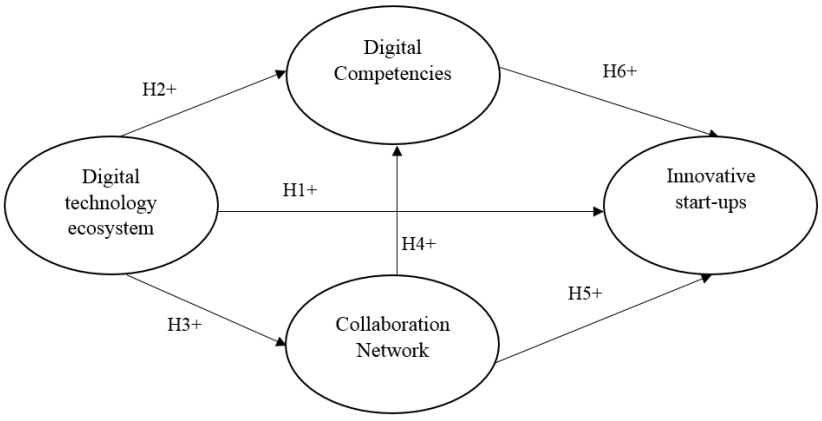

**Fig.1. Proposed research model**

## III. RESEARCH METHODS

This study employs a quantitative methodology to evaluate the impact of the digital technology ecosystem (DTE) on innovation startups (ISU) through the mediating role of DC and CN. Data were collected using a questionnaire that incorporated items measuring key variables in the research model. The questionnaire was designed using a 5-point Likert scale (1 = completely disagree, 5 = completely agree), ensuring an assessment of respondents' level of agreement with statements pertaining to each variable. Data collection was conducted from October 2024 to November 2024. A total of 550 surveys were distributed, and 455 valid samples were obtained, yielding a response rate of 82.7%. Survey samples were gathered from startups in Vietnam, focusing on key economic sectors and industries related to digital technology and innovation. The survey participants were middle and senior managers and employees responsible for innovation within their respective enterprises. The collected data were analyzed using Structural Equation Modeling (SEM) with SmartPLS software. SEM was selected for its capacity to simultaneously examine the relationships between latent and observed variables in the research model, thereby testing the hypotheses regarding the mediating role of digital competencies and support networks. The results of the SEM analysis not only elucidate the direct impact of DTE on ISU but also highlight the mediating role of DC and CN in this relationship. This methodology provides a robust scientific foundation for understanding how DTE drives innovation, and assists in guiding businesses and policymakers in leveraging the digital ecosystem for sustainable development.

## IV. RESULT AND DISCUSSION

### 4.1. Sample description results

The data collection was conducted from the beginning of November to the end of December 2024. A total of 550 surveys were distributed and 455 valid samples were obtained, yielding a response rate of 82.7%. Survey samples were collected from startups in Vietnam, focusing on key economic and industrial sectors related to digital technology and innovation. The survey participants comprised middle and senior managers as well as employees responsible for innovation in their respective businesses. Descriptive statistics of the survey sample include: (1) Gender: The survey sample exhibited a balanced gender ratio, with 52% males and 48% females, ensuring multidimensional representation for the analysis and reflecting the participation of both genders in decisions and evaluations; (2) Education: The majority of respondents possessed undergraduate and postgraduate degrees (87%), indicating a high level of comprehension and ability to evaluate factors in the research, with solid professional knowledge; (3) Age: The age range of respondents primarily spanned from 20 to 55 years old (79%), with the 30–40 age group representing the highest proportion, suggesting substantial practical experience among participants. These statistics provide a robust foundation for further analyses and ensure that the survey sample is highly representative, capable of testing research hypotheses, and facilitating subsequent quantitative analyses.

### 4.2. Common Method Variance Bias Test (CMB)

Variance inflation coefficient (VIF) values were examined as recommended by Kock (2015). The VIF values reported for the structures ranged from 1 to 1.585 (Table 4.1), well below the recommended limit of 5, confirming the absence of CMB.

**Table 4.1. Inner VIF Value**

| | CN | DC | DTE | ISU |
|---|---|---|---|---|
| **CN** | | 1.366 | | 1.554 |
| **DC** | | | | 1.585 |
| **DTE** | 1.000 | 1.366 | | 1.563 |
| **ISU** | | | | |

### 4.3. Reliability Measurement

The partial least squared structure equation model (PLSSEM) was employed to analyze the data. The factor loading values (Table 4.2) were examined to assess convergent reliability. All factor loading values exceeded the recommended threshold of 0.7 (Hair et al. 2019). Furthermore, the Cronbach's Alpha values were all above the minimum threshold of 0.7 and below 0.95 (Hair et al., 2019), confirming the internal consistency reliability of the constructs (Table 4.3). These findings indicate that the model demonstrates high reliability and can be used for subsequent analyses.

**Table 4.2. Factor Loading**

| Factor | Factor | Factor loading | VIF |
|---|---|---|---|
| **Digital technology ecosystem – DTE** | DTE1 | 0.809 | 1.695 |
| | DTE2 | 0.837 | 1.857 |
| | DTE3 | 0.784 | 1.676 |
| | DTE4 | 0.805 | 1.792 |
| **Digital Competencies - DC** | DC1 | 0.818 | 1.561 |
| | DC2 | 0.845 | 1.798 |
| | DC3 | 0.826 | 1.762 |
| **Collaborative Networks - CN** | CN1 | 0.790 | 1.932 |
| | CN2 | 0.748 | 1.728 |
| | CN3 | 0.803 | 2.481 |
| | CN4 | 0.774 | 2.447 |
| | CN5 | 0.746 | 1.604 |
| **Innovative start-ups - ISU** | ISU1 | 0.787 | 1.798 |
| | ISU2 | 0.830 | 1.967 |
| | ISU3 | 0.851 | 2.043 |
| | ISU4 | 0.838 | 1.911 |

The aggregate reliability value exceeded the recommended threshold of 0.7 (Hair et al., 2019). Furthermore, the interpreted mean variance value (AVE) also surpassed the threshold of 0.5 (Hair et al., 2019). The criteria of Fornell and Larcker (1981) were applied to establish the discriminant validity (Table 4.3).

**Table 4.3. Reliability and value**

| | CA | CR | AVE | CN | DC | DTE | ISU |
|---|---|---|---|---|---|---|---|
| **CN** | 0.832 | 0.881 | 0.597 | 0.773 | | | |
| **DC** | 0.795 | 0.880 | 0.709 | 0.527 | 0.842 | | |
| **DTE** | 0.824 | 0.883 | 0.654 | 0.517 | 0.531 | 0.809 | |
| **ISU** | 0.846 | 0.5896 | 0.684 | 0.614 | 0.698 | 0.690 | 0.827 |

Note: *CA = Cronbach's alpha; CR = Composite reliability; AVE = Average variance extracted*

**4.4. Hypothesis testing**

**Table 4.4. Hypothesis test results**

| Hypothesis | Relationship | Original Sample (O) | Standard deviation (STDEV) | *t-value* | *p-Value* | Supported |
|---|---|---|---|---|---|---|
| H1 | DTE → ISU | 0.373 | 0.044 | 8.499 | 0.000 | Yes |
| H2 | DTE → DC | 0.353 | 0.053 | 6.686 | 0.000 | Yes |
| H3 | DTE → CN | 0.517 | 0.050 | 10.428 | 0.000 | Yes |
| H4 | CN → DC | 0.344 | 0.060 | 5.738 | 0.000 | Yes |
| H5 | CN→ ISU | 0.217 | 0.037 | 5.933 | 0.000 | Yes |
| H6 | DC→ ISU | 0.368 | 0.040 | 9.743 | 0.000 | Yes |
| H7 | DTE → DC → ISU | 0.136 | 0.024 | 5.517 | 0.000 | Yes |
| H8 | DTE → CN → ISU | 0.113 | 0.022 | 5.126 | 0.000 | Yes |

Based on the results of the analysis in Table 4.4, all the hypotheses in the study are supported with a high level of statistical significance ($p < 0.001$), confirming the significant role of the DTE, DC, and CN in promoting innovative startups (ISU). Specifically, cooperation (CN) networks demonstrate a positive impact on digital competencies ($\beta = 0.344$) and innovative startups ($\beta = 0.217$), while DC also have a significant impact on innovative startups ($\beta = 0.368$, $t = 9.743$). Furthermore, DTE had a strong impact on CN ($\beta = 0.517$) and DC ($\beta = 0.353$) and exerted a direct effect on ISU ($\beta = 0.373$, $t = 8.499$). The results also elucidate the intermediary roles of DC and CN in the relationship between

DTE and ISU. Digital capacity serves as a crucial intermediary between DTE and ISU, with an indirect impact (β = 0.136), while cooperation networks also contribute significantly to the indirect impact coefficient (β = 0.113). Notably, the relationship between DTE and CN (H3) was identified as having the strongest impact among the direct relationships, underscoring DTE's role in establishing collaborative networks to foster innovation. These findings not only corroborate the theory regarding the role of the digital ecosystem, but also emphasize the importance of digital capabilities and collaborative networks as essential intermediaries in achieving innovation effectiveness.

### 4.5. Intermediary Role Analysis

**Table 4.5. Intermediary Role Analysis**

| Relationship | Original Sample (O) | Standard deviation (STDEV) | t-value | p-Value |
|---|---|---|---|---|
| CN→ DC | 0.344 | 0.606 | 5.704 | 0.000 |
| CN → ISU | 0.350 | 0.041 | 8.547 | 0.000 |
| DC → ISU | 0.368 | 0.039 | 9.853 | 0.000 |
| DTE → CN | 0.517 | 0.047 | 10.994 | 0.000 |
| DTE → DC | 0.631 | 0.034 | 12.240 | 0.000 |
| DTE → ISU | 0.690 | 0.028 | 24.293 | 0.000 |

The authors investigated the mediating role of DC and CN using a bootstrapping method with 2000 resamples and a 95% confidence interval, as recommended by scholars. The results of the analysis indicate that intermediary factors play a significant role in the relationship between DTE and ISU. The variance accounted for (VAF) value was examined to assess the influence of intermediate factors, which were calculated based on the ratio between indirect effects and the sum of the effects (including direct and indirect effects). The results demonstrate that DC serve as a strong mediator, with VAF values exceeding the 20% threshold, indicating that a substantial portion of the impact of DTE on ISU is explained through DC. Similarly, CN also function as important intermediaries, with the VAF value confirming that CN facilitates the transformation of DTE's impact of DTE on ISU. Bootstrapping analysis further reveals that all t-values are greater than 1.96, and p-values are less than 0.05, confirming the statistical significance of intermediary relationships. This supports the hypothesis that digital capabilities are crucial intermediaries in connecting DTE to startup innovation. Concurrently, the CN not only facilitates businesses' access to strategic partners, but also creates a conducive environment for knowledge sharing and the promotion of innovative solutions. Consequently, Table 6 emphasizes that DTE not only directly impacts innovation but also operates through intermediary factors such as DC and CN. These findings underscore the role of intermediaries in optimizing the impact of the digital ecosystem, and provide a foundation for businesses and policymakers to focus on developing digital capabilities and expanding collaborative networks to drive innovation.

## V. CONCLUSION

### 5.1. Conclusion

This investigation elucidated the role of the DTE in fostering innovative startups and confirmed the intermediary function of DC and CN. The findings of this study have demonstrated that DTE not only enables startups to access advanced technology and optimize operational processes but also assists them in developing innovative solutions and enhancing business efficiency and global competitiveness (Elia et al., 2020; Zahra et al., 2023). Compared to previous research, this study further corroborates the conclusions of Cavallo et al. (2021) regarding the role of DTE in enhancing collaboration between startups and strategic partners. Concurrently, the results align with Spigel's (2017) assertion that support and collaboration networks are indispensable elements of the innovation ecosystem. However, this study expands our understanding by highlighting the mediating role of digital competencies and collaborative networks and elucidating how DTEs not only directly impact but also operate through these factors to drive innovation (Zhang et al., 2023). The novel aspect of this study is its focus on startups in Vietnam, an emerging economy in which DTE plays a crucial role in supporting businesses to access digital technology and develop sustainably. The results indicate that digital competencies play a stronger intermediary role in connecting DTE and innovation than do support and collaboration networks. Additionally, research demonstrates that collaborative networks are not only a resource but also

a platform for businesses to share knowledge and develop innovative strategies (Adner, 2017; Zheng et al., 2024). This study contributes to the theoretical foundation of the digital ecosystem and innovative startups and provides a practical basis for businesses and policymakers in Vietnam to construct strategies to support digital-based startups, promote innovation, and sustainable development in the digital era.

**5.2. Administrative implications**

Based on the results, several significant governance implications are proposed to support innovative startups in effectively exploiting the benefits of the digital technology ecosystem.

First, enterprises should invest in developing digital capabilities through the application of advanced technologies such as AI, Big Data, and IoT. This approach not only optimizes operational processes but also enhances products and services and improves business efficiency.

Second, organizations need to maximize the opportunities presented by the digital technology ecosystem to promote innovation. This necessitates managers to proactively integrate technology into business strategies, participate in startup support programs, and collaborate within the ecosystem to access resources and develop innovative initiatives.

Third, the development and expansion of CN are crucial. These networks not only connect startups with investors, support organizations, and strategic partners but also facilitate the sharing of knowledge, experience, and the development of innovative solutions.

Fourth, startups should be encouraged to engage in open innovation activities to leverage external resources for rapid and effective development. Supporting organizations and governments must develop policies, organize technology cooperation, and incubate programs to promote open innovation.

Fifth, the legal environment and support policies play a significant role. The government needs to create policies that encourage the development of the digital technology ecosystem, provide modern digital infrastructure, offer financial support, and organize networking forums to create favorable conditions for startups to develop sustainably.

Finally, enterprises need to establish systems to measure and evaluate the effectiveness of digital technology utilization and participation in cooperative networks. The establishment of evaluation indicators (KPIs) aids in tracking the progress and effectiveness of innovation, thereby enabling timely strategy adjustments to achieve optimal results.

# LANGUAGE, INTERDEPENDENCE, AND PROJECT PERFORMANCE IN GLOBAL SOFTWARE DEVELOPMENT

**Diep Thao Van[1*], Nguyen Kim Thao[1]**

[1]School of International Business – Marketing, University Of Economics Ho Chi Minh City
*Corresponding: vandiep.211109051@st.ueh.edu.vn.

**ABSTRACT**

This study investigates the impact of language distance on dependence, knowledge sharing, and project team performance in software project teams. Using data collected from 229 respondents who work in virtual project teams in the software industry, the study reveals that language distance does not influence team performance directly but affects it through dependence and knowledge sharing among team members. Language barriers create a sense of dependence for team members as they need to rely on others to clarify task requirements. Furthermore, they also enhance communication and collaboration, causing team members to share critical knowledge to avoid misinterpretation. The results show that dependence among team members plays a key mediating role in improving knowledge sharing and, ultimately, project team performance. Moreover, language distance has a full indirect effect on project team performance through dependence and knowledge sharing. These results add to prior research by suggesting that while language barriers can be a challenge to teamwork, they actually act as an enabler to team performance. In addition, dependence fosters collaboration and mitigates these challenges. The study emphasizes the importance of knowledge sharing in overcoming language distance and highlights strategies such as communication tools, language training, and clear information-sharing channels to enhance project team performance in multilingual settings.

*Keywords*: “Language Distance”, “Knowledge Sharing”, “Project Team Performance”, “Dependence”, “Software Project Teams”

## I. INTRODUCTION

### 1.1 Background of the study

In a globalized work environment, particularly in software projects, knowledge sharing among team members is a key determinant of project team performance. However, teams often face multiple complex factors, such as language differences, dependence among team members, and coordination in the knowledge-sharing process.

Numerous studies have provided empirical evidence on the crucial factors affecting the knowledge transfer process, including absorptive capacity—the ability to identify, assimilate, and apply new knowledge (Cohen & Levinthal, 1990), mutual dependence among team members, shared vision, and trust within the team. These factors influence innovation and learning and are closely related to job performance (Michailova & Mustaffa, 2012). Unlike tangible resources, when knowledge is widely disseminated, it takes on the characteristics of a "public good," leading to the phenomenon of "free riding" (Davenport, 1997). This has made knowledge sharing a major challenge in knowledge management (Ruggles, 1998). To maximize the potential of internal knowledge, sharing knowledge among individuals and teams is essential (Chang et al., 2013). An effective sharing process not only enhances collaboration but also shortens problem-solving time by accumulating and spreading knowledge throughout the organization.

Global software development and release model offers numerous strategic benefits, such as adopting the "Follow The Sun" (FTS) model to optimize time, reduce costs, improve customer reach, attract talent, and expand international cooperation opportunities. However, this model also increases the complexity of project management, particularly due to "distances" in time, geography, culture, and language. These distances pose significant challenges in communication, coordination, and collaboration—particularly impacting knowledge sharing, a critical factor in the success of software development. In this context, understanding the relationships between the factors affecting knowledge sharing and project performance is crucial.

For software developers in Vietnam, the globalization of software development projects presents increasingly

complex challenges, especially when there is coordination between local and international teams. Differences in language, culture, and working styles not only create communication barriers but also deeply affect the knowledge-sharing process among team members. In this environment, language distance and mutual dependence emerge as two crucial factors, but they impact knowledge sharing and project performance in different ways. However, these relationships have not been fully explored, particularly regarding how these factors influence knowledge sharing—a core component determining software project performance in multicultural and distributed settings. The lack of in-depth research on the relationship between language, dependence, and knowledge sharing has created a gap that needs to be explored to support more effective management strategies in this complex context.

This research aims to investigate the effects of language distance, dependence, and knowledge sharing on the performance of software project teams. Moreover, the direct and indirect effects of language barriers on performance through dependence and knowledge sharing will be tested. The study makes two key contributions. It identifies language barriers as an enabler to software project team performance and it points out the importance of dependence and knowledge sharing as key factors to realize the benefits of language barriers on team performance.

The paper is structured into four main sections. After the introduction, a literature review is presented to highlight key concepts and existing research of the constructs in the model. Then, the methodological approach will be presented in the methodology followed by findings and discussion. The paper ends with implications for further research and practitioners.

## II. LITERATURE REVIEW AND MODEL DEVELOPMENT

### 2.1. Key concepts

#### Software and Software Release

Computer software has emerged as a major global industry. Software encompasses a collection of programs, processes, algorithms, and documentation that operate computer systems. According to Krishnan (1994), software is not merely a technological product but also a strategic asset, delivering long-term value to businesses. With its pervasive presence across numerous industries and products, software is regarded as one of the most critical assets of modern companies.

Krishnan (1994) also emphasized that software release is not solely the process of creating a technological product but also involves deploying, maintaining, and optimizing software to meet the increasing demand of the market. For many businesses, the use and development of software has grown at a pace far exceeding the overall growth rate of the enterprise, reflecting the growing importance of software in shaping competitive capabilities and sustainable success. As a result, software is increasingly seen as a core factor determining the success of any business, regardless of size or industry.

In addition to software developed internally by businesses, releasing commercial software is also gaining increasing attention in Vietnam. Commercial software refers to any software or application developed and designed for licensing or sale to end-users for commercial purposes. Traditionally, commercial software was defined as proprietary software products. However, in the modern era, some open-source and free software applications are also available for licensing or sale to end-users. Typical examples of commercial software include off-the-shelf software such as games and applications distributed through specialized computer stores or online application stores.

#### Project Team Performance

Project team performance refers to the effectiveness with which a group of individuals collaborates on a project to achieve predefined goals (Jiang et al., 2004). Fundamentally, it serves as a measure of how well the team delivers results. This often involves achieving objectives across three dimensions: meeting deadlines, staying within budget, and producing high-quality work. However, evaluating project performance in a specific context is inherently complex and depends on the evaluator as well as the timing of the evaluation.

The performance of software project teams is a critical factor in determining project success. Research by Jiang et al. (2004) highlights that the performance of software project teams depends on several factors, including the skills and experience of team members, the level of communication and coordination, the commitment and motivation of the

team, and effective project management. Similarly, Hoegl and Gemuenden (2001) emphasize that software project team performance improves when members share common goals, receive leadership support, and have mechanisms for feedback and evaluation. Furthermore, research by Krishnan et al. (2000) underscores the role of knowledge management in software project teams, noting that the sharing of knowledge and experience significantly enhances team performance.

### 2.2 Social Cognitive Theory

Bandura's (1986) Social Cognitive Theory (SCT) emphasizes the interaction between three main factors: that shape human behavior. They are cognitive factors (knowledge, attitude), environment (social norms, access in community, influence by others), and competence factors (skills, self-efficacy). Human behavior is formed by their observation, learning from the environment, and personal motivation. Following this theory, language distance is identified as an environmental factor that influences individual cognition of their ability to complete tasks and their collaborative behavior. Dependence, as an individual factor, is defined as the extent to which individuals feel secure and confident in performing tasks (Bandura, 1986). Language distance creates feelings of insecurity, anxiety, and isolation (Gardner & Lambert, 1972), which leads to the need to depend on others to complete tasks. Differences in language also increase misunderstanding and thus pose challenges for teamwork. Therefore, collaborative activities are necessary to overcome misunderstanding and dependence. This research model highlights the intricate relationships between social, individual, and behavioral factors in enhancing team performance. Reducing language distance and fostering dependence can improve knowledge sharing and project team performance.

### 2.3 Hypotheses Development

#### 2.2.1 Language Distance

Language distance refers to differences in language used by team members. In today's era, software project teams consist of individuals from diverse cultural backgrounds and face cultural differences such as variations in language, traditions, values, and behavioral norms, which can lead to misunderstandings and conflicts (Baumard, 1999; Zhang & Du, 2011). Language distance also creates significant communication gaps among distant colleagues (Zahedi et al., 2016). Team members dispersed globally find it challenging to share and acquire knowledge due to linguistic differences. Moreover, when native languages differ, the diversity in the common working language (often English) leads to various issues and misunderstandings (Aranda et al., 2010). However, language distance also demonstrate diversity in the workplace. Diverse teams may benefit from different perspectives enhanced by contribution of different viewpoints and creative solutions. Therefore, it is offered that:

**H1: Language distance positively impacts project team performance.**

#### 2.2.2 Dependence

In teamwork, particularly in complex projects such as software development, dependence among team members plays a crucial role in coordinating activities and facilitating knowledge sharing. Dependence is defined as the extent to which team members rely on one another to complete their work, requiring close collaboration and continuous information exchange (Van der Vegt & Van de Vliert, 2005). As the level of dependence increases, team members tend to interact more frequently (Kiggundu, 1983; Pearce & Gregersen, 1991). In the context of cross-functional and virtual teams, knowledge sharing among members is indispensable for achieving work efficiency. These teams often face challenges in integrating diverse technical knowledge and expertise, and without effective knowledge sharing, achieving team goals becomes difficult (Sapsed et al., 2002). Leveraging and sharing tacit knowledge enables teams to innovate and address problems creatively, thereby improving performance and work quality (Mascitelli, 2000). Therefore, it is suggested that

Furthermore, research has shown that high levels of dependence positively impact project team performance, as close collaboration among team members enables the team to fully leverage collective knowledge and respond more effectively to project challenges (Rusbult, 1996). This is particularly true in teams where dependence is shaped by repeated and institutionalized interactions over time (Brass & Burkhardt, 1993).

**H2: Dependence is positively related to project team performance**.

**H3: Dependence is positively related to knowledge sharing.**

When teams comprise members from various linguistic backgrounds, they may need to interact more often to reduce misunderstanding. To reduce uncertainty, members need to interact and exchange information with their team mates more often. Interaction and communication among team members are essential to foster commitment, trust, and cohesion, which enable knowledge exchange (Zboralski, 2009). Therefore, it is proposed that:

**H4: Language distance positively impacts dependence.**

**H5: Language distance positively impacts knowledge sharing**

Empirical findings have long confirmed the positive relationship between knowledge sharing and project team performance, especially in virtual and traditional teams (Majchrzak et al., 1995; Cummings, 2004; Hong et al., 2004). This study capitalizes on existing research and agrees that:

**H6: Knowledge sharing is positively related to project team performance.**

### 2.4 Research model

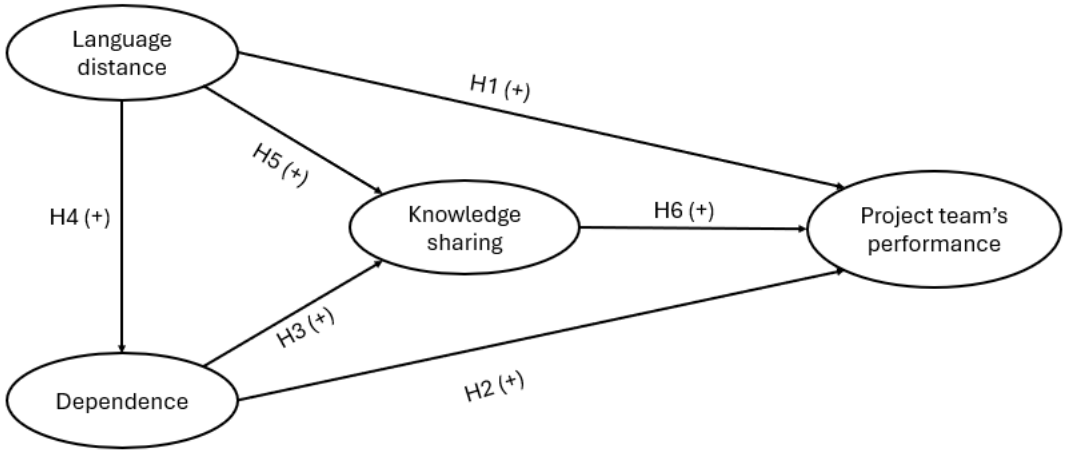

**Fig 1 - Proposed Conceptual Model**

## III. METHODOLOGY AND RESULTS

### 3.1 Methodology

The study adopts the quantitative approach. A large-scale survey was conducted from February to May 2024. Existing scales were adopted to measure the constructs in the model. The 7-Likert six items to measure language distance were borrowed from Anwar et al. (2019). The five item measurement for dependence was borrowed from Park and Lee's (2014) study. Knowledge sharing was measured by five items from Davenport et al (1998) and project team's performance was measured by five items from Park and Lee (2014). Data was analyzed using the SmartPLS 3.0 software

Data was collected using Google Forms. We posted the link to the online survey in social communities of software engineers. In total, we collected 238 responses, of which 229 were valid observations. Among these, 94 respondents were male (41%), and 135 were female (59%). Regarding age groups, 6 responses (2.6%) were collected from participants under 20 years old. The 20–29 age group accounted for the highest number of responses, with 183 (39.9%). The 30–39 age group contributed 33 responses (14.4%), while the 40–49 age group provided 6 responses. Finally, the 50+ age group contributed 1 survey response.

### 3.2. Results

We applied the two-stage approach to test the model. The measurement model was validated by checking the convergent validity, discriminant validity, and reliability. We tested the measurement model until the critical thresholds were met, they are 0.5 for average variance extracted (AVE), above 0,7 for item loadings when testing convergent validity. HTMT values less than 0.85 for discriminant validity, and Cronbach's alpha values are all greater than 0,7. Several items were removed to ensure the quality of the measurement model. Then, we proceeded to investigate the

structural model. Figure 3.2 showed the results of the inner model.

**Table 1 - Reliability and validity of variables**

| | Cronbach's Alpha | rho_A | Composite Reliability | AVE |
|---|---|---|---|---|
| DE | 0.703 | 0.704 | 0.818 | 0.529 |
| KS | 0.752 | 0.755 | 0.843 | 0.574 |
| LD | 0.713 | 0.713 | 0.839 | 0.636 |
| PTP | 0.711 | 0.715 | 0.822 | 0.536 |

**Table 2 – The discrimination of the variables**

| | DE | KS | LD | PTP |
|---|---|---|---|---|
| DE | **0.727** | | | |
| KS | 0.501 | **0.758** | | |
| LD | 0.333 | 0.297 | **0.797** | |
| PTP | 0.428 | 0.553 | 0.283 | **0.732** |

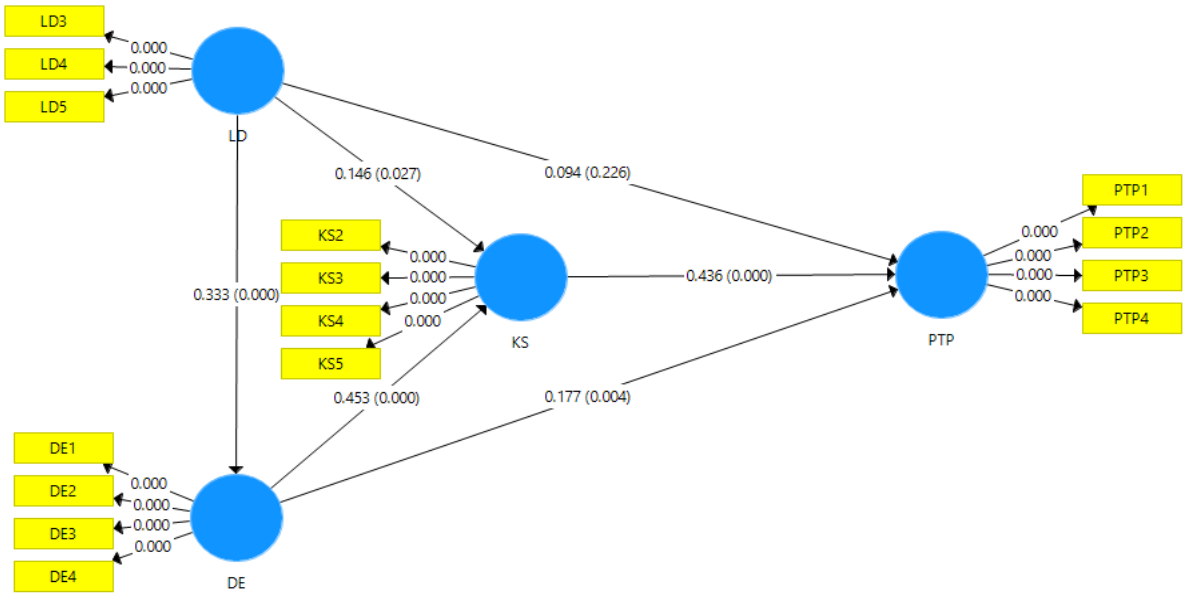

**Fig 2 – The result of research model**

The results of the analysis show that language distance insignificantly influences team performance (β = 0.094, p > 0,05). Therefore, hypothesis H1 was not supported. However, language distance significantly influences dependence (β = 0.333; p < 0.001). Therefore, hypothesis H4 was supported. The results showed that all remaining hypotheses were supported. Dependence positively influences team performance, so H2 was supported (β = 0.177; p < 0.01). Dependence also positively influences knowledge sharing (β = 0.453; p < 0.001). Therefore, H3 was supported. Language distance positively influences knowledge sharing (β = 0.146; p < 0.05), showing H5 was supported. Knowledge sharing positively influences team performance (β = 0.436; p < 0.001), showing that H6 was also supported.

**Table 3 – Results of path coefficient**

| | Original Sample (O) | Sample Mean (M) | Standard Deviation (STDEV) | T Statistics (\|O/STDEV\|) | P Values |
|---|---|---|---|---|---|
| DE -> KS | 0.453 | 0.455 | 0.056 | 8.143 | 0.000 |
| DE -> PTP | 0.177 | 0.179 | 0.061 | 2.904 | 0.004 |
| KS -> PTP | 0.436 | 0.433 | 0.065 | 6.677 | 0.000 |

**Table 5 – Total indirect effects**

| | Original Sample (O) | Sample Mean (M) | Standard Deviation (STDEV) | T Statistics (\|O/STDEV\|) | P Values |
|---|---|---|---|---|---|
| DE -> KS | | | | | |
| DE -> PTP | 0.197 | 0.197 | 0.039 | 5.103 | 0.000 |
| KS -> PTP | | | | | |
| LD -> DE | | | | | |
| LD -> KS | 0.151 | 0.156 | 0.037 | 4.124 | 0.000 |
| LD -> PTP | 0.189 | 0.193 | 0.040 | 4.694 | 0.000 |

Tables 3 and 4 presented the indirect effects. Results showed that language distance indirectly influenced team performance through dependence ($\beta = 0.059$; $p < 0.05$), knowledge sharing ($\beta = 0.064$; $p < 0.05$), and the link between dependence and knowledge sharing ($\beta = 0.066$; $p < 0.001$). This finding also revealed that the mediation path through the link between dependence and knowledge sharing absorbs the most variance as compared to the other two mediation paths.

## IV. DISCUSSION AND CONCLUSION

In this study, we examine the effect of language distance on project team performance. We find that linguistic diversity does not affect project team performance directly, but through dependence, knowledge sharing, and the link between these two factors.

These findings reveal that knowledge sharing plays a crucial role in enhancing project team performance in software development. The results indicate that knowledge sharing is not only a vital factor in teamwork but also a powerful mediator that mitigates the negative effects of language distance and dependence on team performance. In software project teams, knowledge sharing facilitates members in overcoming language barriers and helps establish a shared knowledge base, thereby optimizing team effectiveness. These findings are supported by previous studies, such as Ahmad and Widén (2015), who highlighted that language barriers can be a decisive factor in knowledge sharing, as code-switching beyond the organizational language reduces the ability to share information among employees from diverse linguistic backgrounds.

Similarly, previous research, such as Maznevski and DiStefano (2000), emphasizes that implicit cultural values, including language, influence how team members interact and share knowledge within the group. Although language distance does not directly impact project team performance, it can create a challenging communication environment, leading to difficulties in knowledge sharing and thus reducing team efficiency. However, as highlighted by Lee and Choi (2003), cultural and language barriers can affect the sharing of tacit knowledge—a critical type of knowledge that fosters innovation and problem-solving within teams. Therefore, knowledge sharing serves as an essential bridge, helping to mitigate the negative effects of language distance and dependence.

Within the framework of Bandura's Social Cognitive Theory (SCT), dependence among team members plays a critical role in overcoming language distance barriers. Our findings reveal that dependence (DE) not only has a direct positive impact on knowledge sharing (KS) but also serves as an important mechanism to address the challenges posed by language distance. The relationship LD -> DE -> KS ($\beta = 0.151$) is significantly stronger than the direct relationship LD -> KS ($\beta = 0.146$), affirming that dependence is not merely a mediating factor but also a mitigating force against the

negative effects of language distance on knowledge sharing within teams. Ahmad and Widén (2018) similarly asserted that while code-switching due to language differences may reduce the capacity for knowledge sharing, dependence among team members fosters a willingness to share information and knowledge despite linguistic disparities. This highlights that dependence can enhance collaboration and create a more conducive environment for knowledge sharing, even in multilingual teams.

Our study also demonstrates that dependence influences project team performance (PTP), but its impact becomes more pronounced when mediated through knowledge sharing. Knowledge sharing enhances coordination among team members, improves decision-making processes, and optimizes work performance. This aligns with the findings of Pee et al. (2010), who emphasized that knowledge sharing improves team performance by integrating technical and business expertise. Alongside other theories on knowledge sharing in cross-functional team environments (Holland et al., 2000), our research confirms that knowledge sharing not only compensates for the shortcomings caused by language distance but also equips teams to tackle complex project challenges effectively.

Although our findings indicate that language distance does not directly impact project team performance (PTP), it still exerts an indirect influence through dependence (DE) and knowledge sharing (KS). Previous studies by Hinds et al. (2001) have shown that multilingual teams often face challenges in communication and knowledge sharing, leading to decreased work performance. When language distance is not effectively managed, it can reduce the efficiency of communication and collaboration within the team, negatively affecting decision-making capabilities and task execution in projects.

However, language distance remains a critical factor in multicultural and multilingual teams. While it may not directly affect team performance, if not properly addressed, it can result in adverse effects such as reduced creativity, decreased flexibility in teamwork, and extended timeframes for task completion. Therefore, managing language distance and fostering effective knowledge sharing among team members are crucial to maintaining and enhancing work performance.

While our study is centered on software development teams, the mechanisms identified—namely, the mediating roles of dependence and knowledge sharing in offsetting the negative impacts of language distance—may be applicable to a wide range of industries. For instance, sectors such as manufacturing, finance, and research & development also operate with cross-functional and multilingual teams where effective communication is essential. Harzing (2018) discusses how language barriers in multinational companies can impede communication and collaboration across various sectors. Similarly, Tenzer, Pudelko, and Harzing (2014) highlight the impact of language barriers on trust formation in multinational teams, which is crucial for effective teamwork. Future research could extend our model to these contexts, thereby enhancing the generalizability of the findings.

It is important to note that our study has several limitations. First, the reliance on self-reported data may introduce common method biases, as individual perceptions could be influenced by subjective factors. Incorporating objective performance metrics or multi-source data in future studies could provide a more robust validation of the proposed relationships. Second, the cross-sectional survey design employed in this study limits our ability to draw causal inferences between language distance, dependence, knowledge sharing, and team performance. Longitudinal or experimental research designs would help to better establish causal links and examine these dynamics over time.

Building on the present findings, future research should explore innovative strategies and tools that support multilingual communication in diverse work environments. Investigating the effectiveness of advanced translation technologies, online knowledge-sharing platforms, or intercultural communication training programs could offer practical solutions to mitigate the adverse effects of language distance. Harzing (2018) emphasizes the need for language management strategies in multinational companies to overcome communication challenges. Additionally, comparative studies across different industries could uncover context-specific factors that influence how language distance and dependence interact with knowledge sharing to affect team performance. Lauring and Klitmøller (2015) examine how language diversity impacts knowledge sharing in multinational organizations, suggesting that industry-specific dynamics play a significant role.

In conclusion, language distance indirectly impacts project team performance through dependence and knowledge

sharing. Researchers and managers must pay close attention to minimizing the negative effects of language distance in multilingual environments and develop supportive strategies to optimize knowledge sharing. By addressing these challenges, organizations can not only improve team performance in software development but also enhance collaboration and innovation across a variety of industries.

# FACTORS THAT INFLUENCE CUSTOMER ATTITUDE AND INTENTION TO PURCHASE LIFE INSURANCE: A CASE STUDY IN HO CHI MINH CITY

**Huynh Nguyen Hoai Uyen[1], Pham Thanh Huyen[2]***

[1,2] School of Business, International University, Vietnam National University Ho Chi Minh city..

## ABSTRACT

Life insurance is a financial product that is committed by contract between the buyer and the insurance company. Life insurance is an important tool for risk management and providing financial security (Omar and Owusu, 2007). This financial product is also a financial accumulation tool, so life insurance has witnessed significant growth globally. The insurance industry in general and life insurance in particular has witnessed significant growth worldwide, with premiums reaching approximately $2.8 trillion in 2021 (Swiss Re, 2022). However, Vietnam recorded only 10% of the population participating in life insurance, a much lower penetration rate than other developing countries (Vietnam Insurance Association, 2024). This study mainly investigates the factors that affect customers' attitudes and intentions to purchase life insurance in Ho Chi Minh City. There are 6 variables that the study focused on, including subjective norms, risk aversion motives, saving motives, financial literacy, perceived product benefits, and trustful belief. The findings showed that: (1) savings motives and perceived product benefits have a direct positive influence on purchase intention; (2) while subjective norms, trustful beliefs, and financial literacy have an indirect positive influence on purchase intention through the mediation of attitude.

*Keywords: "attitude", "indêpndent variables", "life insurance", "purchase intention"*

## I. INTRODUCTION

The insurance industry in general and life insurance in particular has witnessed significant growth worldwide, with premiums reaching approximately $2.8 trillion in 2021 (Swiss Re, 2022). This growth is influenced by several factors that influence consumer attitudes towards life insurance products. Life insurance is an important tool for risk management and providing financial security (Omar and Owusu, 2007). Because human life is regarded as the most precious asset, life insurance offers financial security to individuals and their families in times of uncertainty, such as untimely death or an accident (Chaudhary, 2016). According to Zakaria et al. (2016), life insurance not only saves people money, but also shields them against personal risks and hazards. Hofstede (1995) emphasized that the basic goal of life insurance is to protect against financial losses caused by early death.

The Vietnamese market for insurance has expanded considerably over the 30 years prior, with companies growing both in size and in large quantities. To date, there are 81 insurance companies in operation, with total assets exceeding 913 trillion VND. Recent statistics show that the life insurance sector, with more than 11.7 million contracts in force, only covers about 10% of the population. This is in stark contrast to developed countries, where life insurance penetration can reach 70-80%. Although life insurance companies' revenue will decline in early 2024, the overall contributions of insurance to the Vietnamese economy remain significant, such as supporting macroeconomic stability and providing financial security for individuals (Vietnam Insurance Association, 2024). Despite its importance, the literature on the topic of life insurance in Vietnam is still quite limited and lacking in generality. Moreover, with a rapidly developing economy like Vietnam, previous studies cannot portray a comprehensive picture of the current insurance market. Therefore, this paper aims to investigate the role of subjective norms, risk aversion motives, saving motives, financial literacy, perceived product benefits, and trustful belief on purchase intention through consumer attitudes in Vietnam.

The paper opens with an introduction that summarizes the study's background, justification, and purpose. The second section, a literature review, examines the literature on independent variables, attitudes, and purchase intentions for life insurance. Following that, the methodology, results of research, discussion, and conclusion are presented. The final section discusses the implications for practitioners and future investigations.

## II. LITERATURE REVIEW

### 2.1 Factors affecting life insurance purchase intention

This study incorporates a number of factors influencing life insurance purchase intention from earlier research to offer a comprehensive model. By combining subjective factors (including attitude, belief, financial literacy, risk aversion motive and saving motivation), objective factors (sociodemographic traits), and product-related factors (including perceived value), the model offers a comprehensive understanding of the variables influencing consumer decisions. Unlike other research that frequently focuses on distinct elements, this study fills the gap by addressing the interdependence of psychological, social, and economic aspects. As a result, the suggested model is more thorough and includes more elements, offering a better comprehension of the motivation behind purchasing life insurance and acting as a helpful manual for further study and real-world application in the insurance industry.

**Trustful Belief on insurance**

In the insurance business, trust is essential since it fosters strong bonds between policyholders as well as providers. Customers need to feel confident that the insurance company will carry out its end of the bargain, which includes fast claim handling and supplying the promised coverage when needed (Gambetta, 1988). Customers are reassured that their money will be safeguarded by trust, which helps to lower the perceived risk involved with insurance purchases. Research shows that consumers who feel more confident with a provider's dependability are more likely to purchase insurance because they feel more comfortable signing long-term agreements with them (Morgan & Hunt, 1994; Kim et al., 2008). Moreover, trustful belief plays a crucial role in customer loyalty, beyond the factors that influence initial purchase decisions. This makes it an essential component of long-term growth for businesses in the industry (Berry, 1995). In order to establish trust and create enduring client relationships, insurers must prioritise openness, clarity in communication, and dependable service (Sirdeshmukh, Singh, & Sabol, 2002).

**Perceived Product Value**

An assessment of the price of an item and advantages is known as recognised product value, therefore it has a big influence on the decision of the purchaser to buy (Zeithaml, 1988). Perceived value in the life insurance environment is determined by the benefits that clients anticipate, including options for investing, financial security, and protection in the future for those closest to them. When considering insurance, customers will often carefully consider policies, comparing the benefits and costs of purchasing life insurance, as well as whether the level of coverage satisfies their demand (Zakaria et al., 2016). Previous research has found that customers are more inclined to buy life insurance when they perceive it will deliver significant benefits, such as the potential for future wealth growth or comprehensive coverage for health risks (Lim & Haberman, 2003; Chua, 2018).

**Subjective norms**

Subjective norms are the expectations of significant others - friends, family, and coworkers - that influence people's felt social pressure to participate in or refrain from participating in particular behaviors (Fishbein & Ajzen, 1975). These conventions have a big impact on how customers want to use life insurance and make decisions. People are more likely to consider and consider purchasing life insurance when influential people or important social groups around them promote the purchase of life insurance (Ajzen, 1991). These effects are especially noticeable in communal cultures such as Vietnam, where family and community ties deeply influence an individual's decision (Hofstede, 2001). According to research, people in such societies are more likely to consider their social circle's attitudes and behaviors when making financial decisions, such as whether to buy life insurance (Lee & Neale, 2012; Lim et al., 2014). Based on studies, subjective norms can create either positive or negative pressure; if the widespread opinion is that life insurance is necessary for financial stability, people are more inclined to buy it. However, if life insurance is considered septically or as superfluous, social pressure may deter potential buyers (Chua, 2018). Understanding the impact of subjective norms is critical for insurance firms because leveraging positive social influence through targeted marketing or testimonials can enhance consumer engagement and purchase intention (Kotler & Keller, 2016; Lin et al., 2017).

**Saving motives**

Saving motives encompass a range of objectives that drive individuals to secure life insurance, including preparing for emergencies such as illness or unemployment, as well as investing in significant expenditures like housing and medical care (Katona, 1975; Harris et al., 2002; Webley et al., 2000). With the main task of providing a source of

money in unforeseen circumstances, life insurance is considered an important financial safety net in today's volatile society. Understanding this, insurance companies can adjust their products to meet customers' needs effectively, promoting life insurance not only as a means of protection but also as a strategic investment for future financial stability and security (Canova et al., 2005; Huang et al., 2016).

**Risk aversion motives**

Risk aversion motives reflect an individual's preference for certainty and stability over uncertainty and potential risks (Rousseau et al., 1998). This psychological bias significantly influences financial decision-making, especially the purchase of insurance products. Studies have shown a positive correlation between risk aversion and insurance consumption, suggesting that individuals with higher risk aversion tend to seek protection through life insurance (Huang et al., 2016; Lin et al., 2017). For these individuals, life insurance will play an extremely important role in reducing the risks associated with unexpected events, such as illness, disability, or death. It provides them with peace of mind when problems arise that could lead to worrying financial instability for themselves and their families in the future (Browne & Kim, 1993). Furthermore, their desire to protect their personal finances and the quality of life of their dependents motivates them to view life insurance as an important part of their risk management strategy. Understanding this need, insurers can leverage this understanding by promoting a greater focus on the safety and security that life insurance provides. This can effectively attract risk-averse consumers who value safety and financial stability.

**Financial literacy**

According to Bhatia, Bhat & Tikoria (2024), the ability to understand and use knowledge to make decisions is called financial literacy. It includes understanding important financial concepts, such as compound interest, risk management, and the essentials for long-term financial stability (Ismail, Roslan & Shamsuddin, 2024). These studies show that individuals with financial knowledge are more likely to participate in financial plans such as life insurance (Tewari & Sanjay, 2024). However, financial literacy alone is not enough to motivate interest in participating in life insurance. Financial literacy requires other complementary factors, such as risk perception and savings motivation, to make the decision to buy life insurance (Briguglio, Camilleri & Fenech, 2024). It can be said that financial literacy significantly enhances the ability to manage financial matters. According to Liu et al. (2025), financial literacy can help mitigate the negative consequences of impulsive decisions. Individuals who tend to accumulate less wealth and do not have a retirement plan tend to have lower levels of financial literacy (Yu et al., 2025). Lack of financial literacy can have a long-term negative impact on an individual's financial stability.

**Attitude toward life insurance**

The theory of planned behavior (Ajzen, 1991) emphasizes that an individual's attitude is an important predictor of their behavioral intentions, meaning that people with positive attitudes are more likely to perform certain behaviors. In the life insurance sector, positive attitudes correlate with a higher probability of purchasing those products (Ajzen, 1991; Salem & Salem, 2018). Further research suggests that customers' understanding, awareness, and knowledge play a pivotal role in shaping their attitudes toward financial products, especially life insurance (Tania Driver, 2018). When individuals understand exactly what benefits and security life insurance can provide, they will have a more positive attitude toward it. The understanding referred to here may include the recognition of life insurance as a means of financial protection, an investment for future emergencies, or a means of protecting the family from financial crises. Therefore, increasing knowledge and changing the perspective of customers are important strategies for insurers to have a positive impact on attitudes and ultimately promote purchase intentions. Our research investigated the impact of independent factors on the mediating variable attitude. Consequently, the following hypotheses were proposed:

H1.1: Subjective norms directly affects attitude toward life insurance

H1.2: Risk aversion motives directly affects attitude toward life insurance

H1.3: Saving motives directly affects attitude toward life insurance

H1.4: Financial literacy directly affects attitude toward life insurance

H1.6: Trustful belief of insurance directly affects attitudes toward life insurance

H1.7: Perceived product benefits of insurance directly affects attitudes toward life insurance

### 2.2 Life insurance purchase intention

The desire to buy life insurance is reflected in consumers' tendency to buy personal insurance (Sheeran 2002). Purchase intention is a multidimensional concept that represents a consumer's intentional decision or willingness to purchase a product or service. It indicates a consumer's purchasing opportunities, making it a key predictor of actual purchasing behavior (Fishbein & Ajzen, 1975). While intentions don't always result in revenue, they are a reliable sign of customer interest and commitment. Research on life insurance demand has become popular since the 1960s (Hwang & Gao, 2003). Family income (Beck & Webb, 2003; Browne & Kim, 1993), inflation (Beck & Webb, 2003; Outreville, 1996), insurance premiums (Browne & Kim, 1993; Outreville, 1996), and socio-cultural factors (Chui & Kwok, 2008) are all important factors driving the demand for life insurance. Furthermore, socio-demographic characteristics, financial knowledge, and reasons for risk aversion all have a significant impact on consumer intentions (Jahan and Sabbir, 2018). This study examined the influence of eight factors (attitude, subjective norms, ris aversion motives, saving motives, financial literacy, trustful belief, perceived product benefits) on the intention to purchase life insurance. Therefore, the following hypotheses were proposed:

H2.1: Attitude toward life insurance directly affects intention to purchase life insurance.

H2.2: Subjective norms directly affects purchase intention life insurance.

H2.3: Risk aversion motives directly affects purchase intention life insurance.

H2.4: Saving motives directly affects purchase intention life insurance.

H2.5: Financial literacy directly affects purchase intention life insurance.

H2.7:Trustful belief of insurance directly affects purchase intention life insurance.

H2.8: Perceived product benefits of insurance directly affects purchase intention life insurance.

Furthermore, this study also examines the mediating role of customer attitudes between independent variables and life insurance purchase intention. According to Mahdzan and Victorian (2013), people with strong savings motivation tend to have more positive attitudes towards financial products, especially life insurance. Meanwhile, Zeithaml (1988) argued that when customers are aware of specific values and benefits of the product, they will have more positive attitudes. Regarding product benefits, Lim and Haberman (2003) emphasized that factors such as financial protection and estate planning have a strong impact on attitudes. Although Lusardi et al. (2010) argued that people with higher financial literacy tend to have more positive attitudes towards complex financial products such as life insurance. And according to Ajzen (1991), subjective norms—social pressure from family, friends, or colleagues—have a strong influence on attitudes. But according to Morgan and Hunt (1994), trust in the honesty and trustful belief of the supplier will increase the customer's positive attitude towards the product. This research focused on the mediating variable (attitude) to see how independent factors affected intention for buying life insurance. Thus, the following hypotheses were proposed:

H3.1: Subjective norms indirectly affects intention to purchase life insurance through the mediation of attitude

H3.2: Risk aversion motives indirectly affects intention to purchase life insurance through the mediation of attitude

H3.3: Saving motives indirectly affects intention to purchase life insurance through the mediation of attitude

H3.4: Financial literacy indirectly affects intention to purchase life insurance through the mediation of attitude

H3.6: Trustful belief of insurance indirectly affects intention to purchase life insurance through the mediation of attitude

H3.7: Perceived product benefits of insurance indirectly affects intention to purchase life insurance through the mediation of attitude

## III. METHODS

### 3.1 Research Sample

The study's target group is those aged 18 to 59 who live in Ho Chi Minh City, Vietnam, with a preference for those who are familiar with life insurance products and have the financial means to make educated judgments. The research intends to collect data from 200 respondents, which is deemed sufficient for conducting a representative and statistically

relevant examination of customer views and purchase intentions for life insurance.

### 3.2 Data Collection

We obtained data for offline surveys in two ways. The first method of data collection was through Vietnamese life insurance firms. Insurance firms gathered offline questionnaires within three weeks. However, many consumers did not come to obtain life insurance, resulting in a lower number of responders. For online surveys, data was collected using a Google Doc Form. The primary method was to gather replies online by publishing the questionnaire form in online social groups and forums on Facebook. There are several organizations formed for clients who use life insurance in Vietnam to discuss their experiences while purchasing life insurance, particularly in Ho Chi Minh City from November to December 2024.

## IV. FINDINGS

### 4.1 The Profile of the Respndents

A total of 261 respondents over the age of 18 from Vietnam were polled using both online and offline approaches. Table 1 presents an overview of the respondents' demographic characteristics. Females accounted for 49.04% of the total sample. This equates to 128 of 261 responders being female. The other 133 people were men, accounting for 50.96% of all replies.

The bulk of respondents were under 35 years old, accounting for 43.7% of the 261 survey samples. Participants aged 35 to 45 years accounted for 23.4%, while those aged 46 to 55 made up 26.1%. A lower proportion of responders, 5.4%, were aged 56 to 65, while 1.5% were beyond 65.

The largest group of respondents, 38.7%, earn between 10 - 15 million dong, followed by 23.4% of respondents who earn Under 10 million dong. A lower percentage of individuals earns between 16 and 20 million dong (19.5%), 6.5% earn between 21 and 25 million dong, and 5.7% earn between 26 and 30 million dong. The remaining respondents are divided among the higher income brackets: 2.3% make between 31 and 45 million dong, while 3.8% earn over 45 million dong.

About 53.6% held a bachelor’s degree or equivalent. The second-largest group, 19.9%, had a high school diploma, while 16.1% had a technical school diploma or certificate. Only 10% of respondents had earned a master’s degree, and 0.4% had a PhD.

**Table 1. Summary of Demographic Information**

| Variables | Categories | Frequency | Percentage |
|---|---|---|---|
| | Male | | |
| | Female | 133 | |
| **Gender** | Under 35 | 128 | 51 |
| | 35 - 45 | 114 | 49 |
| **Age** | 46 - 55 | 61 | 43.7 23.4 |
| | 56 - 65 | 68 | 26.1 |
| | Above 65 | 14 4 | 5.4 |
| | Under 10 million dong | 61 | 1.5 |
| | 10 - 15 million dong | 101 | 34.1 31.4 |
| **Income** | 16 - 20 million dong | 51 | 16.9 |
| | 21 - 25 million dong | 17 | 5.7 5.7 2.3 |
| | 26 - 30 million dong | 15 6 | 3.8 |
| | 31 - 45 million dong | 10 | 19.9 16.1 |
| | Above 45 million dong | 52 | 53.6 |
| | Secondary school certificate | 42 | 10 |
| | Diploma/technical school certificate | 140 | 0.4 |
| **Education** | Bachelor’s degree or equivalent | 26 | |
| | Master’s degree | 1 | |
| | Doctoral degree | | |

### 4.2 Reliability Test

This study uses reliability analysis to investigate items that are unrelated in each aspect to increase the quality of the final results. Table 2 shows the composite reliability of each variable. According to Hair et al. (2009), a meaningful observation variable should have an outer loading coefficient of at least 0.7. The authors propose that values below 0.4 be eliminated from the model. After determining if all the study items met Hair et al.'s (2007) standards, some with outer loadings less than 0.7 were removed from the model. It is RAM 1. The remaining things in the table are very reliable.

**Table 2. Scales Reliability**

| Constructs | Items | Indicator Reliability |
|---|---|---|
| Subjective norms | SN1/SN2/SN3 | .884/.935/.922 |
| Risk aversion motives | RAM2/RAM2/RAM3/RAM4/RAM5 | .822/.830/.820/.787 |
| Financial literacy Saving | FL1/FL2/FL3 | .869/.876/.894 |
| motives | SM1/SM2/SM3/SM4 | .884/.873/.911/.776 |
| Trustful Belief | T1/T2/T3 | .892/.920/.940 |
| Perceived Product Benefits | PB1/PB2/PB3/PB4/PB5/PB6 | .830/.887/.838/.870/.891/.864 |
| Attitude | ATT1/ATT2/ATT3/ATT4 | .902/.952/.947/0.933 |
| Purchase intention | PI1/PI2/PI3/PI4 | .914/.845/.920/.922 |

### 4.3 Validity Test

Convergent validity assesses the extent to which observed measurements of a latent concept are strongly positively associated. Hair et al. (2014) define a valid measurement scale as one in which a latent variable explains for more than 50% of the variation in the observed variables. This is represented by an Average Variance Extracted (AVE) value of 0.5 or higher. Discriminant validity was assessed using the Fornell-Larcker Criterion, as shown in Table 22. According to this criterion, the square root of the Average Variance Extracted (AVE) for each construct (displayed on the diagonal) should be greater than its correlations with other constructs to ensure that each construct is distinct. The results indicate strong discriminant validity for all constructs. These results confirm that the constructs in the model are distinct from one another, supporting the discriminant validity of the measurement model.

**Table 3. Variable Average Variance Extracted**

| Variable | AVE |
|---|---|
| Subjective norms | 0.835 |
| Risk aversion motives | 0.604 |
| Financial literacy | 0.774 |
| Saving motives | 0.744 |
| Trustful Belief | 0.842 |
| Perceived Product Benefits | 0.746 |
| Attitude | 0.871 |
| Purchase intention | 0.811 |

**Table 4. Discriminant Validity**

| Variable | ATT | FL | PB | PI | RAM | SM | SN | T |
|---|---|---|---|---|---|---|---|---|
| ATT | 0.933 | | | | | | | |
| FL | 0.628 | 0.880 | | | | | | |
| PB | 0.869 | 0.590 | 0.864 | | | | | |
| PI | 0.873 | 0.489 | 0.803 | 0.901 | | | | |
| RAM SM | 0.305 | 0.236 | 0.359 | 0.300 | 0.777 | | | |
| SN | 0.547 | 0.488 | 0.600 | 0.512 | 0.483 | 0.862 | | |
| T | 0.580 | 0.499 | 0.519 | 0.534 | 0.340 | 0.392 | 0.914 | |
| | 0.856 | 0.604 | 0.789 | 0.813 | 0.235 | 0.474 | 0.540 | 0.917 |

### 4.4 Hypotheses Testing

**Factors Affecting attitude**

**Table 5. The direct impact on customer's attitude**

| Hypothesis | | Path coefficient | T-value | Result |
|---|---|---|---|---|
| H1.4 | Financial literacy -> Attitude | 0.062 | 1.366 | Rejected |
| H1.6 | Perceived Product Benefits -> Attitude | 0.465 | 8.477 | Accepted |
| H1.2 | Risk aversion motives -> Attitude | -0.009 | 0.318 | Rejected |
| H1.3 | Saving motives -> Attitude | 0.018 | 0.402 | Rejected |
| H1.1 | Subjective norms -> Attitude Trustful | 0.090 | 2.662 | Accepted |
| H1.5 | Belief -> Attitude | 0.397 | 6.784 | Accepted |

According to the above table, three factors - perceived product benefits, subjective norms, trusting belief, and visual appearance - had a substantial direct impact on attitude, with T-values more than 1.96 (Hair, Sarstedt, Ringle, & Mena, 2012).

**Factors Affecting Life Insurance Purchase Intention**

**Table 6. The direct impact on life insurance purchase intention**

| Hypothesis | | Path coefficient | T-value | Result |
|---|---|---|---|---|
| H2.5 | Financial literacy -> Purchase intention | -0.157 | 3.527 | Accepted |
| H2.7 | Perceived Product Benefits -> Purchase intention | 0.132 | 1.959 | Rejected |
| H2.3 | Risk aversion motives -> Purchase intention | 0.015 | 0.439 | Rejected |
| H2.4 | Saving motives -> Purchase intention | 0.045 | 1.029 | Rejected |
| H2.2 | Subjective norms -> Purchase intention | 0.045 | 0.922 | Rejected |
| H2.6 | Trustful Belief -> Purchase intention | 0.259 | 2.708 | Accepted |
| H2.1 | Attitude -> Purchase intention | 0.579 | 6.549 | Accepted |

Based on the data in table 7, it can be inferred that Attitude (β=0.579, T=6.549) and Trustful Belief (β=0.259, T=2.708) have statistically significant and positive relationships with life insurance purchase intention. On the other hand, Financial Literacy (β=-0.157, T=3.527) has a negative impact on purchase intention, with the relationship being statistically significant. Therefore, hypotheses H2.1, H2.6 and H2.5 were accepted.

**Table 7. Indirect effects on life insurance purchase intention**

| Hypothesis | | Path coefficient | T-value | Result |
|---|---|---|---|---|
| H3.4 | Financial literacy -> Attitude -> Purchase intention | 0.062 | 1.366 | Rejected |
| H3.6 | Perceived Product Benefits -> Attitude -> Purchase intention | 0.465 | 8.477 | Accepted |
| H3.2 | Risk aversion motives -> Attitude -> Purchase intention | -0.009 | 0.318 | Rejected |
| H3.3 | Saving motives -> Attitude -> Purchase intention | 0.018 | 0.402 | Rejected |
| H3.1 | Subjective norms -> Attitude -> Purchase intention | 0.090 | 2.662 | Accepted |
| H3.5 | Trustful Belief -> Attitude -> Purchase intention | 0.397 | 6.784 | Accepted |

As shown in table 8, the indirect effects of attitude towards three factors on life insurance purchase intention are analyzed. Perceived Product Benefits (β=0.269), Trustful Belief (β=0.230) and Subjective Norms (β=0.052) have significant positive indirect effects on purchase intention through attitude.

**Table 8. Total effects on life insurance purchase intention**

| | Effect on Purchase Intention | | |
|---|---|---|---|
| Variable | Direct | Indirect | Total |
| Financial literacy (FL) | -0.157 | - | -0.157 |
| Perceived Product Benefits (PB) | 0.132 | 0.269 | 0.401 |
| Risk aversion motives (RAM) | - | - | - |
| Saving motives (SM) | - | - | - |

| | | | |
|---|---|---|---|
| Subjective norms (SN) | - | 0.052 | 0.052 |
| Trustful Belief (T) | 0.259 | 0.230 | 0.489 |
| Attitude (ATT) | 0.579 | - | 0.579 |

In summary, regarding the total effects on life insurance purchase intention, Attitude (ATT) has the largest impact, with a total effect of β = 0.579, followed by Trustful Belief (β = 0.489), Perceived Product Benefits (β = 0.401), Subjective Norms (β = 0.097) and Financial Literacy (β = -0.157), respectively.

Attitude and purchase intention have fairly high explained variances (R2) for the endogenous components (84.2% and 79.7%, respectively). The findings of the structural model are visually displayed in Figure 1.

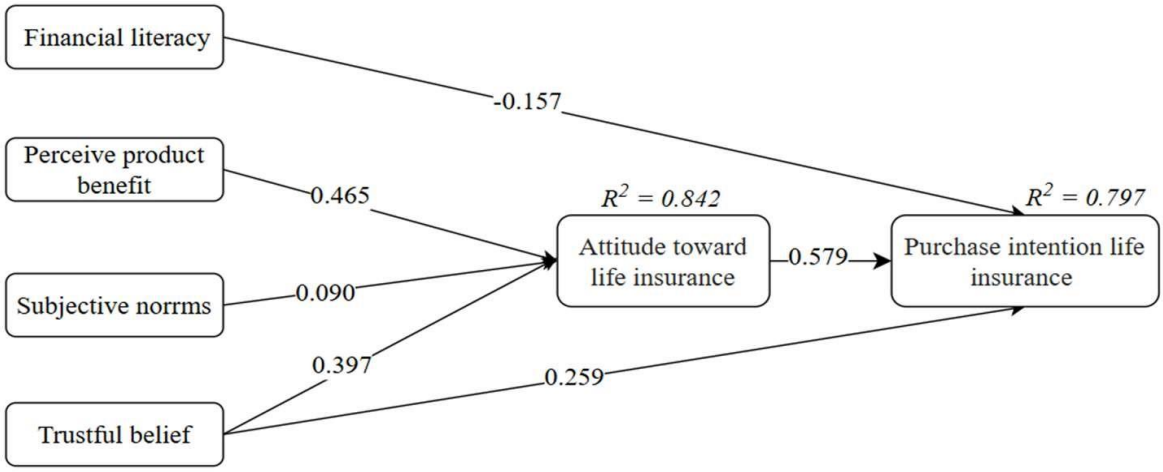

**Figure 1.** Results of the structural model

## V. DISCUSSIONS AND CONCLUSIONS

### 5.1. Discussions

The Impact of Subjective Norms on Life Insurance Purchase Intention Through the Mediation of Attitude

The study found a substantial positive correlation between subjective norms and attitudes towards life insurance. This shows that those who get social support or pressure from family, friends, and coworkers to buy life insurance are more likely to have a positive opinion toward it. Participants who reported significant family support for life insurance, for example, had a more favorable outlook on its advantages and usability. However, the direct influence of subjective standards on purchase intention was not statistically significant. While prior studies, such as Ajzen (1991), stressed the impact of social norms in customers' insurance purchase choices, this study discovered that subjective norms mostly indirectly influenced purchase intention via attitude mediation. Positive social reinforcement enhanced the chance of acquiring life insurance, as evidenced by a strong mediation effect. This complicated finding emphasizes the need of promoting good social discourse around life insurance. By using the power of huge social groups, insurers may alter attitudes and indirectly affect consumer behavior.

The Role of Risk Aversion Motives in Purchase Intention

Risk aversion motives were found to have a significant effect on both attitude and purchase intention. Respondents who prefer certainty and stability tend to value life insurance as a financial safety net. These people see life insurance as a reliable financial cover when they face health risks (they are reimbursed, have money to pay for treatment, surgery, and so on) or life hazards (family members receive compensation, may continue to live well). The study also clearly demonstrates that risk aversion reasons have a twofold impact on buyers. While they have a direct impact on clients' purchasing intentions, they also boost their willingness to acquire life insurance by altering their views. This finding is also consistent with the work of Gokhan and McKenzie (2014), who stressed the importance of risk reduction in insurance uptake. As a result, life insurance companies should stress open communication of corporate policies, and advisors should reinforce these points during the sales process if consumers purchase life insurance. Especially given the nature of life insurance, a product that requires long-term companionship. Customers need to know that when economic risks occur, customers can still maintain regular insurance premium payments for 10-20 years. Therefore,

customers should only participate in life insurance when they can pay for more than 10 years. Highlighting these aspects can resonate with risk-averse individuals and reinforce both attitudes and intentions to purchase life insurance.

Saving Motives and Their Influence on Purchase Intention

Saving motivation significantly predicted attitude and purchase intention. Among these motives, saving for emergencies was the most prominent, reflecting customers' higher awareness of unforeseen events that could seriously impact their personal and family finances. The study identified a strong mediating effect of attitude between saving motive and purchase intention, thus emphasizing the importance of promoting positive perceptions of life insurance as a valuable savings tool. This study also replicated the findings of Katona (1975), reinforcing the results of identifying saving motives as reflecting consumers' sensitivity to risks. The study has contributed to strengthening and emphasizing the role of psychological factors of saving that strongly affect attitudes. Consistent with the research results of Mahdzan and Victorian (2013), the current study shows that attitudes have a strong impact on purchase intention through attitudes. In addition, the study has emphasized the role of savings through data from emergencies, retirement plans, and income continuity. This is completely consistent with the findings of Canova et al. (2005) and Huang et al. (2016). The studies by Canova and Huang also note that life insurance serves as a dual-purpose financial tool - both as a protection against unforeseen risks and as a long-term investment mechanism. Promotional campaigns by insurance companies that focus on the dual role of life insurance will bring positive feedback from customers. When life insurance is both a protection mechanism and a financial planning tool, transparency in these roles can increase its appeal to consumers who have a genuine need to save.

Financial Literacy as a Determinant of Purchase Intention

Financial literacy significantly affects attitude and purchase intention. People with higher levels of financial knowledge have a better understanding of the benefits of life insurance. That allows them to make more informed decisions than other individuals. This finding is consistent with previous studies by Lusardi et al. (2010), which highlighted the important role of financial literacy in shaping consumer behavior. Interestingly, financial literacy had both direct and indirect effects on purchase intentions, indicating its particular importance. While it directly equips individuals with the knowledge to appreciate life insurance benefits, it also fosters positive attitudes that further enhance their purchase intentions. These findings highlight the need for insurers to invest in educational initiatives, such as seminars, webinars and user-friendly materials, to improve consumers' financial literacy and empower them to make confident, informed decisions.

The Role of Perceived Product Benefits

Perceived product benefits had a significant positive impact on attitudes and purchase intentions. Respondents emphasized specific benefits of life insurance, including financial security, wealth planning, and risk reduction. The results of the study show that when life insurance is viewed as a tool to reduce financial uncertainty and provide future financial stability, the intention to purchase life insurance will also change positively. These findings are consistent with Zeithaml's (1988) assertion that perceived value is an important factor in customers' decisions. Lim and Haberman (2003) also found that people tend to be more interested in life insurance when they perceive it as both a risk management tool and a financial asset. In addition, the study highlighted long-term stability and reduced financial uncertainty, like the findings of Zakaria et al. (2016). They found that perceived product benefits, such as comprehensive health coverage and financial protection, are important drivers in life insurance adoption. This implies that, while understanding the physical benefits of insurance may spark immediate interest, building favorable views about insurance might increase the effect and lead to long-term engagement. By contextualizing these findings within the Vietnamese market, the study provides a rich contrast to other developing markets. In a 2019 study by Weedige et al., they highlighted the need for culturally appropriate marketing approaches to effectively highlight product benefits.

To capitalize on these findings, life insurance marketers could create marketing messages that emphasize the real benefits of their products, thereby improving attitudes and purchase intention.

**5.2. Conclusion**

By combining subjective norms, saving motives, risk aversion motives, financial literacy, and perceived product benefits, the study highlighted the mediating role of attitude in these relationships. The findings further supported the

conclusions of previous studies that while subjective norms and risk aversion motives have direct pathways to purchase intention, other variables, such as saving motives, financial literacy, and perceived product benefits - exert their influence primarily through the mediating role of attitude. These results highlight the complex interplay between personal motivation, social influence, and cognitive understanding in driving life insurance adoption. A key finding of this study is the negative relationship between financial literacy and intention to purchase life insurance. Although financial literacy is considered a factor that promotes informed decision-making, its impact on insurance purchase behaviour is more complex. Financial literacy makes consumers more cautious when evaluating insurance products and reduces their likelihood of purchasing life insurance. While financial literacy induces more cautiousness and conservatism, the remaining independent variables may positively influence the intention to purchase life insurance through the mediating variable attitude. The comprehensive analysis of the study provides insights into customer behavior and highlights the important role of cultivating positive attitudes as a path to enhancing purchase intentions. These results underscore the complex interplay between personal motivations, social influences, and cognitive understanding in driving life insurance adoption. The study's comprehensive analysis provides insights into customer behavior and highlights the critical role of fostering positive attitudes as a pathway to enhancing purchase intentions.

**Theoretical Implications**

This study has outlined the theoretical aspects of life insurance purchase behavior more clearly by making some outstanding contributions. First, by incorporating two important variables in financial decision-making, namely financial knowledge and saving motives, the study has extended Ajzen's Theory of Planned Behavior. The paper enriches the theoretical model and better captures the nuances of consumer behavior in the life insurance market. It thus emphasizes the importance of knowledge and cognitive processes in forming key psychological constructs such as attitudes.

Secondly, attitude—the study's mediation variable—has been strengthened as a bridge that converts external factors, such as subjective standards and risk aversion reasons, into precise intents. This study focuses on the attitudinal processes that drive consumer choices and underlines the need of including cognitive and emotional mediators into theoretical frameworks. By establishing this hypothesis, we may enhance the effect of cognitive and social pressure on attitudes. Following that, it offers a thorough explanation of the customer interest in life insurance.

Furthermore, the study applied global ideas to local consumer behavior by taking into account Vietnam's cultural and economic contexts. Vietnam's collectivist culture heavily relies on shared values and social conventions to influence decision-making. Subjective standards have a unique influence in a rising country such as Vietnam, where the middle class is growing. This tweak has helped to improve the appropriateness of current models in Vietnam. It opens up potential for other emerging economies with comparable cultural traits to use this rich theoretical model.

Finally, ensuring long-term financial stability and minimizing risks is one of the main tasks of life insurance that the study wants to emphasize. Through the importance of ensuring financial stability and minimizing risks, the study can determine the level of consumer interest in life insurance. From that result, the study provides valuable insights and, at the same time, depicts a comprehensive picture of the factors that motivate consumers to seek financial security by investing in life insurance. Overall, these findings have partly strengthened the theoretical foundation for future research, especially research in markets with growing economies and developing financial systems.

**Practical Implications**

As a result, governments and insurance firms will find this study especially relevant. We advocate that insurance businesses use the relationships between influencing elements to combine and diversify their marketing efforts. This will build additional bridges, allowing people to get life insurance more easily and consistently. Furthermore, our research indicates that people in their peak earning years (35 to 55 years old) are highly interested in life insurance. By concentrating on these elements, insurance businesses may develop a successful customer strategy.

The outcome shows that trustful belief has both direct and indirect effects on the intention to purchase life insurance of customers. The nature of life insurance contracts is that they are long-term contracts. Along with financial commitments in the event of a crisis, trust is considered a core element and the foundation for the relationship between customers and insurance companies. Research shows that consumers who feel more confident with a provider's

dependability are more likely to purchase insurance because they feel more comfortable signing long-term agreements with them (Morgan & Hunt, 1994; Kim et al., 2008). It can be said that trust is the customer's expectation that the insurance company will fulfill the commitments stated in the contract, especially in difficult times, such as when customers or their families need financial support due to risks. Although the life insurance market is growing, people's trust in insurance is still limited. Especially after the crisis of trust in recent years, insurance companies are having a hard time rebuilding customer trust. First, insurance companies need to increase product transparency. This includes providing full contract information, terms and conditions, and additional costs. In addition, insurance companies also need to publicize and resolve insurance benefits quickly, in accordance with commitments and conveniently for customers. Customers being clearly informed of the necessary documents and waiting times will help them not feel lost or lose confidence when claiming benefits. Improve the compensation process by designing a simple, easy-tounderstand, and effective process. Especially applying digital technology to optimize the process and minimize errors. In addition, it is important to focus on building and enhancing the professionalism of the distribution channel team. Consultants need to have solid knowledge of insurance products and compensation processes to avoid employees providing incomplete information, answering questions, and handling requests ineffectively, leading to misunderstandings and loss of trust from customers. Last but not least, the complaint response and settlement process of insurance companies needs to be concerned and improved. When there is a complaint about insurance benefits, companies need to have a complaint handling process that is as effective as or more effective than the compensation process. Handling complaints transparently, quickly, and accurately will help the company maintain good relationships with customers and enhance the company's image. Trust plays an extremely important role in building customer loyalty and promoting sustainable development for insurance companies. To achieve this, insurance companies need to always ensure service quality, transparency in commitments and benefits, as well as improve customer experience. Customer loyalty is not only the driving force for current development but also a solid foundation for long-term growth in the future.

Perceived product benefits have a significant positive impact on attitude and intention to purchase life insurance. Meanwhile, financial knowledge has a significant negative impact on intention to purchase. The contrast between perceived product benefits and financial knowledge in the study has highlighted the mediating role of attitude. The mediating variable of attitude acts as a psychological bridge, helping consumers easily use financial knowledge to make informed and confident decisions. When consumers have higher financial knowledge, they tend to scrutinise financial products such as life insurance. They easily recognise the potential risks, such as additional costs and investment performance related to policies. From there, they hesitate or refuse to purchase life insurance despite recognising its basic benefits. Therefore, attitude plays an important mediating role, helping to balance rational financial evaluation with emotional and psychological motivation in making life insurance purchase decisions. It can be said that the results of this research can provide important opportunities and strategies for insurance companies. First, raising awareness of insurance benefits is important, as many people do not fully understand or have insufficient awareness of the value of life insurance. Therefore, providing easy-to-understand information about product benefits, especially the intangible values they bring, such as family protection and financial risk avoidance. Companies should avoid focusing too much on complex financial factors such as the level of return or investment; companies should emphasize the peace of mind and protection that insurance brings and help customers feel more clearly the intangible value of life insurance. In addition, financial literacy can make customers cautious and skeptical because they are able to deeply analyze the financial elements of life insurance. They may perceive unreasonable costs, investment performance, or lack of transparency in the contract, thereby reducing their intention to buy insurance. To overcome this situation, insurance companies should provide detailed information about insurance benefits, costs, and contract terms without creating a feeling of being "hidden" about potential costs. This transparency can reduce the concerns of financially literate customers about participating in insurance. To make it accessible to the majority of people, insurance companies need to simplify financial products instead of complicated insurance contracts. Adjustments in marketing strategies, product optimization, and information simplification by companies can increase people's awareness and participation in insurance.

According to research, saving motives and risk aversion motives are two variables that are inextricably connected

and complement one another in influencing the desire to acquire life insurance. Individuals who tend to be risk averse often seek solutions through safe financial solutions such as life insurance. It provides them with peace of mind when problems arise that could lead to worrying financial instability for themselves and their families in the future (Browne & Kim, 1993). Understanding this psychological tendency helps insurance companies easily highlight the protective role of life insurance by exploiting the fear of risk. For example, building strong communication messages, providing real-life situations, and risk simulation videos. On the contrary, insurance companies can receive negative attitudes from these risk-averse individuals when they do not trust or are concerned about the transparency and commitment of the companies. In addition, for individuals who are interested in the financial value of life insurance, companies can turn products that only have a protective function into products that can meet dual needs (both protection and asset growth). Saving motives encompass a range of objectives that drive individuals to secure life insurance, including preparing for emergencies such as illness or unemployment, as well as investing in significant expenditures like housing and medical care (Katona, 1975; Harris et al., 2002; Webley et al., 2000). Thus, insurance firms must adapt their policies to meet the savings needs of each consumer. At the same time, they need to develop confidence by providing transparent information regarding interest rates, accumulation processes, and withdrawal terms. Based on the above analysis, insurance companies should have advertising campaigns focusing on promoting positive perceptions of life insurance as a savings tool with dual value. Life insurance is both a protection product and a tool for family financial planning. However, it should be reiterated that the prerequisite for this campaign to be effective is the effort to strengthen trust and the quality of service provided by insurance companies.

Subjective norms have been found to have a favorable impact and serve as the foundation for attitudes that in turn impact the desire to buy life insurance. On the other hand, the direct effect of subjective standards on purchase intention remains modest. According to Fishbein and Ajzen (1975), subjective norms are the expectations of significant others—friends, family, and coworkers—that influence people's felt social pressure to participate in or refrain from participating in particular behaviors. Attitudes are the bridge between subjective norms and purchase intention. Buyers often have to have positive attitudes toward the product, such as trust and need for financial security, before intending to buy, even when society supports them to do so. It can be concluded that customers' intention to purchase life insurance cannot be based solely on social recommendations and expectations. Therefore, insurance firms should focus on strategies that highlight product benefits, foster trust, and reinforce the financial role of the product. These factors can have a stronger impact on converting attitudes into purchase intentions than subjective norms.

**Limitations and Recommendations for Future Research**

The study has some weaknesses although it provides some useful information. Since this study focused only on Ho Chi Minh City, it is limited in its ability to apply the findings to other locations or cultures. The scope of the study could be increased by including different geographic and demographic contexts. Furthermore, the sample was predominantly young and female, which may have led to demographic bias. Future research should seek more equitable representation to confirm these findings. Furthermore, the study focused on a narrow set of characteristics, ignoring issues such as digital engagement, app usability, and cultural variations. Exploring these additional variables could provide a more complete picture of customer behavior. Researchers should extend previous findings and lead to the creation of stronger strategies to promote life insurance adoption in diverse markets.

**APPENDIX**

This includes the survey's measuring questions for the suggested structures. Respondents were asked to rate their response on a Likert scale of 1 to 5, where 1 represented "strongly disagree" and 5 represented "strongly agree."

| Construct | Code | Measurement items | Sources |
|---|---|---|---|
| Subjective norms | SN1 | Most people who are important to me think I should purchase a life insurance policy | Han et al. (2010) |
| | SN2 | My friends who are important to me would want me to purchase a life insurance policy | |
| | SN3 | My colleagues/peers whose opinions I value would prefer that I purchase a life insurance policy | |
| Risk aversion motives | RAM1 | I do not feel comfortable about taking chances | Mandrik and Bao (2005) |
| | RAM2 | I prefer situations that have foreseeable outcomes | |
| | RAM3 | Before I make a decision, I like to be absolutely sure about how things will turn out | |
| | RAM4 | I avoid situations that have uncertain outcomes | |
| | RAM5 | I feel nervous when I have to make decisions in uncertain situations | |
| Financial literacy | FL1 | I understand the life insurance policy | Mahdzan and Victorian (2013); Hassan (2014) |
| | FL2 | I know about other financial products that might satisfy my financial needs | |
| | FL3 | I understand the financial phrases and symbols of life insurance policy | |
| Saving motives | SM1 | I save money for securing my retirement period | Mahdzan and Victorian (2013) |
| | SM2 | I save money for emergency purposes | |
| | SM3 | I save money because I want to ensure continuity of income upon my death | |
| | SM4 | I save money because I want to leave it as an inheritance | |
| Trustful Belief | T1 | Based on my belief about insurance, I think it is honest and trustworthy | Ajzen, I.B. (2002) |
| | T2 | Based on my belief about insurance, I think it cares about customers | |
| | T3 | Based on my belief about insurance, I think it is well regulated and trustful | |
| Perceived Product Benefits | PB1 | Insurance reduces or eliminates losses hidden in life's uncertainty | Ajzen, I.B. (2002) |
| | PB2 | Insurance provides stability for wealth planning | |
| | PB3 | Insurance serves as capital or wealth accumulation | |
| | PB4 | Insurance provides financial relief to society | |
| | PB5 | With the insurance policy, I obtain a sense of security | |
| | PB6 | The insurance policy assists me to plan my personal financial management | |
| Attitude | ATT1 | I have a positive opinion about life insurance | Marakarkandy et al. (2017); Alam et al. (2012) |
| | ATT2 | I like the life insurance policy because of the advantages it provides | |
| | ATT3 | I think life insurance is good for me | |
| | ATT4 | I think life insurance is beneficial to me | |
| Purchase intention | PI1 | Purchasing a life insurance policy will provide me future surety which I need most for my inheritance | Jahan & Sabbir (2018); Han et al. (2010) |
| | PI2 | I am willing to purchase a life insurance policy | |
| | PI3 | I plan to purchase a life insurance policy in the future | |
| | PI4 | I will make an effort to purchase a life insurance policy | |

# THE INFLUENCE OF GREEN INNOVATION ON THE PERFORMANCE OF SMALL AND MEDIUM ENTERPRISES IN VIETNAM

**Tran Trong Duc[1*],Tran Ba Vuong[1], Nguyen Tran Khanh An[1], Hua Pham Tien Dat[1], Nguyen Yen Nhi[1], Cao Thanh Trang[1]**

[1] National Economics University.

*Corresponding: ductt@neu.edu.vn

**ABSTRACT**

Green innovation has emerged as a vital trend in the sustainable economic advancement of contemporary organizations. A growing number of enterprises are contemplating green innovation in their production, processes, and management to improve organizational performance and establish lasting competitive advantages. This study seeks to establish a research model for green innovation determinants within firms, encompassing green product innovation, green process innovation, and green management innovation. These elements are closely linked to enhancing operational performance, which includes financial, environmental, and operational metrics. The study also investigates the moderating influence of green image on the correlation between green product and process innovation and financial performance. Through a survey of 512 small and medium-sized enterprises (SMEs) in Vietnam and the application of regression analysis, Cronbach's Alpha testing, exploratory factor analysis, and the SEM model via SmartPLS, the authors present recommendations aimed at fostering investment and formulating policies that support green innovation to improve the operational efficiency of SMEs. The research underscores the necessity for governmental bodies to enhance guidance papers and create a regulatory framework for this trend, facilitating the sustainable development of SMEs in Vietnam while augmenting their financial, environmental, and operational performance.

*Keywords*: "Firm Performance", "Green Innovation", "Small and medium-sized enterprises", "Vietnam"

## I. INTRODUCTION

Environmental pollution is escalating in severity and has emerged as a critical concern globally, particularly for Vietnam, especially in light of its industrialization and modernization objectives. The problem necessitates that the government implement suitable steps to comprehensively address it within the framework of the global shift towards prioritizing sustainable development and green innovation. The advancement of the economy in conjunction with environmental conservation has consistently been highlighted; notably, the European Union has introduced an initiative known as the "Carbon Border Adjustment Mechanism" (CBAM). The CBAM mechanism, as reported by the European Commission, the WTO, and the Vietnam Chamber of Commerce and Industry, serves as a tool to promote clean industry and mitigate environmental emissions by levying a carbon tax on all goods imported into European Union (EU) markets, contingent upon the greenhouse gas emission intensity during production in the exporting country.

According to the Vietnam Energy Sector Vision Report from March 2023, our country has the most rapidly increasing greenhouse gas (GHG) emissions in the Greater Mekong Subregion, projected to reach 1,495.4 million tons of CO2 by 2050. Furthermore, the Global Climate Risk Index 2020 research by Greenwatch indicates that from 2016 to 2020, our nation placed 6th among countries most adversely impacted by climate change, with anticipated damages amounting to 0.5% of GDP. The government, cognizant of the urgent situation and its crucial role in fostering economic growth, enhancing competitiveness, and diminishing reliance on polluting fuel sources via green innovation in sustainable development, has proposed policies and strategies for sustainable national development. Nonetheless, given the magnitude of enterprises, the aggregate number of businesses involved in innovative endeavors remains comparatively limited, suggesting that to attain the overarching objective of sustainable development and enhance operational efficiency concerning environmental, financial, and operational aspects, there are persistent challenges and barriers that must be promptly addressed and executed by businesses. A comprehensive array of studies on green innovation has been undertaken globally to elucidate the precise definition of green innovation, its effects on business operational efficiency, and to present the latest data regarding the implementation of green innovation in companies worldwide. Nevertheless, there remains a paucity of research on small and medium-sized organizations, and the

available studies exhibit several shortcomings, including small sample sizes, with some failing to offer strategies for enhancing corporate efficiency. In Vietnam, certain studies have examined industries to elucidate the present status of green innovation implementation in enterprises, the motivators prompting businesses to embrace innovation, and the effects of green innovation on the financial and environmental performance of each enterprise within specific sectors. Nonetheless, the quantity of research concerning the present state of green innovation implementation and its influence on the environmental performance of small and medium-sized enterprises (SMEs) remains significantly restricted and has not thoroughly examined the specific effects of green innovation on diverse facets of enterprises, particularly regarding environmental performance. The study seeks to examine the present circumstances and recommend pragmatic ways to enhance green innovation, thereby improving the environmental performance of small and medium-sized firms.

## II. LITERATURE REVIEW AND THEORETICAL FRAMEWORKS

### 2.1. Green innovation

Green innovation originated in the late 1990s, advocating a transition from traditional industrial technologies to novel processes and products that adhere to environmental standards, with the objective of achieving sustainable development (Cleff & Rennings, 1999; OECD, 2009). This term is frequently delineated in two dimensions: the organization's competencies and ecological initiatives, with this study selecting the latter dimension for consideration. Green innovation denotes environmental initiatives designed to enhance corporate efficiency (Chen et al., 2006; Gluch et al., 2009; Lin et al., 2009). Green innovation enhances product value, conserves energy, reduces expenses, and elevates the company's reputation. Terms like ecological innovation and sustainability might substitute for green innovation to denote efforts to mitigate environmental impact (Schiederig et al., 2011). Moreover, it improves resource efficiency, diminishes pollution, and strengthens long-term competitive advantage (Porter & Van der Linde, 1995; OECD, 2009). Academically, green innovation is categorized into three primary types: product, process, and green management (Chen et al., 2006; Chen, 2008).

#### Green products

Notion Green product innovation pertains to the enhancement of products concerning environmental concerns, including energy conservation, pollution mitigation, and waste recycling, hence increasing product value (Chen et al., 2006). This enables enterprises to manage pollution at its origin and improve their social standing (Hu et al., 2017; Guo et al., 2017). Green product innovation is assessed through three primary dimensions: environmental impact, materials, energy consumption, and pollution, influencing the full product lifecycle from manufacture to disposal. Quantification Green product innovation can be realized by selecting low-pollution materials, incorporating energy-saving features, and ensuring the product's recyclability (Chen et al., 2006). The utilization of sustainable materials and recycling in production mitigates resource and environmental effect (Ljungberg, 2007). Recycling decreases waste while also providing economic and societal advantages (D'Ambrieres, 2019).

#### *G*reen Process

Concept Green process innovation refers to the use of novel production methods that mitigate environmental pollution and enhance energy and resource efficiency (Ma et al., 2019; Kivimaa and Kautto, 2010). This technique entails pollution management with specialized technology and equipment, while adhering to environmental standards (Mantovani et al., 2017). Implementing sustainable procedures enables firms to minimize waste, enhance energy efficiency, and attain competitive cost and market benefits (Chiou et al., 2011). Quantification Green process innovation encompasses elements such as emission reduction, ecological efficiency, and circularity (Sharma & Henriques, 2005; Chen, 2007). Businesses must enhance production processes to minimize waste at the source, optimize resource use, and augment recycling capabilities, consequently diminishing environmental effect and production expenses (Hart, 1995; Gladwin et al., 1995).

#### Green management

Management innovation (MI), often referred to as administrative or organizational innovation, largely emphasizes alterations in managerial practices and has not been thoroughly investigated (Naveh et al., 2006; Alange et al., 1998; Armbruster et al., 2008). Management innovation encompasses two primary perspectives: the rational perspective, grounded in economic theory and focused on improving business efficiency (Sturdy, 2004), and the social approach,

motivated by societal pressure to attain repute and legitimacy (Birkinshaw et al., 2008). Green management innovation refers to the implementation of novel environmental management strategies aimed at reducing adverse effects on the environment (Qi et al., 2010; Ma et al., 2018).

The assessment of green management innovation presently lacks a defined quantitative scale. Studies have suggested measurement based on elements like environmental management methodologies, advanced energy management, knowledge management, and product-service innovation to fulfill environmental requirements (Cramer, 1998; Roy et al., 2020; Ooi, 2014). The implementation phase is the most discernible aspect of the intricate process of green management innovation (Birkinshaw et al., 2008).

### 2.2. Firm performance

#### Financial performance

Financial performance indicates a company's capacity to transform assets into revenue via primary business activities. Net profit serves as a crucial metric that aids analysts in making investment decisions (Jao et al, 2020). Financial performance and green innovation initiatives are interrelated, as green innovation can enhance profitability by minimizing expenses and circumventing environmental rules (Wang et al., 2021; Ki-Hoon Lee et al., 2015). Nonetheless, the financial outcomes of green innovation may require time to manifest (Aguilera-Caracuel & Ortiz-deMandojana, 2013). This study used return on assets (ROA) to evaluate financial performance, owing to its stability and reliability, particularly in various circumstances.

#### Operational performance

Operational performance reflects the strategic aspects that a firm uses to compete, including quality, delivery, flexibility, and cost, to improve production efficiency and create high-quality products, thereby increasing sales and profits (Narasimhan & Das, 2001; Ho et al., 2002; Ward et al., 1998). This study uses the scale of Croteau and Bergeron (2001) and Kearns & Sabherwal (2006) to evaluate operational efficiency, with five main criteria such as: sales growth, market share growth, return on investment, net profit, and financial liquidity compared to competitors.

#### Environmental performance

Environmental performance denotes a company's capacity to mitigate waste and adverse environmental effects, encompassing the reduction of emissions, solid waste, and the use of hazardous materials (Zhu et al., 2008; Claver et al., 2007). This can be accomplished by utilizing recycled materials, enhancing energy efficiency, and minimizing pollution (Lindell et al., 2007). Management strategies, including pollution avoidance and resource conservation, have demonstrated efficacy (Sarkis et al., 2001). The research employs methodologies including Life Cycle Assessment (LCA), Multi-Criteria Analysis (MCA), and the Environmental Performance Index (EPI) to assess the ecological impact of enterprises, each method possessing distinct merits and drawbacks, ranging from the thoroughness of LCA to the lucidity of EPI (Guine´e JB, 2001; Zopounidis et al., 2002; Jasch C, 2000).

### 2.3. Hypotheses

#### 2.3.1. Relationship between Proactive Green Innovation and Green Product Innovation

Product development plays an important role for companies in emerging or common markets (Calantone et al., 1995), especially in shaping brand image and diversifying in a rapidly changing environment (Brown et al., 1995). Krishnan and Ulrich (2001) emphasize that product development is the process of converting market opportunities into products or services that meet the needs of consumers and stakeholders. However, integrating environmental issues into product development is challenging, as Loureiro et al. (2002) point out that not all consumers are willing to pay a premium for environmentally friendly products. Chen (2001) argues that green product development is necessary to reduce environmental burden through design and innovation. To be successful, companies need to focus on environmentally friendly products and services, responding to the growing awareness of consumers about environmental protection (Cronin et al., 2011). Therefore, we assume that proactive green innovation is positively related to green product development performance and imply the following hypothesis:

*H1: Proactive green innovation has a positive impact on Green Product Innovation*

#### 2.3.2. Relationship between Reactive Green Innovation and Green Product Innovation

According to Ayag (2005), product development is an important factor that helps businesses connect with the market and achieve success. To compete, businesses must strategically manage product development activities, otherwise they will face risks and losses in the future (Fitzsimmons et al., 1991). Developing green products, whether differentiated or low-cost, provides an important competitive advantage, attracting environmentally conscious customers (Orsato et al., 2006). Lumpkin and Dess (1996) emphasize that reactive innovation misses the opportunity to lead, while reactive innovation is a timely response to competition. Reactive green innovation meets the requirements of customers and governments, helping businesses adjust to and overcome adverse environments. Based on the above analysis, we argue that reactive green innovation is related to green product development performance. Our research hypothesis is as follows:

*H2: Reactive green innovation has a negative impact on Green Product Innovation*

**2.3.3. The Relationship Between Green Human Capital and Green Product Innovation**

Green human capital helps companies accept risks and uncertainties in the green product innovation process. Flexible, risk-taking employees play an important role in generating new ideas and promoting innovation (Madsen and Ulhøi, 2005; Chen et al., 2006). Therefore, developing green human capital is the key to improving green product innovation performance (Chen and Huang, 2009). Therefore, this study assumes that green human capital has a positive impact on green product innovation performance and puts forward the following hypothesis:

*H3: Green human capital has a positive impact on green product innovation performance*

**2.3.4. The Relationship between Green Human Capital and Green Process Innovation**

Green human capital includes employees' knowledge, skills, abilities, and commitment to environmental protection (Chen, 2008b). Human capital is a core factor that drives organizational innovation, as employees' skills and expertise encourage creativity. Human resources also have a strong influence on high-tech projects (Hayton, 2005) and are an important factor in strategic innovation (Bontis et al., 2000). Green human capital, with its diverse knowledge and skills, helps companies develop sustainable competitive advantages and innovate effectively (Coff and Raffiee, 2015). Employees with environmental expertise can improve processes and reduce waste, thereby improving the effectiveness of green process innovation (Russo and Fouts, 1997). Therefore, this study highlights the role of green human capital in business process innovation. Therefore, the research team considers the green human capital factor in the process of business process innovation

*H4: Green human capital has a positive impact on green process innovation.*

**2.3.5. The Relationship between Green Relational Capital and Green Process Innovation**

Strategic relationships, including alliances with customers and suppliers, help firms achieve desired innovation performance (Badir and O'Connor, 2015; Capello and Faggian, 2005). Close relationships with customers provide diverse perspectives and experiences, which promote product and process innovation (Bonner and Walker, 2004; Wimalachandra et al., 2014a/b). At the same time, relationships with suppliers allow firms to leverage resources to improve innovation performance (Walter, 2003). Alliance partners facilitate knowledge sharing and application to enhance innovation performance (Wu et al., 2007). By building relationships on a green basis, companies can promote green production and process innovation, while reducing waste and energy consumption (Borin et al., 2013; Chiou et al., 2011; Sharma and Vredenburg, 1998; Wu, 2013). Therefore, the research team proposes the following hypothesis:

*H5: Green relational capital has a positive relationship with Green process innovation*

**2.3.6. Relationship between Green Organizational Capital and Green Process Innovation**

Organizational capital includes institutionalized knowledge and experience, embedded in the structure and management system of the company, affecting the ability to innovate (Delgado-Verde et al., 2011). Factors such as organizational structure and culture help improve innovation performance (Aramburu and Saenz, 2011). Implementing an environmental management system such as ISO 14001 can promote environmental performance through organizational behavior (Paille et al., 2014). Continuous investment in environmental protection and sharing of best practices help companies improve green processes and reduce emissions (Albort-Morant et al., 2018). Furthermore, sharing of results and best practices across units also helps improve green process innovation performance (Lanoie et

al., 2011). Therefore, we propose the following hypothesis:

*H6: Green organizational capital has a positive relationship with green process innovation.*

**2.3.7. Relationship between Green Transformational Leadership and Green Management Innovation**

Transformational leadership consists of four dimensions: intellectual stimulation, individual consideration, charisma, and inspirational motivation (Bass, 1985). Intellectual stimulation helps followers develop creative cognitive processes (Reiter-Palmon and Illies, 2004). Individual consideration allows leaders to recognize the needs of their followers and advise them, thereby promoting creativity in the group (Gong et al., 2009). Charismatic leadership provides a clear vision, energizes, and creates a creative environment (Avolio et al., 1999). Inspirational motivation stimulates enthusiasm and encourages followers to express their ideas, supporting creative thinking (Gong et al., 2009). These behaviors enhance creativity and innovation in the workplace by providing employees with a shared vision and autonomy (Henker et al., 2015; Garcia-Morales et al., 2012). Based on the above theories, our research team proposes the following hypothesis:

*H7: Green transformational leadership has a positive relationship with green management innovation.*

**2.3.8. Relationship between Green Training and Green Management Innovation**

Green training is an important part of green human resource management, where green leaders organize workshops and seminars to improve their subordinates' knowledge of green management. These activities can take place online to save energy and costs, including training on waste management, recycling, energy efficiency and safety, using online modules instead of printed materials (Chiou et al., 2011). Green management innovation is considered to have a positive impact on the environment, and innovation activities often originate from the top management level, with the environmental management system serving as an environmental audit tool for senior management. The research team proposes the following research hypothesis:

*H8: Green training has a positive relationship with Green Management Innovation*

**2.3.9. The Relationship between Green Innovation and Performance**

Green product innovation and financial performance.

Green product innovation focuses on improving the design of existing products or creating new products using renewable and non-toxic materials, to reduce environmental impacts and improve energy efficiency (Zhang et al., 2019). This innovation not only helps reduce environmental impacts throughout the product life cycle (Christensen, 2011) but also meets consumers' sustainability needs, thereby increasing sales and brand recognition (Cheng et al., 2014). In recent years, green product innovation has been considered an important factor for environmental sustainability (Dangelico & Pujari, 2010) and helps firms avoid environmental protests and open up new market opportunities (Chiou et al., 2011). It also enhances green capabilities, strengthens the firm's green image, and improves financial performance (Ar, 2012; Ilker Murat Ar et al., 2012). Xuemei Xie and team (2019) found that green product innovation has a mediating role between green process innovation and financial performance, with green image moderating this relationship. Although some of the moderating effects of green subsidies have not been demonstrated, green product innovation investment (GPdI) has been found to have a positive impact on firm performance (Wong, 2012; Ar, 2012; Ashraf, 2021). Based on previous studies, we focus first and foremost on the causal relationship between green product innovation and financial performance in Vietnamese firms.

*H9a: A firm's green product innovation is positively related to its financial performance.*

*Green process innovation and financial performance.*

Green process innovation, although requiring more internal resources and higher costs, has been shown to outperform other green practices (Gopalakrishnan, Bierly, & Kessler, 1999). This innovation may include adding a solution such as a chimney scrubber or integrating it into the production process through input substitution, production optimization, and output recovery (Rennings, 2000). Previous research has shown that green process innovation positively affects the competitive advantage and sustainability of enterprises (Chen et al., 2006; Cheng et al., 2014; Sezen & Çankaya, 2013), making investment in green process innovation make business sense (Li et al., 2017). Specifically, green process innovation not only improves the existing production process but also adds new processes to reduce negative environmental impacts and enhance environmental compliance, thereby creating a differentiation

advantage for the company (Cheng et al., 2014). In addition, Xie et al. (2016) suggested that clean technology and end-of-pipe technology are important elements of green process innovation that are positively related to financial performance. Therefore, we hypothesize:

*H10a: A firm's green process innovation is positively related to its financial performance.*

*Green management innovation and financial performance*

Green management innovation aims to improve production processes through the adoption of new management structures, systems, and strategies (Li et al., 2018). Green innovation can be divided into two types: green technological innovation and non-green technological innovation (Evangelista & Vezzani, 2010), and this can improve the financial performance of the firm (Ashraf et al., 2021). Although technological innovation has been widely studied, the literature on non-technological innovation is limited (Li et al., 2018). Innovation positively affects the competitive advantage and performance of enterprises (Azadegan & Dooley, 2010; Kim & Chai, 2017; Ojha et al., 2016). Green and smart ideas proposed by management can enhance brand value and revenue, thereby improving corporate performance (Somjai et al., 2020). Green management innovation not only brings economic benefits but also reduces negative environmental impacts through the adoption of new management systems and improved production processes (Qi et al., 2010).

*H11a: Green management innovation is positively correlated with corporate financial performance.*

*The Relationship between Green Innovation and Environmental Performance*

Environmental performance is considered from many aspects, including management indicators such as water quality, pollutant emissions, solid waste production, and noise, reflecting the environmental legitimacy of enterprises (Boons and Wagner, 2009; Dong et al., 2014). Green process innovation and green product innovation are two parts of green technology innovation, which are positively correlated with environmental performance (Huang and Li, 2017; Du et al., 2019; Mahto et al., 2020). These activities not only minimize negative environmental impacts but also optimize resources and reduce costs, thereby improving financial and social performance (Weng et al., 2015). In addition, linking management activities with the natural environment, such as total environmental quality management and environmental management systems, also contributes to improving the environmental performance of enterprises (Ma et al., 2018; Inoue et al., 2013). Energy management tools can help identify the potential for eco-efficiency and implement measures to improve environmental performance and reduce energy costs (Schaltegger and Synnestvedt, 2002; Fernando and Hor, 2017). Therefore, the research team decided to divide green innovation into green product innovation, green process innovation, and green management innovation. In this paper, the research team will study this issue in more detail to clarify the influence of green innovation factors on the environmental performance of enterprises. From there, the research team proposed the following hypotheses:

*H9b: Green product innovation has a positive relationship with environmental performance.*

*H10b: Green process innovation has a positive relationship with environmental performance.*

*H11b: Green management innovation has a positive relationship with environmental performance.*

*Relationship between Green Innovation and Operational Performance*

Green innovation is an important driver for businesses to improve their performance by addressing environmental issues such as reducing environmental impacts, waste and CO2, while enhancing productivity, reputation and competitiveness (Pujari, 2006; Mu et al., 2009; Porter, 1995). Operational performance is measured through factors such as cost, production cycle time, reliability and product quality (Huckman et al., 2008). Xue et al. (2019) emphasized that integrating a green talent workforce with quality management plans and pollution prevention strategies can improve a company's operational performance. Stakeholders evaluate green operational performance based on many components, including competition, market dynamics, product quality, cost, and customer satisfaction (Zhu et al., 2008). Based on the above literature and opinions, the research team proposes the following hypothesis:

*H9c: Green product innovation has a positive impact on operational performance.*

*H10c: Green process innovation has a positive impact on operational performance.*

*H11c: Green management innovation has a positive impact on operational performance*.

**2.3.10. The Moderating Role of Green Image**

A company's image, including positive environmental impressions or greenness, has a significant impact on consumer and stakeholder satisfaction (AmoresSalvadó, Martín-de Castro, & Navas-López, 2014). Companies that invest in improving their green image can avoid trouble from environmental protests and increase consumers' expectations of environmental friendliness (Chen, 2010). Although many companies in China have made efforts to position themselves as "green," adequate promotion of green product innovation is necessary to receive positive market feedback (AmoresSalvadó et al., 2014). However, consumer pressure and expectations can lead to success (Lin, Zeng et al., 2014), while higher prices for green products can reduce market performance (Rehfeld et al., 2007; Dangelico and Pujari, 2010). Corporate image can increase consumer trust and influence purchase decisions (Chang & Fong, 2010), thereby improving brand loyalty and financial performance (Zhu & Sarkis, 2004). Similarly, when a company implements green process innovation, promoting a green image will help reduce production costs, attract customers, and increase sales, thereby improving financial performance (Chen, 2008).

From there, the research team leads to the following two hypotheses:

*H12a: Green image has a moderating effect on the relationship between green product innovation and financial performance of the company.*

*H12b: Green image has a moderating effect on the relationship between green process innovation and financial performance of the company.*

**2.4. Research method**

The authors conducted quantitative research to evaluate the reliability of the scale using Cronbach's Alpha reliability coefficient to eliminate inappropriate observations based on SPSS software techniques, then tested the value of the scale using the EFA exploratory factor analysis method.

The research hypotheses were then tested and the influence of the mediating variables and independent variables on the dependent variable was assessed by performing SEM linear structural model analysis through the SmartPLS program.

The size of the research sample depends on many different factors such as the required reliability, processing method... To use EFA, a large sample size is required, usually determined based on the minimum size and the number of measured variables included in the analysis (Nguyen, 2013). Hair et al. (1998) estimated that the number of samples needed is 5 times the number of variables. In this study, the sample size was chosen so that the linear structural model is meaningful. There are a total of 69 variables that need to be factor analyzed, so the smallest sample size needed is: 69x5 = 365 observations.

The authors expect the number of research samples to be 553 survey forms to ensure the reliability of the research results. This number of samples is suitable for the requirements as the studies presented above.

Sampling method: Using appropriate sampling methods. The survey was conducted across the three regions of North, Central and South, the survey subjects were small and medium-sized enterprises in Vietnam participating in green innovation, so the authors considered this a reasonable sampling method.

To suit the model and research objectives, the authors developed the scale according to the following steps: (1) Synthesis of related studies; (2) Qualitative research; (3) Preliminary quantitative research; (4) Finalizing the scale to conduct official quantitative research. Questionnaires are based on previously validated survey instruments from the literature.

**III. RESULT AND DISCUSSION**

**Construct reliability and validity**

Evaluating the reliability of the scale on SmartPLS through two main indexes: Cronbach's Alpha and Composite Reliability.

**Table 3.1: Construct reliability and validity**

| | Cronbach's alpha | Composite reliability (rho a) | Composite reliability (rho c) | Average variance extracted (AVE) |
|---|---|---|---|---|

| | | | | |
|---|---|---|---|---|
| **EP** | 0.852 | 0.857 | 0.900 | 0.694 |
| **FP** | 0.953 | 0.954 | 0.970 | 0.915 |
| **GHC** | 0.910 | 0.911 | 0.937 | 0.787 |
| **GI** | 0.959 | 0.971 | 0.965 | 0.776 |
| **GL** | 0.912 | 0.917 | 0.932 | 0.695 |
| **GMI** | 0.927 | 0.928 | 0.945 | 0.775 |
| **GOC** | 0.879 | 0.889 | 0.908 | 0.621 |
| **GPcI** | 0.881 | 0.881 | 0.918 | 0.737 |
| **GPdI** | 0.913 | 0.915 | 0.935 | 0.742 |
| **GRC** | 0.924 | 0.928 | 0.943 | 0.768 |
| **GT** | 0.924 | 0.924 | 0.940 | 0.724 |
| **OP** | 0.919 | 0.928 | 0.940 | 0.758 |
| **PGI** | 0.891 | 0.891 | 0.924 | 0.753 |
| **RGI** | 0.924 | 0.927 | 0.946 | 0.813 |

All variables have high reliability and convergence when the Cronbach Alpha and Construct Reliability indexes are greater than 0.7

Author uses the average variance extracted index (AVE) to evaluate convergence on SmartPLS. All variables ensure convergence because they all have AVE indexes greater than 0.5.

*Discriminant validity*

The distinctiveness of a construct when compared to other constructs in the model is shown by its discriminant validity. Discriminant validity is guaranteed when the square root of the AVE for each latent variable is higher than all the correlations between the latent variables with each other (Fornell and Larcker, 1981). The Fornell and Larcker table results are as shown in Table 3.2 below. The number at the top of each column is the square root of the AVE (0.833; 0.956; 0.887; 0.881; 0.834; 0.880; 0.788; 0.858; 0.862; 0.876; 0.851; 0.871; 0.868; 0.902), and the number below is the correlation between the latent variables. We see that the square root of AVE > Correlation between latent variables (Fornell and Larcker, 1981), ensuring discrimination. With the HTMT index, according to Garson (2016), when the HTMT index is less than 1, the discrimination value between two latent variables is guaranteed when. Meanwhile, Clark and Watson (1995) and Kline (2015) use a more difficult standard threshold of 0.85. The group of authors prioritizes choosing the threshold of 0.85 in the evaluation.

**Table 3.2: Discriminant validity - Fornell and Larcker criterion**

| | **EP** | **FP** | **GHC** | **GI** | **GL** | **GMI** | **GOC** | **GPcI** | **GPdI** | **GRC** | **GT** | **OP** | **PGI** | **RGI** |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **EP** | 0.833 | | | | | | | | | | | | | |
| **FP** | 0.287 | 0.956 | | | | | | | | | | | | |
| **GHC** | 0.502 | 0.252 | 0.887 | | | | | | | | | | | |
| **GI** | 0.737 | 0.429 | 0.634 | 0.881 | | | | | | | | | | |

| **GMI -> OP** | 0.304 | 0.306 | 0.047 | 6.474 | 0.000 |
| **GOC -> GPcI** | 0.113 | 0.116 | 0.054 | 2.099 | 0.036 |
| **GPcI -> EP** | 0.388 | 0.388 | 0.047 | 8.256 | 0.000 |
| **GPcI -> FP** | 0.093 | 0.091 | 0.044 | 2.108 | 0.035 |
| **GPcI -> OP** | 0.268 | 0.267 | 0.039 | 6.913 | 0.000 |
| **GPdI -> EP** | 0.164 | 0.165 | 0.063 | 2.587 | 0.010 |
| **GPdI -> FP** | 0.210 | 0.211 | 0.057 | 3.713 | 0.000 |
| **GPdI -> OP** | 0.209 | 0.209 | 0.053 | 3.978 | 0.000 |
| **GRC -> GPcI** | 0.318 | 0.318 | 0.058 | 3.978 | 0.000 |
| **GT -> GMI** | 0.251 | 0.251 | 0.066 | 3.784 | 0.000 |
| **PGI -> GPdI** | 0.303 | 0.305 | 0.063 | 4.791 | 0.000 |
| **RGI -> GPdI** | 0.186 | 0.186 | 0.072 | 2.585 | 0.010 |
| **GI x GPdI -> FP** | 0.217 | 0.218 | 0.032 | 6.705 | 0.000 |
| **GI x GPcI -> FP** | -0.144 | -0.143 | 0.037 | 3.935 | 0.000 |

All P Values of the interactions are < 0.05, so these interactions are statistically significant.

There are 3 variables that affect GPcI: GHC, GOC and GRC. The standardized impact coefficients of these 3 variables are 0.193, 0.113 and 0.318 respectively. In which all 3 variables have a positive impact with the order of strength on GPcI being GRC > GHC > GOC.

There are 3 variables that affect GPdI being GHC, PGI and RGI. The standardized impact coefficients of these 3 variables are 0.257, 0.303 and 0.186 respectively. In which all 3 variables have a positive impact with the order of strength on GPdI being PGI > GHC > RGI.

There are 6 variables that affect FP: GI, GMI, GPcI, GPdI, GI x GPdI and GI x GPcI. Of which, 5 variables have a positive impact. The standardized impact coefficients of these 5 variables are 0.140, 0.180, 0.093, 0.210, and 0.217, respectively. The order of impact of these 5 variables is GI x GPcI > GI x GPdI > GPdI > GMI > GI > GPcI. In addition, there is 1 variable that has a negative impact, GI x GPcI, with O = -0.144.

There are 2 variables that affect GMI: GL and GT. The standardized impact coefficients of these 2 variables are 0.411 and 0.251, respectively. Of which, both variables have a positive impact with the order of strength: GL > GT.

There are 3 variables that affect EP: GMI, GPcI and GPdI. The standardized impact coefficients of these 3 variables are 0.241, 0.388 and 0.164 respectively. In which all 3 variables have a positive impact in the order of strong and weak on GPcI > GMI > GPdI. There are 3 variables that affect OP: GMI, GPcI and GPdI. The standardized impact coefficients of these 3 variables are 0.304, 0.268 and 0.209 respectively. In which all 3 variables have a positive impact in the order of strong and weak on GMI > GPcI > GPdI.

## IV. CONCLUSION

To improve operational efficiency, small and medium-sized firms in Vietnam must concentrate on all facets of green innovation, encompassing product-related aspects, processes, and management capabilities aimed at sustainable and long-term growth objectives.

Initially, the environmental consciousness of enterprises will be pivotal in the green product invention process.

Consequently, organizations must improve collaboration and knowledge exchange with partners and industry communities. Fostering a collaborative and knowledge-sharing environment among enterprises, non-governmental organizations, and communities will facilitate the advancement of green product creation. Consequently, enterprises can cooperate to investigate and devise novel solutions, exchange insights and expertise about eco-friendly production methods, and aid in establishing green product innovation initiatives to foster the industry's sustainable development. Ultimately, small and medium-sized firms in Vietnam must commence investment in, research on, and development of green technologies. By creating and implementing green technology in the production process, firms can augment green product innovation, thereby enhancing environmental performance. Furthermore, new technology like high-efficiency machinery, water recycling systems, and clean production processes can reduce waste and mitigate adverse environmental effects. This entails minimizing production expenses, augmenting competitiveness, and satisfying global market requirements for sustainable products.

Secondly, to execute green process innovation, small and medium-sized firms in Vietnam must prioritize the optimization of production processes and the management of raw resources. Companies can accomplish this by refining and enhancing production methods, as well as successfully overseeing and managing raw material sources. Businesses can eliminate waste, decrease wastefulness, enhance production efficiency, and strengthen environmental protection capabilities. To facilitate the precise implementation of green process innovations, small and medium-sized enterprises in Vietnam should pursue certification and adhere to environmental standards such as ISO 14001 (Environmental Management System) or industry benchmarks like the Higg Index. This not only guarantees that the production process is conducted responsibly but also fosters trust and confidence among clients in the product.

Thirdly, about green management innovation, enterprises must elevate awareness and commitment from the top tier. The dedication to implementing green innovation at the leadership level is a crucial component influencing the success of green management innovation. Consequently, to foster green management innovation, organizations must cultivate a workplace that stimulates creativity and solicits contributions from all tiers of personnel. Leadership support and respect will facilitate the adoption of green management innovation strategies and enhance the environmental performance of the organization. Furthermore, small and medium-sized firms in Vietnam must invest in the training and development of their personnel. Green management innovation necessitates comprehension and expertise from all personnel within the organization. To do this, firms must spend in staff training and development while imparting green management principles and techniques to their workforce. Establishing a learning environment and fostering knowledge exchange will enable firms to ensure that their staff comprehend green management and can implement this information in their everyday tasks.

Fourth, to advance green training within enterprises to improve environmental performance, firms should prioritize the development of tailored green training programs that address the workforce's need for education on green innovation. The United Nations in Vietnam projects that by 2030, green innovation would generate 8.4 million new employment opportunities for youth. According to Ms. Pauline Tamesis, the UN Resident Coordinator in Vietnam, the country has not yet fulfilled the growing demand for green talents. By 2030, 60% of youth may be deficient in the requisite skills to succeed in the green economy. Consequently, the proactive development, design, and delivery of tailored green training programs by enterprises will address the workforce's knowledge deficit concerning green innovation and expedite its implementation, thus enhancing environmental performance.

Fifth, to augment the green capability of small and medium-sized firms in Vietnam and boost environmental performance, it is essential to bolster training and skill development for personnel, particularly in the realm of green innovation. A report from the Ministry of Industry and Trade of Vietnam in early 2022 indicates that over 75% of industrial workers are either untrained or have undergone training for less than three months. The predominant workforce in this sector consists of unskilled laborers engaged in product processing, whereas stages necessitating specialized expertise, such as dyeing, fabric finishing, or product design, remain insufficiently staffed. Consequently, businesses, as the primary agents actively engaged in the advancement of a green industry, must augment training and skill development for employees in green innovation to equip them with the essential knowledge and tools to facilitate the green transition within the organization. The training program must explicitly delineate the challenges and opportunities, the technical environmental regulations, technology, and the reorganization of production and business

frameworks to fulfill the mandates of efficiency and minimal emissions that contribute to pollution, environmental degradation, and the economical and efficient utilization of resources. It may concentrate on domains such as clean production technology, the utilization of recycled materials, waste management and reduction, as well as energy and resource conservation methods.

Sixth, small and medium-sized firms in Vietnam must boost their management of green customer and supplier relationships to improve their green relationship capital. Nielsen Vietnam's 2023 study indicates that 72% of Vietnamese consumers have confidence in brands dedicated to environmental sustainability. Consequently, establishing an eco-friendly business environment is both an ethical imperative and a crucial strategic element for client attraction and retention. To accomplish this, enterprises must invest in cultivating and sustaining environmentally friendly partnerships with clients and suppliers. This may involve formulating environmentally sustainable customer and supplier relationship rules and processes, alongside educating personnel on the company's ecological principles and commitments. Simultaneously, instituting systems to assess and oversee the efficacy of green relationship management initiatives is a crucial measure to guarantee the continuity and durability of this strategy.

Seventh, to sustain and enhance green organizational capital, organizations must implement green technology in their production processes, such as utilizing recycled materials, employing eco-friendly dyes, and adopting energy-efficient technologies. These technologies assist enterprises in reducing environmental impact, improving manufacturing efficiency, and conserving expenses. Faslink Fashion Connection Joint Stock Company has been a pioneer in the utilization of sustainable materials since 2008. The remarkable attributes of the materials utilized by Faslink include their natural provenance, eco-friendliness, safety for human health, ease of processing in fashion production, and their capacity for natural decomposition over time. Faslink prioritizes the utilization of eco-friendly resources while also promoting sustainable production practices, operational methods, and commercial strategies, ultimately aiming to establish a novel industrial framework that integrates green materials with advanced technology. Furthermore, enterprises ought to formulate plans to cultivate a sustainable organizational culture, enhance employee understanding regarding environmental conservation, and coordinate collective ecological initiatives such as afforestation and energy efficiency efforts.

# FACTORS AFFECTING GREEN INNOVATION ADOPTION IN SMALL AND MEDIUM ENTERPRISES IN THANH HOA PROVINCE, VIETNAM

**Le Thi Nuong**[1]
[1]Hong Duc University
*Corresponding: lethinuongkt@hdu.edu.vn

**ABSTRACT**

Environmental and social concerns have made green innovation a global trend, especially in developed countries. However, small and medium enterprises (SMEs) are still a significant source of pollution. This paper studies the determinants of green innovation adoption in 389 SMEs in 5 manufacturing sectors in industrial parks in Thanh Hoa province, using a 5-level Likert questionnaire and analyzed by Smart PLS4 software. The results of the study show that Technological factors, including Complexity of green innovation, have the strongest negative impact, while compatibility and relative benefits have positive impacts. Organizational factors, including Organizational support and human resource quality, have significant positive impacts. Environmental factors, including legal pressure and customers, have positive impacts, while environmental uncertainty and government support have no impact. The study provides important basis for managers and policy makers to promote green activities in SMEs.

*Keywords:* "Environment", "Green innovation", "Organization", "SMEs", "Technology".

## I. INTRODUCTION

Environmental degradation is a serious threat to natural ecosystems and sustainable economic growth. It directly affects the performance of manufacturing enterprises (Tseng et al., 2019; Tseng et al., 2013). In response, governments and enterprises have begun to integrate sustainable production processes and methods into their business operations (Huang et al., 2022).

Small and medium-sized enterprises (SMEs), considered the backbone of the economy, play an important role in creating jobs and promoting innovation (Muangmee et al., 2021). However, SMEs are also a major source of industrial pollution, accounting for more than two-thirds of total pollution due to their low attention to environmental protection. In developing countries, SMEs often apply conventional production methods (CPM), which are harmful to environmental health due to the lack of conservation and protection measures (Albort-Morant et al., 2017; Anazonwu et al., 2019). Rapid industrial development has brought about environmental problems such as waste disposal, resource shortages, carbon emissions, and climate change (Asiaei et al., 2022). These challenges require businesses to adopt advanced technology and green practices, combined with social responsibility to achieve sustainability. Current global management policies increasingly emphasize sustainability, especially in large manufacturing companies (Ha, 2022). In this context, SMEs are becoming the focus, with stakeholders pushing for environmental performance analysis and green operational orientation (Nyahuna & Doorasamy, 2022).

Green innovation brings great value to SMEs, helping to improve environmental performance and reduce pollution, while maintaining profitability and social responsibility (Alsmadi & Alzoubi, 2022). SMEs need to proactively improve productivity and competitiveness through green technologies and processes (Voza et al., 2022). The difference between successful and unsuccessful SMEs lies in the adoption of sustainable initiatives (Idris & Mohamad, 2017).

In Vietnam, SMEs account for 99.4% of the total number of enterprises, contribute 40% of GDP and create jobs for 60% of the workforce, becoming an important force in economic development and environmental protection. Understanding the factors affecting the adoption of green innovation by SMEs will support policy makers in developing solutions to promote sustainable economic growth (Lutf et al., 2023). However, SME social responsibility initiatives have not received due attention from researchers and stakeholders (Singh, 2022).

To promote green innovation, it is necessary to fully measure these activities to help managers identify drivers, barriers and establish appropriate policies. This will not only raise environmental awareness in enterprises but also improve business performance. The current study focuses on identifying factors affecting the adoption of green

innovation by SMEs in Thanh Hoa, in order to propose policies to promote sustainable development and more effective environmental protection.

## II. LITERATURE REVIEW

### 2.1 Green innovation

Innovation is the process of introducing new activities in a company, including products, processes, services, and policies to improve efficiency and productivity. Green innovation, a branch of innovation, focuses on reducing negative environmental impacts through improvements in technology, production processes, and management methods (Kemp, 2010). Green innovation is often synonymous with terms such as eco-innovation or environmental innovation, emphasizing the use of environmentally friendly raw materials, eco-design, and emission reduction.

Henriques and Sadorsky (2007) classify green innovation into two groups: administrative innovation, which deals with management and policies, and technical innovation, which involves improving processes and technologies to reduce environmental costs. Green products and processes not only reduce pollution but also improve sustainable performance throughout the entire product life cycle (Tseng et al., 2013).

### 2.2. Impact of Technology Factors (TF) on Green Innovation Adoption

The advancement of science and technology offers convenience but also leads to challenges like environmental damage, climate change, and resource depletion. Green innovation (GI) has emerged as a global solution, leveraging advanced technology to reduce pollution, protect the environment, and optimize resources (Zhao et al., 2022). While technology modernizes life, it also addresses climate change, waste management, and food security (Mai & Phuong, 2021). SMEs, known for their adaptability, have adopted GI initiatives under stakeholder pressure (Aboelmaged & Hashem, 2019). However, studies on technological factors in GI adoption remain limited, despite the significant influence of complexity, compatibility, and relative advantage on decisions (Lin & Ho, 2011).

**Perceived green innovation's complexity**

Complexity is the extent to which a technical innovation is perceived as difficult to understand and use, thereby hindering knowledge transfer and diffusion of the innovation (Rogers, 2003). Green innovation, which combines both tacit and explicit knowledge, often increases ambiguity, creating barriers to innovation transfer within an organization. When complexity is high, especially for technologies that require a lot of tacit knowledge, learning and knowledge sharing are difficult, negatively affecting organizational performance and environmental management effectiveness (Ho & Lin, 2012). Green activities are also often complex due to the need to change many processes (Mohd Rizaimy et al., 2018), leading to difficulties in adopting new initiatives. Conversely, if the green innovation adoption process is simple and easy to implement, implementation will be smoother. Therefore, it can be predicted that perceived complexity has a negative impact on the likelihood of adopting green innovations in SMEs. Therefore, the following hypothesis is proposed:

*H1: The complexity of a green innovation is negatively related to the adoption of green innovations in SMEs.*

**Perceived green innovation's compatibility**

Compatibility is the degree to which an innovation fits with the values, experience, and needs of the firm, which reduces resistance to adopting a new technology (Rogers, 2003). The integration of a green innovation into existing technology is a process of knowledge accumulation, in which compatible innovations are more easily adopted (Etzion, 2007). High compatibility not only facilitates the integration of green innovations but also increases environmental performance (Ho & Lin, 2012). The fit between prior experience and environmental protection measures promotes employees' perception of the benefits of green innovations, which in turn encourages the adoption of new technologies. Therefore, green innovations that fit with existing technologies and processes are positively related to their adoption, especially in SMEs. Therefore, the following hypothesis is proposed:

*H2: The degree of compatibility of green innovations is positively related to the adoption of green innovations in SMEs.*

**Perceived green innovation's relative advantage**

Relative advantage is the extent to which an innovation is perceived to provide superior benefits compared to

alternatives, including economic, social, and convenience benefits (Rogers, 2003). Firms often adopt technologies that provide high performance and financial benefits, such as reduced energy consumption, waste reduction, and improved environmental performance (Etzion, 2007). These benefits motivate firms to implement green innovations, which reduce emissions and toxic waste, and improve ecological efficiency (Konietzko et al., 2020). Despite requiring initial investment, green initiatives often pay for themselves through savings and improved efficiency (Premaratna et al., 2021). Economic and financial advantages are important technological factors that positively influence the adoption of clean technology (Del Rio Gonzalez, 2005). Therefore, the relative advantage of green innovations is expected to promote their adoption in SMEs. The following hypothesis is proposed:

*H3: There is a positive relationship between the relative advantage of green innovations and the adoption of green innovations in SMEs.*

### 2.3. Impact of Organizational Factors on Green Innovation Adoption

The organizational context includes factors and processes that can support or hinder technological innovation. Studies have shown that organizational characteristics such as human resource quality, leadership, organizational support, corporate culture, and firm size have a significant impact on technological innovation and environmental strategy (Etzion, 2007). Abundant resources and strong organizational capabilities play an important role in promoting technological innovation and improving environmental performance (Jeyaraj et al., 2006). Factors such as resource availability, management support, organizational learning capacity, and human resource quality also influence the adoption of green initiatives (Lin & Ho, 2011). This study focuses on three factors: human resource quality, organizational support, and firm size, as these are important factors in studies of technical innovation and environmental management.

#### Quality of Human Resource

Highly qualified human resources are an important factor in promoting green initiatives due to their ability to learn and innovate. Implementing green initiatives requires cross-functional coordination and process changes, requiring significant human resources and specialized skills through training and active employee involvement. However, limited employee learning ability can be a major barrier to the transfer of technical knowledge (Szulanski, 1996). Companies need to invest in intensive training for employees to understand and effectively apply green initiatives. Employees with good learning ability will promote innovation and help organizations implement more advanced environmental strategies (Christmann, 2000). Management commitment and skilled human resources are also important factors in promoting green innovation (Lee, 2008). Therefore, human resource quality not only enhances the ability to adopt green initiatives but also is the main driving force for SMEs to achieve sustainable performance.

*H4: There is a positive relationship between human resource quality and green innovation adoption in SMEs.*

#### Organizational support

Management concern and organizational support play an important role in promoting green innovation. Management with high environmental concern will actively support the adoption of green initiatives, improving economic, environmental and social performance (Qi et al., 2010). Environmental management responsibility is a decisive factor in implementing waste prevention and eco-innovation methods. At the same time, organizational support, including the provision of necessary technology, systems, and resources, helps employees adopt green habits and innovate effectively (Mohd Rizaimy et al., 2018). To be successful, businesses need to build cross-functional collaboration capabilities, change current operations, and train employees to meet the requirements of green initiatives (Ibrahim et al., 2018). Companies with strong support and highly qualified employees will easily achieve an environmental competitive advantage.

*H5: Organizational support positively affects green innovation adoption in SMEs.*

### 2.4. Impact of Environmental Factors (TF) on Green Innovation Adoption

In this study, environmental factors are understood as aspects of the external environment that influence innovation behavior and green strategies of enterprises. Environmental factors such as uncertainty, environmental generosity, government support, competitive pressure and network relationships all have significant impacts on technical

innovation and environmental strategies (Jeyaraj et al., 2006; Etzion, 2007). Among them, uncertainty and the availability of external resources are two prominent factors (Rothenberg & Zyglidopoulos, 2007). The government also plays an important role in providing resources and promoting the adoption of innovation (Lee, 2008). Based on the model of Lin and Ho (2011), this study focuses on the impact of uncertainty, government support, and stakeholder pressure on the innovation process.

**Environmental Uncertainty**

Environmental uncertainty, including changes in customer preferences, technology, and competition, significantly influences firm decisions (Lin & Ho, 2011). To maintain competitiveness, firms must adapt proactively and embrace innovation. In such environments, companies often collect and analyze information to adopt green practices, enhancing environmental performance and reducing risks (Rothenberg & Zyglidopoulos, 2007).

This uncertainty drives measures like green procurement and sustainable internal management (Ibrahim et al., 2018). Market and stakeholder pressures, including from customers, suppliers, and competitors, further fuel innovation (Abdullahi et al., 2018). SMEs, known for their agility, prioritize market intelligence and supply chain flexibility to meet customer needs and improve performance (Federica et al., 2016; Benzidia & Naouel, 2020). Thus, environmental uncertainty presents both challenges and opportunities for promoting green innovation.

*H6: There is a positive relationship between market changes and green innovation adoption of SMEs*

**Government support**

Government policies play an important role in encouraging small and medium-sized enterprises (SMEs) to adopt environmentally friendly production methods, especially in developing countries. Policies such as financial incentives, training programs, pilot projects, and technical assistance help SMEs shift from conventional to green technologies, as seen in Korea and Malaysia (Scupola, 2003). Governments can also provide tax subsidies, low-interest bank financing, and incentives for alternative energy technologies (Aragon-Correa & Sharma, 2003).

Government support not only provides resoGurces but also motivates SMEs to engage in green supply chains and improve environmental performance. Studies by Lee (2008) and Shaharudin et al. (2015) show that government intervention has a positive impact on participation in green initiatives. These policies also help to reduce financial burdens and encourage the adoption of green processes to meet environmental protection requirements (Mohd Rizaimy et al., 2018).

With government support, SMEs can overcome resource barriers and shift to green operations, thereby improving environmental performance and enhancing competitiveness. Therefore, government support is expected to have a positive impact on the adoption of green initiatives in SMEs.

*H7: There is a positive association between government support and the adoption of green initiatives in SMEs.*

**Rule and regulation pressure**

Global companies today face pressure from governments to develop environmentally friendly production activities and comply with legal regulations. Many studies have shown that government regulations and pressure play an important role in promoting enterprises to adopt environmental protection initiatives (Freeman, 2011). Regulatory changes and government enforcement have a great impact on the environmental management activities and business growth of companies (Huang et al., 2009).

The pressure from environmental regulations not only forces enterprises to comply but also promotes green innovation (GI) to improve cost efficiency and productivity (Chan et al., 2016). Small and medium-sized enterprises, facing regulatory burdens, are often under greater pressure to implement green initiatives (Berrone et al., 2013). Environmental protection regulations and strict enforcement of rules have promoted the adoption rate of green innovation (Zeng et al., 2011).

These regulations not only protect the ecosystem but also contribute to promoting green innovation in enterprises (Sanni, 2018). Government pressure, especially on SMEs, has increased commitment and participation in environmental protection initiatives, improving corporate competitiveness and performance.

*H8: There is a positive relationship between Rule and regulation and green innovation adoption of SMEs.*

**Customer Pressure**

In recent decades, customer concern for environmental issues, especially the demand for green products, has been increasing. Customer pressure has become an important factor motivating SMEs to improve and adopt green innovation to meet sustainability requirements and customer satisfaction (Huang et al., 2016). Research shows that customer engagement can help firms recognize and exploit opportunities in green product innovation.

In addition, customer pressure combined with other factors such as legal requirements and ethical issues creates strong incentives for firms to undertake environmental protection initiatives (Yalabik & Fairchild, 2011). To maintain a competitive advantage, firms find it necessary to understand and respond promptly to changes in customer preferences, especially when customers prioritize environmentally friendly products and are willing to pay a premium (Varadarajan, 2020).

As customers demand more green products, SMEs will increase their efforts to invest in green innovation to meet this demand (Lestari et al., 2021). Therefore, a positive relationship between customer demand and eco-innovation in SMEs is clearly predicted.

*H9: There is a positive relationship between customer pressure and green innovation adoption of SMEs*.

From the above research hypotheses, the author builds the following research model

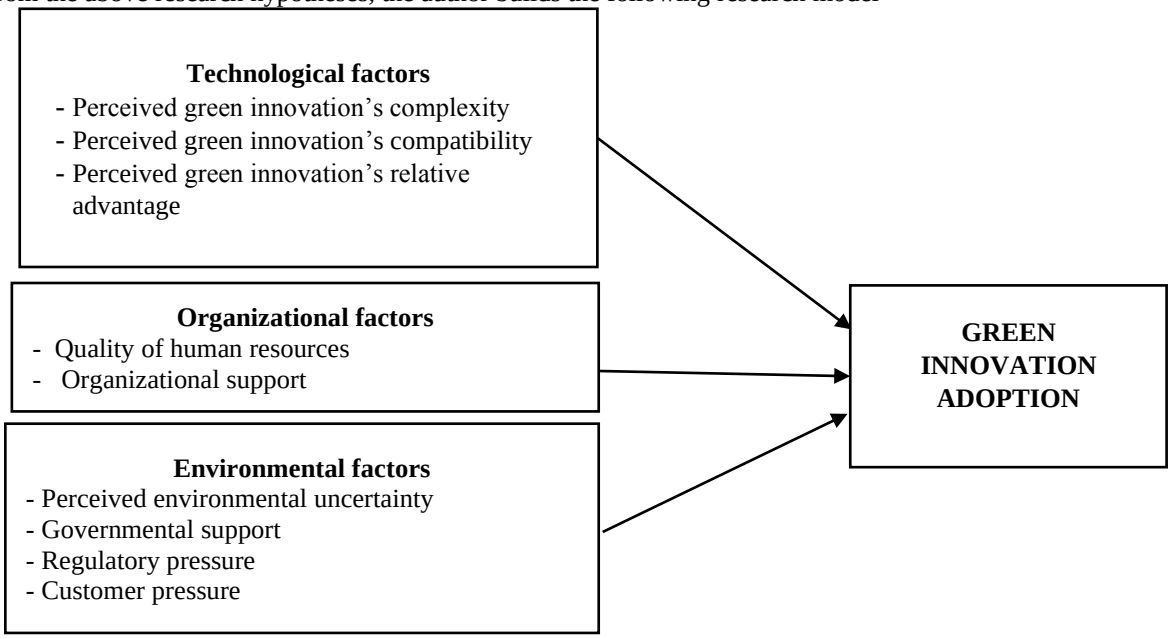

**Figure 1: Conceptual framework**

## III. RESEARCH METHODOLOGY

This study is empirical in nature and uses quantitative methods. To test the hypotheses, the structural equation model using partial least squares (PLS-SEM) was applied and analyzed using SmartPLS 4.0 software. This method was chosen because it is suitable for the explanatory nature of the study (Hair et al., 2010). In addition, according to Hair et al. (2017), PLS is the preferred choice when the sample size is small and the model is complete. Chin & Newsted (1999) recommend the use of PLS-SEM because it is effective in discovering latent factors. The reason is that PLS-SEM does not require the assumption of normal distribution, is capable of handling many dependent and independent variables simultaneously, and is suitable for small sample sizes and handling multicollinearity problems between independent variables. The methodology section is divided into three parts: data and sample size, measures construction, and data analysis.

**Data and sample size**

Research data were collected in two stages. First, semi-structured interviews with five managers and directors of manufacturing SMEs in Thanh Hoa were conducted to identify key factors influencing the adoption of green innovation, based on previous literature. Next, a research questionnaire was developed and distributed to 600 SMEs in five manufacturing sectors in Thanh Hoa's industrial zones, including textiles, chemicals, food and beverages,

construction materials, and pharmaceuticals. These sectors were selected because of their large scale and high level of pollution.

The total number of SMEs registered in the list from the Department of Industry and Trade was 1326. The study applied a random sampling method to ensure that each unit had an equal chance of selection. Using the formula of Yamane (1967), the minimum sample size was determined to be 307.

$$n = \frac{N}{1+Ne^2},$$

where n is the sample size, N is the total population, and e is the significance level (0.05), resulting in the following equation:

$$n = \frac{1326}{1 + 1326 * (0.05) * (0.05)} = 307$$

The author sent 600 questionnaires to various small and medium-sized enterprises (SMEs) online via email and Google form URL. Of the total number of questionnaires sent, 389 were retrieved for analysis. These questionnaires were sent to CEOs, managers, directors, and departments in charge of environmental protection related to production and operations because these people have direct and in-depth information and knowledge about the green innovation application situation of the enterprise and the whole industry.

**Measurement**

The questionnaire for this study is divided into four main parts: company information, influencing factors (Perceived green innovation's complexity (Complex), Perceived green innovation's compatibility (Compa), Perceived green innovation's relative advantage (Advan), Quality of human resources (HR), Organizational support (ORS), Perceived environmental uncertainty (EnUn), Governmental support (GoS), Regulatory pressure (RP), Customer pressure (CP)). Furthermore, a five-point Likert scale was used to measure the items ranging from strongly disagree (1) to strongly agree (5). To ensure validity, the items of the independent factor scale were taken from the available literature in the study of (Ming-Horng Weng & Lin, 2011), the dependent variable (Green Innovation) was inherited from the study of Chiou et al. (2011), Abdullah et al., 2016; Soewarno et al., 2019).

## IV. RESULTS AND DISCUSSION

### 4.1 Demographic characteristics of the survey subjects

Table 2 shows that the majority of respondents are male, accounting for 61.18%. In particular, respondents who are in leadership positions, Third level managers account for 40.87%, Second level managers account for 32.39%, Top level managers account for 22.88% and Employees in charge of green innovation of the enterprise account for 3.86%. These are people who are knowledgeable about the green innovation activities of the enterprise. The working time at the enterprise of the respondents is long enough for them to be knowledgeable about the enterprise's activities, especially green innovation activities. Those who have worked at the company from 5-10 years account for the highest proportion (55.78%), followed by More than 10 years (accounting for 34.70%) and under 5 years account for 9.51%. Regarding the business sector of the enterprise, the highest proportion is food and beverage enterprises (accounting for 32.9%), followed by construction materials enterprises (accounting for 27.76%), pharmaceutical enterprises (accounting for 19.91%), textile enterprises (accounting for 14.65%), and finally chemical enterprises (9.77%). Regarding the duration of operation of the enterprise, the number of enterprises with a duration of operation from 10-15 years accounts for the highest proportion (42.67%), followed by enterprises operating for over 15 years accounting for 30.85%, enterprises operating for 5-10 years accounting for 22.37% and finally enterprises operating for less than 5 years accounting for 4.11%.

**Table 1:Respondent's and SMEs' information**

| | Number | Percentage | | Number | Percentage |
|---|---|---|---|---|---|
| **Gender** | | | **Business sectors** | | |
| Male | 238 | 61.18 | Textiles | 57 | 14.65 |
| Female | 151 | 38.82 | Chemicals | 38 | 9.77 |

| | | | | | |
|---|---|---|---|---|---|
| **Position** | | | Food and beverage | 128 | 32.9 |
| Top level managers | 89 | 22.88 | Building materials | 108 | 27.76 |
| Second level managers | 126 | 32.39 | Pharmaceuticals | 58 | 14.91 |
| Third level managers | 159 | 40.87 | **Time of operation** | | |
| Corporate Green Innovation Officer | 15 | 3.86 | Less than 5 year | 16 | 4.11 |
| **Seniority** | | | From 5 – less than 10 years | 87 | 22.37 |
| Less than 5 years | 37 | 9.51 | From 10- 15 years | 166 | 42.67 |
| From 5- 10years | 217 | 55.78 | More than 15 years | 120 | 30.85 |
| More than 10 years | 135 | 34.70 | | | |

*(Source: Smart PLS data processing results)*

### 4.2 Assessing the quality of the measurement model

**Scale quality**

To assess whether the observed variables are meaningful or not, analyze the PLS-SEM algorithm to get the outer loading results. According to Hair et al. (2022), for the measurement model, the quality of observed variables is reflected through the outer loading. If this coefficient is >= 0.7: Very good, < 0.4: Rejected. The data analysis results of the observed variables in this study show that the outer loadings of all variables are > 0.7 (table 2), thus ensuring the quality of the observed variables for further analysis.

**Table 2. Values of the outer loading factors of the scale and observed variables**

| Factors | Variables | Outer loading | Factors | Variables | Outer loading |
|---|---|---|---|---|---|
| **Complex** | Complex1 | 0.711 | **EnUn** | EnUn1 | 0.828 |
| | Complex2 | 0.723 | | EnUn2 | 0.824 |
| | Complex3 | 0.763 | | EnUn3 | 0.785 |
| | Complex4 | 0.730 | | EnUn4 | 0.792 |
| **Compa** | Compa1 | 0.829 | **GoS** | GoS1 | 0.814 |
| | Compa2 | 0.803 | | GoS2 | 0.845 |
| | Compa3 | 0.818 | | GoS3 | 0.729 |
| **Advan** | Advan1 | 0.860 | **CP** | CP1 | 0.862 |
| | Advan2 | 0.868 | | CP2 | 0.912 |
| | Advan3 | 0.851 | **RP** | RP1 | 0.882 |
| **HR** | HR1 | 0.816 | | RP2 | 0.901 |
| | HR2 | 0.832 | **GIA** | GIA1 | 0.770 |
| | HR3 | 0.816 | | GIA2 | 0.817 |
| | HR4 | 0.856 | | GIA3 | 0.818 |
| **OrS** | OrS1 | 0.757 | | GIA4 | 0.833 |
| | OrS2 | 0.748 | | | |
| | OrS3 | 0.794 | | | |
| | OrS4 | 0.792 | | | |

*(Source: Smart PLS data processing results)*

**Construct Reliability and Validity of the scale**

SmartPLS 4 software provides three indicators to assess scale reliability or internal consistency reliability: Cronbach's alpha, Composite reliability rho_a, Composite reliability rho_c (CR). Hair et al. (2017) proposed to focus on two indicators: Cronbach's alpha and Composite reliability rho_c. (Table 3).

**Table 3. Values of indicators to assess scale reliability**

| Factors | Cronbach's alpha | Composite reliability (rho_c) | Average variance extracted (AVE) |
|---|---|---|---|
| **Advan** | 0.759 | 0.859 | 0.670 |

| | | | |
|---|---|---|---|
| **CP** | 0.702 | 0.870 | 0.771 |
| **Compa** | 0.750 | 0.857 | 0.667 |
| **Complex** | 0.874 | 0.914 | 0.726 |
| **EnUn** | 0.823 | 0.882 | 0.652 |
| **GIA** | 0.825 | 0.884 | 0.656 |
| **GoS** | 0.712 | 0.839 | 0.636 |
| **HR** | 0.850 | 0.898 | 0.689 |
| **OrS** | 0.775 | 0.856 | 0.597 |
| **RP** | 0.743 | 0.886 | 0.795 |

*(Source: Smart PLS data processing results)*

Regarding the reliability test of the scales in the measurement model, also according to Hair et al. (2022), Cronbach's alpha and Composite reliability values ranging from 0.6 to 0.7 are considered acceptable, and values ranging from 0.7 to 0.9 are considered satisfactory. If the construct has a value lower than 0.6, it is considered to lack internal consistency reliability. The results of the reliability test of the scales from the survey data in this study are shown in Table 3. The data analysis results show that both Cronbach's alpha and Composite reliability values are greater than 0.7, thus ensuring the internal consistency and reliability of the scales.

Next, the convergent validity of the scales is examined based on the Average Variance Extracted (AVE) index. According to Hair et al. (2022), when the AVE index is ≥ 0.5 (the latent variable explains at least 50% of the variance of each observed variable), the scales ensure convergent validity. According to the data analysis results in Table 3, the AVE values of all factors are above 0.5, demonstrating the convergent validity of the construct for further analysis.

**Discriminant Validity**

From the results of the PLS-SEM algorithm analysis on SmartPLS 4 software, we have 3 results to evaluate the discriminant validity of the research scale, including: Cross loadings (Table 2), Heterotrait-Monotrait Ratio (HTMT) (Table 4) and Fornell and Larcker table (Table 5).

**Table 4. Heterotrait-Monotrait Ratio (HTMT) Index**

| | **Advan** | **CP** | **Compa** | **Complex** | **EnUn** | **GIA** | **GoS** | **HR** | **OrS** | **RP** |
|---|---|---|---|---|---|---|---|---|---|---|
| **Advan** | | | | | | | | | | |
| **CP** | 0.201 | | | | | | | | | |
| **Compa** | 0.136 | 0.240 | | | | | | | | |
| **Complex** | 0.362 | 0.403 | 0.388 | | | | | | | |
| **EnUn** | 0.044 | 0.107 | 0.250 | 0.275 | | | | | | |
| **GIA** | 0.522 | 0.454 | 0.460 | 0.880 | 0.256 | | | | | |
| **GoS** | 0.235 | 0.320 | 0.238 | 0.312 | 0.131 | 0.365 | | | | |

Henseler et al. (2015) stated that if the HTMT index of a pair of factors is greater than 0.9, the discriminant quality of the factor is violated. If the HTMT index is below 0.85, the discriminant quality is well guaranteed. Thus, the range from 0.85 to 0.9 will be the acceptable threshold. The data results in Table 5 show that all values are less than 0.9, so the discriminant quality is guaranteed.

**Table 5: Fornell Larcker**

| **CP** | 0.135 | **0.878** | | | | | | | | |

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| **Compa** | -0.006 | 0.070 | **0.817** | | | | | | | |
| **Complex** | -0.000 | 0.123 | 0.302 | **0.852** | | | | | | |
| **EnUn** | 0.268 | 0.071 | 0.198 | 0.058 | **0.808** | | | | | |
| **GIA** | 0.184 | 0.257 | 0.362 | 0.483 | 0.214 | **0.810** | | | | |
| **GoS** | -0.012 | 0.139 | 0.174 | 0.149 | 0.093 | 0.281 | **0.797** | | | |
| **HR** | 0.121 | 0.142 | 0.112 | 0.235 | 0.084 | 0.315 | 0.126 | **0.830** | | |
| **OrS** | 0.169 | 0.207 | 0.123 | 0.078 | 0.172 | 0.403 | 0.103 | 0.028 | **0.773** | |
| **RP** | 0.210 | 0.152 | 0.130 | 0.209 | 0.088 | 0.450 | 0.214 | 0.194 | 0.161 | **0.892** |

*(Source: Smart PLS data processing results)*

Table 5 shows the correlations of all constructs. In the table, the bold numbers above the diagonal represent the square root of the average variance extracted (AVE) for each variable, while the numbers below the diagonal represent the correlation coefficient between each pair of variables. The comparison shows that the square root of the AVE for each variable is larger than the values in the corresponding rows and columns of the correlation matrix, indicating that the discriminant reliability is satisfactory.

Therefore, the model in this study demonstrates reliability, and the designed scales demonstrate high reliability and stability. The measurement items of the system meet the measurement requirements and are of high quality. All reliability indices meet the established evaluation criteria.

### 4.3 Evaluation of the SEM linear structural model

#### Collinearity of independent variables

According to Hair et al. (2019), gives the following VIF (variance inflation factor) thresholds in assessing collinearity: VIF ≥ 5: very high probability of collinearity, the model is seriously affected, 3 ≤ VIF < 5: the model may have collinearity, VIF < 3: the model does not have collinearity.

**Table 6. VIF value table of commitment, value, trust and communication variables**

| | VIF |
|---|---|
| **Advan -> GIA** | 1.407 |
| **CP -> GIA** | 1.188 |
| **Compa -> GIA** | 1.137 |
| **Complex -> GIA** | 1.362 |
| **EnUn -> GIA** | 1.095 |
| **GoS -> GIA** | 1.128 |
| **HR -> GIA** | 1.136 |
| **OrS -> GIA** | 1.102 |
| **RP -> GIA** | 1.449 |

*(Source: Smart PLS data processing results)*

The data results in Table 6 show that the VIF threshold values are all less than 3, so the research model does not encounter multicollinearity.

#### Research hypothesis analysis

Bootstrapping analysis on SmartPLS gives the Path coefficients results as in Table 7.

**Table 7. Path coefficients**

| Hypothesis | Relationship | Original sample (O) | Standard deviation (STDEV) | T statistics (\|O/STDEV\|) | P values | Decision |
|---|---|---|---|---|---|---|
| **H1** | **Complex -> GIA** | -0.439 | 0.049 | 9.020 | 0.000 | Accepted |
| **H2** | **Compa -> GIA** | 0.137 | 0.032 | 4.202 | 0.000 | Accepted |
| **H3** | **Advan -> GIA** | 0.159 | 0.041 | 3.887 | 0.000 | Accepted |

| | | | | | | |
|---|---|---|---|---|---|---|
| **H4** | **HR -> GIA** | 0.094 | 0.032 | 2.945 | 0.003 | Accepted |
| **H5** | **OrS -> GIA** | 0.223 | 0.034 | 6.641 | 0.000 | Accepted |
| **H6** | **EnUn -> GIA** | 0.019 | 0.028 | 0.694 | 0.488 | Not Accepted |
| **H7** | **GoS -> GIA** | 0.045 | 0.030 | 1.513 | 0.130 | Not Accepted |
| **H8** | **CP -> GIA** | 0.082 | 0.032 | 2.546 | 0.011 | Accepted |
| **H9** | **RP -> GIA** | 0.145 | 0.043 | 3.366 | 0.001 | Accepted |

*(Source: Smart PLS data processing results)*

The data results in Table 7 show that 7/9 impact relationships are statistically significant (P value < 0.05), so the research hypotheses H1, H2, H3, H4, H5, H8 and H9 are accepted, while hypotheses H6 and H7 are not accepted. Regarding the direction of impact, all impacts are positive (the Original sample (O) path coefficient has a + sign), except for the impact of Complex → GIA which is a negative impact (the Original sample (O) path coefficient has a - sign). The path coefficient value is also the basis for assessing the strength of the impact of the independent variable on the dependent variable, specifically the order from large to small is as follows: Complex → GIA (-0.439) > OrS -> GIA (0.223) > Advan -> GIA (0.159) > RP -> GIA (0.145) > Compa -> GIA (0.137) > HR -> GIA (0.094) > CP -> GIA (0.082).

## V. RESULTS AND DISCUSSION

The study uses regression analysis to examine the impact of technological, organizational, and environmental factors on SMEs' adoption of green innovation. Results show that technological factors significantly influence adoption, with perceived complexity negatively affecting it, while compatibility and relative advantage have positive effects. SMEs are more likely to adopt green innovations when they are simple, compatible with existing operations, and beneficial for economic and environmental performance. To enhance adoption, SMEs should increase environmental knowledge, clarify green initiatives, and align innovations with existing systems. Suppliers should also highlight the relative advantages of green technologies.

Organizational factors, including support from management and high-quality human resources, positively influence adoption. Organizational support motivates employees and ensures the availability of resources for green innovation, while training and knowledge management systems further promote adoption.

Regarding environmental factors, perceived uncertainty and weak government support do not significantly affect green innovation adoption. However, regulatory and customer pressures play crucial roles. Regulatory policies enforce compliance, while growing consumer demand for sustainability drives firms to adopt green standards. To promote green innovation, governments should offer consistent financial and technical support, enforce clear regulations, and enhance transparency. Meanwhile, SMEs should focus on developing sustainable products, leveraging customer demand, and reducing uncertainty to identify opportunities for green innovation.

**ABSTRACT**

This study investigates the factors influencing university students' entrepreneurial intentions to return to their hometowns and start businesses, focusing on the roles of attitude, government support, and perceived behavioral control. By applying the Model of Goal-Directed Behavior (MGB), the research highlights the mediating role of desire in shaping intentions. The research utilized a quantitative approach, employing an exploratory survey method to collect data from 311 university students in Vietnam. The findings emphasize that government support plays a pivotal role in fostering entrepreneurial intentions. Attitude, identified as the strongest predictor of desire, underscores the importance of cultivating a positive entrepreneurial mindset among students. However, the study finds that while a positive attitude is essential, it is insufficient without adequate resources and support. Additionally, enhancing perceived behavioral control through initiatives like entrepreneurship workshops and peer networks can further empower students to pursue entrepreneurial goals. The study's insights contribute to understanding how supportive environments and policy measures can motivate young entrepreneurs to participate in rural revitalization and sustainable development. This research underscores the need for comprehensive strategies to bridge the gap between entrepreneurial desire and actionable intention among university students.

*Keywords*: "Entrepreneurial Intention", "Government Suppor"t, "Attitude", "Perceived Behavioral Control", "Rural Development"

## I. INTRODUCTION

### 1.1 Background of the study

Nguyen (2014) suggests that rural Vietnam can be analyzed through three primary dimensions: agriculture, rural development, and rural livelihoods, each encompassing both positive and negative aspects (Powell et al., 2011). Rural development is a complex and multifaceted process that requires diverse resources (Thuy, Thanh et al., 2024). Rural entrepreneurship, in particular, has long been recognized as a key driver of economic growth (Wortman, 1990). According to Steiner and Atterton (2015), rural entrepreneurship significantly benefits local communities by generating employment, advancing local products and services, and creating indirect contributions such as spillover effects and added value from core business activities.

Entrepreneurial learning experiences play a crucial role in shaping the intentions of rural students to return home and start businesses (Li, Li et al., 2024). This not only contributes to rural economic development but also serves as an effective means to address unemployment (Van Praag and Versloot, 2007). Recent data indicates substantial growth potential in rural areas of Vietnam, showing a narrowing gap in development between rural and urban regions (Lê Minh Hoan, 2023). However, while development is occurring, the process remains slow and appears to be decelerating.

Studying the aspirations and entrepreneurial tendencies of recent graduates is especially vital given the competitive job market and the unequal distribution of talent across regions (Chen et al., 2021). The concept of returning home to start a business refers to the intention of rural university students to establish ventures in their hometowns after completing their education. Several factors influence this decision. For instance, rural entrepreneurial behavior is often motivated by a desire to care for family members and contribute to the development of their hometowns (Ren and Shi,

2017). Therefore, identifying the key factors that most influence an individual's decision to pursue entrepreneurship is crucial (Liñán et al., 2011).

Prior research indicated that attitudes, support from the government, and perceived behavioral control had a favorable impact on university students' desire to launch a startup in their hometowns. It's possible that the consequences' full scope won't be investigated. The gaps in literature were addressed in a number of ways by this study. First, the government support variable acted as an external factor, making the model more generalizable. However, this was a self-made variable and there was no study to compare with except He et al (2023). Therefore, we studied and contributed to the source of future comparisons. Second, previous studies were conducted in Western countries or developing countries (He & Ding, 2023; Justice Malebana, 2014; Liñán et al., 2011; Perugini & Bagozzi, 2001). As a result, we contributed by expanding the research to Vietnam, a developing nation. In order to generalize the correlations under study across many cultural and national contexts, this was a crucial step. Finally, because there are numerous cultures in various geographic regions, students may think, feel, and behave differently. We performed the survey at numerous universities and extended its reach to students from various region of Vietnam. As a result, the results were more varied and had broad applicability.

### 1.2 Research Questions and objectives

Research questions: How to create entrepreneurial intention among returning home students from cognitive drivers (e.g., attitude), external factors (e.g., government support), and percevied behavioral control with students' desire as the mediating variable?

Research objectives: To estimate the sequencing relationships from various drivers (attitude, government support, percevied behavioral control), desire as a goal-oriented behavior, to entrepreneurial intention among returning home students.

## II. MATERIAL AND METHODOLOGY

### 2.1. Conceptual Foundation

#### Model of Goal-Directed Behavior (MGB)

According to Perugini et al. (2001) the MGB views intentions to carry out a behavior as primarily driven by the desire to carry out the behavior. This desire is thought to reflect the effects of attitude, perceived behavioral control, and frequency of prior behaviors, and to mediate their influence on intentions.

The four primary components of the The Theory of Planned Behavior are behavioral intention, behavioral attitude, subjective norm, and perceived behavioral control (He & Ding, 2023). In contrast to the Theory of Planned Behavior, MGB emphasizes the mediating function of desire and enhances the capacity to forecast individual behavior and behavioral goals. It does this by taking into account a person's behavioral aptitude from both the cognitive and motivational levels (Perugini & Bagozzi, 2001).

### 2.2. Research method

#### 2.2.1. Attitude

Perugini et al. (2001) defined attitudes as essentially a judgment of conduct expressed with a degree of favoritism or dislike. On the other hand, a desire alone, coupled with the conviction that one can act, is enough to activate an intention and doesn't need to be positively assessed (Bagozzi, 1992).

He et al. (2023) found no evidence that behavioral attitude had a substantial impact on an individual's desire to become an entrepreneur. Behavioral attitude, according to Perugini and Bagozzi (2001), influenced behavioral intention indirectly through desire rather than directly. Thus, the more favorable and positive a person's assessment of and attitude toward entrepreneurship, the more appealing and inspiring it is for that person to pursue entrepreneurship.

*H1: Attitude has a significantly positive impact on desire for returning home to start a business among university students.*

#### 2.2.2. Government support

The government and municipal governments should do more to support and encourage students. These pertinent

resources can be supplied by the government within the framework of a rural revitalization plan. He et al. (2023) discovered that the intention of university students to launch a startup in their home cities is significantly influenced by government support, which also has a major influence through desire. The more clearly university students intend to return home to launch startup and take part in rural revitalization, the more the federal government or local governments can encourage entrepreneurship through loan support programs, more venture capital, and loans.

*H2: Government support has a significantly positive impact on desire for returning home to start a business among university students.*

**2.2.3. Perceived behavioral control**

The term "perceived behavioral control" describes a person's belief in their capacity to carry out a particular conduct (Ajzen, 2005). An individual's perceived control over his behavior is stronger when he believes that he can access more resources and that the predicted impediment is smaller. Although it is also asserted that the concept of perceived behavioral control is similar to that of self-efficacy, or the individual's assessment of their own ability to perform the behavior, it is conceptualized as an estimate of the degree to which the person has control over whether or not they are able to perform the behavior (Ajzen & Madden, 1986).

Research indicated that perceived behavioral control has no discernible effect on desire (He & Ding, 2023), previous MGB studies confirmed that perceived behavioral control has a significant influence on desire. However, the strength of influence of these constructs on intention to perform a behavior occured indirectly through desire (Perugini & Bagozzi, 2001). In addition, the ability of perceived behavioral control as an independent variable to both directly influenced behavioral intention and positively influence it through desire (Meng & Choi, 2016). Thus, the following is the study's hypothesis:

H3: Perceived behavioral control has a significantly positive impact on desire for returning home to start a business among university students.

**2.2.4. Desire and its mediation effect**

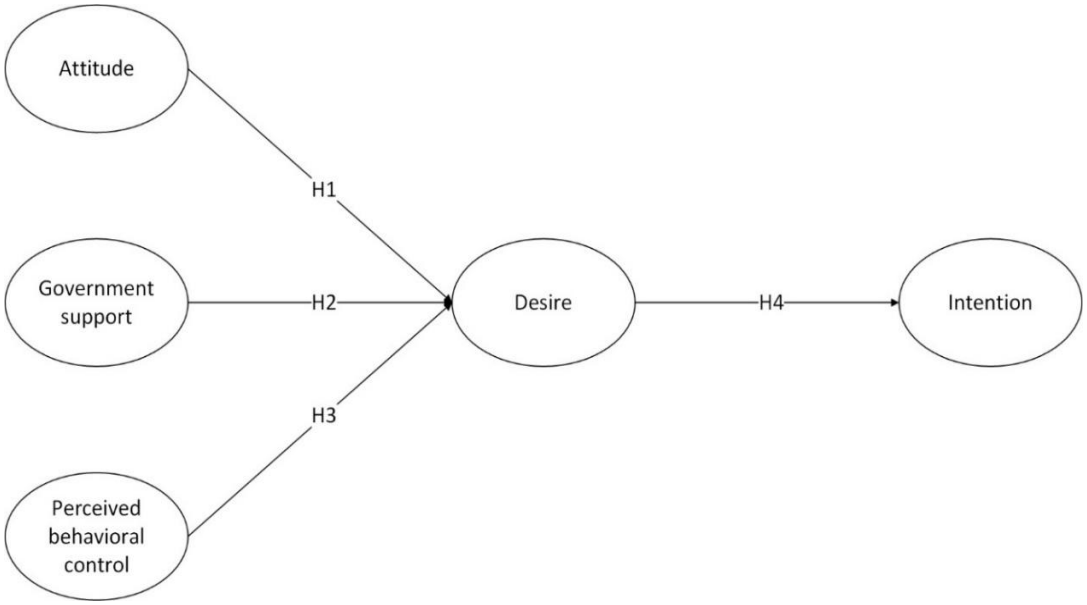
Desire is a mediating factor that directly affects behavioral intentions (Perugini & Bagozzi, 2001). The MGB distinguished clearly between intentions and desires. Unlike desires, intentions are more closely linked to results and may entail preparation for carrying out the desired conduct. As it stands, attitude is an evaluation of an action; however, unless the evaluation is coupled with a desire to take action, no action will be taken. A person who finds an act appealing may not want to carry it out and may choose not to do it or may not have any intention at all (Bagozzi, 1992).

Only when self-efficacy is present will a desire result in an intention. In the same way, having an intention indicates self-efficacy, but having a desire does not. As a result, desires and intentions are not the same thing, and they can theoretically have distinct validity (Bagozzi, 1992).

In the MGB, desire acts as a mediator between behavioral determinants and behavioral intention, which in turn influences target behavior performance. Fans' intention to visit places with pop culture features was positively and significantly influenced by desire, according to research by S. J. Lee et al. (2018). Through certain variations in their search, He et al. (2023) demonstrated that desire also directly affects university students' intentions of returning home city and launch a business. Thus, the following is the hypothesis:

*H4: Desire has a significantly positive impact on intention for returning home to start a business among university students.*

**2.3. Research Model**



This study indicates that the following factors may have an impact on students' intentions to launch a business in their hometown by returning there, according to the goal-directed behavior model (MGB), which takes into account intentions based on people' levels of cognition and motivation. The following factors influence behavior: Desire; Attitude; Perceived behavioral control; Government support (Perugini & Bagozzi, 2001). He (2023) applied this theory to determine the factors that impact students' intention to start a business in their hometown. Prior research has examined the factors (like attitudes and support policies) that impact university students' intention to start a business in their hometown, as well as the fact that students' desires also impact their entrepreneurial intentions (Lee et al., 2018;

Perugini & Bagozzi, 2001). Furthermore, He (2023) specified that when a person thinks he can access more resources and that the anticipated obstacle is less, he feels more in control of his conduct. Using this idea, we examined how university students' intentions to return to their hometown and launch a business are influenced by their perception of behavioral control, as some earlier research has also shown (Meng & Choi, 2016).

**Figure 8: The conceptual framework adopted from (He & Ding, 2023; Justice Malebana, 2014; Liñán et al., 2011; Perugini & Bagozzi, 2001). (Source: The authors.)**

### 2.4. Sample design

University students between the ages of 18 and 25 were the appropriate respondents chosen to take part in the survey. This age group was chosen because they are part of Generation Z, a large cohort that is developing career

orientations and seeking job opportunities. This group also has a certain degree of education, is youthful, aspirational, and has numerous prerequisites for establishing a future career path.

Additionally, students from provinces outside Ho Chi Minh City who plan to return home and start a business after graduation were included in the survey. Participants must intend to return to their hometowns to start a business after completing their university degree. Their responses should be objective and accurate to ensure reliable research results.

### 2.5. Sample size

For every variable that was measured in the study model, at least five respondents are needed, according to Hair's (1998) EFA analysis theory. From there, the first equation, 17 x 5 = 85, was used to determine the sample size because the research model in this study included 17 items, which corresponded to 17 major survey items in the questionnaire survey. To guarantee the accuracy and diversity of the results, Hair (1998) also recommended that the sample size should not be less than 100 survey participants. To improve the representativeness of the sample, the anticipated sample size for this study was at least 200 respondents.

### 2.6. Questionnaire design and measurement items

#### Questionnaire design

A prior empirical study about entrepreneurship and rural revitalization served as the model for the questionnaire. To make sure the questionnaire was as clear as possible and to prevent any unintended confusion, all questions were further edited by qualified teachers and entrepreneurial experts after being carefully and thoughtfully translated from English to Vietnamese for the target audience. The intended respondents were then given the survey for three months in a row (September to December 2024). The questionnaire's structure was divided into two sections. A few demographic and general questions, such as age, gender, school, year of study, hometown, income, and prior experiences, were asked of respondents in the first section. They were then asked to complete a 5-point Likert scale regarding their attitude, perceived behavioral control, government support, organizational commitment, and entrepreneurial desire and intention in the second section. (See Appendix).

**Measurement items**

Five points Likert-scale was applied to measure the variables in the research model, from 1 representing for strongly disagree to 5 for strongly agree. Each measurement item was modified from earlier empirical studies and had been widely used by many scholars (see Table 7 in Appendix).

Attitude (BA). We adopted 4 items from He et al. (2023). One of these items was "Returning home to start a business can achieve greater value of life".

Government support (GS). This variable was measured using 3 items selected out of study by He et al. (2023), whose research had also adapted questions from Justice Malebana (2014). A sample item was "Government commits to support them with funds for college students home business".

Perceived behavioral control (PBC). We further adopted 4 items from He et al. (2023), whose research had also adapted questions from Justice Malebana (2014). A sample item included "I think I have a good family environment encouraged me to start a business".

Desire (D). We again utilized 3 items from He et al. (2023), whose research had also adapted questions from Perugini et al. (2001). A sample item was "I am eager to return home to start a business".

Intention (I). We adopted 3 items from Liñán et al., (2011) and He et al. (2023). A sample item included "I will make every effort to start and run my own firm".

### 2.7. Data collection

We compiled a list of universities in Ho Chi Minh City, An Giang Province and Can Tho Province. Then we contacted teachers and officials working at the schools to find out the potential survey subjects. The research team went directly to each class, introduced the research project and the research phenomenon, and described the phenomenon being studied in a simple, clear, and engaging manner. Then, we invited them to participate in the survey. We focused on students from the provinces who intended to return home to start a business, or at least students from the provinces, rather than a random selection.

After thorough editing and consultation with professionals, the questionnaires were distributed to the intended respondents via links to Google Forms through online platforms (Facebook, Zalo, etc.).

## III. RESULT AND DISCUSSION

### 3.1 Research subjects

STATA was used to evaluate the collected data and produce descriptive statistics. Next, Smart-PLS was employed to assess validity and reliability and examine the relationships between Government Support, Attitude, Perceived Behavioral Control, Desire, and Intention.

### 3.2. Model results

Of the 311 valid observations, 55.31% were male, 44.05% were female, and 0.64% identified as other gender/identity" or whatever the category was 45.02% were 4th-year students, while 22.83% had studied for more than 4 years, and 25.40% had graduated. Out of the respondents, 94 students (30.23%) were majoring in Science & Engineering, while 217 students (69.77%) were majoring in Social Science & Art, and Economics-Business-Management. In terms of work experience (internship/part-time/full-time), the two groups were quite different: 67.52% of students had experience, while 32.48% did not. Additional demographic details were presented in Table 1 below.

**Table 9: Demographic information**

| Categories | Outcomes | Respondent | Percentage (%) |
|---|---|---|---|
| Gender | Female | 172 | 55.31 |
| | Male | 137 | 44.05 |

### 3.2.1. Measurement model testing

When employing the PLS-SEM technique, certain procedures for data analysis were recommended (F. Hair Jr et al., 2014). In order to assess the measurement model (outer model), the study must first look at the connections between the latent variables and their indicators (validity and reliability testing). The suggested hypotheses between constructs were then examined after the structural model (inner model) had been examined (Caldeira & Kastenholz, 2018).

The Intention concept was removed during the Measurement Model Testing run. Therefore, Intention did not appear in Table 2, Table 3 and Table 4. Also, in the Structural model testing section, H4 was removed, as shown in the model analysis result figure.

In order to achieve indicator reliability for the first stage, which involves assessing the link between latent constructs and observed indicators, the variables' Cronbach α must be greater than 0.6. Furthermore, it was recommended to delete any indications whose outer loadings fall below the 0.7 cut-off value (Henseler et al., 2012). Table 2 showed that the outer loadings for all variables exceed the 0.7 threshold. All factors' Cronbach's α values were more than 0.8 except variable Desire (refer to Table 2). All constructions had composite reliability (Rho_A) over 0.7, indicating strong internal consistency. All factors' AVE values were above the 0.5 threshold existed, demonstrating acceptable levels of convergent validity. Refer to Table 2. Additionally, our study used a collinearity test, which required variance inflated factors (VIF) to be below the 3.3 threshold (Kock, 2015). VIF values above this threshold would suggest the presence of common-method bias and collinearity amongst constructs. CMV was not a serious problem in this investigation, as shown by Table 2, which showed that all VIF values were significantly below the criteria.

**Table 10: Reliability and convergent validity of latent constructs**

| Construct | Code | Factor loading | Cronbach's alpha | CR (rho_a) | CR (rho_c) | AVE | R-squared | Full collinearity VIF |
|---|---|---|---|---|---|---|---|---|
| **Threshold** | | **≥ 0.708** | | **[0.7;0.95]** | **[0.7;0.95]** | **≥ 0.5** | | **≤ 3.3** |
| Attitude | | | 0.803 | 0.805 | 0.871 | 0.629 | | 1.876 |
| | BA1 | 0.799 | | | | | | |
| | BA2 | 0.812 | | | | | | |
| | BA3 | 0.775 | | | | | | |
| | BA4 | 0.785 | | | | | | |

*Source: The author.*

The study complied with Fornell & Larcker (1981) criteria for discriminant validity. The first requirement was satisfied because, as Table 3 illustrated, the square roots of the AVE in diagonal of each construct were much higher than the correlation coefficient of that construct with other components. The Monte Carlo simulation analysis demonstrated that HTMT performed better than the Fornell-Larcker criterion and the cross-loadings criterion, with sensitivity and specificity rated of 97% to 99%, compared to 20.82% for the Fornell-Larcker method and 0.00% for cross-loadings. The absence of discriminant validity was shown by HTMT values near 1. Comparing the HTMT to a predetermined threshold was the process of using it as a criterion. If the HTMT value exceeded this threshold, discriminant validity was considered lacking (Ab Hamid et al., 2017). All results in Table 4 were below 1, specifically below 0.95, confirming the presence of discriminant validity.

**Table 11: Discriminant validity (Fornell-Larcker Criterion).**

| | Construct | Fornell-Larcker criterion | | | |
|---|---|---|---|---|---|
| | | 1 | 2 | 3 | 4 |
| 1 | Attitude | **0.793** | | | |
| 2 | Desire | 0.721 | **0.834** | | |
| 3 | Government support | 0.751 | 0.752 | **0.772** | |
| 4 | Perceived behavioral control | 0.694 | 0.738 | 0.763 | **0.799** |

*Source: The authors.*

*Note: The square roots of AVEs are in bold on diagonal*

**Table 12: Discriminant validity (Heterotrait-Monotrait Ratio)**

| | Construct | Heterotrait-monotrait ratio (HTMT) | | | |

### 3.2.2. Structural model testing

After the measurement model has been analyzed, the inner model was examined. The suggested hypotheses were then tested using bootstrapping with 10,000 samples to determine significance values in the two-tailed t-test (Caldeira & Kastenholz, 2018). H1, H2, and H3 were supported at the 1% significance level. Furthermore, it was evident that H3 had the greatest influence whereas H1 had the least. Overall, it was said that every suggested association is statistically significant. Figure 4 below provided a visual summary of the path analysis and hypothesis testing results.

In addition, the idea of effect size—which was quantified by the f2 metric—offers important information about

how the model's capacity to explain the variance in endogenous latent variables was impacted when a specific component was eliminated. In essence, f2 values measured how big these effects are; small medium, and large effects are indicated by values of 0.02, 0.15, and 0.35, respectively. An f2 value of less than 0.02 indicated that there was no discernible impact. The f2 values for each latent variable could be fully understood by reviewing Table 5, which showed how each one contributed to the explanatory power of the model. Table 5 further showed that Desire was only slightly impacted by constructions like Attitude, Government support, and Perceived behavioral control. This thorough analysis underscored the importance of evaluating each construct's contribution to the overall explanatory power of the model.

**Table 13: Results of hypothesis testing.**

| Hypothesis | Causal relationship | Estimate | Effect size ($f^2$) | Supported |
|---|---|---|---|---|
| H1 | Attitude -> Desire | 0.272*** | 0.087 (small) | Yes |
| H2 | Government support -> Desire | 0.306*** | 0.089 (small) | Yes |
| H3 | Perceived behavioral control -> Desire | 0.316*** | 0.113 (small) | Yes |

*Note: *** p-value ≤ 0.001; ** p-value ≤ 0.01; * p-value ≤ 0.05.*

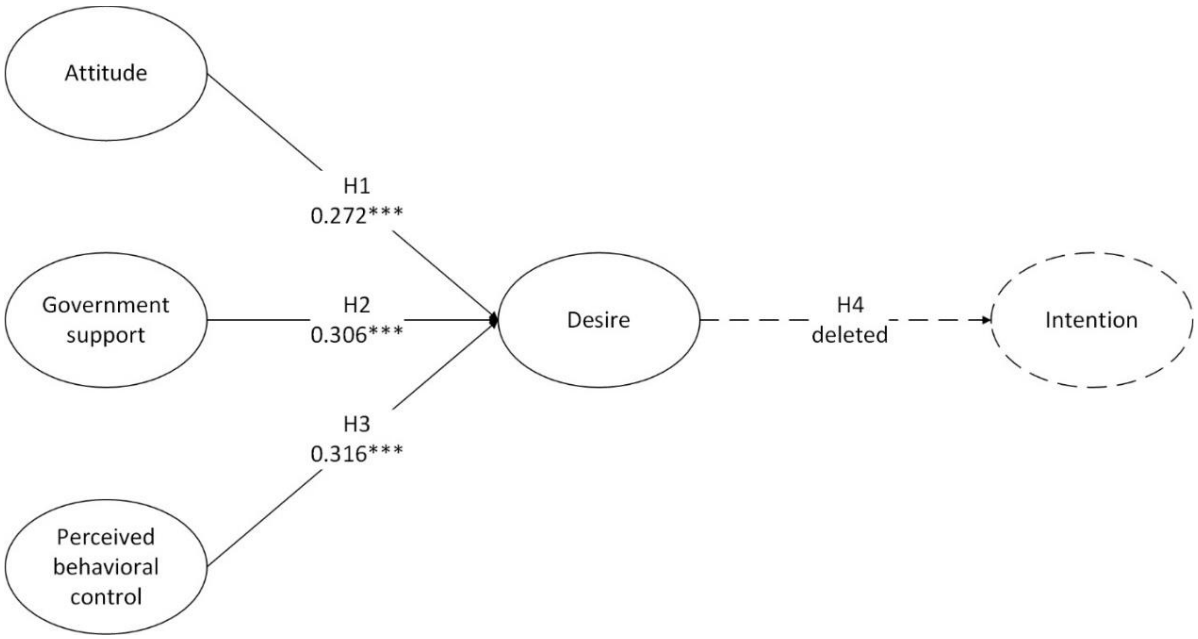

**Figure 9: Theoretical estimation**

*Note 1: *** p-value ≤ 0.001; ** p-value ≤ 0.01; * p-value ≤ 0.05.*

*Note 2: Intention and one hypothesis (H4) were deleted through inferential analysis.*

*Source: The authors.*

Through examining students' desire, our study aims to investigate the relationships between attitude, perceived behavioral control, government support, and entrepreneurial intention. Specifically, we explored how university students' desire to start a business in their home country is influenced by their attitudes, perceived behavioral control, and government support. This desire eventually translated into an intention to start a business back home. By applying the Model of Goal-Directed Behavior (MGB) theory to describe people's intentions and actual behaviors, we further clarified these mechanisms. Overall, our results lent support to the proposed connections.

First, the hypothesis that attitudes have a positive effect on students' desire of starting a business in their home country was supported by our study. This supports Perugini and Bagozzi's (2001) proposed connection between attitudes and desire. Attitude has historically been used to assess a path of action. Students were more inclined to start a business in their hometown if they believed they can succeed at something. This was because their desire to do something demonstrates a motivational commitment to do it. This, however, ran counter to the findings of the He et al. (2023) investigation. According to He et al. (2023), there was no proof that behavioral attitudes significantly influenced

a person's desire to start their own business. The fact that people might not want to do something, had no intention of doing it, or had no intention of doing it at all while they found it attractive could help to explain this. Like attitudes, these assessments do not by themselves reveal motivating commitments.

Second, our findings demonstrated a positive effect between government support and university students' intention of returning home to start a startup. However, there was not much pertinent literature to compare with due to government backing was a self-created variable. The findings were in line with the theory put forth in the earlier empirical study by He et al. (2023), which held that government assistance had a direct impact on university students' desires and was a significant external factor influencing their intention to return home and launch a business. The likelihood of entrepreneurs starting new businesses will increase with their access to and knowledge of entrepreneurial support (Delanoë, 2013).

Finally, our data were not sufficient to support H4 (which has been deleted), which means that we did not demonstrate that attitude, perceived behavioral control, and government support had an impact on university students' intention to return to their hometown to start a business through the mediating variable desire, which was very different from previous studies (He & Ding, 2023; Lee et al., 2018; Perugini & Bagozzi, 2001). The study only demonstrated the links between the variables and the desire variable for university students to establish a business in their hometowns because we stopped the model at the desire variable. Personal desire might really play a major role in determining university students' entrepreneurial intention to launch a firm in their hometown since it encouraged tactics that make the intention more likely to be followed through on. In contrast to desire, intention had a stronger correlation with the result and might necessitate preparation to carry out the desired conduct. Desire did not lead to intention unless self-efficacy was present. Likewise, whereas desire did not signify self-efficacy, intention did. According to Bagozzi (1992), desire and intention were not the same thing, and they might even have different values. Students had a desire of returning hometown to start a startup, but self-efficacy was not sufficient so that desire did not lead to intention.

### 3.3. Theoretical contributions

The current study added to the body of research on university students' desire to start a business in their hometown after graduation, as well as their attitudes and perceived behavioral control over this endeavor. It also examined the ways in which government support influenced this desire. First, although our study did not incorporate new variables, the government support variable which was an external factor, a self-created variable, and there was no study to compare it with except He et al. (2023) It was studied by us and contributed to the source of future comparison. According to the same findings as He et al. (2023), government assistance was unavoidably a factor in the desire of university students to launch a business in their hometown. In other words, people were more inclined to launch a business when they received greater government support. Second, this study was carried out in a developing nation, in contrast to earlier research carried out in Western or developed nations. This was a significant step in generalizing the connections studied in various national and cultural contexts. Desire was not included as an intermediary variable in any of the earlier papers, despite the fact that there were several studies in Vietnam that look at the elements influencing entrepreneurial intention. This study helped to illustrate how desire influences intention in various cultural situations and in a developing nation. The findings, which had not been discovered in other studies, demonstrated that while students may wish to return to their hometown to launch a startup in a developing nation, this desire alone was insufficient to generate the intention. This could be explained by the student's internal or external factors, such as financial constraints or a lack of confidence in their entrepreneurial knowledge. Lastly, students from a wide range of Vietnamese regions participated in this survey, which was carried out across numerous universities. As a result, the findings were more varied and broadly applicable. Students from many regions might find this course useful in advancing their entrepreneurial goals and aspirations. Students could think, feel, and act differently due to the many cultures in various geographic regions. For this reason, students' desires differ from one another.

### 3.4. Practical implications

The findings of the study emphasize the critical role of government support in fostering university students' desire to return to their hometowns and launch businesses after graduation. The strong correlation between government assistance and entrepreneurial desire underscores the need for central and local governments to actively encourage and

support rural entrepreneurship. Policies that provide comprehensive business training, tailored guidance, and accessible venture capital loans with little or no interest can create a more favorable entrepreneurial environment. These initiatives can not only enhance students' entrepreneurial skills but also restore pride in their hometowns, ultimately motivating them to participate in rural regeneration efforts.

Moreover, the study reveals that attitude is the most significant factor influencing entrepreneurial desire. This highlights that an individual's mindset is crucial in shaping their intention to act. However, a positive attitude alone is insufficient to translate desire into action. For instance, despite perceiving the benefits of returning home to start a business, students may hesitate due to external pressures or perceived risks, such as lack of knowledge or inadequate funding. To bridge this gap, policymakers should focus on sustaining and reinforcing the factors that build a positive attitude, such as offering high-quality entrepreneurship courses and practical skill development programs. These measures can instill confidence and equip students with the necessary expertise to pursue their entrepreneurial aspirations.

Finally, enhancing students perceived behavioral control is essential. Governments and universities could encourage participation in entrepreneurship classes, establish dedicated workshops, and facilitate the creation of entrepreneurship-focused clubs. These platforms would allow students to share experiences, address challenges, and exchange ideas, thereby reducing perceived barriers to entrepreneurship. When students feel they have sufficient resources and support to overcome anticipated challenges, their confidence in their ability to act increases. A supportive environment that addresses their concerns and provides actionable knowledge will reduce their anxiety about starting a business, fostering both the desire and intention to return home and contribute to rural economic revitalization. Through these strategic interventions, governments can play a pivotal role in nurturing a generation of entrepreneurs who are empowered to drive sustainable rural development. Considering the function of entrepreneurial ecosystems in sustaining long-term involvement of university graduates in their hometowns can help to improve the practical relevance of this study. Beyond training and financial support, it is imperative to build an innovative culture by means of industry relationships and cooperative networks. Regional entrepreneurial hubs where students may access not only financing but also legal advice, business advising, and mentoring should be supported by governments. Startups can find incubators in these centres, which offer shared resources and co-working environments to lower first expenses for young business owners. Universities should also aggressively incorporate experiential learning through industry collaborations so that students may work on actual business problems and get practical knowledge before starting their businesses. In order to guarantee a support network that goes beyond graduation, policymakers should also create tax incentives for nearby companies that mentor or fund student-led firms. Furthermore, encouraging digital entrepreneurship by means of e-commerce training and online business models will enable students to grow their companies outside of local markets, therefore rendering rural entrepreneurship more feasible. Encouragement of university alumni networks to assist recent graduates with knowledge-sharing platforms, funding possibilities, and networking events would help to increase entrepreneurial sustainability even more. Taken together, these steps can turn entrepreneurial aspirations into profitable long-term companies supporting local economic development and regional advancement.

## IV. CONCLUSION

Our study provided contributions to the existing literature on the relationship between desire and intention and examines the positive effects of attitude, government support, perceived behavioral control on desire or on intention indirectly through desire. The study revealed the beneficial benefits of government support on university students' willingness to return to their hometown to establish a business and rural revitalization, based on 311 responses gathered from students at Vietnamese universities (particularly in Ho Chi Minh City, An Giang). In particular, assistance measures encouraged students' desire. Students will be more motivated and eventually develop a desire to launch a business if they obtain assistance from the government or local authorities (such as low-interest loans, resources, or land for new entrepreneurs). This study also demonstrated that a person's desire to launch a business in their hometown was influenced by their attitude and perceived behavioral control. These findings had implications for creating an environment that encourages and facilitates the sharing of ideas, worries, and entrepreneurial experiences. Furthermore, offering entrepreneurship classes ranging from foundational to advanced helped students become more self-assured,

which in turn boosted their desire to launch their own business in their home city.

The following were some limitations of this study that should be highlighted. First off, only students were the target demographic for our survey. This group could be more optimistic, oblivious to risks and obstacles that come with being an entrepreneur. This could cause some inaccuracy in the study's findings. Since master's and doctoral students might have taken courses or heard of entrepreneurship, the study might broaden its focus to include them. Second, the model's variables lacked sufficient diversity to assess the factors influencing university students' intentions to return home and launch a business based on their desires. To develop a more comprehensive and rigorous model, future research should incorporate not just personal emotional aspects but also external factors like family dynamics or business knowledge. In order to completely comprehend the fundamental mechanisms in the relationship between the intention variable and the mediating variable desire, university students' desire to return to their hometown and launch a business can therefore combine a wide range of additional variables in addition to those listed in the research model. Lastly, while this study demonstrated some disparities between the North, Central, and South areas of Vietnam, the the sample size were insufficient to support the findings. Future studies might examine each region in further detail to analyze the variations in students' intentions to start a business in their hometowns.

# DETERMINANTS OF ADOPTING OPEN INNOVATION: A STUDY IN SMALL AND MEDIUM-SIZED ENTERPRISES IN THANH HOA PROVINCE

**Do Thi Man[1]**

[1]Faculty of Economic and Business Administration, Hong Duc University.
*Corresponding: dothiman@hdu.edu.vn

**ABSTRACT**

Open innovation (OI) is among the vital innovation paradigms for assisting small and medium-sized enterprises (SMEs) to implement innovation initiatives effectively. This study explores the determinants of adopting OI in SMEs in both inbound and outbound OI. Through using partial least squares structural equation modeling (PLS-SEM) with a survey sample of 376 SMEs in Thanh Hoa province, The results show that organizational agility and economic and financial capacity are the two factors that have the most significant influence on OI adoption in SMEs, in which organizational agility is the most important determinant of inbound OI adoption. In contrast, economic and financial capacity is the most significant determinant of outbound OI adoption. The following factors determining the adoption of OI in SMEs are absorptive capacity and corporate strategy, in which absorptive capacity plays a more critical role for inbound OI adoption, and corporate strategy plays a more important role for outbound OI adoption. From the findings, the author has proposed several recommendations for SMEs to promote OI adoption, thereby improving business efficiency for enterprises.

*Keywords*: "Absorptive Capacity", "Economic and Financial Capability", "Inbound open innovation", "Outbound open innovation", "SMEs"

## I. INTRODUCTION

Chesbrough (2003) first defined open innovation (OI) as "the intentional use of inside-out and outside-in knowledge flows to drive internal innovation and expand the corresponding market for external OI adoption." This approach is closely related to the flow of inside-out and outside-in knowledge across all internal and external factors related to the product, such as competitors, internal aspects of the enterprise, cooperation with suppliers, and other agencies such as universities, research centers, academies, and research institutes. The OI approach suggests enterprises should be more flexible and open to innovation processes. This not only helps businesses attract many benefits, such as increasing competitiveness from outside but also helps businesses convert ideas, increase innovation, and develop and promote the transfer of researched technologies within the company to other organizations and businesses (Spender et al., 2017).

OI has become a widely recognized and implemented concept in large corporations to accelerate and enhance the innovation process of organizations and commercialize their innovations (Puriwat & Tripopsakul, 2021). For small and medium-sized enterprises (SMEs), although recent literature suggests that adopting OI can help SMEs increase their innovation performance, SMEs benefit differently from different OI implementation methods and adoption models depending on the size of the enterprise (Sikandar & Abdul Kohar, 2022). Therefore, a better understanding of the conditions and contexts of SMEs will increase the chances of successfully adopting OI methods in enterprises.

In Vietnam, SMEs account for about 98% of nearly 930 thousand enterprises. SMEs play an important role in economic growth and job creation, reducing poverty and improving workers' income. SMEs are also the source of innovation in business and the bridge to bring scientific and technological research results to practical life. In the current trend, it is no longer appropriate for SMEs to rely solely on their resources for development. They must promote their internal strengths and seek support from external resources. In particular, OI is a highly effective solution, helping SMEs solve difficulties in the digital transformation process. However, in applying OI, Vietnamese SMEs still face many barriers, such as limitations in capacity, skills, strategies, and management knowledge of enterprises, business risks, and difficulty in accessing external financial resources (Nhuan & Trang, 2023). Therefore, research on factors affecting the application of OI in SMEs is significant. This is a way to help enterprises identify which factors hinder or promote the application of open OI in enterprises, thereby helping SMEs overcome limitations and difficulties from the

characteristics, capacity, and resources within the internal structure of the enterprises and the external impact environment.

This article focuses on an overview of OI in enterprises and the factors influencing the application of OI in Vietnamese SMEs. It uses the results of empirical analysis from the PLS-SEM model, with a survey sample of 500 SMEs in Thanh Hoa province. The results of this study will be an essential basis for managers and policymakers to develop better solutions and policies to promote OI in Vietnamese SMEs in the coming time.

## II. LITERATURE REVIEW

### 2.1. Open Innovation

According to Chesbrough (2003), OI is the practice of encouraging organizations to use external sources to improve product or service lines while shortening the time needed to bring products to market and commercialize them or to provide OI results that the organization has developed internally that are not yet suitable for the current business model of the enterprise, but can be effectively used elsewhere outside. OI practices will allow organizations to explore and acquire new technologies and knowledge from external sources, while external OI refers to the use of internal ideas or technological knowledge through licensing, patenting, or legal partnerships to obtain financial or non-financial benefits (Popa, Soto-Acosta & Martinez-Conesa, 2017; Rumanti et al., 2021)

Regarding the process and operating mechanisms and specific application of OI, previous studies have suggested two main approaches to OI: the inside-out approach and the outside-in approach (Chesbrough H, 2003; Chesbrough & Brunswicker, 2013). Specifically, OI includes two mechanisms: The first mechanism is the outside-in knowledge flow approach, meaning that the OI activities of the enterprise are related to receiving knowledge flows, ideas, or technology from the outside and applying them in the enterprise. This is how enterprises exploit technology and knowledge from external partners such as suppliers, customers, competitors, suppliers, or research institutes and universities and apply them in the enterprise. OI activities can be carried out through short-term employee exchanges, technology transfer into enterprises, mergers and acquisitions, and outsourcing activities (Rumanti et al., 2021). The second mechanism refers to the flow of knowledge, ideas, technology, and inventions to the market through the sale and transfer of intellectual property from enterprises to partners and separation into subsidiaries. This is the inside-out process, that is, activities such as licensing, selling ideas, technology, and other enterprises' resources to the market to partners (Rumanti et al., 2021). Other studies suggest a third approach, the hybrid process—a combination of external and internal knowledge flows through building alliances within the industry or technology sector (Ahn, Minshall & Mortara, 2015; Mazzola, Bruccoleri & Perrone, 2016).

### 2.2. Factors affecting Open Innovation adoption in enterprises

#### Organizational Agility and OI

Organizational agility is the ability of a firm to respond to unforeseen changes through immediate and innovative responses (Walter, 2021). Previous studies confirm that organizational agility is one of the important capabilities that help firms grasp current market trends (Cai et al., 2019; Walter, 2021). Organizational agility is a multidimensional concept that scholars have classified according to different criteria (Lu & Ramamurthy, 2011). Nafei (2016) suggested three aspects of organizational agility: Sensing Agility, Decision-Making Agility, and Acting Agility/Practicing. Vázquez-Bustelo et al. (2007) classified organizational agility according to five factors: agile human resources, technology, value chain integration, concurrent engineering, and knowledge management. Zandi & Tavana (2011) classified organizational agility into three factors: strategic, operational, and functional agility. Sambamurthy et al. (2003) also identified three dimensions of organizational agility: customer, partner, and operational agility.

According to the concept of dynamic capabilities, organizational agility can arise from integrating strategic resources. Teece et al. (2016) argue that organizational agility is a prerequisite for adopting OI. By allowing flexible access to external knowledge, OI reduces the risk associated with experimentation and stimulates firms' innovation motivation, allowing flexibility when attempting radical innovation (Liao et al., 2019). Using external resources helps firms continuously communicate and share knowledge, enhancing the diffusion of know-how (Scuotto et al., 2017). From the research overview, the author proposes the following hypothesis:

*H1a: Organizational agility has a positive impact on adopting inbound OI;*

*H1b: Organizational agility has a positive impact on adopting outbound OI.*

**Organizational absorptive capacity and OI**

According to Overby et al. (2006), absorptive capacity is a set of processes and routines through which firms acquire, transform, and use knowledge to create a dynamic organization. According to Arias-Pérez et al. (2020), absorptive capacity is divided into four dimensions: (1) the ability to acquire, identify, evaluate, and utilize external knowledge about operations; (2) assimilation, understanding of knowledge acquired from outside; (3) transformation, the ability to integrate old knowledge with newly acquired and assimilated knowledge; (4) exploitation, the ability to combine acquired, assimilated, and transformed knowledge into usable organizational routines. Previous literature confirms that adopting OI in a firm requires the firm to acquire, disseminate, and utilize external and internal knowledge (Arias-Pérez et al., 2020). Successful innovation processes are influenced by the skills and capabilities of leaders to access internal and external knowledge sources (Aboelmaged et al., 2019). Absorptive capacity is a prerequisite for any knowledge management activity involving the deliberate management of knowledge flows beyond the organization's boundaries to generate innovation (Spithoven et al., 2010). It represents the presence of a knowledge base that facilitates the adoption of innovation, where context is key to inspiring the creation of new concepts and finding new ways to use the knowledge of external partners (Aboelmaged et al., 2019). The absorptive capacity allows firms to collaborate actively in a proactive manner rather than passively observing. In the long term, absorptive capacity allows for consolidation of high success rates in co-innovation projects, high reputation in the virtual environment, and positive valuation by external partners, enhancing collaborative work ( Arias-Pérez et al., 2020; Aboelmaged et al., 2019; Tsou & al., 2019). From the above studies, the author proposes the following hypothesis on the relationship between organizational absorptive capacity and the adoption of OI in SMEs as follow:

*H2a: Organizational absorptive capacity has a positive impact on adopting inbound OI;*

*H2b: Organizational absorptive capacity positively impacts adopting outbound OI.*

**Economic and financial capacity and OI**

The ability of enterprises to apply internal research and development projects will depend mainly on financial and economic potential factors. Strong financial capacity will help enterprises have investment potential, achieve superior knowledge resources to develop products and services, promote innovation activities faster, and respond faster to market needs (Chesbrough H, 2003). Many previous studies have identified financial capacity as the driving force for OI. SMEs apply OI to access external financial and economic resources (Van de Vrande et al., 2009). The article in the research work of Praest Knudsen & Bøtker Mortensen (2011) shows that OI is costly and leads to more expensive product development projects than the traditional closed OI model, so it requires businesses to have strong financial capacity. There are also similar views cited by Oduro (2020) & Brunswicker (2009) that investment costs for ensuring and enforcing intellectual property rights and limitations in research and development activities can hinder SMEs' application of OI. According to Binh & Cuong (2015), financial capacity is one of the fundamental issues determining the success of OI due to the increasing scale and integration of technology in innovative solutions, requiring linkages in financial investment. The issue of intellectual property trading in OI requires promotion into an important market. That forces managers to continue to improve research on business models and relationships in the context of multiple ownership, intellectual property transfer, profit sharing, and reinvestment. From the above theoretical foundations, the study proposes the following hypothesis:

*H3a: Economic and financial capacity has a positive influence on adopting inbound OI;*

*H3b: Economic and financial capacity positively influences adopting outbound OI.*

**Business strategy and OI**

Huston & Sakkab (2006) point out that OI efforts must at least be consistent with the firm's strategy and preferably be an integral part of each firm's strategy. According to Schilling (2015), when choosing a partner, two factors need to be carefully considered: resource compatibility and strategic compatibility. "Resource compatibility refers to the extent to which potential partners possess resources that can be effectively integrated to create a value-creating strategy," and "strategic compatibility refers to the extent to which potential partners share similar goals and styles/strategies." This view is agreed upon by several scholars, including Chesbrough & Crowther (2006). These authors argue that similarity

in resources and strategies between partners is an indispensable requirement for effectively pursuing, implementing, and managing an OI strategy. The model developed by Crema & Verbano (2013) demonstrates that the strategy influences the openness toward the external environment; this approach is followed especially when firms want to achieve radical innovation. Crema, Verbano, & Venturini (2014) confirmed helpful indications on how to define competitive strategy and coherent level of OI to pursue improved firm performance. Results highlighted that firms that pursue an innovative strategy invest more in technical skills and core competencies. Companies that choose a diversification strategy are likely to use exclusively managerial practices of OI. At the same time, firms focused on a strategy of efficiency are inclined toward OI practices and, to a lesser extent, to the development of core competencies. From the above studies, hypothesis H4 is proposed as follows:

*H4a: Firm strategy has a positive influence on adopting inbound OI;*

*H4b: Firm strategy has a positive influence on adopting outbound OI.*

Based on an extensive literature review, the author has developed a research model to examine the determinants of adopting OI in Thanh Hoa SMEs **(** Figure 2.1). This model is structured to explore the influence of factors including organizational agility, absorptive capacity, economic and financial, and corporate strategy on applying OI in two aspects: inbound OI and outbound OI.

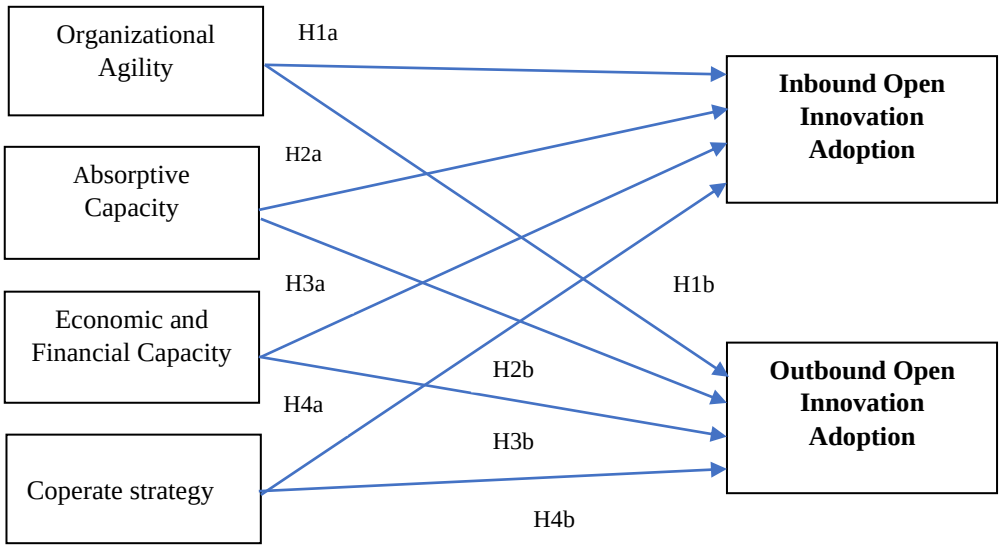

**Figure 2.1. Proposed research model**

## III. METHODOLOGY

The study uses quantitative research methods through PLS-SEM analysis to test the research hypotheses regarding the relationships between factors and OI adoption. To apply OI of SMEs in Thanh Hoa City.

The study sample size was determined based on the minimum sample size for quantitative analysis. This includes the required sample size for regression analysis following the formula 50+8m, where m represents the number of independent variables (Tabachnick & Fidell, 1996). The proposed research model includes four independent variables and two dependent variables with 25 observed variables, so the minimum sample size required to be surveyed is 50 + 8.25 = 250 observations. In addition, according to Hair et al. (2022), the Sample size for EFA analysis is at least 5 times the number of observed variables (75 observations). The author selected a formal quantitative sample of 400 questionnaires to ensure objectivity and reliability. After the survey, the author collected 376 valid questionnaires, meeting the requirements for analysis.

Data collection process: Surveys were administered in person and via email, depending on the respondents' accessibility. Survey questionnaires were sent to managers in SMEs (key actors in the innovation process) from August to October 2024. The 5-point Likert scale expressed their agreement with the given statements. The data collection period spanned three months, allowing ample time for responses.

The collected data were processed and analyzed by SMART PLS 3.0 software, using several techniques to ensure

robust results. The following methods were applied: Reliability testing of the scales through Cronbach's alpha and Composite reliability (CR) coefficients; Convergent and discriminant validity testing through Average Variance Extracted (AVE) and Heterotrait-Monotrait Ratio (HTMT) matrix; Collinearity testing of the observed variables through outer Variance Inflation Factor (VIF) / inner VIF; and evaluation of the PLS-SEM to test the research hypotheses.

The questionnaire includes two main sections: (1) typical information related to respondent demographics and (2) measurement items on a five-point Likert scale ranging from strongly agree (5) to disagree (1) strongly. This study measures six constructs: Organizational Agility (OA), Absorptive Capacity (AC), Economic and Financial Capacity (EFC), Outbound OI Adoption (OOI), and Inbound OI Adoption (IOI).

**Table 3.1. Scales of variables in the research model**

| Code | Scales | Source |
|---|---|---|
| **OA** | **Organizational Agility** | |
| OA1 | The business always responds to customer needs quickly. | Puriwat & Tripopsakul (2021) |
| OA2 | Businesses can quickly adjust production scale to meet changing customer needs. | |
| OA3 | Businesses can quickly make internal adjustments when there are changes from suppliers. | |
| OA4 | Businesses are constantly innovating to serve customers and the market better and better. | |
| OA5 | Businesses can manage relationships well with stakeholders. | |
| **AC** | **Absorptive Capacity** | |
| AC1 | Businesses can find and use relevant information easily. | Puriwat & Tripopsakul (2021) |
| AC2 | Businesses can communicate information to departments quickly. | |
| AC3 | The company's employees can absorb new knowledge quickly. | |
| AC4 | Businesses can adapt technology to new knowledge. | |
| **EFC** | **Economic and Financial Capacity** | |
| EFC1 | Enterprises have enough financial resources to start implementing OI projects. | Puriwat &Tripopsakul (2021) |
| EFC2 | Enterprises with external partners have full technology and modern infrastructure conditions for OI projects. | |
| EFC3 | Enterprises have full labor conditions to implement OI projects initially. | |
| EFC4 | Enterprises have full conditions in terms of capital and land to carry out OI projects. | Nhuan & Trang (2023) |
| **CS** | **Corporate strategy** | |
| CS1 | Applying OI is a goal in enterprises' business strategies. | Huston & Sakkab (2006) |
| CS2 | Collaboration with outsiders in innovation is a part of the enterprise's business strategy. | |
| CS3 | Potential business partners share similar goals and strategies | Schilling (2015), |
| CS4 | Enterprises choose diversification strategies to suit the application of OI. | Crema, Verbano & Venturini (2014) |
| **OOI** | **Outbound OI Adoption** | |
| OOI1 | Businesses seek to gain additional benefits from the internal innovations that have been implemented. | Rumanti et al. (2021) |
| OOI2 | Businesses adopt innovative methods learned from other organizations. | |
| OOI3 | Businesses willing to sell product licenses to other organizations | |
| OOI4 | Businesses are willing to sell patents outside. | |
| **IOI** | **Inbound OI Adoption** | |
| IOI 1 | External organizations are directly involved in enterprises' innovation activities. | Rumanti et al. (2021) |
| IOI2 | External organizations such as governments, research institutes, universities, | |

| | | |
|---|---|---|
| | consultants, etc., support business innovation activities. | |

## IV. RESULTS AND DISCUSSION

### 4.1. Measurement Model Evaluation

According to Hair et al. (2022), for the measurement model, the quality of observed variables is reflected through the outer loading coefficient. Suppose this coefficient is >= 0.7: Very good, < 0.4: Rejected. The data analysis results of the observed variables in this study show that the outer loading coefficients of all variables are > 0.7 (Table 2), thus ensuring the quality of the observed variables for further analysis.

Regarding the reliability test of the scales in the measurement model, according to Hair et al. (2022), Cronbach's alpha and Composite reliability values ranging from 0.6 to 0.7 are considered acceptable, and values ranging from 0.7 to 0.9 are considered satisfactory. If the construct has a value lower than 0.6, it is supposed to lack internal consistency reliability. The results of the reliability test of the scales from the survey data in this study are shown in Table 4.1. The data analysis results show that both Cronbach's alpha and Composite reliability values are more significant than 0.7, thus ensuring the internal consistency and reliability of the scales.

In addition, the convergent validity of the scales is examined based on the Average Variance Extracted (AVE) index. According to Hair et al. (2022), when the AVE index is ≥ 0.5 (the latent variable explains at least 50% of the variance of each observed variable), the scales ensure convergent validity. The results in Table 2 show that AVE values of all factors are above 0.6, demonstrating the convergent validity of the construct for further analysis.

**Table 4.1. The outer loadings, Composite Reliability (CR), Cronbach's alpha, and Average Variance Extracted (AVE)**

| Latent variables | Item Code | Item loadings | CR | Cronbach's Alpha | AVE |
|---|---|---|---|---|---|
| Organizational Agility (OA) | OA1 | 0.816 | 0.889 | 0.841 | 0.623 |
| | OA2 | 0.882 | | | |
| | OA3 | 0.853 | | | |
| | OA4 | 0.850 | | | |
| | OA5 | 0.773 | | | |
| Absorptive Capacity (AC) | AC1 | 0.765 | 0.893 | 0.842 | 0.677 |
| | AC2 | 0.834 | | | |
| | AC3 | 0.827 | | | |
| | AC4 | 0.862 | | | |
| Corporate strategy (CS) | CS1 | 0.867 | 0.893 | 0.841 | 0.678 |
| | CS2 | 0.858 | | | |
| | CS3 | 0.802 | | | |
| | CS4 | 0.760 | | | |
| Economic and Financial capability (EFC) | EFC1 | 0.854 | 0.926 | 0.894 | 0.760 |

| | IOI4 | 0.930 | | |

*Source: Data processing results*

The discriminant validity of the scales in this study is examined through the Heterotrait-Monotrait Ratio (HTMT). If the HTMT value is high, it indicates a discriminant validity issue. According to Henseler et al. (2015), the threshold value is 0.90. If the construct value is greater than 0.9, it indicates a lack of discriminant validity. The data analysis results in this study show that all HTMT values in Table 4.2 are lower than the threshold value of 0.9. Therefore, all scales ensure discriminant validity.

**Table 4.2. Discriminant Validity- Heterotrait- monotrait ratio (HTMT)- Matrix**

| | AC | CS | EFC | IOI | OA | OOI |
|---|---|---|---|---|---|---|
| AC | | | | | | |
| CS | 0.174 | | | | | |

### 4.2. Evaluation of PLS-SEM Structural Model

#### Multicollinearity checking and model fit

For the structural model, the study first examines the multicollinearity of the independent variables (Inner VIF). If the VIF value is > 5, it indicates the possibility of collinearity between the independent variables, and the model is no longer reliable for testing the research hypotheses. If the VIF value remains low < 5 or > 3.3, it indicates a potential multicollinearity issue ( Hair et al., 2022). In this study, all VIF values are less than 3. Therefore, there is no multicollinearity between the variables in the structural model.

The explanatory power of the independent variables on the dependent variables was assessed through the R-square of the model. The data analysis results show that the R-square of the Inbound OI Adoption model is 0.433. This means that independent variables in the model explain 43.3% of the variance in the Inbound OI Adoption of SMEs, while the R-square of the Outbound OI Adoption model is 0.346. This means that independent variables in this model explain 34.6% of the variance in SMEs' Outbound OI Adoption. Thus, it can be seen that four factors in this model determine the Inbound OI Adoption more than the Outbound OI Adoption in Thanh Hoa SMEs.

#### Structural Model and Hypotheses Testing

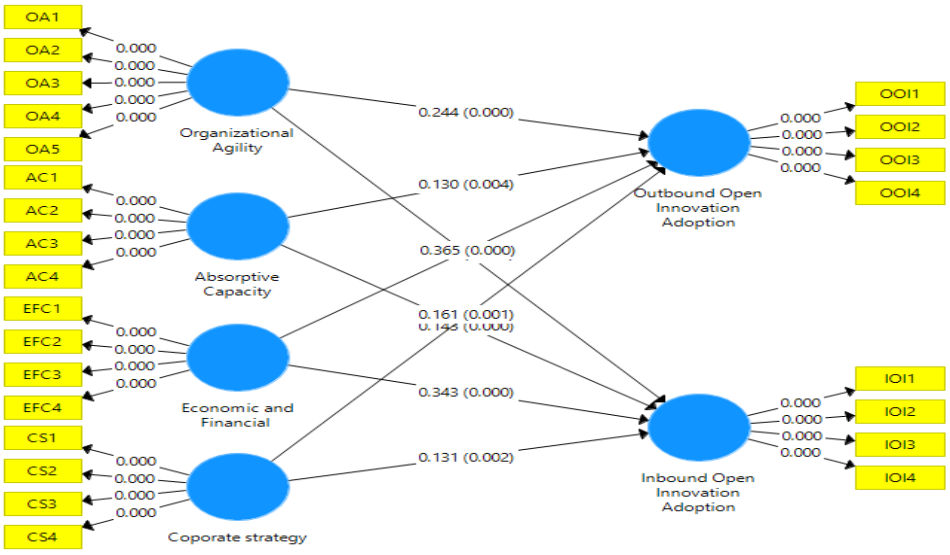

**Figure 4.1. PLS-SEM Estimation Results**

After assessing the measurement model, the structural model was developed. Figure 4.1 demonstrates outcomes for the path model, illustrating an adequate model fit to the data. This study estimates the structural model at 5000 iterations and the stopping criterion of 0.00000001. The estimation result shows the regression coefficients and p-values for testing the statistical significance of the regression coefficients.

The results of the hypothesis testing of the models are shown in Table 4.3. Compromising, all eight hypotheses are supported at the 5% significance level after testing with the PLS-SEM model. The results show that at a 5% significance level (95% confidence level), Organizational Agility, Absorptive Capacity, Corporate strategy, and Economic and Financial Capability all affect both Outbound OI Adoption and Inbound OI Adoption in SMEs (The p.value values in the paths in the structural model are <0.05).

**Table 4.3. Results of Hypothesis Testing**

| Hypothesis | Relationship | Original Sample | P Values | Test results |
|---|---|---|---|---|
| H1a | Organizational Agility -> Inbound OI Adoption | 0.381 | 0.000 | Supported |
| H2a | Absorbent Capacity -> Inbound OI Adoption | 0.143 | 0.001 | Supported |
| H3a | Economic and Financial Capability -> Inbound OI Adoption | 0.343 | 0.000 | Supported |
| H4a | Corporate strategy -> Inbound OI Adoption | 0.131 | 0.002 | Supported |
| H1b | Organizational Agility -> Outbound OI Adoption | 0.244 | 0.000 | Supported |
| H2b | Absorbent Capacity -> Outbound OI Adoption | 0.130 | 0.004 | Supported |
| H3b | Economic and Financial Capability -> Outbound OI Adoption | 0.365 | 0.000 | Supported |
| H4b | Corporate strategy -> Outbound OI Adoption | 0.161 | 0.001 | Supported |

*Source: Data processing results*

**4.3. Discussion**

Inbound OI of SMEs is demonstrated through the fact that external organizations such as the government, research institutes, universities, consultants, etc., support the innovation activities of enterprises and directly participate in the innovation activities of enterprises; at the same time, enterprises use the latest tools and materials to enhance internal innovation and are willing to buy copyrights and patents from outside to carry out internal innovation. The research results show that the factors determining inbound OI adoption include organizational agility, followed by economic and financial capability, absorptive capacity, and finally, corporate strategy, in which the most significant influence is organizational agility, with an influence coefficient of 0.381, meaning that the agility of enterprises towards customers, suppliers, markets and stakeholders are the factors that have the most substantial impact on SMEs' inbound OI. This result is also similar to the conclusion shown in Teece et al.'s (2016) study that organizational agility acts as a prerequisite for the adoption of OI and is also similar to the result from Scuotto et al.'s (2017) study that using external resources helps firms to communicate and share knowledge continuously, thus enhancing the diffusion of know-how.

Organizational agility is the second most influential factor for outbound OI adoption after economic and financial capability. The influence of organizational agility on outbound OI adoption is explained by the fact that by allowing flexible access to external knowledge, OI reduces the risk associated with experimentation and stimulates the innovation motive of the enterprise, allowing flexibility when attempting radical and radical innovation (Liao et al., 2019). The research results show that among the four factors included in the model, economic and financial capability is the most significant determinant of enterprises' adoption of innovation methods learned from other organizations. This is a rather costly process in terms of money and other resources. This conclusion is similar to the research results of Binh & Cuong (2015) when it stated that financial capacity is one of the fundamental issues determining open OI's success due to the increasing scale and integration of technology in innovative solutions, requiring linkages in financial investment. Economic and financial capability is the second factor determining inbound OI adoption. This study shares the same view as Puriwat & Tripopsakul's (2021) research. Thus, it can be seen that organizational agility and the economic and financial capacity of enterprises are the two factors that significantly influence the application of OI in SMEs in Thanh Hoa province.

The following factors that determine the adoption of OI in SMEs are an absorptive capacity and corporate strategy, in which an absorptive capacity is the third most influential factor on inbound OI adoption and the fourth most

influential factor on outbound OI adoption. Meanwhile, corporate strategy determines outbound OI adoption at the third level and is the fourth most influential factor in inbound OI adoption. Adopting inbound OI will be easier and faster when a business can search for and use relevant information, absorb new knowledge quickly, and adapt technology to new knowledge. This result is similar to the conclusion of Arias-Pérez et al. (2020), who states that adopting OI in a business requires the business to collect, disseminate, and use external and internal knowledge. Similarly, Aboelmaged et al. (2019) also confirmed that the successful innovation process is influenced by the skills and capabilities of leaders in accessing internal and external knowledge sources. In addition, the research results also show that corporate strategy, the enterprise's goal of OI with external cooperation in the enterprise's business strategy, and the choice of diversification strategy to suit the application of OI are decisive factors for the successful application of OI.

Although the results from this study are limited to 376 SMEs surveyed in Thanh Hoa province, they have also shown the role of factors in the application of OI in two directions: (1) Receiving knowledge, ideas, and technology sources from outside the organization to combine with internal resources (inbound OI), and (2) Commercializing knowledge, ideas, and technology sources outside (outbound OI). These factors include organizational agility, economic and financial capability, absorptive capacity, and corporate strategy. These are also real factors that have influenced the successful application of OI from enterprises in Vietnam and around the world. An example in the world is the OI ecosystem of Samsung with the highlight of the ability to coordinate with external organizations to create new values by linking knowledge, information, and technology resources. With IBM, Samsung has established a cross-licensing agreement, allowing both parties to use each other's patents to innovate since 2011. In addition, Samsung also cooperates with universities and research institutes to provide expert human resources, research expertise and infrastructure, and also acquires and merges with technology companies. OI strategies are integrated into the overall corporate strategy of Samsung and are implemented with organizational agility, while technology absorption is always the top goal.

In Vietnam, the story of the OI of Viettel Telecommunications and Technology group with both inbound OI and outbound OI directions is also a typical example of successful OI coming from the agility and absorption capacity of the organization. Viettel regularly participates in annual Mobile World Congress events to seek cooperation opportunities in the technology field, and organizes the Innovative Me contest to encourage employees to share their creative messages; has an information portal to manage initiatives and topics so that domestic and foreign units can register their initiatives. Viettel also has two Innovation Labs facilities with full equipment to meet 4.0 technology to nurture new technology ideas and connect the domestic and foreign information technology community. In addition, Viettel has cooperated with Qualcomm to bring 5G technology to the world. Another example is from Phuc Sinh Joint Stock Company - Vietnam's leading agricultural product exporter established in 2001. With the agility of the leadership team, Phuc Sinh has considered OI as a vital strategy to enhance the Company's competitiveness. Phuc Sinh has chosen the form of OI combining experimental research with innovation with Rainforest Alliance and cooperating with advertising media partners to improve the effectiveness of customer access and product advertising. In addition, Phuc Sinh also organized a national innovation contest to seek ideas from young people and consumers.

From the above practical examples, it can be seen that although the research results are only within the scope of SMEs in Thanh Hoa province, reality has shown that for enterprises that have successfully implemented OI, organizational agility, absorptive capacity, corporate strategy as well as enterprise capacity are factors that directly affect the successful application of OI. Thus, these findings might apply to other regions or industries as well. Vietnam currently has an OI ecosystem, where the business community and startups have many opportunities when joining hands with other enterprises, aiming to promote internal innovation and expand the corresponding market. However, for SMEs in Thanh Hoa, the application of OI still faces many difficulties, especially for outbound IO because the majority of SMEs are small and micro enterprises, with limited economic and financial capacity, the absorption capacity of enterprises, especially the ability to absorb technology, is difficult. In addition, many business leaders are afraid of change and lack agility, which are also barriers leading to not applying OI.

This study is limited to SMEs in Thanh Hoa province as well as potential biases in self-reported data or challenges in accessing financial resources for OI. Therefore, the future research direction is to expand the scope of research across regions as well as add secondary data on the current status of OI adoption in enterprises to have more basis for

comparing the differences in OI adoption between regions as well as between industries, thereby drawing more appropriate general conclusions.

## V. CONCLUSION AND RECOMMENDATION

OI is an inevitable approach in the current context of enterprises, especially SMEs, to implement innovation initiatives to enhance their competitiveness. This study explores the determinants of adopting OI in SMEs in both inbound and outbound OI. Accordingly, a comprehensive research model based on the concepts of organizational agility, absorptive capacity, economic and financial capacity, and corporate strategy has been proposed to examine and evaluate the factors affecting the adoption of innovation by SMEs. The research results through the PLS-SEM model with a survey sample of 376 SMEs in Thanh Hoa province show that organizational agility and the economic and financial capacity of enterprises are the two factors that have the most significant influence on the application of OI in SMEs in which organizational agility has the most significant impact on inbound OI adoption. In contrast, economic and financial capacity impacts outbound OI adoption the most. The following factors that determine the application of OI in SMEs are an absorptive capacity and corporate strategy, in which an absorptive capacity plays a more important role for inbound OI adoption, and corporate strategy plays a more important role for outbound OI adoption.

From the findings, the author proposes recommendations for SMEs to apply OI. Firstly, to apply OI in an organization, entrepreneurs and leaders of SMEs must foster an agile culture for all employees. Moreover, nurturing the organization's absorptive capacity is also necessary for SMEs to promote OI. Business leaders need training sessions, sharing sessions, and specialized training programs for employees to improve their knowledge and develop their capacity to effectively absorb internal and external knowledge, which are also urgent initiatives to achieve the orientation of OI. Secondly, SMEs need to enhance their access to capital sources and make the most of the government's support programs to promote SMEs' business development in general and innovation projects in particular. In addition, it is necessary to enhance the ability to cooperate with partners through the core competitive advantages of the enterprise itself. Third, SMEs need to increase adaptability and flexibility, consider adjusting the overall business strategy, and try to balance internal strategic factors with external partners to enhance the effectiveness of cooperation. Furthermore, to avoid the opportunistic behavior of innovation partners, SMEs need to establish precise mechanisms and contracts to ensure satisfactory rights for both parties in the cooperation process. Finally, SME leaders must build an open corporate culture, create easy connections, and share knowledge inside and outside the enterprise. In addition to maintaining the current R&D system, it is advisable to consider establishing a separate team/department specializing in supporting the development of innovation projects with external partners. OI can sometimes encounter obstacles from employees in the enterprise, so it is necessary to have appropriate communication activities about the benefits of OI to employees. At the same time, it is essential to raise awareness and knowledge to form a culture of adaptation and readiness for innovation for all employees in the enterprise.

# FACTORS AFFECTING THE SUSTAINABILITY AND GROWTH OF SMALL AND MEDIUM ENTERPRISES IN VIET NAM

**Dao Thu Tra**[1]
[1]Hong Duc University
*Corresponding: daothutra@hdu.edu.vn

**ABSTRACT**

Small and medium enterprises are recognized as playing an important role in the socio-economic development of a country. In Vietnam, they are considered a way to create jobs, alleviate poverty, ensure food security and promote private sector development. Although there are a number of government support programs and plans to empower SMEs to be more competitive and sustainable, many businesses continue to fail at an alarming rate. This study aims to identify and assess the impact of factors on sustainability and growth of SMEs in Vietnam. To achieve the research objective, the author conducted a survey of 419 SMEs in Vietnam using a structured questionnaire on a 5-point likert scale. The data collected was analyzed using SPSS 20.0 software. The research results show that all 5 factors proposed in the research model, including: Financial factors, Infratructural factors, Political- Legal factors, Owner/ Manager personal characteristics, Technological factors all have an impact on the sustainability and growth of SMEs in Vietnam, in which Infratructural factors have the greatest impact and Owner/ Manager personal characteristics have the least impact. Based on the research results, the author proposes recommendations to promote the usability and growth of SMEs in Vietnam in the coming time.

*Key words: SMEs, sustainability, growth, social- economic development.*

## I. INTRODUCTION

Small and medium-sized enterprises (SMEs) play an important role in creating jobs, promoting economic growth and sustainable development, which is recognized worldwide. As the "home" of entrepreneurship, SMEs are often the starting point for many large enterprises, gradually developing through capital accumulation and management experience. In particular, SMEs are an important driving force for socio-economic empowerment, supporting start-ups, developing new technologies and replacing imports.

The importance of SMEs for long-term growth has attracted global attention due to their role in poverty reduction, job creation, increasing self-sufficiency, promoting production and exports, and contributing greatly to GDP. In developing countries, including Vietnam, SMEs and the informal sector are the main source of income, contributing to local economic development and serving as a basic means of survival. SMEs are an important part of the private economic sector, present in most regions, localities, and areas and accounting for a large proportion of the Vietnamese business community. According to the General Statistics Office, by the end of 2023, Vietnam currently has about 900,000 enterprises, of which SMEs account for about 97%, employ 51% of the workforce and contribute more than 40% to the value of the gross domestic product (GDP). However, an obvious phenomenon is that the SME economic sector develops unsustainably (Trang & Thu, 2023).

The concept of sustainability of MSEs has no common definition. Hubbard (2009) views sustainability as the ability to meet the needs of stakeholders without affecting the future. Savitz and Weber (2006) emphasize that sustainable enterprises must both generate profits, protect the environment and improve community life. Thus, sustainability requires balancing economic, environmental and social benefits, bringing value to all stakeholders.

Currently, the challenges for SMEs are on both sides: (i) At the macro level, national policies still have institutional barriers; (ii) At the micro level, SMEs are limited by endogenous capacity, low competitiveness of goods and services, difficulty in accessing financial capital, and lack of management and operation experience. In this context, the problem is that Vietnamese SMEs, with their inherent flexibility, need to develop sustainably to promote economic growth, trade and investment, increase state budget revenue, create jobs for workers and contribute to improving national competitiveness. Therefore, it is necessary to study the factors affecting the sustainable development of

Vietnamese SMEs, contributing to proposing solutions to help SMEs develop sustainably in the coming time.

## II. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

### 2.1. Literature review

The development and sustainability of SMEs are influenced by a group of internal factors such as: human resources, financial resources, technological and technical level of the enterprise, management and operation capacity of business leaders, marketing strategy and a group of external factors such as: Policies, macroeconomic environment and infrastructure factors (Ngo Kim Thanh, 2013). Empirically, there have been many studies on factors affecting the sustainability of SMEs both domestically and internationally. A recent study by Dang Thi Mai Huong et al., (2021) demonstrated that there are 10 factors that influence the development of SMEs, namely production technology level, government policies, raw materials, labor, management capacity, local support policies, access to finance, corporate social responsibility, green growth orientation and global pandemic, in which production technology level and access to finance have the greatest impact on the business results of SMEs in Vietnam. Tan Trinh Le's (2019) study of SMEs in Da Nang showed that factors such as government policies, financial capital, cultural factors, social factors and human capital affect the business results of SMEs, especially startups. Nguyen Van Thich (2018) also identified seven factors affecting the business performance of SMEs in Ho Chi Minh City: technological resources, management skills, products and services, marketing strategies, cooperation and business methods, financial resources and external environment. A study conducted by Cherkos et al. (2018) also demonstrated that due to poor working conditions, lack of access to finance, infrastructure problems and lack of business capacity, the dropout rate is 50% in MSEs in Amhra Region, Ethiopia.

Based on the findings of previous studies, the factors affecting the success of small and medium enterprises are classified into the following categories: (1) Characteristics of Entrepreneurs, (2) Financial factors, (3) Government support, (4) external environment, (5) infrastructure factors, (6) technological factors, (7) cultural factors, (8) social factors, (9) marketing strategies, (10) customers and markets. However, within the framework of this study, we only focus on 5 factors based on their suitability to the context of Vietnam, including: Financial factors, Political-Legal factors, Infrastructural factors, Personal characteristics of the manager or owner, Technological factors

### 2.2 Hypothesis development

Based on previous studies as well as business practices in Vietnam, the author proposes the following research hypotheses:

**Financial factors**

In Vietnam, only 30% of SMEs have access to bank capital, while 70% have to use their own capital or borrow from outside with high interest rates (15–18%) (Vietnam Association of Small and Medium Enterprises). Limited access to credit due to complicated procedures, high credit requirements and high transaction costs make banks prioritize larger projects. At the same time, the lack of collateral, weak accounting systems and ineffective financial management make it difficult for SMEs to access the necessary capital to expand their scale (Vo Thanh Danh et al., 2013; Nguyen Van Thich, 2018).

According to research by Kassa (2021) and Meressa (2020), access to finance has a significant impact on SME growth. Enterprises with access to finance from financial institutions have a 13.475 times higher chance of expansion than those without access to credit. In contrast, enterprises with poor financial management have a 5.49 times higher risk of bankruptcy (Worku, 2009). In addition, higher initial investment is also an important factor, helping enterprises grow faster and more sustainably (Radzi et al., 2017; Meressa, 2020).

In summary, access to finance, together with effective financial management and appropriate initial investment, play a key role in the development of SMEs. Thus, the author proposes the following research hypothesis:

*H1: Financial factors have a positive impact on the sustainability and growth of small and medium enterprises in Vietnam*

**Political-Legal Factors**

Political and legal factors have a strong impact on the production and business activities of enterprises, including

the policy system, laws, diplomatic trends, and domestic and international political developments. Enterprises must comply with regulations related to labor, tax, safety, environmental protection, and other business conditions. In particular, in the context of Vietnam participating in new-generation free trade agreements (FTAs), these factors have a profound impact on business operations.

Political stability creates a favorable environment, ensures investment safety and ownership rights, thereby promoting confidence and attracting domestic and foreign investment. An effective and transparent legal mechanism not only supports enterprises to adapt to changes but also creates growth opportunities. However, the level of government intervention in the economy can create both advantages and challenges, requiring businesses to quickly identify opportunities and risks to adjust their operations and avoid major disruptions (Le et al. 2022).

Political-legal variables such as lack of government support, high taxes, and lack of transparency about regulations are major barriers to the sustainable development of small and medium-sized enterprises (MSEs) (Ismanu & Kusmintarti, 2020). Despite efforts to improve the policy and institutional environment, there is still a gap between issued policies and implementation practices, along with issues such as inadequate business support services and unreasonable tax requirements. Collaboration with business support organizations and related organizations can help businesses access the necessary services and expertise, improving their long-term survival and growth.

From the above observations, the author proposes the following research hypothesis:

*H2: Political-legal factors have a positive impact on the sustainability and growth of small and medium enterprises in Vietnam*

**Infrastructural factors**

Infrastructure is an important factor in promoting economic growth, improving productivity and efficiency, and contributing to solving social problems. A synchronous and modern infrastructure system helps to easily circulate resources, optimize logistics costs, and facilitate businesses to process information, shortening customer service time (World Bank, 2018). On the contrary, infrastructure shortages and weaknesses, such as power outages, poor transportation services, lack of clean water, and limited information technology, will cause "bottlenecks" that slow economic growth and reduce business efficiency. Failure to carefully study infrastructure conditions before starting a business also causes businesses to face unsuitable business locations, leading to increased costs and reduced profits. In particular, owning a private office or a convenient business location helps businesses grow faster, while high rental costs or a poor business environment are major barriers to expansion and diversification (Abay et al., 2014; Tarfasa et al., 2016). Therefore, access to adequate infrastructure, from transportation, information technology to workplaces, plays a decisive role in the sustainability and growth of businesses, especially in developing countries like Vietnam.

From the above observations, the author proposes the following research hypothesis:

*H3: Infrastructural factors has a positive impact on the sustainability and growth of small and medium enterprises in Vietnam*

**Personal characteristics of the manager or owner**

Business success is influenced by many factors, but the most important factor is the entrepreneur behind the business (Olakitan & Ayobami, 2011). Entrepreneurial characteristics, such as education, experience, managerial ability, and entrepreneurial motivation, play a key role in business performance and growth (Wodajo et al., 2020). Entrepreneurs with higher levels of education and experience tend to own and operate businesses with superior financial performance and growth rates (Alene, 2020). Businesses with a high proportion of educated and skilled workers also expand significantly faster, consistent with the theory of change in business and technical education.

Business education helps entrepreneurs improve their skills, providing the information needed to improve performance and competitiveness. SMEs with access to business information tend to expand faster, thanks to their ability to strengthen customer relationships, promote market connections, and enhance corporate image (Batisa, 2019). In Vietnam, management efficiency and entrepreneurial skills are decisive factors for the survival and sustainable growth of SMEs (Le et al, 2022).

Owner motivation is also an important factor. Entrepreneurs who start their own businesses out of passion and

volunteerism tend to perform better than those who consider it a last resort (Alemayehu & Gecho, 2016). Conversely, lack of training and access to information often leads to poor performance, slowing down the growth of the business (Kanbiro & Bekele, 2020). In summary, factors such as qualifications, experience, management capacity, and personal motivation play an important role in the development and success of enterprises.

From the above observations, the author proposes the following research hypothesis:

*H4: Personal characteristics of managers have a positive impact on the sustainability and growth of small and medium enterprises in Vietnam*

**Technological factors**

Technology is an important factor, bringing both opportunities and challenges to businesses. The emergence of new technology can increase the competitive advantage of alternative products, pushing traditional products into the risk of obsolescence, forcing businesses to innovate to maintain competitive advantage. Research has shown that small and medium enterprises (SMEs) that innovate technology achieve higher performance than those that do not apply technology (Subrahmanya et al., 2010). The application of information and communication technology (ICT) also helps to improve the competitiveness and sustainability of SMEs, especially in developing countries (Apulu & Latham, 2011). However, lack of technological capacity remains a major barrier to the development of SMEs, especially when faced with expensive hardware and software costs, lack of IT experts, and limited access to the internet (Hashim, 2015).

In Vietnam, technology adoption is a vital factor for SMEs, with a direct impact on business performance. Research also shows that low IT skills and limited internet usage are factors that reduce the performance of SMEs (Hashim, 2015). In addition, maintaining outdated working techniques and lack of willingness to continuously improve are also major challenges to the competitiveness and growth of businesses (Batisa, 2019). To overcome these barriers, SMEs need to commit to innovation and continuously improve technology and work processes to improve their adaptability and competitiveness in the market.

From the above observations, the author proposes the following research hypothesis:

*H5: Technological factors have a positive impact on the sustainability and growth of small and medium enterprises in Vietnam*

From the above research hypotheses, the author proposes the following research model:

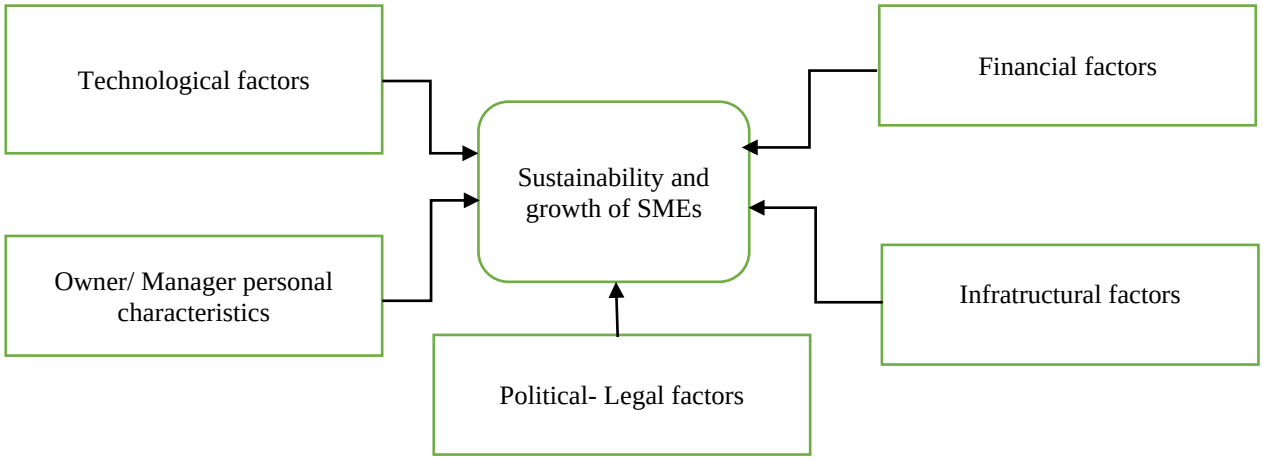

**Figure 1: Conceptual framework**

## III. RESEARCH METHODOLOGY

### 3.1. Population and Sample

The population of this study is the SMEs registered in the General Statistics Office. Then, the sample was selected by stratified sampling method. The selected SMEs are represented by their managing owners. A total of 1500 questionnaires were distributed. After two reminders, 435 responses were successfully collected. However, 16 responses were considered inappropriate (due to incomplete information or filling in all questions with the same

answer). Therefore, this paper achieved a response rate of 27.93% with 419 usable responses.

### 3.2. Measurement scale

This study is quantitative in nature and uses a questionnaire survey method to collect the desired data. The items in the questionnaire were adapted from many previously established studies. Specifically, the financial factor scale (5) is inherited with adjustments from the research of Nuong & Anh (2017) and Loan (2018); The administrative-legal scale (5) is inherited from the research of Phan Thi Minh Ly (2011), the infrastructure scale (6) is inherited from the research of Zamberi Ahmad & Xavier (2012), the technological factor scale is inherited from the research of (Do Tuan Vu, 2023), the business owner scale (6) is inherited from the research of Man et al. (2002), Mitchelmore & Rowley (2013); the scale of business existence and development (4) is inherited from the research of (Do Tuan Vu, 2023). All items used a 5-point Likert-type rating scale (1 = "strongly disagree" to 5 = "strongly agree").

## 4. Analysis and discussion of research results

### 4.1. Scale evaluation

#### 4.1.1. Scale reliability testing

According to Peterson (1994), any scale with a Cronbach's Alpha coefficient less than 0.6 will be eliminated from the research model and observed variables with a total item correlation coefficient less than 0.3 are considered junk variables and will also be eliminated from the scale (Nunnally & Burnstein, 1994). The test results for the scales and observed variables that meet the criteria are shown in the following Table 1.

**Table 1. Cronbach's alpha test**

| Varibales | Corrected Item-Total Correlation | Cronbach's Alpha if Item Deleted |
|---|---|---|
| **Financial factors** | | |
| **Fin1**- The enterprise has a good financial foundation and sufficient cash resources | .723 | .861 |
| **Fin2**- A stable financial structure ensures the enterprise's business operations | .718 | .862 |
| **Fin3**- The enterprise can access alternative external financial sources if needed | .721 | .862 |
| **Fin4**- The enterprise's current capital is long-term capital | .705 | .866 |
| **Fin5**- The enterprise has good financial management capabilities | .754 | .854 |
| **Cronbach's Alpha** | .886 | |
| **Political- Legal factors** | | |
| **Pol1**- Enterprises receive much support from state agencies in receiving and training workers | .672 | .829 |
| **Pol2**- Enterprises receive much support from state agencies in supporting loans with low interest rates | .660 | .832 |
| **Pol3**- Enterprises receive much support from state agencies in supporting trade promotion | .648 | .835 |
| **Pol4**- Enterprises receive much support from state agencies in supporting funding for technological innovation | .685 | .825 |
| **Pol5**- The government has many attractive tax incentives for enterprises. | .702 | .821 |
| **Cronbach's Alpha** | .858 | |
| **Infrastrutural factors** | | |
| **Inf1**- the physical infrastructure (roads, utilities, communications, waste disposal) provides good support for new and growing firms. | .650 | .855 |
| **Inf2**- It is not too expensive for a new or growing firm to get good access to communications (phone, internet, etc.) | .670 | .852 |

| | | |
|---|---|---|
| **Inf3**- We can get good access to communications (telephone, internet, etc.) in about a week | .719 | .843 |
| **Inf4**- We can afford the cost of basic utilities (gas, water, electricity, and sewer) | .688 | .849 |
| **Inf5**- We can get good access to utilities (gas, water, electricity, and sewer) in about a month | .683 | .850 |
| **Inf6**- We can rent business premises in the area we desire. | .635 | .858 |
| **Cronbach's Alpha** | .873 | |
| **Technology factor** | | |
| **Tech1**- Enterprises regularly update and apply new technology to production and business activities. | .701 | .823 |
| **Tech2**- Businesses apply modern technology in marketing and brand promotion | .697 | .825 |
| **Tech3**- Enterprises always attach importance to investing in research and development of new technologies. | .719 | .815 |
| **Tech4**- The level of technology in production of the enterprise is high compared to the average. | .705 | .822 |
| **Cronbach's Alpha** | .860 | |
| **Owner/ Manager personal characters** | | |
| **OPC1**- The business owner's ability to recognize business opportunities is high. | .667 | .826 |
| **OPC2**- The business owner's ability to effectively coordinate business resources is highly appreciated. | .736 | .813 |
| **OPC3**- The business owner is highly dedicated to the business. | .723 | .815 |
| **OPC4**- The business owner's ability and business management skills are well suited to the role of a business leader. | .736 | .814 |
| **OPC5**- The business owner is a very hard-working person. | .680 | .824 |
| **OPC6**- The business owner always has patience and high determination to pursue goals. | .340 | .884 |
| **Cronbach's Alpha** | .855 | |
| **Sustainability and growth of business** | | |
| **Sus1**- Businesses with the potential for long-term revenue growth | .594 | .786 |
| **Sus2**- Businesses have the ability to attract potential customers. | .669 | .751 |
| **Sus3**- Business with long-term profitability | .632 | .768 |
| **Sus4**- Businesses have the ability to increase expansion and develop market share in the long term. | .642 | .764 |
| **Cronbach's Alpha** | .815 | |

The test results show that from 30 observed variables belonging to 6 initially proposed scales (5 independent scales and 1 dependent scale), the remaining 29 observed variables belonging to 6 scales meet the requirements. Of which, 1 observed variable was eliminated, which is the observed variable OPC6 (Owner/Manager Personal Characteristics scale) because this variable has a Cronbach's Alpha coefficient if the variable is eliminated greater than the Cronbach's Alpha coefficient of the scale, so this variable is considered a garbage variable and is eliminated from the scale (Nguyen Dinh Tho, 2011).

*4.1.2. Convergent value and discriminant value analysis*

The factor analysis process is carried out through 4 testing steps as follows: (1) The factor loading coefficient of the observed variables in the factor rotation matrix is all greater than 0.5, proving that these observed variables are reliable; (2) KMO coefficient > 0.5 satisfies the suitability of factor analysis if $0.5 \leq KMO \leq 1$ (Hair et al., 2010); (3) Sig.

coefficient with value < 0.005 of Bartlett's test indicates that there are statistically significant correlations between observed variables in the population, so the observations are suitable for factor analysis; (4) The extracted variance value or cumulative variance indicates the percentage of total variance explained by factors or the change of factors explained by observed variables and according to Gerbing and Anderson (1988), this cumulative variance is greater than 50% suitable for factor analysis. Table 2 below summarizes the results of factor rotation for 25 observed variables that meet the standards.

**Table 2. Results of EFA analysis**

| Variables | Factors | | | | |
|---|---|---|---|---|---|
| | 1 | 2 | 3 | 4 | 5 |
| Inf5 | .757 | | | | |
| Inf4 | .756 | | | | |
| Inf3 | .740 | | | | |
| Inf6 | .697 | | | | |
| Inf1 | .693 | | | | |
| Inf2 | .675 | | | | |
| Fin5 | | .819 | | | |
| Fin3 | | .811 | | | |
| Fin1 | | .803 | | | |
| Fin4 | | .786 | | | |
| Fin2 | | .786 | | | |
| OPC2 | | | .793 | | |
| OPC5 | | | .767 | | |
| OPC4 | | | .749 | | |
| OPC3 | | | .723 | | |
| OPC1 | | | .690 | | |
| Pol5 | | | | .799 | |
| Pol4 | | | | .798 | |
| Pol1 | | | | .780 | |
| Pol2 | | | | .778 | |
| Pol3 | | | | .763 | |
| Tech3 | | | | | .829 |
| Tech2 | | | | | .814 |
| Tech1 | | | | | .811 |
| Tech4 | | | | | .803 |
| Eigenvalues | 7.788 | 4.208 | 2.681 | 1.889 | 1.551 |
| Extracted variance (%) | 25.959 | 14.028 | 8.938 | 6.29 | 5.169 |
| Total variance extracted (%) | | | | | 65.462 |
| KMO | | | | | 0.904 |
| Sig. | | | | | 0.000 |

The results of the exploratory factor analysis in Table 2 show that the criteria satisfy the 4 tests mentioned above and 5 new factors are formed. Thus, these 5 newly formed factors will be included in the regression model to analyze and test the correlation with the dependent variable Y.

#### 4.1.3. Results of the regression analysis

The results of the regression of factors affecting sustainability and growth of SMEs are shown in the following Table 3.

**Table 3: Coefficients[a]**

| Model | | Unstandardized Coefficients | | Standardized Coefficients | t | Sig. | Collinearity Statistics | |
|---|---|---|---|---|---|---|---|---|
| | | B | Std. Error | Beta | | | Tolerance | VIF |
| 1 | (Constant) | -.158 | .172 | | -.918 | .359 | | |
| | Fin | .120 | .022 | .200 | 5.522 | .000 | .814 | 1.228 |
| | Pol | .187 | .026 | .254 | 7.074 | .000 | .833 | 1.200 |
| | Inf | .247 | .030 | .328 | 8.152 | .000 | .663 | 1.508 |
| | Tech | .154 | .022 | .258 | 7.159 | .000 | .822 | 1.216 |
| | OPC | .130 | .025 | .175 | 5.170 | .000 | .935 | 1.070 |
| Sig. F | | 0.000 | | | | | | |
| Adjusted R Square | | .553 | | | | | | |

**a. Dependent Variable: Sus**

The analysis results in Table 3 show that the observed significance level is very small (Sig. = 0.000), indicating that the model is statistically significant at the 1% level. The adjusted R2 value = 0.553 means that 55.3% of the impact on sustainability and growth of SMEs is explained by the linear correlation between the dependent variable and the independent variables included in the research model. In addition, the variance inflation factor (VIF) of the variables in the model is much smaller than 10, so we conclude that the variables included in the model do not have multicollinearity.

The regression results show that, of the 5 factors included in the research model, all 5 factors have a statistically significant impact on sustainability and growth of SMEs. These factors include Financial factors, Infratructural factors, Political- Legal factors, Owner/ Manager personal characteristics, Technological factors. All of these factors have a positive correlation with sustainability and growth of SMEs. Infratructural factors have the greatest influence (β= 0.328), followed by Technological factors (β= 0.258), Political-Legal factors (β= 0.254), Financial factors (β= 0.200), and finally Owner/Manager personal characteristics (β= 0.175).

With the highest impact coefficient, infrastructure factors play a leading role in promoting the sustainability and growth of SMEs. This can be explained by the dependence of businesses on basic infrastructure such as transportation, telecommunications, energy, and information technology to maintain efficient operations, optimize supply chains, and connect with markets. Good infrastructure will reduce operating costs, improve production efficiency, and help businesses access business opportunities more easily.

Technology plays a role in promoting innovation and improving productivity for SMEs. This coefficient reflects that investment in technology, digital transformation, and the use of modern digital solutions are important factors that help businesses increase competitiveness, improve products/services, and access larger markets, especially in the context of the 4.0 industrial revolution.

Political and legal factors have a great influence because they create a stable and transparent business environment. A clear legal system, appropriate support policies, and political stability help SMEs minimize risks and increase confidence in the market. Support from the government, such as financial incentive programs or tax incentives, is also a factor that promotes growth.

Financial factors play an essential role, but their influence is lower than the above factors. This may stem from the fact that SMEs often have difficulty accessing capital, but when available capital is combined with effective financial management, it will be an important tool for businesses to expand their scale, invest in technology, and improve product quality.

The personal characteristics of the business owner or manager have a significant impact, but do not play a dominant role. This may indicate that although their vision, experience, and leadership capacity are important, they need to be supported by other factors such as infrastructure, technology, and policy environment to maximize their effectiveness.

This research results emphasize that the sustainable development and growth of SMEs depends on the effective coordination of many factors. In particular, improving infrastructure and taking advantage of modern technology are top priorities. At the same time, businesses also need to take advantage of a favorable legal environment, strict financial management, and improving leadership capacity to achieve comprehensive development.

## V. CONCLUSION

Small and medium-sized enterprises (SMEs) play a pivotal role in a country's long-term economic growth, driving rapid and sustainable economic development. In Vietnam, many national development plans have emphasized the role of SMEs in broad-based economic transformation. Despite the government's efforts to support them, SMEs still face many challenges: many do not sustain their operations or survive long without innovation, producing similar and substandard products (Cherkos et al., 2018).

This study aims to provide inputs to policy makers and development agencies, and assess the key factors affecting the sustainability and growth of SMEs in Vietnam. Both internal and external factors are empirically examined, including: Financial factors: Exploring ways to improve access to capital, strengthen financial management practices, enhance credit knowledge, and optimize working capital. Political-legal factors: Identifying opportunities to leverage government support, simplify policy frameworks, and ensure clear, accessible legal guidance. Infrastructure: Highlighting strategies to improve access to essential resources such as electricity, water, and suitable business locations, while fostering a more supportive business environment. Characteristics of business owners: Empowering business owners through targeted initiatives to enhance management skills, expand business knowledge, and cultivate innovative thinking. Technological factors: Encouraging the adoption of modern technology by building awareness, improving access to advanced tools, and fostering a proactive mindset toward technological advancements.

## VI. RECOMMENDATIONS

To improve sustainability and growth, suggested solutions include:

*Finance*: Encourage banks and financial institutions to provide more accessible credit support policies. Microfinance institutions (MFIs) should develop product portfolios suitable for each stage of development of SMEs, combining post-loan support and raising awareness of savings. The government can establish venture capital organizations to support capital for potential startups.

*Marketing and training:* Develop business skills training programs, technology support, and market connections to help SMEs improve their marketing and management capabilities.

*Linking and sharing resources*: Develop a business support network to share information and resources.

*Internal self-improvement*: SMEs are recommended to focus on addressing internal factors such as improving management skills, business thinking, and technological innovation instead of relying on external solutions.

This study not only provides information for policy makers but also serves as a reference for future studies, contributing to promoting economic progress and enhancing the competitiveness of SMEs in Vietnam.

# EMPOYEE'S GREEN AWARENESS AT 5-STAR HOTELS IN HA LONG (QUANG NINH)

**Nguyen Thi Mai Linh[1], Tran Duc Thanh[2]**

[1]MA. Faculty of Tourism, Ha Long University; PhD.Candidate Faculty of Tourism, University of Social Sciences and Humanities, Vietnam National University, Hanoi

[2]Associate Professor, Dr. University of Social Sciences and Humanities, Vietnam National University, Hanoi

Corresponding: nguyentmlinh@daihochalong.edu.vn

**ABSTRACT**

This study investigates and evaluates employees' green awareness in 5-star hotels in Ha Long and its potential influence on their workplace practices and daily behaviors. The research was conducted among employees at six 5-star hotels in Ha Long, using a Google Forms survey to collect 200 responses. The collected data was analyzed using SPSS software, with results statistically processed and presented in a descriptive format. The findings reveal that employees generally have an initial awareness of green, express support for green human resource management initiatives, and are practicing certain green behaviors both at work and at home. However, based on the majority of respondents' feedback, the study includes discussions assessing employees' awareness of green and provides recommendations for fostering greater awareness and implementation of green practices in the workplace.

*Keywords: "*awareness", "green", "green human resource management", "employee", "hotel"

## I. INTRODUCTION

Greening businesses and maintaining environmental sustainability have become top priorities for decision-makers in the 21st century, leading to the exploration of innovative alternatives to traditional human resource management practices. Among various workgroups, employees play a critical role in advancing corporate greening initiatives by adopting environmentally friendly and socially responsible behaviors. Human resource management (HRM) has proven to be a powerful mechanism for fostering green and sustainable practices, particularly when environmental sustainability becomes a central focus of research on green human resource management (GHRM) (Jose et al., 2019). In Vietnam, research on GHRM within the tourism and hospitality sector remains limited, despite the sector's significant environmental footprint and dependence on ecological sustainability. This gap underscores the need to study and enhance awareness of green among those working in the tourism industry. Employee environmental awareness is increasingly seen as critical to a company's sustainability and performance. Studies have shown that employee environmental awareness, knowledge, and skills have a positive impact on a company's ability to implement green practices. In the hospitality industry, employee environmental awareness contributes significantly to overall environmental performance.

Environmental sustainability is becoming more and more important to the hospitality sector. Businesses, especially hotels, are expected to implement sustainable practices as environmental deterioration and climate change become more widely recognized. This change is a reflection of a larger social need for businesses to adopt environmentally conscious practices, not only a reaction to customer demand. Employees are crucial in promoting green activities in their workplaces in this context. Their knowledge of and dedication to sustainability can have a big impact on how well their companies' environmental initiatives work.

Employees' knowledge of environmental issues and how they affect the workplace and society at large is referred to as their "green awareness." This knowledge is crucial for developing a sustainable culture in hotels because it encourages staff members to take an active role in green projects and embrace eco-friendly practices. According to research, employees are more likely to engage in good green behaviors, including cutting back on waste or using less energy, when they believe their companies are sincerely devoted to sustainability (Khan et al., 2022). In the hotel industry, leadership has a significant impact on how environmentally conscious staff members are. Employees' psychological green climate can be improved by ethical leadership that prioritizes environmental responsibility, which will encourage them to engage in green behaviors (Khan et al., 2022) (Zheng et al., 2021). Additionally, by

incorporating sustainability into the corporate culture and guaranteeing that all staff members support the organization's environmental objectives, the adoption of Green Human Resource Management (GHRM) techniques helps speed up this process (Gulakdeniz & Karadas, 2024).

This study aims to evaluate the awareness of green among employees at six 5-star hotels in Ha Long. It emphasizes the importance of cultivating appropriate awareness, as this serves as the foundation for fostering the right attitudes and behaviors towards sustainable practices in the workplace and beyond.

## II. MATERIAL AND METHODOLOGY

### Green Awareness (GA)

According to (Partanen-Hertell et al., 1999), awareness is the combination of Motivation, Knowledge and Skills. Green awareness has recently emerged as a prominent topic of discussion in different fields. In terms of state behavior, (Shao, 2019) found that the state has increased its attention to the environment, green consumption, and other aspects as well as publicity efforts to promote the adoption of green low-carbon behavior. (Liao et al., 2022) explored how social green preferences influence individual green behavior. High social green preferences, especially when transmitted by high-status individuals, significantly boost green motivation and actions, revealing important social dynamics in promoting sustainable practices. (Conte et al., 2024) explored interdisciplinary approaches to nature-based solutions and environmental awareness. The Aula Verde Aniene project in Rome, combining ecology, urban forestry, and various art forms, engaged the community through art and citizen science, enhancing the perception of ecosystem services and fostering a sense of belonging to nature. (Bae et al., 2022) investigated the influence of awareness regarding social and environmental sustainability practices on impulse buying. They found that social and environmental sustainability awareness positively influences green trust, which in turn enhances impulse buying. The study strongly advises that policymakers and marketers prioritize efforts to enhance awareness of environmental and social sustainability, along with fostering green altruism.

Green awareness refers to individuals' understanding and awareness of environmental and sustainability issues, influencing their behaviors, attitudes, and knowledge to support sustainable practices and reduce environmental damage, influencing their decision-making and behavior. (Kollmuss & Agyeman, 2002; Ottman et al., 2006)

Research based on the resource-based theory (RBV) and social learning theory (SLT): Resource-based theory clarified that resources were formed in the early 1980s and widely recognized in the 1990s, this theory plays an important role in the practice of green human resource management, which is valuable when they help a company implement and form approaches to improve the performance of the company. Social learning theory is understood as the influence of cognition and environment on human understanding, behavior, and education.

### Green human resource management

The term “green” in Green Human Resource Management (Green HRM) signifies the integration of environmentally conscious policies and practices into human resource management. While it often refers to environmental sustainability, it also represents the broader awareness businesses have of their ecological impact.

Green HRM encompasses all HR activities aimed at making employees environmentally conscious, supporting the organization’s environmental goals, and contributing to sustainability. (Renwick et al., 2013) define it as the degree of integration between HRM activities and environmental management. Similarly, (Jabbour, 2011) views it as embedding environmental management into HR processes. (Mandip, 2012) and (Ahmad, 2015) describe Green HRM as utilizing HR policies to promote sustainable resource usage in organizations and further environmental sustainability efforts. (Gupta, 2018) added that Green HRM supports sustainable resource use, environmental awareness, and employee commitment to environmental challenges.

### Research method and hypothesis development

*Research method*

To assess employees' green awareness, the research team designed a structured questionnaire. The questionnaire included items directly related to the research objectives, with a 5-point Likert scale used for responses (1 = Strongly Disagree, 2 = Disagree, 3 = Unsure, 4 = Agree, 5 = Strongly Agree).

A simple, convenient random sampling method was employed, and data was collected through an online survey. This approach was chosen for its suitability given the employees' working conditions, allowing the questionnaire to be distributed via email, text messages, and group communications. A total of 250 questionnaires were distributed, resulting in 200 valid responses.

The survey was developed based on scale criteria derived from established studies by (Tang et al., 2018), (Mukherjee & Chandra, 2018); (Suki, 2013). The sample size determination followed the guidelines for exploratory factor analysis (EFA), where the minimum sample size is calculated as: Sample size = Number of observed variables × 5. With 27 observed variables in this study, the minimum sample size required was 135 (5 × 27). However, to ensure sufficient data for analysis and to account for potential non-responses or invalid responses, the team distributed 250 questionnaires.

Both primary and secondary data sources were utilized in this study. Primary data was collected through the questionnaire, while secondary data was obtained from previous research on GHRM, particularly studies by international authors and articles published in reputable scientific journals. Quantitative research methods were applied, with the collected data analyzed using SPSS software. The results were presented as descriptive statistics to explore and understand employees' awareness of GHRM.

*Hypothesis Development*

Green Training (GT)

Green training is a practice that enables workers to learn environmental conservation capabilities and environmental protection, both of which are critical to achieving environmental objectives (Jabbour, 2011) Green training practices include raising workers' environmental awareness, instilling green values, and improving their ability to implement green working practices (Zoogah & Peng, 2011). It heightens their understanding of the connection between their activities and the environment.

Green training involves educating employees about the importance of environmental management and equipping them with skills to save energy, reduce waste, and enhance environmental awareness within the organization. This training also provides opportunities for employees to engage in solving environmental challenges. By fostering creativity and innovation, green training not only enhances employees' knowledge but also encourages active participation in addressing environmental issues. Organizations increasingly recognize the significance of green training as environmental concerns grow. It equips employees with the skills needed to address these issues effectively, contributing to the organization's sustainability goals.

*H1: Green training positively impacts employees' green awareness.*

Green Rewards (GR)

Green rewards are a strategic tool used to motivate employees to align with an organization's environmental goals by offering financial and non-financial incentives. These rewards not only drive employees toward eco-friendly practices but also help retain talented individuals and attract new recruits familiar with green methodologies.

Research highlights that organizations can achieve improved environmental performance by providing diverse incentives. Examples include thank-you letters, promotions, job changes, monetary bonuses, gifts, and more (Ahmad, 2015; Arulrajah & Opatha, 2016; Prasad, 2013; D. W. S. Renwick et al., 2013b). While green rewards significantly enhance employees' environmental awareness, their implementation remains limited and underexplored, especially within the hospitality sector.

*H2: Green rewards positively impacts employees' green awareness.*

Green participation (GP)

Green participation involves employees working collaboratively to address environmental challenges, generate innovative ideas, resolve conflicts in environmental management, and foster environmental learning (Jabbour, 2011)

Employees should be encouraged to contribute to pollution control and realize environmental benefits by allowing them to participate in green activities within the organization (Renwick et al., 2008). (Tseng et al., 2012) concluded that improving the effectiveness of green human resource management practices is important for attracting employees to

participate in green functions. (Renwick et al., 2008) stated that green learning environments, clear green visions, multiple communication channels that provide green activities, and encouragement of green participation are necessary components to measure green employee participation.

*H3: Green participation positively impacts employees' green awareness.*

Green performance management (GPM)

Green performance appraisal system is a framework to determine the performance behavior of employees in the process of environmental management (Jabbour, 2011). Jabbour identified that this activity ensures the incorporation of green issues into the daily routine of individuals. The organization must determine a structured method to implement environmental performance management as this will enhance and stimulate more employees to be environmentally responsible.

*H4: Green performance management positively impacts employees' green aw*

Green culture (GC)

Organizational culture is the set of norms and expectations for how people behave and work within a corporation (Upadhyay & Kumar, 2020). Understanding and putting into practice green culture helps organizations better commit to their people, green projects, and business goals (Ramasamy, 2017). A company without a green culture will find it difficult to realize the green potential, incentives, and possibilities of its personnel. The main characteristics of a green culture in an organization are the creation of formal and informal communication channels for the development of a green culture (Tang et al., 2018), the support of senior executives for green initiatives (Masri & Jaaron, 2017), and organizational support for a mission that prioritizes environmental issues (Gupta, 2018); (Paillé et al., 2020).

*H5: Green culture positively impacts employees' green awareness.*

**Research model**

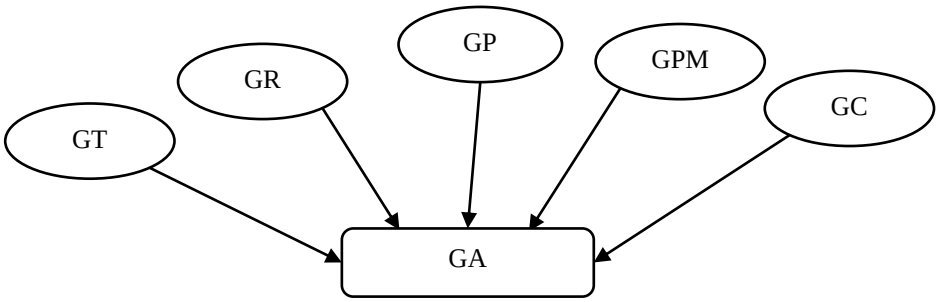

**Figure 1. Research model**

According to the model, there are 5 variables considered as independent variables: Green training, Green rewards, Green participation, Green performance management, Green culture; 01 dependent variable is Green awareness. The questionnaire was designed into 3 parts, including questions about general information, questions related to awareness of green human resource management activities, and questions about general Green awareness. It was sent to employees at six 5-star hotels in Ha Long, collecting 200 valid responses. To increase the reliability and value of the data, a pilot study was conducted. After receiving the results of the pilot, there were some minor changes in the questionnaire, and some criteria were reduced due to duplication in expression and investigation to obtain the current results.

## III. RESULT AND DISCUSSION

*Criteria of green human resource management activities were surveyed:*

Green human resource management activities are divided by the authors into 5 groups of criteria belonging to each green human resource management activity to study the opinions and perceptions of hotel employees: (1) Green training (with 5 measurement variables); (2) Green rewards (with 4 measurement variables); (3) Green participation (with 5 measurement variables); (4) Green performance management (with 5 measurement variables); (5) Green culture (with 5 measurement variables). And the group of criteria Green awareness (with 3 measurement variables). The scale used to evaluate the criteria is a 5-level Likert scale: (1) Strongly disagree; (2) Disagree; (3) Neutral; (4) Agree; (5) Strongly agree.

*Cronbach's Alpha reliability test*

Before conducting data analysis, the study conducted a reliability test of the scale. The reliability of measurement criteria was tested through Cronbach's Alpha coefficient to eliminate irrelevant variables (Garbage Items) before conducting EFA. If the composite reliability and Cronbach's α score are greater than 0.70 (Nunnally, 1994), it is called a strong structure.

**Table 1. Results of Cronbach's Alpha reliability coefficient analysis**

| Criteria | Total variable correlation | Cronbach's Alpha if this variable is excluded |
|---|---|---|
| **Green Training** (GT): Cronbach's Alpha = 0.884 | | |
| GT1 | 0.753 | 0.852 |
| GT2 | 0.830 | 0.832 |
| GT3 | 0.522 | 0.902 |
| GT4 | 0.711 | 0.861 |
| GT5 | 0.800 | 0.840 |
| **Green Rewards** (GR): Cronbach's Alpha = 0.805 | | |
| GR1 | 0.615 | 0.759 |
| GR2 | 0.528 | 0.797 |
| GR3 | 0.642 | 0.746 |
| GR4 | 0.704 | 0.713 |
| **Green participation** (GE): Cronbach's Alpha = 0.886 | | |
| GE1 | 0.501 | 0.908 |
| GE2 | 0.695 | 0.867 |
| GE3 | 0.766 | 0.852 |
| GE4 | 0.843 | 0.831 |
| GE5 | 0.827 | 0.835 |
| **Green performance management** (GPM): Cronbach's Alpha = 0.914 | | |
| GPM1 | 0.808 | 0.889 |
| GPM2 | 0.878 | 0.874 |
| GPM3 | 0.648 | 0.920 |
| GPM4 | 0.777 | 0.896 |
| GPM5 | 0.795 | 0.892 |
| **Green culture** (GC): Cronbach's Alpha = 0.874 | | |
| GC1 | 0.770 | 0.830 |
| GC2 | 0.792 | 0.824 |
| GC3 | 0.641 | 0.862 |
| GC4 | 0.621 | 0.867 |
| GC5 | 0.701 | 0.848 |
| **Green awareness** (GA): Cronbach's Alpha = 0.770 | | |
| GA1 | 0.602 | 0.694 |
| GA2 | 0.620 | 0.673 |
| GA3 | 0.591 | 0.705 |

*Source: Authors synthesize SPSS processing results*

The study used Cronbach's Alpha reliability coefficient test to evaluate the consistency of the criteria. The results of the reliability assessment showed that all factors met the reliability requirements (0.6 < Cronbach's Alpha) and the total correlation coefficient of the observed variables was greater than 0.3, indicating that these variables had a good correlation with the overall scale. Thus, through the results of the reliability test, 24 observed variables of 5 independent variable scales will be included in the EFA exploratory factor analysis, these observed variables remain the same as the original observed variables included in the model.

*Exploratory factor analysis EFA*

To apply factor analysis, it is necessary to test the suitability of the data for the factor analysis method. This test is performed through two quantities: KMO (Kaiser-Meyer-Olikin Meansure of Sampling Adequacy) and Barlett's Test of Sphericity.

The KMO coefficient in EFA is an index used to examine the appropriateness of factor analysis. The KMO coefficient is applied to the analysis as follows: $0.5 \leq KMO \leq 1$: Qualified for factor analysis; $KMO < 0.5$: Factor analysis is not suitable for the data.

**Table 2. Results of KMO and Bartlett's Test**

| KMO and Bartlett's Test | | |
|---|---|---|
| Kaiser-Meyer-Olkin Measure of Sampling Adequacy. | | ,761 |
| Bartlett's Test of Sphericity | Approx. Chi-Square | 3793,373 |
| | Df | 276 |
| | Sig. | ,000 |

*Source: According to SPSS processing results of the author group*

KMO coefficient = 0.761 > 0.5, thereby showing that the analysis is suitable for the research data. The significance level Sig. in the Bartlett test is less than 0.05, proving that the collected research data used for analysis is completely suitable.

**Table 3. Factor rotation results**

| Rotated Component Matrix | | | | | |
|---|---|---|---|---|---|
| | Component | | | | |
| | 1 | 2 | 3 | 4 | 5 |
| GPM2 | ,865 | | | | |
| GPM4 | ,826 | | | | |
| GPM5 | ,826 | | | | |
| GPM1 | ,821 | | | | |
| GPM3 | ,736 | | | | |
| GT2 | | ,887 | | | |
| GT5 | | ,871 | | | |
| GT1 | | ,840 | | | |
| GT4 | | ,815 | | | |
| GT3 | | ,671 | | | |
| GE4 | | | ,922 | | |
| GE5 | | | ,868 | | |
| GE3 | | | ,838 | | |
| GE2 | | | ,804 | | |
| GE1 | | | ,514 | | |
| GC2 | | | | ,908 | |
| GC1 | | | | ,888 | |
| GC5 | | | | ,755 | |
| GC3 | | | | ,708 | |
| GC4 | | | | ,659 | |
| GR4 | | | | | ,826 |
| GR3 | | | | | ,782 |
| GR1 | | | | | ,770 |
| GR2 | | | | | ,727 |

*Source: According to SPSS processing results of the author group*

Through the processing results, it shows that 24 variables included in the EFA analysis all have factor loadings greater than 0.5, so they are retained in the model and used for subsequent testing.

**Table 4. Results of factor analysis of independent variables**

| Total Variance Explained | | | | | | |
|---|---|---|---|---|---|---|
| Component | Initial Eigenvalues | | | Extraction Sums of Squared Loadings | | |
| | Total | % of Variance | Cumulative % | Total | % of Variance | Cumulative % |

| 4 | 2,347 | 9,777 | 62,537 | 2,347 | 9,777 | 62,537 |
| 5 | 1,848 | 7,701 | 70,238 | 1,848 | 7,701 | 70,238 |
| 6 | ,898 | 3,741 | 73,980 | | | |
| 7 | ,895 | 3,727 | 77,707 | | | |
| 8 | ,714 | 2,975 | 80,682 | | | |
| 9 | ,634 | 2,641 | 83,323 | | | |
| 10 | ,580 | 2,415 | 85,737 | | | |
| 11 | ,525 | 2,189 | 87,926 | | | |
| 12 | ,494 | 2,058 | 89,984 | | | |
| 13 | ,435 | 1,811 | 91,796 | | | |
| 14 | ,380 | 1,583 | 93,378 | | | |
| 15 | ,335 | 1,396 | 94,774 | | | |
| 16 | ,313 | 1,305 | 96,079 | | | |
| 17 | ,220 | ,916 | 96,995 | | | |
| 18 | ,182 | ,759 | 97,754 | | | |
| 19 | ,149 | ,619 | 98,373 | | | |
| 20 | ,126 | ,523 | 98,896 | | | |
| 21 | ,117 | ,489 | 99,385 | | | |
| 22 | ,068 | ,284 | 99,669 | | | |
| 23 | ,047 | ,195 | 99,864 | | | |
| 24 | ,033 | ,136 | 100,000 | | | |

*Source: According to SPSS processing results of the author group*

According to the processing results, the total variance extracted was recorded as 70.238% > 50%, factor analysis was appropriate, therefore it can be stated that the factors in the study explained 70.238% of the variation in the research data. In which:

Green Training (GT) includes 5 variables GT1, GT2, GT3, GT4, GT5

Green Rewards (GR) consists of 4 variables GR1, GR2, GR3, GR4

Green participation (GE) includes 5 variables GE1, GE2, GE3, GE4, GE5

Green Performance Management (GPM) includes 5 variables GPM1, GPM2, GPM3, GPM4, GPM5

Green Culture (GC) includes 5 variables GC1, GC2, GC3, GC4, GC5

*KMO test and Bartlett's Test of dependent variable*

**Table 5. Results of KMO and Bartlett's Test of dependent variable**

| KMO and Bartlett's Test | | |
|---|---|---|
| Kaiser-Meyer-Olkin Measure of Sampling Adequacy. | | ,699 |
| Bartlett's Test of Sphericity | Approx. Chi-Square | 154,519 |
| | Df | 3 |
| | Sig. | ,000 |

*Source: According to SPSS processing results of the author group*

The conditions for testing KMO and Bartlett's Test for the dependent variable are similar to the conditions for testing the independent variable. After analyzing the 3 observed variables for the dependent variable "Green awareness", the results showed that the KMO index was 0.699 (0.5 < 0.699 <1) and Bartlett's Test gave a Sig. value = 0.000 < 0.05, so the collected data met the conditions for conducting factor analysis.

**Table 6. Results of factor analysis of dependent variable**

| Communalities | | |
|---|---|---|
| | Initial | Extraction |
| GA1 | 1,000 | ,683 |
| GA2 | 1,000 | ,703 |
| GA3 | 1,000 | ,670 |

*Source: According to SPSS processing results of the author group*

The results of the exploratory factor analysis extracted one factor, which was created from three observed variables that the topic had proposed before. Thus, the research model after the EFA exploratory factor analysis did not have any significant changes compared to the original, no observed variables were removed from the model during the process of testing the reliability of the scale and the exploratory factor analysis.

*Building a linear regression model*

After conducting exploratory factor analysis (EFA) to discover factors affecting the dependent variable "Green awareness", the authors built a linear regression model to determine the direction and level of influence of these factors on hotel employees' green awareness. The regression model was built including the dependent variable and independent variables extracted from the exploratory factor analysis (EFA). The regression model was built as follows:

$$GA = \beta0 + \beta1.GT + \beta2.GR + \beta3.GE + \beta4.GPM + \beta5.GC$$

In there:

Green awareness (GA) as the dependent variable.

The independent variables include: Green training (GT), Green Rewards (GR), Green Engagement (GE), Green Performance Management (GPM), Green Culture (GC).

The corresponding Beta coefficients are: β0. β1, β2, β3, β4, β5.

*Evaluation of linear regression model*

**Table 7. Results of model fit test and ANOVA test**

| ANOVA[a] | | | | | | |
|---|---|---|---|---|---|---|
| Model | | Sum of Squares | Df | Mean Square | F | Sig. |
| 1 | Regression | 32,632 | 5 | 6,526 | 11,788 | ,000b |
| | Residual | 107,412 | 194 | ,554 | | |
| | Total | 140,044 | 199 | | | |

*Source: According to SPSS processing results of the author group*

The ANOVA analysis results show that the F value has a significance level of Sig.= 0.000 (less than 0.05), which means that the regression model is suitable for the collected data and the included variables are all statistically significant at a significance level of 5%. Thus, the independent variables are related to the dependent variable, and it is appropriate to use them.

*Regression model analysis*

**Table 8. Regression analysis results**

| Coefficients[a] | | | | | | | |
|---|---|---|---|---|---|---|---|
| Model | | Unstandardized Coefficients | | Standardized Coefficients | T | Sig. | Correlations |
| | | B | Std. Error | Beta | | | Zero-order |
| 1 | (Constant) | ,688 | ,326 | | 2,110 | ,036 | |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| | GTtb | ,124 | ,059 | ,134 | 2,092 | ,038 | ,165 |
| | GRtb | ,184 | ,066 | ,183 | 2,788 | ,006 | ,294 |
| | GEtb | ,149 | ,068 | ,154 | 2,184 | ,030 | ,316 |
| | GPMtb | ,159 | ,073 | ,161 | 2,185 | ,030 | ,346 |
| | GCtb | ,165 | ,071 | ,167 | 2,335 | ,021 | ,316 |

**Coefficients[a]**

| Model | | Correlations | | Collinearity Statistics | |
|---|---|---|---|---|---|
| | | Partial | Part | Tolerance | VIF |
| 1 | (Constant) | | | | |
| | GTtb | ,149 | ,132 | ,965 | 1,036 |
| | GRtb | ,196 | ,175 | ,916 | 1,092 |
| | GEtb | ,155 | ,137 | ,795 | 1,258 |
| | GPMtb | ,155 | ,137 | ,724 | 1,381 |
| | GCtb | ,165 | ,147 | ,775 | 1,290 |

*Source: According to SPSS processing results of the author group*

The results of the multiple linear regression analysis show that the VIF magnification coefficients of the independent variables are all < 10, so there is no multicollinearity between the independent variables, so the model is accepted. The Sig. values of the independent variables are all < 0.05 and the T value is positive, so we can say that all the influencing factors are significant in the model and have a positive impact on employees' green awareness. The standardized regression values of the independent variables in the model are respectively: Green training (GT) 0.134, Green rewards (GR) 0.183, Green participation (GE) 0.154, Green performance management (GPM) 0.161, Green culture (GC) 0.167. Through the results of the regression analysis, we have the following standardized regression equation:

$$GA = 0.134*GT + 0.183*GR + 0.154*GE + 0.161*GPM + 0.167*GC$$

From the above regression results we see:

– *Green Reward (GR)* is the factor that has the greatest influence on employees' awareness of green human resource management (because it has the largest Beta coefficient). The positive sign of Beta shows that the relationship between green rewards and green participation and employees' green awareness is in the same direction (correlated with each other). The regression results show that the Beta coefficient is 0.183 and Sig. = 0.006 (< 0.05).

– *Green culture (GC)* is the second most influential factor on employees' perception of green human resource management. The positive sign of Beta *shows* the relationship between Green culture and employees' green awareness are positively related (correlated). The regression results show that the Beta coefficient is 0.167 and Sig. = 0.021 (< 0.05).

– *Green Performance Management (GPM)* is the third most influential factor on employees' green awareness. The positive sign of Beta shows the relationship between Green performance management and employees' green awareness are positively related (correlated). The regression results show that the Beta coefficient is 0.161 and Sig. = 0.030 (< 0.05).

– *Green engagement (GE)* is the fourth most influential factor on employees' green awareness. The positive sign of Beta shows the relationship between Green participation and employees' green awareness are positively related (correlated). The regression results show that the Beta coefficient is 0.154 and Sig. = 0.030 (< 0.05).

– *Green Training (GT)* is the factor that has the smallest influence on employees' green awareness. However, green training is still the factor that influences employees' green awareness. The positive sign of Beta shows that the relationship between green training and employees' green awareness is in the same direction (correlated). The regression results show that the Beta coefficient is 0.134 and Sig. = 0.038 (< 0.05).

**Table 9. Evaluation results**

| Observation variable | Max | Min | Mean |
|---|---|---|---|
| **Green Training (GT)** | | | 2,893 |
| GT1 | 5 | 1 | 3,075 |
| GT2 | 5 | 1 | 2,770 |
| GT3 | 5 | 1 | 2,885 |
| GT4 | 5 | 1 | 2,685 |
| GT5 | 5 | 1 | 3,155 |
| **Green Reward (GR)** | | | 2,793 |
| GR1 | 5 | 1 | 2,830 |
| GR2 | 5 | 1 | 2,750 |
| GR3 | 5 | 1 | 2,700 |
| GR4 | 5 | 1 | 2,890 |
| **Green participation (GP)** | | | 3,113 |

*Source: Authors synthesize SPSS analysis results*

According to the analysis results, total 34,5% of employees agree and strongly agree that green awareness is very important, while 40.5% rated it at a normal level, and total 25% disagreed and strongly disagree that it is very important. Although the percentage of employees who agreed was relatively high, the number of employees who rated it as normal or disagreed was not small, which is noteworthy.

At the same time, the percentage of employees who agreed that green human resource management is important also correlates with those who believe it is necessary in the training process and those who will implement it in the future. Specifically, 32.5% of employees find green human resource management necessary in the training process,

while a large proportion, 39.5%, rated it as normal, and 28% disagreed. Similarly, 37% of employees stated they would implement green human resource management, but a significant percentage (41.5%) rated it at the normal level, and 21.5% disagreed.

The average score evaluation results also showed that while employees' green awareness is good, the level of awareness is not very high. This highlights the need to raise employees' awareness of green and green human resource management.

**Discussion of research results**

This study found that while the majority of hotel employees were aware of green, their understanding was primarily at an initial level. However, most respondents expressed willingness to participate and commit to a green organization, workplace, and green culture. Renwick et al. (2013) concluded in their study on GHRM that compensating and rewarding employees for their participation in green activities, combined with green training and employee empowerment, are critical for achieving the overall environmental management goals (Gupta, 2018).

The findings suggest that green training should be a primary focus to enhance environmental awareness and the adoption of green human resource management practices by employees. Through training, employees can develop a deeper understanding of the organization's environmental strategies and sustainable development goals. Regarding green rewards, the study showed that when employees perceive that green rewards are tied to their work, it boosts morale and commitment to the organization. These incentives encourage employees to work harder toward green goals and exhibit both task-related and voluntary green behaviors. Organizations may consider various reward forms, such as offering hybrid vehicle loans or holding gratitude meetings, to motivate employees to engage more in environmental management. The study also highlights the significance of green participation in shaping employees' voluntary green behaviors. When employees are aware of green participation, they develop a better understanding of the organization's goals, missions, and green policies. This contributes significantly to improving the hotel's long-term green performance. Research on green performance management shows that it is crucial for fostering a sense of responsibility among employees to effectively implement green human resource management practices. The hotel can achieve its green and sustainable goals through employees' awareness of green performance management, as their evaluations and commitment to those criteria motivate them to pursue organizational rewards. The results regarding green culture underline the vital role of organizational culture in implementing green human resource management within hotels. A strong green culture helps the organization achieve environmental sustainability and improve green performance. Therefore, hotel managers should institutionalize and promote green culture, emphasizing the organization's commitment to environmental issues and sustainable development, which will further raise employees' awareness of the company's green practices.

## IV. CONCLUSION

Human resources are the most valuable assets of an organization and play a crucial role in management activities. With the growing emphasis on greening organizations and businesses, modern human resource managers are tasked with integrating green human resource concepts, green human resource management (GHRM) activities, and green initiatives into the organization's mission statement and HR policies. Employees' voluntary, green-related behaviors stem from an awareness of green practices, which are essential for adapting to job requirements.

This study has some limitations. First, the research relied on a questionnaire survey via Google Forms, without combining other methods such as in-depth interviews or group discussions, which could offer deeper insights into green human resource management practices. Second, the research area and field were not representative of the entire region or other industries. Third, certain aspects of green human resource management, such as employee health and safety, job analysis, and compensation, were not covered in this study. Future research could address these limitations to offer a more comprehensive understanding.

**ABSTRACT**

The main purpose of this study is to determine the impact of employer branding on employee retention and the mediating role of relational psychological contracts in the military banking industry (MB Bank) in Ho Chi Minh City. This study uses qualitative and quantitative research methods, using SPSS 26.0 and AMOS 24.0 software to analyze data collected from empirical surveys. The study collected 219 valid survey forms from managers and employees working in MB Bank in Ho Chi Minh City, aiming to detect factors of employer branding that have positive and significant impacts on relational psychological contracts and employee retention. The results indicate that, in order to retain qualified and skilled employees, organizations need to focus on factors that enhance employee retention through employer branding strategies. An employer branding strategy is affirmed to include: (1) A healthy working environment; (2) Training and development; (3) Work-life balance; (4) Corporate social responsibility; (5) Compensation and benefits, have a positive impact on employee retention. As a result, employees are more likely to stay with the organization for a longer period of time. This study also provides empirical evidence that employer branding can positively influence employee retention through psychological contracts with employees.

## I. INTRODUCTION

Globalization, technological advancements, and demographic changes are driving businesses to look for innovative ways to improve their competitiveness (Junça Silva & Dias, 2023). The labor market is impacted by competition between organizations to attract and retain talent, and competition to maintain employment (Pollock et al., 2019; Dineen & Allen, 2016). These challenges force businesses to constantly promote themselves to attract employees and strengthen the trust of stakeholders. Employer branding (EB) has become an important tool to promote the organization to employees (Biswas & Suar, 2016), and helps reduce turnover rates (Tumasjan et al., 2020). Talent management emerged in the 1990s and remains a priority in human resource management (Maurya & Agarwal, 2018). Building on brand marketing, EB integrates human resource management to build a transparent image of an attractive employer (Lievens & Slaughter, 2016).

In modern organizations characterized by ambiguity and uncertainty, it is necessary to build and attract a qualified workforce (Amarakoon & Colley, 2022; Jaiswal et al., 2022). Rapid advances in digitalization and technological innovation have prompted organizations and HR professionals to pay more attention to the role of human resources (HR) in ensuring corporate sustainability. Research by Menz et al. (2021) asserts that a skilled workforce with decision-making capabilities plays a key role in a company's competitive advantage. Employees possessing the necessary skills become an intangible source of sustainable competitive advantage (Bharadwaj & Yameen, 2020). However, attracting and retaining talent is a major challenge for business sustainability (Guchait et al., 2015; Botella-Carrubi et al., 2021).

Therefore, organizations strive to attract and retain experienced personnel (Bharadwaj & Yameen, 2020). Many studies emphasize that the most important human resource strategy to maintain a sustainable competitive advantage is to attract and retain talent (Maheshwari et al., 2017; Chawla, 2019; Tanwar et al., 2019). One of the strategies that has attracted the attention of scholars and experts is employer branding. An employer branding model that emphasizes the role of psychological contract in influencing employee retention has been identified by Tanwar & Prasad (2016), Poisat

et al. (2018) and Deemah & Dukhaykh (2023). The development of a nation depends on the positive contribution of the banking sector (Serhan & Gazzaz, 2019).

In Vietnam, the banking system has affirmed the important role of the banking network in participating in the country's overall economic achievements in all four macroeconomic indicators: Economic growth, monetary stability, unemployment reduction and improvement of the international balance of payments (Nguyen Dai Lai, 2024). In particular, the Military Bank (MB Bank) is developing rapidly, creating a competitive and dynamic environment, increasing the demand for talented personnel. MB Bank leaders in Ho Chi Minh City assessed that in digital transformation, the core factor determining success is people, not technology, hardware or finance (CEO - Luu Trung Thai, 2022). Therefore, to thrive in the banking industry, managers need to recognize the importance of employer branding in attracting and retaining employees. Therefore, this study will examine the impact of employer branding on employee retention, and consider the mediating role of relational psychological contract in the military banking industry (MB Bank) in Ho Chi Minh City.

## II. MATERIAL AND METHODOLOGY

### 2.1. Conceptual Foundation

#### Employer Branding

Research by Deemah & Dukhaykh (2023), indicates that employer branding is a strong predictor of employee retention, building a strong organizational brand can support employers' employee retention efforts. Since the term "Employer Branding" emerged, originating from the application of branding principles to human resource management to attract and retain current and potential employees (Backhaus & Tikoo, 2004; Rai & Nandy, 2021), the concept has evolved over time from a basic description of the features offered by an organization to a process of identifying what makes a company unique. According to Backhaus & Tikoo (2004), employer branding is a process of promoting the unique and distinctive characteristics of an organization to differentiate itself as an employer from other competitors. Edwards (2009) also argued that employer branding involves building an image and identity for the organization as a "Best Place to Work" among current competitors by promoting and managing unique aspects of the organization, such as tangible and intangible services. Furthermore, Wahba & Elmanadily (2015) stated that employer branding is a strategy to externally and internally communicate the unique attributes of the organization, defining the organization's identity as an employer, to attract and retain potential and current employees.

In addition, studies by Tanwar & Prasad (2017) and Deemah & Dukhaykh (2023) identified five dimensions of employer branding, including: (1) Healthy work environment; (2) Training and development; (3) Work-life balance; (4) Ethics and corporate social responsibility (CSR); (5) Compensation and benefits. In which, CSR is assessed as the impact of an organization taking into account the interests of society in how its activities affect stakeholders (Tanwar & Kumar, 2019; Abd Rahim et al., 2011). A healthy work environment reflects a positive and welcoming team spirit, as well as decent and respectful relationships among colleagues (Hadi & Ahmed, 2018). Employee training and development represent the development value of employer branding (Berthon et al., 2005). Furthermore, the competitiveness of compensation and benefits packages provided to employees helps organizations maintain their competitiveness in the market and attract and retain talent (Tanwar & Prasad, 2017). This study applies the five dimensions of Tanwar and Prasad (2017), as they consider a comprehensive measurement of employer branding (Gupta et al., 2021). This study also inherits the scales from Deemah & Dukhaykh (2023) and has adjusted and supplemented the observed variables to suit the management situation of MB Bank in Ho Chi Minh City.

#### Employer Branding and Employee Retention

In a competitive labor market where employees receive multiple job offers, organizations must differentiate themselves by investing in an employer branding strategy to attract and retain talent (Tanwar & Kumar, 2019). Das & Baruah (2013) define employee retention as maintaining or encouraging employees to stay with the organization for a long time. Hadi & Ahmed (2018) argue that a strong employer brand helps businesses retain talent by building a positive image of the work environment. Bharadwaj & Yameen (2020) also emphasize that an employer branding strategy with unique elements provides a competitive advantage in retaining employees. In addition, Easa & Bazzi (2020) also point out that to retain highly skilled employees, organizations need to focus on factors that increase

engagement, reflected in the characteristics and attributes of the employer brand.

According to social exchange theory, when reciprocal exchanges occur, the relationship between employers and employees becomes stronger, creating positive emotions such as trust, loyalty, and commitment (Cropanzano & Mitchell, 2005). This theory is based on the principle of give and take, leading to mutually beneficial exchanges (Chawla, 2019). Studies show that when organizations provide attractive benefits and attributes, employees' intention to leave is reduced. For example, corporate social responsibility (CSR) and work-life balance are important predictors of employee retention (Tanwar & Prasad, 2016; Chawla, 2020). In addition, employers' reward strategies also have a significant impact on employee retention (Matongolo et al., 2018). Research by Deemah & Dukhaykh (2023) identified employer branding as a strong predictor of employee retention. Furthermore, according to the social exchange theory (Cropanzano & Mitchell, 2005), an effective employer branding strategy that includes: Healthy work environment; Attractive compensation; Work-life balance; CSR; Training and development can positively impact employee retention (Guchait et al., 2015; Holland & Scullion, 2019; Deemah & Dukhaykh, 2023).

**Employer Branding and Relational Psychological Contract**

Rousseau (1989) defines the psychological contract as "an individual's belief about the terms and conditions of an exchange agreement between him or her and another party." This contract includes expectations and beliefs about the performance of mutual obligations in an employment relationship. Employer obligations may include training, career development, fair pay, rewards, and commitment (Rousseau, 1995; Pimentel et al., 2021). The psychological contract is considered a set of unwritten expectations based on the exchange relationship between an employee and an organization (Chambel & Alcover, 2011). Since the introduction of the term by Argyris (1960), scholars have continuously studied the antecedents and effects of the psychological contract (Shaheen et al. 2019). Psychological contracts are often classified into two types: transactional and relational (Rousseau, 1995). Transactional psychological contracts are short-term, based on economic value and tangible rewards, while relational psychological contracts are long-term, incorporating both economic and socio-emotional benefits (Binu Raj, 2020; Rahman et al., 2017).

Festing & Schäfer (2014), organizations that invest in human resource management to attract and retain employees can establish a relational psychological contract by meeting the expectations of talented employees. These expectations are often reflected in an employer branding strategy with unique attributes (Tanwar & Prasad, 2016). Research by Ruchika & Prasad (2017) and Millward & Hopkins, (1998), also indicates that employee expectations and beliefs are core elements of the psychological contract (Rousseau, 1989), which can be formed through the organization's brand attributes. Unlike the transactional psychological contract which is short-term and limited, the relational psychological contract emphasizes the continued commitment, stability in the organization, and personal well-being of employees (Rahman et al., 2017; Ruchika & Prasad, 2017).

When employees perceive that the employer brand represents enduring and distinctive characteristics (Lievens & Slaughter, 2016), the relational psychological contract can be strengthened by the organization meeting these expectations (Festing & Schäfer, 2014). Social exchange theory can provide a theoretical basis for establishing a positive association between the employer brand and the relational psychological contract. According to social exchange theory, employees exhibit positive behaviors as a result of positive actions provided by the employer and vice versa (Shaheen et al., 2019).

**The Mediating Role of the Psychological Contract in the Relationship between Employer Branding and Employee Retention**

Researchers have increasingly focused on the mediating role of psychological contract between employer branding and employee retention. Tanwar & Prasad (2016) conducted a qualitative study to explore the factors that shape employer branding from the perspective of employees at a large IT company in India. The results showed that factors such as work environment, work-life balance, corporate social responsibility (CSR), and training and development have a positive impact on employee psychological contract, which in turn impacts employee retention. However, there has been little research that has systematically assessed the mediating role of psychological contract in the relationship between employer branding and employee retention. This suggests that further empirical studies are needed to determine the extent of psychological contract influence in this relationship, thereby providing theoretical and practical

basis for organizations in building strategies to attract and retain talent (Deemah & Dukhaykh, 2023).

Social exchange theory may explain the mediating role of the relational psychological contract between employer branding and employee retention (Deemah & Dukhaykh, 2023). Scholars argue that the psychological contract is based on the principles of social exchange theory (Cropanzano & Mitchell, 2005; Jha et al., 2019), in which the relationship between two parties is strengthened through a reciprocal process, based on economic and socio-emotional exchanges (Blau, 1964; Cole et al., 2002). Since the relational psychological contract emphasizes a long-term commitment between an employer and an employee, including both monetary and non-monetary benefits, employees tend to be more loyal to the organization in exchange for long-term benefits such as job stability, organizational recognition, and career development opportunities (Rahman et al., 2017). When an employer brand creates an attractive work environment with consistent human resources policies, employees can feel a stronger commitment to the organization, thereby reducing their intention to leave the company.

This suggests that organizations can enhance employee retention by building a strong employer brand, while maintaining and strengthening the relational psychological contract with employees through appropriate human resource policies (Deemah & Dukhaykh, 2023). Studies have provided ample evidence of the positive impact of the relational psychological contract on employee behaviors and attitudes, including contextual performance and job satisfaction (Dechawatanapaisal, 2018), work engagement (Soares & Mosquera, 2019), and employee retention (Moquin et al., 2019).

The relational psychological contract is formed when employees perceive positive organizational behaviors, such as autonomy, fair compensation, organizational support, trust, and a challenging yet supportive work environment (Shaheen et al., 2019; Moquin et al., 2019; Deemah & Dukhaykh, 2023). These factors not only enhance employee satisfaction and engagement but also promote their long-term commitment to the organization. Therefore, the relational psychological contract plays an important role in retaining talented employees, as it strengthens their trust and loyalty to the organization (Guchait et al., 2015; Holland et al., 2019). This highlights the importance of building and maintaining a strong employer brand, in order to create positive employee experiences and thereby improve employee retention rates (Deemah & Dukhaykh, 2023).

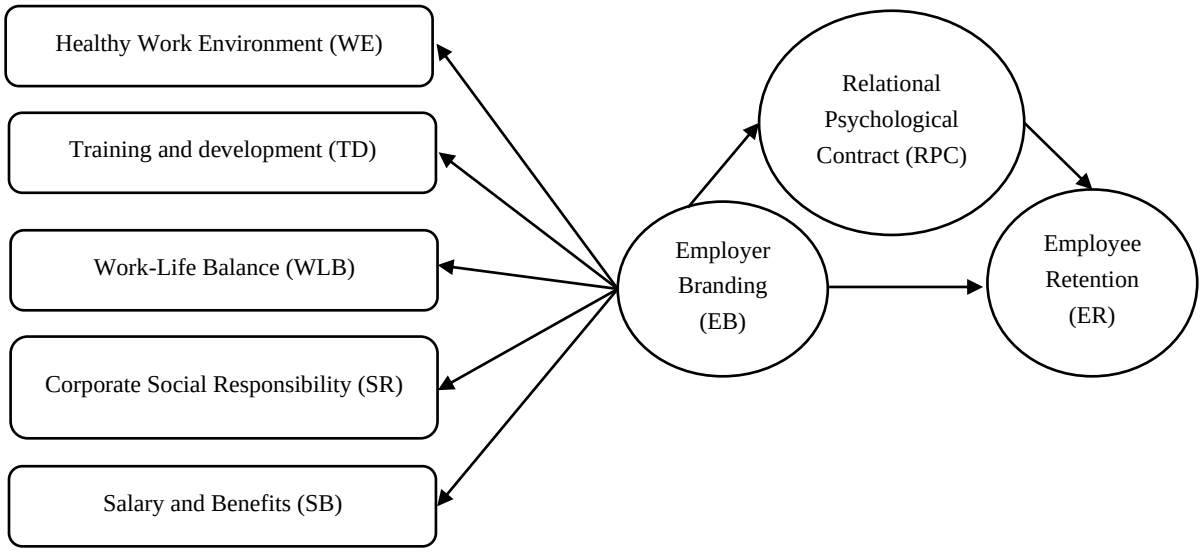
### 2.2 Research method

The study used a mixed research design that included qualitative and quantitative methods.

#### Qualitative research

The study collected domestic and foreign documents to find data related to this study, including reports and research results published in domestic and international scientific journals. Based on the theory of employer branding, psychological contract and social exchange theory, the study systematized the concepts, components and meanings of employer branding, psychological contract and employee retention. At the same time, the study found out the components of employer branding.

The study sought some information about MB Bank branches in Ho Chi Minh City that have built employer branding, combined with a survey of management experts and group discussions to propose a proposed research model. The expert method according to Delphi conducted a survey of five experts, including three management experts in MB Bank and two academic experts. As a result of the discussion, the research team inherited the scales and adjusted and supplemented the observed variables to suit the practice of building the employer brand of MB Bank in Ho Chi Minh City.



#### Quantitative research

The survey was sent to managers and employees of MB Bank in Ho Chi Minh City. Data were collected through both face-to-face and online surveys. The study used exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) techniques, as Hair et al. (2006) detailed the sample size calculated using the formula N = 5*m, where m represents the number of observed variables. With 35 observed variables in the conceptual scales, the required sample size was calculated as 175, to ensure the results have high reliability, the sample size was chosen as 250.

The sampling technique used was convenience sampling. Valid questionnaires were collected from 219 samples

representing 47 transaction offices of MB Bank in Ho Chi Minh City. The scales in the model were assessed for reliability using Cronbach's Alpha coefficient, exploratory factor analysis (EFA), confirmatory factor analysis (CFA), and structural equation modeling (SEM). Quantitative analysis was performed using SPSS 26.0 and AMOS 24.0 software.

**2.3 Research Model**

*Source: Research team proposed*

**Fig 1. Proposed Conceptual Model**

**III. RESULT AND DISCUSSION**

**3.1 Cronbach's Alpha Test**

According to Hair et al. (2006), a Cronbach's alpha coefficient of 0.6 or higher is considered acceptable. After conducting the Cronbach's alpha test, all observed variables showed a total correlation coefficient greater than 0.3 and the Cronbach's alpha coefficient of all factors exceeded the threshold of 0.6. The total correlation coefficient of observed variables was greater than 0.5, indicating a close correlation between the variables. Therefore, all variables met the criteria for inclusion in the EFA analysis.

**3.2 Exploratory Factor Analysis (EFA)**

The study used principal axis analysis for extraction and Promax rotation for matrix rotation, applying these techniques to all 35 variables. The results are summarized as follows:

**KMO and Bartlett's test**

**Table 1. KMO and Bartlett's test results**

| | | |
|---|---|---|
| KMO value (Kaiser-Meyer-Olkin of Sampling Adequacy) | | .958 |
| Bartlett's statistic (Bartlett's Test of Sphericity) | Approx. Chi-Square | 8403.820 |
| | Df | 595 |
| | Sig. | .000 |

*Source: Quantitative data results*

Table 1 shows that the KMO value is 0.958, which is greater than 0.5, indicating that the EFA is well-suited to the actual data. Additionally, the significance value for Bartlett's test is 0.000, which is less than 0.05, suggesting that the observed variables are linearly related to the representative factor.

*Rotated matrix of factors, eigenvalue coefficients, and extracted variance criteria*

The analysis results show that all observations have factor loadings greater than 0.5 and 35 observed variables are extracted into 07 factor groups with eigenvalues of all factors > 1. The total extracted variance is 78.770%. Therefore, the 07 extracted factors reflect 78.770% of the variation in the original data.

**3.3 Confirmatory Factor Analysis (CFA)**

EFA extracted 07 factors, each factor corresponding to a group of scales, which were then used to develop a measurement model of the concepts. This model was analyzed by CFA to assess its suitability to the research data. The results of CFA are summarized as follows:

**Model fit testing**

**Table 2. Indexes assessing the model's suitability to the research data**

| Measure | Estimate | Threshold | Interpretation |
|---|---|---|---|
| CMIN | 810.408 | -- | -- |
| DF | 539.000 | -- | -- |
| CMIN/DF | 1.504 | Between 1 and 3 | Excellent |
| CFI | 0.967 | >0.95 | Excellent |
| SRMR | 0.039 | <0.08 | Excellent |
| RMSEA | 0.048 | <0.06 | Excellent |
| PClose | 0.656 | >0.05 | Excellent |

*Source: Quantitative data results*

Table 2 shows that 1 < CMIN/DF = 1.504 < 3; CFI, SRMR, RMSEA, and PClose are all suitable. Therefore, the model is suitable compatible with the market research data.

*Scale reliability assessment*

A scale is deemed reliable if the composite reliability (CR) exceeds 0.5 and the average variance extracted (AVE) is above 0.5 (Hair et al., 2006). According to the results in Table 3, all CR values are greater than 0.5, and the AVE for all scales also exceeds 0.5. Thus, the measurement scales are considered reliable.

**Table 3. Composite reliability and total variance extracted for factors**

| Latent Variable | Cronbach's Alpha | Composite Reliability | Average Variance |
|---|---|---|---|
| **WE** | 0.938 | 0.913 | 0.679 |
| **TD** | 0.925 | 0.902 | 0.649 |
| **WLB** | 0.937 | 0.893 | 0.625 |
| **SR** | 0.958 | 0.895 | 0.589 |
| **SB** | 0.965 | 0.894 | 0.628 |
| **RPC** | 0.949 | 0.877 | 0.590 |
| **ER** | 0.938 | 0.894 | 0.585 |

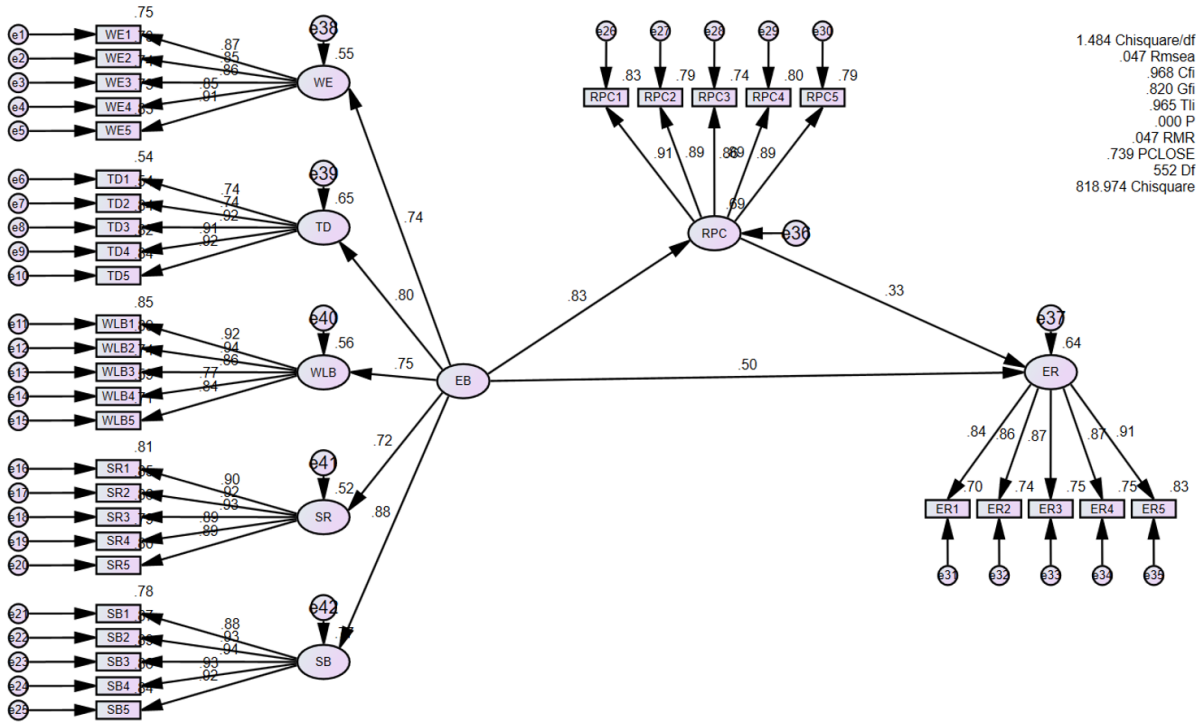
*Source: Quantitative data results*

*Convergent validity test*

A scale demonstrates convergent validity when the standardized weights of the scales exceed 0.5 and are statistically significant (Hair et al., 1992). Additionally, convergent validity is assessed by the average variance extracted (AVE), with Fornell and Larcker (1981) suggesting that an AVE of approximately 0.5 or higher is indicative of convergent validity. According to the results in Table 3, all coefficients exceed 0.5, and the AVE values are either above or near 0.5. Thus, it can be concluded that the factors demonstrate convergent validity.

The correlation coefficients among the concepts indicate that the AVE for each concept exceeds the square of its correlation coefficients with other concepts. Consequently, these findings confirm that each concept or scale demonstrates discriminant validity. The correlation matrix for the concepts is presented in Table 4 below.

**Table 4. Correlation matrix between concepts in the study**



| | AVE | MSV | WE | TD | WLB | SR | SB | RPC | ER |
|---|---|---|---|---|---|---|---|---|---|
| **WE** | 0.755 | 0.417 | **0.869** | | | | | | |

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| **TD** | 0.717 | 0.514 | 0.566*** | **0.847** | | | | | |
| **WLB** | 0.754 | 0.433 | 0.557*** | 0.631*** | **0.868** | | | | |
| **SR** | 0.821 | 0.417 | 0.545*** | 0.544*** | 0.539*** | **0.906** | | | |
| **SB** | 0.848 | 0.535 | 0.646*** | 0.717*** | 0.658*** | 0.646*** | **0.921** | | |
| **RPC** | 0.790 | 0.558 | 0.617*** | 0.666*** | 0.610*** | 0.617*** | 0.731*** | **0.889** | |
| **ER** | 0.754 | 0.558 | 0.629*** | 0.641*** | 0.567*** | 0.549*** | 0.662*** | 0.747*** | **0.868** |

*Source: Quantitative data results*

### 3.4 Structural equation analysis

After the CFA, the study used SEM to determine the relationship between the factors in the research model, presented in Figure 2 below.

*Source: Quantitative data results*

**Figure 2. SEM linear structural model analysis results**

Figure 2 shows that the model fits the research data with 1 < CMIN/DF = 1.484 < 3; CFI, SRMR, RMSEA, and PClose are all suitable. The results of the SEM analysis show that 07 extracted factors explain 78.770% of the data variation. Accordingly, all hypotheses stated in the proposed model are accepted at a 95% confidence level.

**Table 5. SEM linear structural model analysis results**

| Relationship/Link (Paths) | | | Unstandardized | S.E. | C.R. | P-value | Standardization |
|---|---|---|---|---|---|---|---|
| **RPC** | <--- | EB | 1.245 | 0.123 | 10.107 | *** | 0.831 |
| **ER** | <--- | RPC | 0.274 | 0.086 | 3.2 | 0.001 | 0.329 |
| **ER** | <--- | EB | 0.627 | 0.141 | 4.453 | *** | 0.503 |
| **WE** | <--- | EB | 1 | | | | 0.742 |
| **TD** | <--- | EB | 0.971 | 0.112 | 8.645 | *** | 0.804 |
| **WLB** | <--- | EB | 1.119 | 0.119 | 9.399 | *** | 0.75 |
| **SR** | <--- | EB | 1.11 | 0.123 | 9.002 | *** | 0.722 |
| **SB** | <--- | EB | 1.332 | 0.128 | 10.382 | *** | 0.879 |

*Source: Quantitative data results*

Table 5 shows that the hypotheses in the model are all accepted and the factors in the model all have positive effects. Therefore, the model is suitable and compatible with the market research data.

## IV. CONCLUSION

The research results show that employer branding has a positive impact on employee engagement through employee psychological contracts. At the same time, this research also shows that employer branding has a positive relationship with relational psychological contracts. The research results show that, in order to retain qualified and skilled employees, organizations need to focus on factors that enhance employee retention through the characteristics and attributes of employer branding. As a result, employees who consider their organization as a strong brand are more likely to stay with the organization for a long time. The research results also show that employer branding is a strong factor in employee retention. Therefore, an employer branding strategy is affirmed to include: (1) Healthy working environment; (2) Training and development; (3) Work-life balance; (4) Corporate social responsibility; (5) Compensation and benefits have a positive impact on employee retention.

The results of the study also suggest that the relational psychological contract plays an important role as an antecedent to employee engagement. Previous studies have argued that the relational psychological contract can influence employee engagement (Tanwar & Prasad, 2016; Tanwar & Kumar, 2019; Chawla, 2020; Deemah & Dukhaykh, 2023). These results are consistent with similar studies that have found evidence supporting the positive effect of the relational psychological contract on positive employee attitudes and behaviors. Therefore, employees will demonstrate a longer-term commitment to the organization in exchange for employers fulfilling their relational psychological contract. This result supports the notion that employees who demonstrate positive efforts will be rewarded appropriately (Tanwar & Prasad (2017; Deemah & Dukhaykh, 2023).

In addition, the study results support the social exchange theory, which suggests that employees will form positive and lasting relationships with their employers as a result of an exchange process that includes both economic and socio-emotional exchanges (Deemah & Dukhaykh, 2023). This study also provides empirical evidence that employer branding can positively influence employee engagement through psychological contracts with employees.

# SESSION 4: FINANCE & ACCOUNTING

# DEVELOPING GREEN CREDIT AT COMMERCIAL BANKS IN VIETNAM

**Nguyen Thi Ngoc Diem**[1]
[1]Saigon University
*Corresponding: ntndiem@sgu.edu.vn

**ABSTRACT**

Banks are not only the primary channel for capital provision in the economy but also play a pivotal role in "greening" investment flows, thereby contributing to green growth and sustainable development. As challenges related to energy security and environmental protection become increasingly urgent, the importance of green credit has grown significantly. In recent years, commercial banks in Vietnam have actively implemented green credit programs to support enterprises investing in environmentally friendly sectors such as renewable energy, clean energy, and sustainable development projects. However, green credit in Vietnam remains underdeveloped, with significant untapped potential and persistent challenges. This paper provides a theoretical overview of green credit, analyzes its current implementation within commercial banks, and proposes solutions to foster the development of green credit in Vietnam in the near future.

*Keywords: "*Green credit", "green banking", "sustainable development".

## I. INTRODUCTION

The greening of the economy has become a global trend and is increasingly prioritized in international agendas, aiming to mitigate the adverse impacts of economic growth on the environment and society. Most green projects require significant long-term investment capital. In addition to other funding sources such as state budget funds, green bonds and equities, investment funds, and foreign direct investment (FDI), bank credit plays a crucial role in financing these projects. Banks not only serve as the most significant capital providers in the economy but also contribute to "greening" investment flows, thereby fostering green growth and sustainable development.

Green credit has long been developed globally, financing projects focused on energy efficiency, renewable energy, and clean technologies, with the dual objective of achieving economic growth while protecting the environment (Bos & Gupta, 2019). In terms of trends, green credit will undoubtedly continue to grow robustly as environmental concerns gain increasing prominence. Nations worldwide, including Vietnam, are under mounting pressure from the international community to reduce greenhouse gas emissions and protect the environment. Consequently, green credit will become a vital tool in promoting sustainable projects and fulfilling international commitments on environmental protection. Furthermore, with the advancement of technology and innovative financial initiatives, green credit is expected to become even more widespread.

Given this context, developing green credit is an essential solution for transitioning the economy towards green and sustainable growth objectives. This paper provides a theoretical overview of green credit, analyzes the current status of green credit in commercial banks, and proposes recommendations to further develop green credit in these banks in Vietnam in the near future.

## II. THEORETICAL BASIS OF GREEN CREDIT

### 2.1. Theories on Green Banking – Green Credit

Green banking is understood as the provision of banking services that aim to support activities that have a positive impact on the environment, reduce carbon emissions, conserve natural resources, and promote sustainable development (Lalon, 2015). Broadly speaking, green banking refers to banks that build sustainable business strategies, providing banking services that meet environmental and social responsibility criteria. In addition, green banks are considered sustainable banks (Mustafizur et al., 2013). Green banking refers to activities that encourage environmental practices and reduce carbon emissions, such as promoting the use of green products and services; applying environmental standards to approve loans or providing preferential credit for CO2 reduction projects (UNESCAP, 2012).

Chao et al. (2021) and Anderson & Zylicz (1999) define green credit as credit provided by banks to projects that

pose no significant environmental risks or are explicitly designed to protect the environment. The green credit model is viewed as a unique financial tool, playing a critical role in controlling environmentally responsible behavior among enterprises and preventing the uncontrolled development of polluting businesses that harm the environment (Xu & Li, 2020; S. Zhang et al., 2022). Green credit activities, particularly for corporate clients, are implemented by banks through specialized funding groups for large-scale renewable energy projects, clean energy, and debt portfolios committed to financing all or part of these initiatives (Xie & Liu, 2019; Uchida, 2011).

Green credit influences the structure of long-term and short-term credit ratios for businesses, which, in turn, impacts the investment structure and efficiency of heavily polluting enterprises (Wang et al., 2019). During the green credit approval process, banks utilize project and borrower information as lending criteria to assess and determine loan decisions (Yao et al., 2021). In other words, green credit refers to loans provided to support production and business projects that have no or minimal environmental risks, contributing to ecological preservation and reflecting a financial system oriented toward sustainable development.

According to the Green Loan Principles (GLP 2018), issued in 2018 by the Loan Market Association and the Asia Pacific Loan Market Association, green credit is defined as any type of loan exclusively provided to finance or refinance, in whole or in part, new and/or existing eligible green projects. The categories under GLP 2018 include: renewable energy, energy efficiency, green transportation, environmentally friendly products and production technologies adapted to a sustainable economy, sustainable water management and wastewater treatment, green buildings, sustainable agriculture and forestry, as well as pollution prevention and control (Thuy Ha, 2023). In Vietnam, according to Article 149 of the Law on Environmental Protection No. 72/2020/QH14, approved by the 14th National Assembly on November 17, 2020, green credit is credit provided for investment projects that: (i) use natural resources efficiently; (ii) respond to climate change; (iii) manage waste; (iv) treat pollution and improve environmental quality; (v) restore natural ecosystems; (vi) conserve nature and biodiversity; and (vii) create other environmental benefits.

In summary, green credit can be understood as loans provided by banks for “green” production and business projects with low environmental risks to address environmental and social challenges.

**2.2. Characteristics of Green Credit**

Green credit is a credit activity provided by commercial banks; however, it has some distinct characteristics.

First: Green credit is granted for "green" production and business projects with low environmental risks. Generally, the credit granting process of a bank is based on three principles: (i) The borrower commits to complying with the terms of the credit agreement; (ii) The bank only provides credit for effective production and business projects; (iii) The bank grants credit based on collateral. Therefore, any legal entity or individual that meets all three of these principles will be considered by the bank for financing their business activities. However, when granting green credit, the bank is required to carefully evaluate the "green" factor of the projects. This requirement makes the process of granting green credit more complex than conventional credit granting. The repayment period for green projects is usually longer than for typical loans, thus increasing the risk level of these projects.

Second: The main source of funds for commercial banks to implement green credit activities is capital obtained through green funding sources, such as central bank trust contracts, government green credit support funds, or directly issuing green bonds on the market. In addition, commercial banks may arrange and allocate part of their raised funds for green credit implementation.

Third: The process of granting green credit by banks involves many relevant agencies. Green credit is granted for green projects, which often require large investment costs, high product prices, and long payback periods. Therefore, to encourage investors, the government supports these projects through tax policies and stable output price commitments for businesses investing in projects that prioritize environmental protection. Banks commit to providing long-term financing at preferential interest rates. Creating a competitive market for renewable energy supply in rural areas, through a combination of interest rate support, capital support, and other financial incentives, is crucial.

**2.3. The Role of Green Credit in Commercial Banks**

In practice, the trend of green credit growth has been developing globally for a long time, with projects focused on energy conservation, renewable energy, and clean technologies, aiming to achieve the dual goal of sustainable

economic growth and environmental protection.

Green credit is an important solution for individuals, organizations, and businesses, helping to reduce the negative impact of life and production on the environment and society, contributing to the sustainable development of the economy.

Commercial banks are increasingly aware of their role in minimizing environmental harm by financing green projects and restricting funding for projects with adverse effects. Green credit offers multiple benefits for the sustainable development of the banking system, including (1) Credit Risk Reduction: Green credit helps minimize bad debts and enhance financial stability; (2) Reputation Risk Mitigation: Supporting environmentally and socially beneficial initiatives helps protect a bank's reputation in the market; (3) Legal Risk Reduction: Avoids legal disputes related to environmentally harmful projects (Yu et al., 2018; Zhang et al., 2021).

Moreover, the implementation of green credit programs enhances financial stability and protects the bank's brand image in the market. Banks can leverage this opportunity to position themselves as environmentally friendly brands, attracting and building trust with customers and investors who prioritize sustainability. Additionally, restructuring and improving green credit systems at commercial banks while promoting efficient investments in energy and resource projects with high added value will lead to long-term profitability. Green projects also tend to have lower risks and higher profitability due to strong governmental support and the rising trend of green consumption among citizens (Aizawa & Yang, 2010). Banks can seize this opportunity to diversify their investment portfolios and expand market share.

## III. CURRENT STATUS OF GREEN CREDIT IN VIETNAM

### 3.1. Organization of Green Credit Implementation

The legal basis directly regulating green credit activities issued by the State Bank is Directive No. 03/CT-NHNN dated March 24, 2015, on promoting green credit growth and managing environmental and social risks in credit activities. The Directive specifies that the banking sector's credit activities should focus on environmental protection and human health, ensuring sustainable development. Additionally, the Governor of the State Bank also issued Decision No. 1552/QD-NHNN dated August 6, 2015, on the action plan of the banking sector to contribute to and support the implementation of the National Green Growth Strategy. On August 7, 2018, the Governor issued Decision No. 1640/QD-NHNN approving the Green Bank Development Plan in Vietnam. The State Bank has cooperated with the International Finance Corporation (IFC) to research and issue the Environmental and Social Risk Assessment Handbook for 10 economic sectors. This is an important document that helps credit institutions and businesses better understand the environmental and social risks when granting credit and take necessary measures to mitigate these risks in the mentioned sectors. Decision No. 34/QD-NHNN dated January 7, 2019, by the State Bank of Vietnam issued the action program of the banking sector to implement the Strategy for the Development of the Vietnamese Banking Sector by 2025, with a vision toward 2030, which focuses on "implementing green banking activities through increasing awareness and responsibility for the environment and society in banking business; enhancing the capacity of credit institutions to develop products for mobilizing and lending funds to renewable energy, clean energy, and low-carbon production and consumption sectors to contribute to environmental protection and improve resource and energy efficiency.

Thus, Vietnam is in the process of building and improving the policy system to regulate the green credit activities of credit institutions. The above legal framework shows that both providers and users of green credit services benefit from support and incentives from the government and foreign organizations. In addition, the legal framework stipulates the functions and tasks of the relevant parties, all aiming to promote socio-economic development in a green and sustainable direction.

### 3.2. Green Credit at Vietnamese Commercial Banks

#### 3.2.1. General Situation of Green Credit Loan Balance

The Vietnam Banking Sector Development Strategy to 2025, with a vision to 2030, emphasizes the role of green credit in promoting sustainable social development. As energy security and environmental issues become increasingly pressing, the role of financial institutions has grown in importance. In recent years, Vietnamese commercial banks have

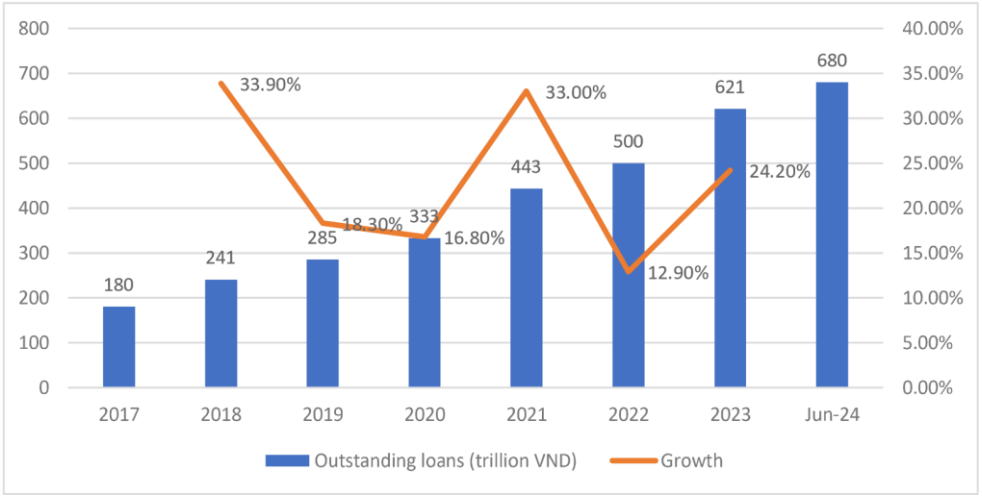
actively implemented green credit packages to support businesses investing in renewable energy, clean energy, and sustainable, environmentally friendly projects.

In recent years, Vietnamese commercial banks have provided a wide variety of green credit products, focusing primarily on the following areas:

**Agriculture, Forestry, and Aquaculture:** This includes products such as:

– Loans for high-tech agricultural development programs, implemented by Agribank, Vietcombank, Vietinbank, BacABank, Sacombank, ACB, HDBank, etc.;

– Loans for sustainable agricultural transformation in Vietnam, implemented by BIDV;



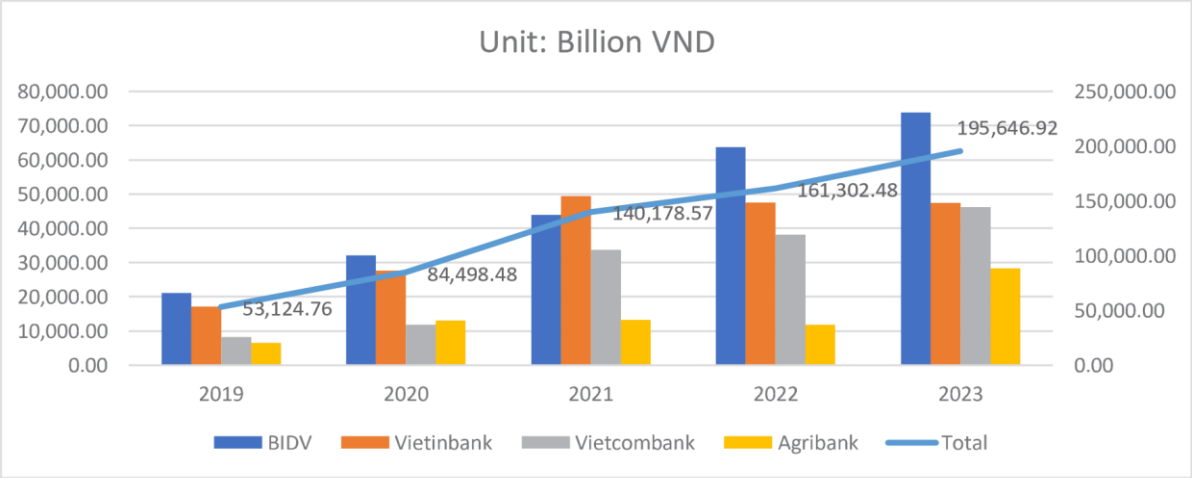
– Loans for sustainable forestry development under the Modernization of the Forestry Sector and Coastal Resilience Project (FMCR), implemented by Agribank.

**Clean Energy and Renewable Energy**: This includes products such as loans for solar energy production systems, wind power, projects to reduce CO2 emissions, energy-saving initiatives, etc., for both businesses and households. Notable banks providing these products include BIDV, Sacombank, TPBank, Vietinbank, HDBank, NamABank, MB, etc.

**Clean Water, Wastewater Treatment, and Waste Management**: Loans for clean water projects and rural environmental sanitation, with Agribank being the main bank participating in projects funded by the World Bank (WB).

In practice, the trend of green credit has been increasingly developed by many commercial banks in recent years. While lending, banks still need to select loans and clients to ensure compliance with general conditions and standards, green projects tend to carry less risk and bring significant sustainable development benefits. As a result, they are seen by banks as a promising niche market.

In recent years, the growth rate of green credit in Vietnam has shown positive signs. The green credit balance in Vietnam has increased from over 71 trillion VND at the end of 2015 to 620.984 trillion VND by the end of 2023, with 47 credit institutions reporting green credit balances, a 24% increase compared to the end of 2022. As a result, the green credit balance continues to grow. However, green credit from bank funding has not developed strongly in recent years. This is reflected in the low proportion of green credit in the banking sector's credit structure, which accounted for only 4.5% of the total credit balance in the economy in 2023.



*Source: State Bank of Vietnam, BIDV Research and Training Institute synthesis*

**Figure 1: Green credit outstanding balance in Vietnam from 2017 – 2024**

As of December 31, 2023, there were 47 credit institutions in Vietnam participating in green credit activities. Among them, several banks actively provide green credit, such as Vietnam Joint Stock Commercial Bank for Industry and Trade (VietinBank), Joint Stock Commercial Bank for Foreign Trade of Vietnam (Vietcombank), Bank for Investment and Development of Vietnam (BIDV), and Vietnam Bank for Agriculture and Rural Development (Agribank)...

Although the green credit balance in Vietnam has been increasing rapidly year by year, the scale of the balance is still relatively small compared to the total credit in the system. Specifically, the proportion of green credit balance in the total credit balance in Vietnam has increased from 1.5% in 2015 to 5.3% in 2022. The green credit activities of commercial banks still face difficulties because Vietnam currently lacks regulations on environmental criteria and the verification of projects receiving green credit, which would serve as a basis for credit institutions to prioritize capital allocation and loan approval for projects classified as "green."

*Source: State Bank of Vietnam*

**Figure 2: Green credit outstanding balance of selected commercial banks during 2019-2023**

During the period 2019 - 2023, BIDV's total green credit outstanding balance grew 3.48 times from VND 21,172 billion in 2019 to VND 73,777 billion in 2023, accounting for about 5% of BIDV's total outstanding loans. VietinBank's total green credit outstanding balance grew 2.76 times from VND 17,189.08 billion in 2019 to VND 47,464.54 billion in 2023. Vietcombank's total green credit outstanding balance increased 5.55 times, from approximately VND 8,303.98 billion in 2019 to over VND 46,100 billion in 2023, accounting for 3.6% of total outstanding loans. During 2019 - 2023, Agribank's total green credit outstanding balance continuously grew strongly, reaching nearly VND 28,277.2 billion by the end of 2023 (SBV, 2024).

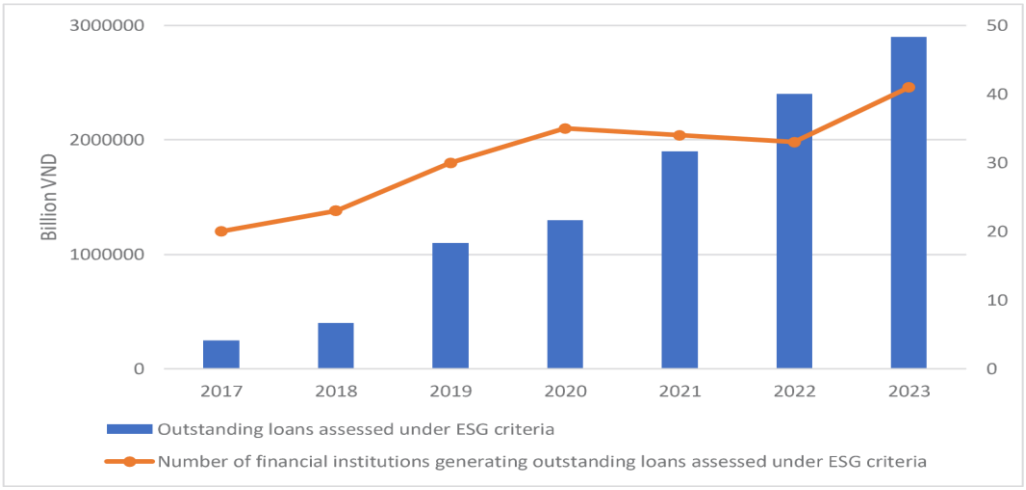


**Figure 3: Outstanding loans assessed under ESG criteria during 2018–2023**

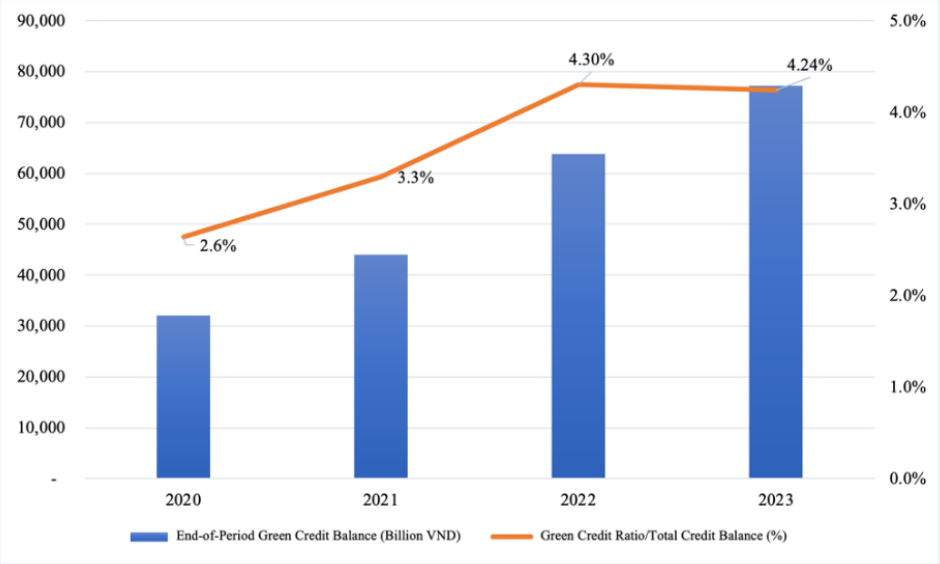
Many commercial banks have developed green credit packages and green credit programs tailored to their business activities and green transition needs. These banks have strengthened their assessment of environmental, social, and governance risks (ESG) in credit operations, implementing ESG across its three pillars: Environmental, Social, and Governance.



As of December 31, 2023, outstanding loans assessed for environmental and social risks reached VND 2.84 quadrillion, accounting for more than 20% of total loans in the economy, an increase of over 20% compared to the end of 2022 (Anh Minh, 2024). Specifically: 30.7% of commercial banks have established internal regulations on risk

management, 21.9% have established dedicated units or departments for ESG risk assessment, 30% conduct environmental risk assessments, only about 20% have separate, audited reports that systematically evaluate environmental-related risks.

### 3.2.2. Green Credit Balance at Some Vietnamese Commercial Banks

As of the end of 2023, the green credit balance of commercial banks reached nearly 528.3 trillion VND, accounting for approximately 4.2% of the total credit balance in the banking system for the entire economy. Among these, the Vietnam Bank for Agriculture and Rural Development (Agribank) holds the highest green credit balance in areas such as forestry, renewable energy, clean energy, and green agriculture. Additionally, the Joint Stock Commercial Bank for Investment and Development of Vietnam (BIDV) is also a pioneer in green economy lending. Other Vietnamese commercial banks, such as the Joint Stock Commercial Bank for Foreign Trade of Vietnam (Vietcombank), the Joint Stock Commercial Bank for Industry and Trade of Vietnam (VietinBank), the Military Commercial Joint Stock Bank (MBBank), and the Asia Commercial Bank (ACB), have also achieved an average annual growth rate of over 45% in green credit balances. The projects that these banks focus on investing in include renewable energy, circular economy, and climate change mitigation.

BIDV, a leading commercial bank with a strategic orientation of being a "green bank," continued to lead the market in financing green projects in 2023. The bank provided green credit to 1,764 customers, with 2,132 projects/plans receiving green credit totaling 74.177 trillion VND, accounting for 4.24% of the total credit balance. Regarding the structure of green credit lending, 81% of the credit balance is allocated to renewable energy projects, including hydropower, wind power, solar power, and other clean and renewable energy sources.

*Source: BIDV Annual Report*

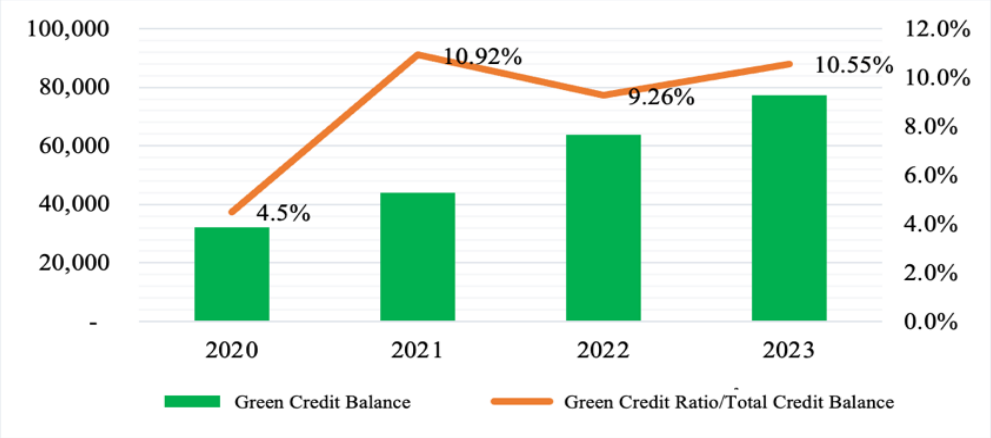


**Figure 4: Green Credit Balance and Green Credit Ratio at BIDV**

For individual customers: BIDV has launched a short-term credit package of 20,000 billion VND with preferential interest rates for individuals engaged in green sectors such as crop cultivation, livestock farming, aquaculture, food processing, and safe food supply. These customers must meet safety and environmental protection certifications such as VIETGAP, GLOBALGAP, BAP, ISO 22000, HACCP, GMP, SQF, etc. At the same time, BIDV continues to research new products and policies targeting green credit, such as electric vehicles and green buildings, to meet sustainable credit growth goals.

For evaluating projects using green capital: BIDV focuses on thorough evaluation and assessment of projects/organizations using green funds, specifically: Assessing the positive environmental impact of the project before, during, and after receiving funding; Ensuring that the project complies with legal regulations and international environmental protection standards and risk management before making a lending decision.

In particular, BIDV is the first domestic bank to issue an environmental and social risk management framework,

applicable to projects and clients receiving international capital.

*Source: MB Annual Report 2023*

**Figure 5: Green Credit Balance and Green Credit Ratio at MB Bank**

MB Bank: 2023 marks the second year of implementing the 2022–2026 Strategy. The senior leadership transition has opened a new chapter for MB on its strategic journey to "Become a Digital Enterprise - Leading Financial Group," maintaining a strong commitment to fulfilling assigned tasks and contributing positively to sustainable development goals. MB has been at the forefront of digital transformation, expanding green credit, with the green credit ratio accounting for 11% of total credit balance, growing year by year and 3.8 times higher than in 2020. In addition to continuously improving its organizational structure and enhancing ESG governance capacity, MB has actively developed a diverse range of green credit products, suitable and effective for its target customers. In 2023, the total green credit balance (including loans and bonds) reached 64,960 billion VND, serving 3,762 customers, reflecting a growth of 47% compared to 2022. MB has also developed data fields to identify green customers/products/programs within the system. In 2023, MB implemented environmental and social risk management regulations according to Circular 17/2022/NHNN, which helped strengthen the legal framework and policies related to credit linked with environmental and social management.

The green credit balance at commercial banks in Vietnam has grown significantly in recent years. Commercial banks like BIDV, MB, Agribank, and VCB have established green credit programs to provide financing for projects such as renewable energy (solar, wind), wastewater treatment, waste management, and sustainable agriculture. However, to optimize the effectiveness of this activity, close collaboration is needed between commercial banks, businesses, and the government in establishing clear standards and raising awareness about the benefits of green credit.

Currently, sustainable development is a global trend, and projects that are not environmentally friendly will face significant pressure, which could lead to boycotts or suspension of the projects, causing businesses to go bankrupt and default. These risks also mean that banks may face bad debts from the investors they have financed. Additionally, the reputation and credibility of banks could be affected if lawsuits arise related to environmentally harmful projects. However, many banks do not prioritize energy-saving or environmentally friendly projects because they require large investments and long payback periods. Some banks feel safer providing credit for projects that require less investment and have faster payback periods, rather than balancing economic benefits with the unclear advantages of becoming a "greener" bank.

### 3.3. Issues Regarding the Development of Green Credit

Despite the positive signals, green credit funding in Vietnam is considered underutilized, with several challenges and limitations:

Firstly, Incomplete legal framework: The legal foundation remains insufficient, lacking specific criteria for defining a green project portfolio. This results in difficulties for commercial banks in developing mechanisms for implementing green activities and providing green credit. Currently, regulations on green banking and green credit mainly serve as guidelines and incentives rather than mandatory requirements for credit institutions.

Secondly, limited policies to support green credit funding: Current policies have not resolved the issue of capital sources for commercial banks to implement green credit. Green projects require longterm, large-scale funding with extended payback periods, while commercial banks primarily rely on short-term mobilized funds. This makes it difficult for banks to balance their capital and comply with regulations on short-term capital for medium- and long-term lending.

Thirdly, uncompetitive interest rates: While green projects are prioritized for loans, the actual lending interest rates are not significantly different from other types of loans. Short-term loan interest rates range from 6.2% to 9.4% per year, while medium- and long-term loans range from 9.4% to 11.4% per year. This is due to unclear preferential mechanisms, high investment costs, extended payback periods, market risks, and additional potential expenses (The Anh, 2022).

Fourthly, challenges in environmental and social risk assessment: Banks face difficulties in appraising, evaluating, and managing environmental and social risks due to a lack of specialized personnel or experts in these areas. Commercial banks have extensive networks and large workforces; however, knowledge of environmental and social risk assessment requires specialized expertise. Developing processes, adjusting behaviors, and training staff in environmental protection, social safeguards, and sustainable finance knowledge require considerable time and effort to ensure systematic and effective implementation across the banking system.

Fifthly, lack of internal ESG frameworks: Some banks have not yet established internal regulations on ESG or dedicated departments for project appraisal, environmental and social risk assessment, and monitoring the effectiveness of green credit throughout a project's lifecycle. Additionally, businesses are only beginning to adopt ESG practices. As a result, it requires significant time and resources to train, persuade, and support enterprises—especially large, leading companies—in pursuing sustainable development goals.

Lastly, investor capacity limitations: The capabilities of project developers also create challenges for commercial banks when considering green credit approvals. Many new businesses undertaking projects are recently established, making it difficult for banks to assess their financial capacity and project implementation experience. Green projects often involve financial risks related to price fluctuations, technology costs, and regulatory requirements. Project implementation in Vietnam is frequently delayed due to prolonged licensing and land clearance phases. Therefore, commercial banks must thoroughly assess and manage risks when providing green credit.

## IV. SOME SOLUTIONS FOR THE DEVELOPMENT OF GREEN CREDIT

To promote the development of green credit in Vietnam, both the State Bank and commercial banks need to take a series of actions and solutions. For the State Bank, a comprehensive plan for the banking sector should be developed, including mechanisms, policies, and specific green credit programs. Relevant agencies also need to collaborate to increase capital and capacity, as well as create incentive mechanisms. Some specific solutions include:

### 4.1. For Commercial Banks

First, research and issue a Green Credit Framework (for banks that have not issued one) or continuously improve the content of the Green Credit Framework (for banks that have already issued one), ensuring that the process of using and managing green credit capital meets green criteria.

Second, develop an Environmental-Social Risk Management System according to the Operating Standards issued by the International Finance Corporation (IFC), which includes: internal guidelines on environmental and social risk management in credit activities; an organizational structure to manage and assess environmental and social risks; assignment of responsibilities, resource allocation, and implementation of the system; reporting systems for environmental and social risk management activities; and capacity-building programs for the bank's institutional ability to manage environmental and social risks. Consider establishing specialized departments (for banks that have not set up such departments) consisting of personnel with expertise in environmental and social fields to have the capacity to build internal regulations and evaluate loan conditions. Clearly define the responsibilities of each department and individual in the green credit process, ensuring that all credit proposals from customers are identified, classified by the level of environmental-social risks, and undergo thorough evaluation to determine compliance and appropriate risk management measures based on the identified risk level.

Third, strengthen activities to improve the quality of the bank's staff by conducting regular training and workshops on green projects and green credit. A deep understanding of environmental-social issues in green sectors is a prerequisite for staff to effectively implement green credit activities and assist customers.

Fourth, closely cooperate with the State Bank's functional units to assess needs, build training programs, and implement them within the bank and/or across the banking sector. Work closely with the State Bank's functional units and the environmental sector to develop a system of data on corporate compliance and violations of environmental requirements, creating a basis for commercial banks to assess the environmental risk level when evaluating borrowers. This will help limit or reduce loans for activities that harm the environment..

**4.2. Recommendations for the State Bank of Vietnam, Government, and Related Ministries**

– Developing National Green Criteria and Standards: First, expedite the establishment of a national framework of green criteria and standards aligned with international practices. This will provide legal foundations for selecting investment projects across ministries, sectors, and localities while enabling the quantification and assessment of progress in green growth. Second, strengthen the activities of green rating and evaluation organizations, ensuring transparency and disclosure of green rating indicators.

– Improving the Legal Framework for Green Credit: First, continue to refine the legal framework for green credit development, focusing on the creation and improvement of green credit standards. These standards will serve as a basis for commercial banks to assess, evaluate, and monitor green credit activities. Second, standardize the definition of green sectors and fields based on a list issued by regulatory authorities. Developing a green taxonomy based on international standards will clarify the criteria and key factors for evaluating the sustainability of projects.

– Enhancing Coordination Among Stakeholders: First, establish a coordination mechanism among ministries, sectors, and localities to identify and propose priority investment areas from the early stages of investment promotion. Second, the State Bank of Vietnam should work with relevant ministries to develop guidelines on green lists and criteria for identifying green projects aligned with Vietnam's economic sector classification. This will provide a foundation for commercial banks to assess, evaluate, and monitor green credit. Third, develop general ESG guidelines to support businesses in green transformation.

– Creating Incentives for Green Projects: First, formulate and improve policies to incentivize and support green projects, which often require long payback periods, large investments, and face high risks. Second, the State Bank of Vietnam should consider preferential policies, such as reducing reserve requirements and increasing access to concessional funding sources. Third, the government can explore establishing a Sustainable Development Support Fund for green projects by referencing international best practices. Fourth, reevaluate the existing policy framework to ensure focus and avoid resource fragmentation while researching mechanisms and policies to develop the green bond market.

– Raising Awareness on Green Growth: First, increase awareness of green growth among individuals, businesses, and organizations in society through practical, effective, and widespread initiatives. Second, promote energy conservation and environmental protection awareness, encouraging more customers to adopt green credit, thereby accelerating its development in Vietnam. Third, strengthen information dissemination and communication about environmental-social risk management and green credit policies.

**V. CONCLUSION**

The development of green credit services will be one of the key focuses of the sustainable development policies of banks and the Government in the future. The investments made by commercial banks in Vietnam, such as solar energy, waste treatment, and green agriculture, align with the global trend toward sustainability and environmental protection. To ensure that green credit becomes an effective tool in implementing the National Sustainable Development Strategy, the Government, regulatory agencies, commercial banks, and businesses must focus on implementing a coordinated series of appropriate solutions.

# THE ROLE OF LIFESTYLE IN MEDIATING THE INFLUENCE OF FINANCIAL LITERACY AND FINANCIAL INCLUSION ON ONLINE LOAN DECISION MAKING FOR WOMEN IN INDONESIA

**Hedwigis Esti Riwayati[1*], Suharyanto Suharyanto[2], Nani Fitriani[3], Achmad Syauqi Ilal Jinan[4], Noor Hazila Ismail[5]**

[1, 2, 3, 4]Faculty of Economics and Business, Perbanas Institute, Jakarta Indonesia
[5]Fakulti Perniagaan, Universiti Teknologi MARA Malaysia, Johor Malaysia
*Corresponding: hedwigis.esti@perbanas.id

**ABSTRACT**

This study aims to examine the role of lifestyle in mediating the influence of financial literacy and financial inclusion on the decision to take online loans. This research was conducted on women who use online loans in Indonesia. The sampling method used nonprobability sampling with the number of respondents 200 Indonesian women who used online loans. Data analysis uses Partial Least Square to test the direct and indirect effects of financial literacy and financial inclusion on online loan decision-making. The results show that financial literacy, financial inclusion and lifestyle have a significant positive effect on online loan decision-making. Financial literacy is not able to affect lifestyle, while financial inclusion has a significant positive effect on the lifestyle of women in Indonesia. Lifestyle is unable to mediate the influence of financial literacy and financial inclusion on women's online loan decision-making in Indonesia. The results of this study emphasize the importance of financial literacy and financial inclusion in shaping good financial behavior, especially in making decisions to apply for loans. Efforts to increase financial literacy and access to financial inclusion can be the main strategy to improve the financial behavior of women in Indonesia in online loan decision-making.

* Corresponding: jasman@perbanas.id

**ABSTRACT**

This research addresses a significant research gap in green accounting, company size, leverage, and firm value. A factor which is thought to be considered influence the gap is because of differences in profitability. This study aims to determine the role of the profitability on the effect of green accounting, company size, and leverage on firm value. The research object is manufacturing companies in the energy sector and basic materials for 4 (four) years in 2018 – 2023 which were selected based on purposive sampling method. The testing and analysis method used was multiple linear regression analysis and moderated regression analysis. The results indicate that green accounting has a positive effect on firm value. Leverage has a negative effect on firm value. Meanwhile, company size has no effect on firm value. In addition, profitability is able to strengthen the positive effect of green accounting on firm value. Profitability is able to weaken the negative effect of leverage on firm value. Meanwhile, Profitability is not able to moderate the positive impact of company size on firm value.

*Key words:* “green accounting”, “company size”, “leverage”, “profitability”, “firm value”.

# DEEP LEARNING - BASED TIME SERIES ANALYSIS WITH REAL - WORLD APPLICATION

**Thinh Nguyen[1,2], Tuan Le[1,2], Phuc Nguyen[1,2,*]**

[1]Faculty of Information Systems, University of Economics and Law, Ho Chi Minh City, Vietnam

[*]Corresponding: phucnq@uel.edu.vn

**ABSTRACT**

Time series forecasting, particularly for volatile and noisy data such as stock prices, demands robust and flexible methods capable of uncovering hidden patterns within the fluctuations. The primary challenges arise from the nonlinear nature, instability of the data, and the presence of irregular patterns. Notably, the dataset employed in this study exhibits high irregularity as it includes the period during the COVID-19 pandemic, when financial markets experienced significant and unpredictable impacts. This research systematically evaluates the performance of five forecasting models—ARIMA, Holt-Winters, LSTM, BiLSTM, and GRU—on stock price datasets from three different sectors: banking (ACB), retail (MWG), and technology (CMC), each with unique structural characteristics, trends, and noise levels. To address the high irregularity of the data, advanced data-splitting techniques such as expanding window and sliding window (rolling window) were applied. These methods not only allowed the models to learn trends from the data but also ensured objective performance evaluation. Experimental results demonstrate that incorporating these techniques significantly enhanced the forecasting accuracy of deep learning models, particularly BiLSTM, across datasets with varying levels of noise and distinct characteristics. Our analysis reveals that deep learning models, especially BiLSTM, consistently outperformed traditional methods, achieving an impressive RMSE of 0.0224 on the MWG dataset or 0.0157 with GRU on the ACB dataset. These findings emphasize that advanced features such as bidirectional processing enable BiLSTM to effectively capture dynamic temporal dependencies while adapting to the specific characteristics of each dataset. By employing advanced data-splitting techniques and comparing model performance across datasets with varying complexities and irregularities, this study provides valuable insights into the strengths and limitations of each method. Furthermore, the research underscores the importance of tailoring model architectures to the unique challenges of specific datasets, particularly under high-irregularity scenarios such as those observed during the COVID-19 pandemic. This study contributes practical knowledge regarding the application of deep learning in time series forecasting, particularly for addressing complex and volatile real-world financial data.

## I. INTRODUCTION

Time series forecasting is a critical field in data science, particularly in its applications across finance, business, supply chain management, and production. A time series is a sequence of observations recorded over time. It includes patterns like trends or seasons that show how things change over time. These patterns can make analyzing the data more challenging because they need to be considered, but they also provide useful clues that can improve predictions. Due to their inherent complexity and variability, time series data pose significant challenges, particularly when dealing with rapidly fluctuating values, nonlinear relationships, and changing statistical properties over time.

Currently, time series forecasting models can be categorized into two main groups: traditional models and modern deep learning techniques. Traditional models such as ARIMA (Auto-Regressive Integrated Moving Average) and Holt-Winters are well-suited for time series that exhibit linearity, stationarity, or stable seasonal patterns. Their effectiveness stems from their simplicity, which allows for straightforward implementation, and their interpretability, which makes it easier to understand and explain the relationships within the data (Dariusz Kobiela, 2022). However, these models struggle when dealing with nonlinear or highly volatile time series. For instance, Holt-Winters, while effective for stable and seasonal data, fails to handle nonlinear or rapidly shifting trends (GAN Pongdatu, 2018). On the other hand, deep learning models like LSTM (Long Short-Term Memory), GRU (Gated Recurrent Unit), and Bi-LSTM

(Bidirectional LSTM) excel at capturing complex nonlinear relationships and long-term dependencies but require significant computational resources and longer training times (Peter T Yamak, 2020). Recent studies have demonstrated the superiority of deep learning methods in time series forecasting. LSTM has been shown to reduce forecasting errors by 84% to 87% compared to ARIMA for financial time series. Bi-LSTM, with its ability to learn from both directions of the time series, has outperformed LSTM and ARIMA in forecasting financial indicators (Shamsul Masum, 2018). GRU, a simpler variation of LSTM, has also shown strong performance on complex time series while significantly reducing training times (Sima Siami-Namini, 2018).

This study aims to identify the most suitable time series forecasting model for datasets with distinct structural characteristics. Five forecasting models—ARIMA, Holt-Winters, LSTM, Bi-LSTM and GRU are evaluated on three datasets representing different sectors: banking (ACB), retail (MWG), and technology (CMC). Each dataset exhibits unique patterns, trends, and noise levels, requiring tailored approaches to achieve optimal forecasting accuracy. To achieve this, the data is segmented using two advanced approaches: rolling window and expanding window. The rolling window method evaluates model performance by focusing on short-term patterns using fixed-sized sliding windows, making it effective for detecting localized trends and anomalies that could impact predictions. The expanding window progressively incorporates historical data to account for long-term dependencies while also highlighting any persistent irregularities, such as those arising during the COVID-19 period. The combination of these two segmentation methods ensures a comprehensive assessment of each model's ability to handle various time series dynamics, including the identification of anomalies and unusual patterns that may influence forecasting accuracy, particularly in datasets containing the volatile COVID-19 phase. The aims of this study are articulated through the following research questions:

(1) Which forecasting model among ARIMA, Holt-Winters, LSTM, Bi-LSTM and GRU is most suitable for each dataset, considering its unique structural characteristics?

(2) How do traditional models (ARIMA, Holt-Winters) compare to deep learning models (LSTM, Bi-LSTM, GRU) in handling volatile and nonlinear data?

(3) What are the strengths and limitations of each model when applied to datasets with varying complexities and segmentation methods?

By addressing these research questions, this study aims to provide substantive insights into identifying the most suitable forecasting model for datasets with varying structural characteristics. The findings are expected to advance the accuracy and efficiency of time series forecasting methodologies while offering a robust foundation for data-driven decision-making in business and technology domains.

## II. MATERIAL AND METHODOLOGY

### 2.1. Conceptual Foundation

#### 2.1.1 ARIMA Model

The ARIMA model is a foundational approach in time series analysis, combining two key processes: autoregressive (AR) and moving average (MA), which rely on weighted delayed random components. The “I” in ARIMA represents the integration level of the variable being analyzed, indicating the number of differences required to achieve stationarity. Stationarity refers to a condition where a time series has a constant mean and variance over time, and the covariance between two observations depends only on their lag, not their absolute position in time. ARIMA is particularly suitable for modeling stationary or non-stationary time series that can be transformed into a stationary series through differentiation. As a traditional forecasting model, ARIMA performs well with linear and stable datasets that exhibit clear trends but is less effective with nonlinear or highly volatile data, where it lacks the flexibility to capture complex relationships (Malska & Wachta, 2015).

The general ARIMA model is denoted as ARIMA(p, d, q), where p represents the order of autoregression, d indicates the degree of differencing, and q corresponds to the order of the moving average. Constructing an ARIMA model typically follows the Box-Jenkins methodology, which comprises three phases. The first phase, identification, involves analyzing the time series to determine whether transformations or differentiations are needed to stabilize its mean and variance. This step uses statistical tools such as the autocorrelation function (ACF), partial autocorrelation

function (PACF), and Dickey-Fuller or Augmented Dickey-Fuller tests (Eurostat, 2022). The second phase focuses on estimation and testing, where model parameters are estimated, and the final model selection is based on criteria such as the Akaike Information Criterion (AIC) or Bayesian Information Criterion (BIC). Residual diagnostics are then performed to ensure that errors follow a white noise process. If significant autocorrelation is detected in the residuals, the model must be refined or re-evaluated. The third phase involves forecasting, with the dataset split into in-sample and out-of-sample periods for parameter estimation and performance evaluation, respectively. Forecasting accuracy is generally deemed more reliable when assessed on out-of-sample data, as in-sample results can be overly influenced by outliers (Eurostat, 2022).

While ARIMA remains a popular choice for time series forecasting, especially with linear and trend-based datasets, its limitations in addressing nonlinear or volatile data underscore the need for more flexible models in complex scenarios. Nonetheless, its simplicity and reliability in stable conditions make it an enduring tool in time series analysis (Malska & Wachta, 2015).

### 2.1.2 Holt-Winters

The Holt-Winters model, also known as Triple Exponential Smoothing, is a statistical method specifically designed for forecasting time series data with inherent trends and seasonality. The model operates on three key components: the level, which represents the average value of the series at a specific time; the trend, which captures the direction and rate of change over time; and the seasonality, which models recurring patterns at regular intervals.

Holt-Winters supports two variations: the additive model, which is suitable for datasets with constant seasonal variations, and the multiplicative model, which is used when seasonal variations are proportional to the series level. By applying exponential weighting, the model smooths the data, making it ideal for short-term forecasts. This method is particularly effective for simple datasets with well-defined seasonal and trend patterns. Common applications of the Holt-Winters model include demand forecasting, predicting website traffic, and analyzing energy consumption trends, where accuracy in short-term predictions is crucial.

### 2.1.3 LSTM Model

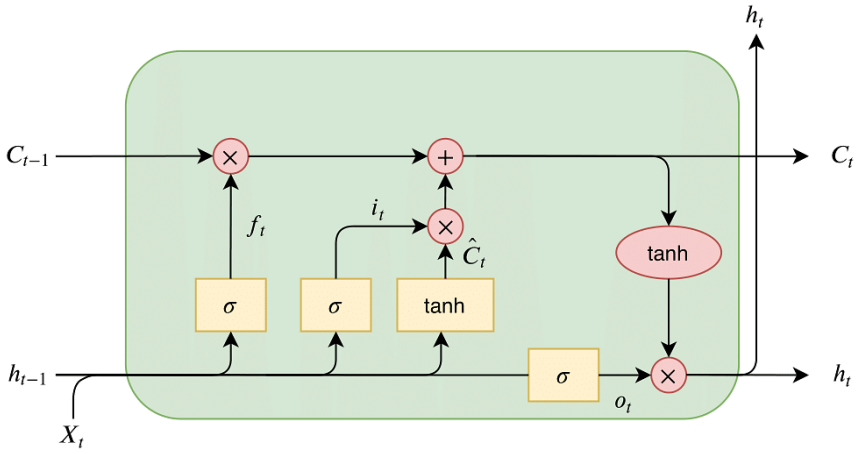

**Figure 1 – LSTM Model**

The concept of artificial neural networks (ANNs) was introduced in 1943 by McCulloch and Pitts, who described the foundational model of an artificial neuron, inspired by the biological structure of nerve cells. This breakthrough laid the groundwork for further exploration into neural network architectures (McCulloch & Pitts, 1943). Over the years, significant advancements were made, including Hebb's discovery in 1949, which proposed a theory on how learning processes modify the connection strengths between neurons (Hebb, 1949).

In 1958, Rosenblatt advanced the field by developing the “Perceptron”, a neural network capable of recognizing alphanumeric characters. This invention marked the transition from theoretical frameworks to functional neural network systems and spurred widespread interest in ANN research globally (Rosenblatt, 1958).

A major development in neural networks occurred with the introduction of Recurrent Neural Networks (RNNs). RNNs are a specialized class of models designed to process sequential data, making them particularly effective for tasks

such as natural language processing, time series forecasting, and classification. Unlike traditional feedforward networks, RNNs retain information from previous steps, enabling them to learn patterns and dependencies over time. However, RNNs face limitations, particularly the issue of vanishing gradients, which impairs their ability to model long-term dependencies.

To address these limitations, Hochreiter and Schmidhuber (1997) introduced the Long Short-Term Memory (LSTM) model, which enhances RNN capabilities by using gated mechanisms to selectively retain or discard information. This innovation allows LSTM networks to capture both short-term and long-term dependencies more effectively, making them highly suitable for complex time series forecasting (Hochreiter & Schmidhuber, 1997).

### 2.1.4 BI-LSTM

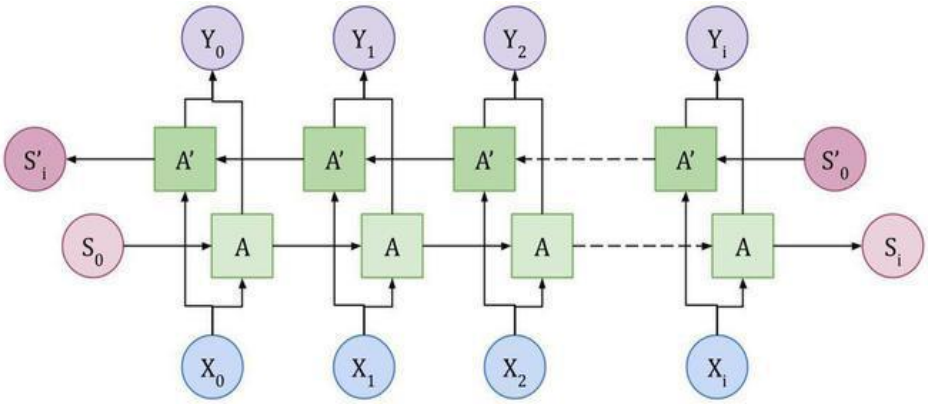

**Figure 2 – BI-LSTM Model**

Bidirectional Long Short-Term Memory (BiLSTM) networks extend traditional LSTM by processing data in both forward and backward directions. This bidirectional approach enables BiLSTM to capture contextual information from both past and future time steps, resulting in enhanced prediction accuracy. The architecture of BiLSTM consists of two LSTM layers: a forward layer that processes the sequence from the beginning to the end, and a backward layer that processes the sequence in reverse order. The outputs from these two layers are combined to form a comprehensive final output, encapsulating richer contextual insights. BiLSTM is particularly advantageous in applications where information from both past and future time steps is critical for accurate predictions. These applications include natural language processing, where understanding the full sentence context is crucial; sentiment analysis, where the tone may depend on preceding and succeeding phrases; and financial forecasting, where data trends often rely on historical patterns and anticipated future movements. Its ability to handle complex sequential data with strong dependencies makes BiLSTM a powerful tool for diverse predictive tasks.

### 2.1.5 GRU

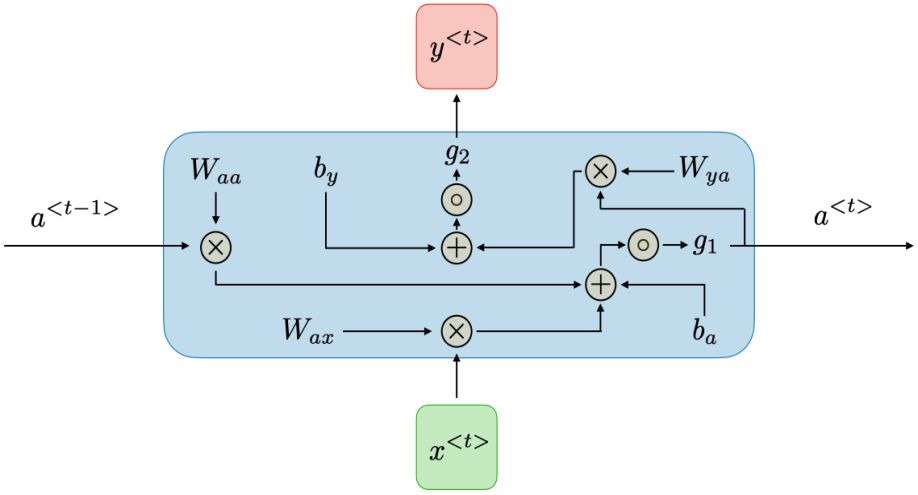

**Figure 3 – GRU Model**

The Gated Recurrent Unit (GRU) is a streamlined variant of the LSTM model, designed to address sequential data

challenges while minimizing computational demands. By simplifying the architecture, GRU replaces LSTM's three gates with two: the update gate, which determines how much of the information from the previous state is retained or updated, and the reset gate, which controls the influence of past information on the current state. This simplification allows GRU to maintain effectiveness while reducing the complexity and resources required for training and inference. GRU is particularly advantageous in scenarios where computational efficiency is critical, such as smaller datasets or applications requiring real-time predictions. Examples include Internet of Things (IoT) signal analysis, where devices generate continuous streams of data, and anomaly detection in systems where rapid identification of outliers is crucial. Despite its reduced complexity, GRU excels in capturing sequential relationships and long-term dependencies, making it a robust choice for tasks that demand a balance between speed and predictive accuracy.

**2.2 Experimental method**

This study adopts a multi-perspective approach to identify the most suitable forecasting models for time series data across three distinct stock sectors: banking (ACB), retail (MWG), and technology (CMC), each characterized by unique patterns, trends, and levels of variability. To achieve this, the performance of five forecasting models—ARIMA, Holt-Winters, LSTM, Bi-LSTM and GRU is analyzed using two segmentation methods: rolling window and expanding window. These techniques support the evaluation of model performance across datasets with varying structural characteristics, providing an approach for assessing their effectiveness in handling diverse data types.

Rather than segmenting the data into short-term, medium-term, and long-term phases as done by Dariusz Kobiela (Dariusz Kobiela, 2022), this study adopts a different approach. Dividing the data in such a way could unintentionally isolate anomalies, reducing their contextual significance for anomaly detection. Instead, the rolling window method focuses on short-term patterns by utilizing fixed-sized sliding windows, while the expanding window progressively incorporates historical data to account for long-term dependencies. This combined approach ensures a thorough evaluation of model performance across stable, volatile, and transitional market conditions while preserving the contextual relevance of anomalies within the datasets.

To evaluate the performance of the models, this study uses Root Mean Squared Error (RMSE) as the primary accuracy metric. RMSE quantifies the difference between actual values ($x_i$) and predicted values ($\hat{x}_i$), ensuring consistent and objective comparisons across models. The formula for RMSE is expressed as follows:

$$\text{RMSE} = \sqrt{\frac{1}{N}\sum_{i=1}^{N}(x_i - \hat{x}_i)^2}$$

Where:

*N:* Total number of observations,

$x_i$*:* Actual values,

$\hat{x}_i$*:* Predicted values.

RMSE is particularly useful as it penalizes large errors, making it more sensitive to significant deviations. Additionally, RMSE normalizes the error to the same units as the forecasted values, ensuring interpretability within the study's context (e.g., monthly forecasts). By utilizing RMSE, this study provides a comprehensive evaluation of the effectiveness of models in handling diverse data conditions and segmentation methods (rolling window and expanding window). This assessment offers critical insights into the adaptability and accuracy of each model for datasets with unique structural characteristics.

**III. RESULT AND DISCUSSION**

The research results are analyzed based on the time series data structure of three datasets representing the retail (MWG), banking (ACB), and technology (CMC) sectors, alongside the performance of forecasting models. The evaluation focuses not only on model performance but also on the structural characteristics of the data to identify anomalies that may impact forecasting accuracy.

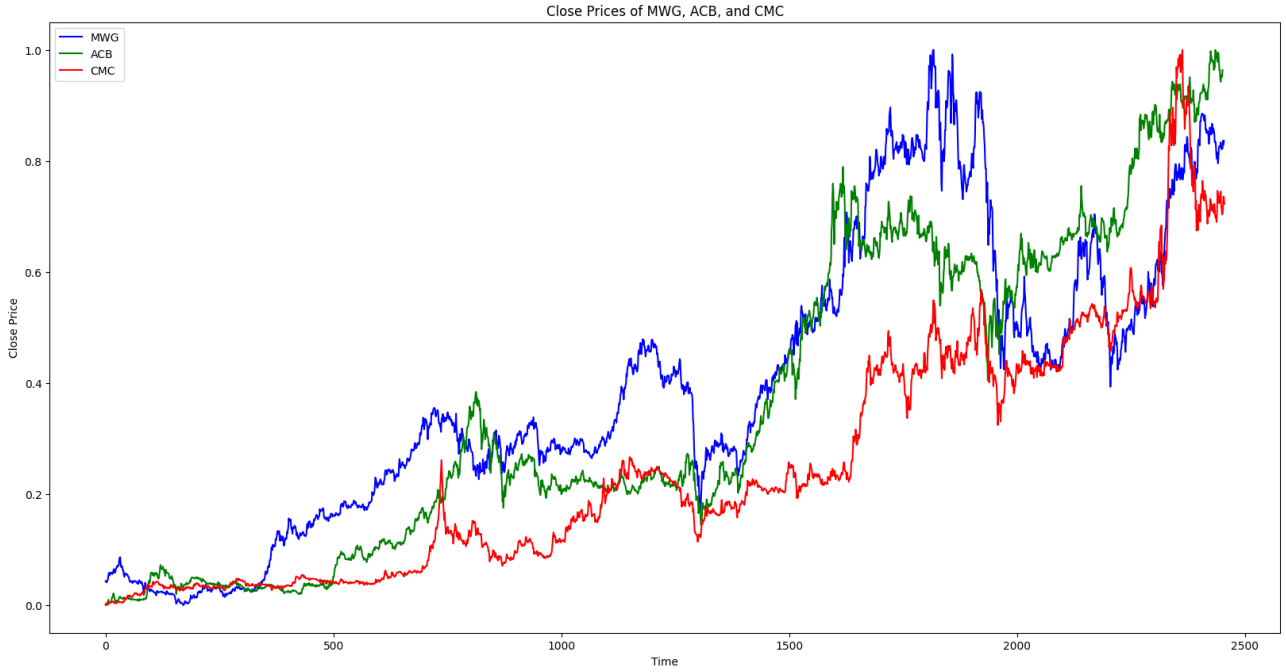

**Figure 4 - Close Price of MWG, ACB and CMC**

As depicted in Figure 4, the closing price charts of MWG, ACB, and CMC illustrate substantial variations in volatility across the respective sectors. The MWG dataset (retail) exhibits a steady upward trend but is accompanied by pronounced short-term fluctuations, reflecting the sensitivity of the retail market to supply and demand changes. The ACB dataset (banking) appears more stable, with a clear long-term upward trend and fewer short-term variations, characteristic of the financial sector's steadiness. In contrast, the CMC dataset (technology) shows high volatility, especially during periods of significant market changes, highlighting the instability and rapid evolution inherent to the technology sector. All three datasets are considered to be nonlinear and contain periods of substantial volatility, particularly around 2020 (approximately at point 1500 on the x-axis), likely linked to unusual impacts from the COVID-19 pandemic. These characteristics require forecasting models that not only capture long-term trends but also adapt well to short-term and unusual fluctuations.

**Table 1 - Best Results of Traditional Models**

| Model | Stock | RMSE |
|---|---|---|
| Arima | MWG | 6725.8229 |
| Holt-Winters | MWG | 6855.8016 |
| Arima | ACB | 2241.4632 |
| Holt-Winters | ACB | 2288.8692 |
| Arima | CMC | 7560.7487 |
| Holt-Winters | CMC | 8965.4100 |

The results from Table 1 reveal that both ARIMA and Holt-Winters exhibit relatively high RMSE values across all three datasets, particularly on MWG (RMSE = 6725.8229) and CMC (RMSE = 8965.4100). This poor performance indicates that traditional models are not suitable for handling the data used in this study. The primary reason lies in the fact that the time series data for MWG and CMC display highly irregular behavior, with significant short-term fluctuations and nonlinear characteristics. Traditional models like ARIMA and Holt-Winters are designed to perform well on linear, stable datasets with trends, as observed in the ACB dataset (which achieved a lower RMSE: 2241.4632 with ARIMA). However, even for ACB, the results are far from ideal. When tasked with processing complex, volatile, and nonlinear data, these models lack the flexibility to fully capture the hidden relationships in the time series. Therefore, transitioning to deep learning models such as LSTM, Bi-LSTM, and GRU is necessary. These models are capable of capturing both long-term trends and short-term fluctuations, enabling more accurate forecasting in cases of nonlinear and highly volatile data.

**Table 2 - Summary of Best RMSE Values for Forecasting Models**

| Model | Stock | Segmentation Method | RMSE |
|---|---|---|---|
| LSTM | MWG | Sliding window | 0.025 |
| BiLSTM | MWG | Sliding window | 0.021 |
| BiLSTM | CMC | Sliding window | 0.0431 |
| GRU | ACB | Expanding window | 0.0157 |
| GRU | CMC | Expanding window | 0.0226 |

The results from Table 2 indicate that the performance of forecasting models varies depending on the dataset and segmentation method applied. Bi-LSTM demonstrates superior performance when using the sliding window method, particularly on datasets with high volatility and clear short-term trends. On the MWG dataset, Bi-LSTM achieves an RMSE of 0.021, outperforming LSTM (RMSE = 0.025), highlighting its greater effectiveness in handling short-term fluctuations in retail data. Similarly, on the CMC dataset, Bi-LSTM achieves an RMSE of 0.0431, showcasing its adaptability to the significant volatility inherent in technology data.

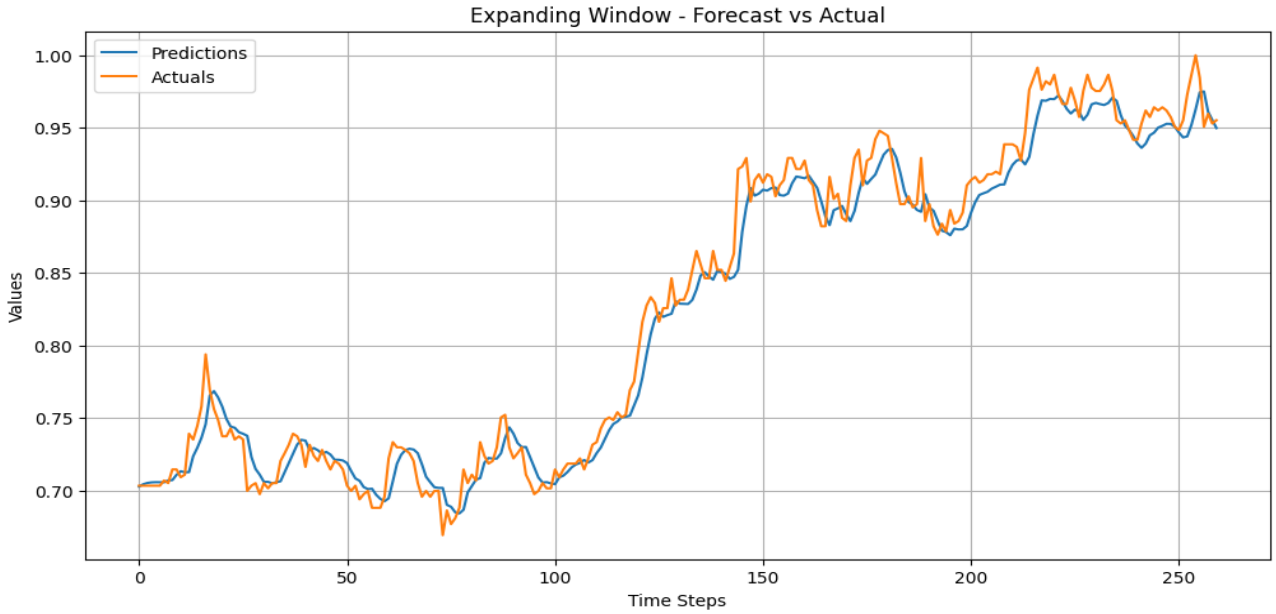

**Figure 5 - GRU Expanding Window - Best RMSE in ACB**

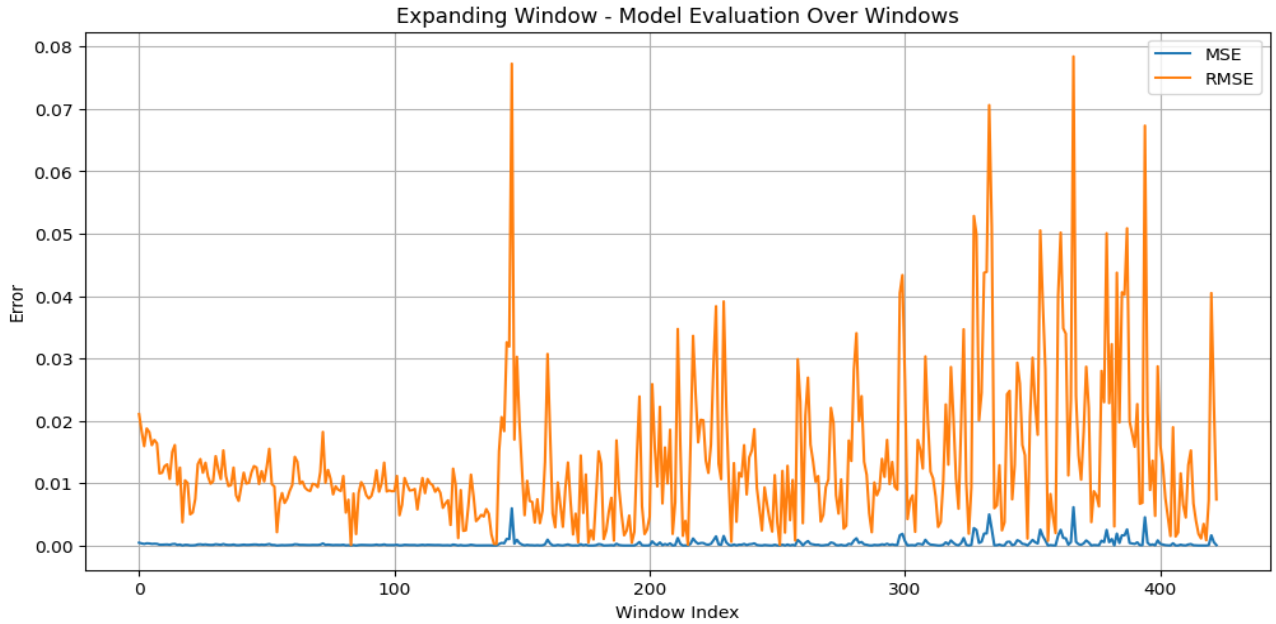

**Figure 6 - Performance of the GRU model over windows on CMC**

Using the expanding window method, GRU excels in capturing long-term dependencies in stable and moderately volatile data (see Figure 5). On the ACB dataset, GRU achieves an RMSE of 0.0157, demonstrating high efficiency in leveraging long-term trends within banking data. Additionally, on the CMC dataset, GRU achieves an RMSE of 0.0226, making it suitable for technology data that requires a balance between short-term volatility and long-term dependencies.

Although LSTM does not lead in performance, it delivers stable results on the MWG dataset with an RMSE of 0.025. This indicates that LSTM performs well under common data conditions but is not the optimal model for scenarios that demand a higher capacity to handle volatility or long-term dependencies.

As shown in Figure 6, the GRU model with the Expanding Window method exhibits a strong sensitivity to anomalies in the CMC dataset. In the initial phase, with smaller window sizes, the model achieves relatively low and stable RMSE values, indicating its ability to effectively capture early trends in stable data. However, as the window size increases, the RMSE begins to fluctuate significantly, particularly during periods corresponding to unusual events or high volatility, such as those associated with the COVID-19 pandemic. These sharp increases in RMSE highlight the challenges faced by the model in handling anomalous patterns and abrupt changes in the dataset.

The presence of pronounced RMSE peaks during these phases underscores the heightened sensitivity of the GRU model to the anomalous and nonlinear characteristics inherent in the CMC data. Despite these challenges, GRU demonstrates adaptability, as evidenced by the gradual reduction in RMSE following periods of high volatility. This indicates the model's ability to learn and adjust to the evolving characteristics of the data, although its overall performance remains influenced by the complexity and irregularity of the input.

These findings emphasize the model's capability to effectively manage the impact of anomalous patterns on forecasting accuracy. With the capabilities of models such as GRU, their performance can be further optimized to handle complex and volatile time series data.

Based on the research findings, the most effective forecasting models have been identified for each dataset, highlighting their distinct advantages. For the MWG dataset, characterized by a steady upward trend with pronounced short-term fluctuations, Bi-LSTM stands out as the most effective model, achieving an RMSE of 0.021 when using the sliding window method. Its ability to process information bidirectionally gives Bi-LSTM a clear advantage over LSTM and traditional models, particularly in capturing the retail market's sensitivity to supply and demand changes during Coivid19. For the ACB dataset, which exhibits greater stability and a clear long-term upward trend, GRU proves to be the most suitable model with the lowest RMSE of 0.0157 when applying the expanding window method. GRU's ability to capture long-term dependencies in the data makes it particularly well-suited to the characteristics of the financial sector, where stability and long-term trend analysis play a critical role. For the CMC dataset, characterized by high volatility and rapid changes, the results indicate that different methods are required for optimal performance. Using the sliding window method, LSTM achieves an RMSE of 0.0352, demonstrating strong adaptability to short-term fluctuations in technology data. Meanwhile, when using the expanding window method, GRU once again shows superior performance by effectively balancing short-term volatility and long-term trends, achieving an RMSE of 0.0226. These results suggest that selecting the appropriate model and segmentation method heavily depends on the characteristics of the time series data. Bi-LSTM demonstrates exceptional performance in handling short-term fluctuations and highly volatile data, while GRU proves highly effective for stable or moderately volatile data, particularly in long-term forecasting tasks. These findings provide practical guidance for selecting suitable forecasting models, effectively supporting strategic decision-making in various industries.

## IV. CONCLUSION

This study analyzed the performance of forecasting models, including ARIMA, Holt-Winters, LSTM, Bi-LSTM, and GRU, on three financial time series datasets representing the retail (MWG), banking (ACB), and technology (CMC) sectors. The results revealed that Bi-LSTM is the most effective model for datasets with high volatility, such as MWG and CMC, when using the sliding window method. This reflects Bi-LSTM's exceptional ability to capture both long-term trends and short-term fluctuations. For more stable datasets like ACB, GRU achieved the best performance when using the expanding window method, due to its ability to leverage long-term dependencies in the data.

Our experiments revealed limitations in traditional models like ARIMA and Holt-Winters when handling nonlinear, volatile data, particularly during events like the COVID-19 pandemic. Despite their stability with linear datasets, these models struggle to capture the complex hidden relationships within time series data. This highlights the critical role of deep learning models like Bi-LSTM and GRU in managing complex time series data.

This research contributes to the field of time series forecasting by providing deep insights into how to select forecasting models appropriate for specific data characteristics. Additionally, the research lays the groundwork for future studies focused on parameter optimization, developing hybrid models that combine traditional and deep learning methods, or expanding the scope to other domains such as energy, healthcare, or weather forecasting. These findings not only add academic value but also offer practical recommendations for applications in financial forecasting and related fields.

**ABSTRACT**

The main aim of this study was to explore how technologically vigilant leadership (TVL) impacts on smart sustainable circular supply chain management (SSCSCM) in context 6.0. This was accomplished by analyzing the mediating effects of the digital environment management accounting system (DEMA) on the link between TVL and SSCSCM. This research evaluated the proposed model using two distinct statistical methods within the framework of structural equation modeling, which facilitated the assessment of both linear and non-linear correlations among the constructs. Linear relationships were analyzed using AMOS, whereas non-linear relationships were examined with WarpPLS. The data was obtained from a sample of respondents employed in small and medium enterprises. In both instances, the influence of TVL on SSCSCM was significant and favorable, as demonstrated by CB-SEM and PLS-SEM techniques. Furthermore, DEMA partially mediated the relationship between TVL and SSCSCM. In addition to its theoretical contribution to the research trends associated with Industry 6.0, this study significantly enhanced the comprehension of SMEs as they endeavored to implement SSCSCM through TVL and DEMA. Notably, these profound insights would provide guidance for policymakers in developing improved TVL mechanisms to leverage the advantages of DEMA and thereby strengthen SSCSCM.

*Key words: "circular economy"; "environmental management accounting"; "Industry 6.0"; "smart supply chain"; "vigilant leadership".*

## I. INTRODUCTION

The supply chain is the lifeblood of the world economy and society (Ivanov, 2020). Sustainability imperatives and transformative technological advancements have necessitated responsible consumption and enhanced production from the industrial sector (Mathiyazhagan et al., 2022). The supply chain in a company is always an important step to assist all activities that take place sequentially and ensure efficiency. In fact, SMEs have certain limitations in terms of personnel, resources and people. However, an inevitable thing in the process of rapid and strong development of the current economy is the great impact of technology and the circular economy. This will make the management process of managers need to change and adjust. Disruptive technologies are improving the speed and resilience of supply chain operations while reducing carbon footprints (Karuppiah et al., 2024). According to Singh et al. (2024), researchers are beginning to consider Industry 6.0, a novel concept, as an advancement beyond Industry 5.0. As stated by Kumari et al., (2024), the emergence of Industry 6.0, defined by the incorporation of advanced technologies like artificial intelligence, blockchain, and the Internet of Things, has ushered in a novel epoch of connectivity and collaboration. A smart sustainable circular supply chain management (SSCSCM) amalgamates Industry 6.0 and circular economy principles inside the supply chain to fulfill sustainable objectives. As such, effective leadership will play an important role in enabling organizations to succeed in SSCSCM. Gao et al. (2024) assert that vigilant leaders, who prioritize predicting possible issues and obstacles, will significantly reduce followers' complacency and foster a sense of duty to implement constructive changes.

In line with the findings of Gao et al. (2024), technologically vigilant leadership (TVL) is characterized by leaders who raise awareness of recent technological advancements, assess which of these pose threats or opportunities, manage their effects on products, services, and the internal organization, and concurrently guide employees during periods of uncertainty while motivating them to adopt precautionary measures to alleviate those threats. Remarkably, top management should consider the implementation of EMA as a strategy to improve their environmental performance by

maintaining a comprehensive record of all materialistic inputs and outputs, such as garbage, emissions, water, and materials (Hasan et al., 2024). The deployment of EMA has a markedly favorable impact on corporate performance, and that EMA fosters innovation in processes, hence enhancing overall company performance. From the standpoint of managerial accounting, EMA is a synthesis of cost and financial accounting techniques aimed at reducing environmental impacts, managing risks, and lowering costs (Bresciani et al., 2023). The improvements of Industry 6.0 will undoubtedly influence accounting ecosystem (Deliu & Olariu, 2024). Digital EMA (DEMA) can be understood as the integration of digital technologies of Industry 6.0 into EMA system. The combined study of vigilant leadership, sustainable circular supply chain, Industry 6.0, and EMA in small and medium enterprises (SMEs) in the context of developing countries has been the subject of limited research until recently. This is primarily due to the emergence of these relationships in recent years. In light of this, it is imperative to establish more comprehensive management models and policies to optimize and enhance the efficiency of the SSCSCM of SMEs. The primary objective of this investigation is to investigate the potential role of TVL in improving SSCSCM and the role of DEMA in this relationship. The primary objective of this study is to analyze the stated reasons through the systematic development of research questions.

- RQ1. What is the effect that TVL induces on SSCSCM?
- RQ2. Does DEMA mediate the relationship between TVL and SSCSCM?

The present study addressed specific voids that were identified in the examination of the overall results and key observations, thereby making contributions to both the academic and practitioner communities. By addressing the voids in the literature on SSCSCM in developing countries, the current research's findings broaden the existing boundaries of knowledge. In developed countries, sustainable supply chain management (SCM) techniques are becoming prevalent, whereas developing countries exhibit a deficiency in sustainable practices due to many constraints, including knowledge, resources, support, and guidance (Syuaib, 2016). The current research is a pioneering study that examines the interconnection between TVL and SSCSCM in SMEs in developing countries. The perceptions of top management on environmental challenges affect the opportunities for and implementation of voluntary environmental strategies (Li et al., 2023). TVL allows executives to view the overarching context from a temporal standpoint and discern fundamental issues that could result in future failures in the management of smart sustainable circular supply chains. As such, the TVL is crucial for the expansion and reinforcement of SSCSCM. It also addressed a research gap in previous studies by providing empirical evidence on the mediating role of DEMA in the relationship between TVL and SSCSCM. With the increasing frequency and speed of information transmission across the supply chain network, supply chain managers can share enduring behavioral data regarding products and provide virtually instantaneous answers through innovative processing methods. The exchange of information among supply chain partners (Grimm et al., 2014) and forecasting methods that yield reliable outcomes while minimizing waste production are recognized as essential elements for effective circular SCM (Mena et al., 2014). The use of EMA provides enhanced visibility of environmental information to numerous stakeholders (van Der Poll, 2022), and this visibility significantly positively influences environmental practices (Aluchna et al., 2022). It enables practitioners and policymakers to establish strategies and policies that assist enterprises in implementing the incentives of Industry 6.0, resulting in significant enhancements in their processes and the industry.

The present investigation is organized as follows. Section 2 provides a concise overview of conceptual elements and their theoretical foundations. Section 3 of the study delineates the formulation of research hypotheses and the construction of a research model. Additionally, Section 4 provides a detailed overview of the research methodology, while Section 5 presents the outcomes derived from the study. The sixth section of the manuscript delineates theoretical and practical implications, as well as noteworthy insights for future research.

## II. LITERATURE REVIEW

### 2.1. Stakeholder theory

Stakeholder theory offers a conceptual structure for comprehending the wider social, environmental, and economic impacts of operational activities in organization (Dmytriyev et al., 2021). With the advent of digital technology, key stakeholders have gained more authority to exert influence on organizations, either directly or indirectly, to advocate for

digitalization (Jin et al., 2024). Stakeholder pressure has intensified for firms to engage in sustainable development (Waheed et al., 2024). Sustainability pressures and radical technological development have mandated responsible consumption and value-added production from the industrial community (Mathiyazhagan et al., 2022). Thus, this theory is able to elucidate the reasons behind how TVL and DEMA will improve and enhance SSCSCM.

### 2.2. Smart sustainable circular supply chain management

Industry 6.0 anticipates intelligent, fully integrated systems that reduce human intervention by amalgamating artificial intelligence, human-robot collaboration, cloud computing, big data analytics, and quantum computing (Deliu & Olariu, 2024). Sustainable SCM refers to the collaboration of organizations to deliver environmental and social advantages either inside an individual organization or across the entire supply chain (Taylor & Vachon, 2018). Geissdoerfer et al. (2018) assert that managing a circular supply chain aims to shut material and energy loops, minimize resource inputs and waste, thus improving operational efficiency and securing a competitive advantage. The incorporation of I6.0 technologies into the circular SCM has represented a substantial advancement in sustainable operations in recent years. A SSCSCM amalgamates Industry 6.0 and circular economy principles inside the supply chain to fulfill sustainable objectives. By promoting the use of circular economy ideas, Industry 6.0 enhances environmental sustainability while providing businesses with avenues for innovation, competitive edge, and enduring viability.

### 2.3. Digital environmental management accounting

Managerial accounting is one of the important fields in providing financial, accounting, and strategic budget information, helping leaders of units to plan and establish policies, tasks and plans in the medium- and long-term periods. Building on the viewpoint of Amoako et al. (2021), EMA was developed to assist companies in identifying, measuring, and managing the costs related to natural resource utilization, waste production, and pollutant emissions, thereby enhancing organizational transparency regarding environmental expenses, improving resource efficiency, minimizing waste, and reducing operational costs. In this research, DEMA can be understood as the integration of digital technologies of industry 6.0 into EMA system.

### 2.4. Technologically vigilant leadership

Leadership is not only defined by those working in positioning orientation, but it exists at all levels in every entity and society. In business, it is a set of behaviors used to unify direction and strategy for each level of employees, implementing plans and continuously innovate, bringing value to the organization. Effective leadership is when the leader can lead the group and organization to achieve goals effectively and sustainably. To become an effective leader, it is necessary to have a combination of skills and leadership styles suitable for specific circumstances and environments. In line with the findings of Gao et al. (2024), TVL is characterized by leaders who raise awareness of recent technological advancements, assess which of these pose threats or opportunities, manage their effects on products, services, and the internal organization, and concurrently guide employees during periods of uncertainty while motivating them to adopt precautionary measures to alleviate those threats.

## III. HYPOTHESIS DEVELOPMENT

Supply chains must be more intelligent to address the previously mentioned challenges (Wu et al., 2016), deliver sustainable outcomes (Zouari et al., 2021), and minimize human-machine interaction to promote the adoption of sustainability practices that support circular economy principles (Yadav et al., 2020). A smart supply chain enables stakeholders to optimize and streamline processes, aiming to reduce production costs and company expenses. Gao et al. (2024) assert that vigilant leaders, who prioritize predicting possible issues and obstacles, will significantly reduce followers' complacency and foster a sense of duty to implement constructive changes. TVL allows SMEs to evaluate the prospective future results of their current activities and is affected by those potential outcomes. TVL allows executives to view the overarching context from a temporal standpoint and discern fundamental issues that could result in future failures in the management of smart sustainable circular supply chains.These arguments aid in the development and formulation of the following hypothesis.

**Hypothesis 1 (H1).** TVL is likely to significantly and positively influence SSCSCM.

The vigilant leaders prioritize the long-term sustainability of their teams and motivate their staff to gather

peripheral information and anticipate potential issues prior to their emergence (Gao et al., 2024). The EM pertains to environmental information that has ecological implications and enhances the sustainability performance of an organization (Deb et al., 2023). Executives with an optimistic perspective on the implementation of environmental practices are more inclined to enhance their companies' engagement in environmental management (Park & Kim, 2014). Digitalization has substantial prospects for process enhancement by enabling a corporation to reduce resource consumption through the implementation of information and communication technology tools (Agrawal et al., 2022). When companies implement innovative systems, they enhance their ability to improve their EMA systems; hence, they can make more effective decisions, ultimately resulting in improved financial performance (Abdelhalim et al., 2023). These arguments aid in the development and formulation of the following hypothesis.

**Hypothesis 2 (H2).** *TVL is likely to significantly and positively influence DEMA.*

The effectiveness of sustainable supply chains is contingent upon the circular economy proficiency of organizations, as evidenced by pollution levels and resource utilization efficiency within supply chain operations (Zeng et al., 2017). The deployment of EMA has a markedly favorable impact on corporate performance, and that EMA fosters innovation in processes, hence enhancing overall company performance. From the standpoint of managerial accounting, EMA is a synthesis of cost and financial accounting techniques aimed at reducing environmental impacts, managing risks, and lowering costs (Bresciani et al., 2023). These arguments aid in the development and formulation of the following hypothesis.

**Hypothesis 3 (H3).** DEMA is likely to significantly and positively influence SSCSCM.

Digitalization is as essential as circular development for firms' enduring advantages in attaining sustainability. The shift to Industry 6.0 has catalyzed the redefinition of SCM towards smarter, more sustainable, and circular approaches. TVL refers to leader behaviors aimed at encouraging people to concentrate on prospective issues related to digital technologies and to prepare for unforeseen setbacks in the future. Leaders who are technologically vigilant and prioritize the anticipation of potential issues in SSCSCM will significantly reduce followers' complacency and foster a sense of duty to implement constructive changes for success in this domain. Executives with an optimistic perspective on the implementation of environmental practices are more inclined to enhance their companies' engagement in environmental management (Park & Kim, 2014). The use of EMA provides enhanced visibility of environmental information to numerous stakeholders (van Der Poll, 2022), and this visibility significantly positively influences environmental practices (Aluchna et al., 2022). These arguments aid in the development and formulation of the following hypothesis.

**Hypothesis 4 (H4).** DEMA is likely to mediate the relationship between TVL and SSCSCM.

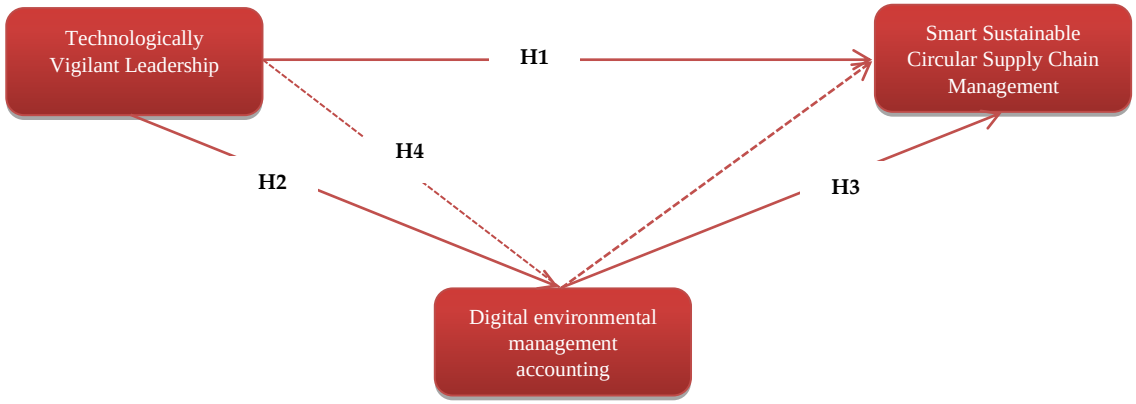

**Fig. 3.1 Conceptual model and hypotheses**

## IV. RESEARCH METHODOLOGY

### 4.1 Measurement scale

This work collected data via questionnaires. English questionnaires were translated to Vietnamese by bilingual experts and back-translated by additional bilingual experts for dataset establishment and data analysis. Then, the two English questionnaires were cross-checked for item consistency. After setting up the questionnaire, a pilot test verified

the concept interconnections and ensured participant clarity. A 35-person pilot test was conducted. Hair et al. (2011) used Cronbach's α value to assess questionnaire construct internal consistency, requiring 0.7 or above for acceptable reliability. Internal consistency reliability studies found that the questionnaire's Cronbach's alpha value exceeded 0.7, confirming its reliability and consistency (Hair et al., 2011). The current research used the seven-point Likert scale from 1 = "strongly disagree" to 7 = "strongly agree" for all measurement scales.

*Technologically vigilant leadership.* The TVL construct in the current investigation was determined as a higher-level combination of three core constructs – Task-oriented behavior; Relational-oriented behavior; Change-oriented behavior which were modified from the findings of DeRue et al. (2011); Gerpott et al. (2019); Gao et al. (2024); Abbu et al. (2023).

*Smart sustainable circular supply chain management.* The SSCSCM construct in the current investigation was determined as a higher-level combination of three core constructs - Circular economy SCM design; Circular economy supply chain relationship management; Circular economy human resource management which were modified from the findings of Kim et al. (2019); Zeng et al. (2017); Kayikci et al. (2022).

*Digital environmental management accounting.* The DEMA construct in the current investigation was determined as a higher-level combination of five core constructs – Environmental cost, Environmental regulation, Environmental safety, Management commitment, Customer and stakeholder focus which were modified from the findings of Abdelhalim et al. (2023), Fuzi et al. (2020).

### 4.2 Sampling and data collection

The principal data in this study were obtained through two sample units. The primary sample unit consisted of organizations, while organizational accountants served as the secondary sampling unit. The present study focuses on SMEs situated in Vietnam. The accountants were responsible for executing the control mechanisms and strategizing the organization. Gupta (2021) proposed that the ideal sample size should range from 5:1 to 20:1, with 5 and 20 being the sample size for each individual item, respectively. Data was gathered from May 2024 to October 2024. Following the evaluation of the questionnaires, the final sample comprised 356 valid replies, resulting in a data loss rate of 28.80 percent. The examination of the sample's socio-demographic profile indicated that males constituted 57.58 percent of participants, whereas females represented 42.42 percent. The study indicated that people aged "41-50" comprised 54.21 percent of the overall sample. The age group "31-40" constituted around 37.36 percent. In contrast, the groups classified as "below 30" and "above 51" represented a minimum of 4.78 and 3.65 percent, securing the lowest ranks among the previously described categories. The majority of participants possessed at least a graduate degree in academic qualifications. The respondents have almost eight years of collective expertise in accounting.

### 4.3. Data analysis technique

We employed two statistical software tools, WarpPLS 7.0 and SmartPLS 4.1.0.9, for data analysis. Linear relationships were analyzed using CB-SEM in SmartPLS 4.1.0.9, whereas non-linear relationships were examined with WarpPLS 7.0. The recent emergence of software tools for non-linear route studies, such as WarpPLS, enabled researchers to account for non-linearity in determining coefficients of association among interconnected variables (Kock, 2019).

## V. RESULT ANALYSIS

### 5.1 Common method bias

In order to ascertain the potential presence of common method variance in the study results, this study implemented Harman's single-factor test. The results indicated that the common method variance was 16.377%, which was less than the widely accepted threshold of 50%. Consequently, this indicated that it was not a significant concern.

### 5.2 Model fit indices

Model fitness evaluations were performed utilizing standard assessments with the support of Smartpls 4.1.0.9, including Chi-square/df; p-value; Root Mean Square Error of Approximation (RMSEA); Goodness of Fit Index (GFI); Adjusted Goodness-of-Fit Index (AGFI); Comparative Fit Index (CFI); Parsimonious Goodness of Fit Index (PGFI); Standardized Root mean square residual (SRMR); Normed Fit Index (NFI). Accordingly, a significant value higher than

0.05 (p-value >0.050) emphasized that there was no difference between the sample covariance and the covariance of the prediction model. The statistical outcomes of model fit were illustrated in **Table 5.1**.

**Table 5. 1 – Results of Model fit**

| Criteria | Acceptable fit | Value |
|---|---|---|
| Chi-square/df | ≤ 3 | 1.085 |
| P-value | >0.050 | 0.106 |
| Root Mean Square Error of Approximation (RMSEA) | ≤ 0.08 | 0.015 |
| Goodness of Fit Index (GFI) | ≥ 0.90 | 0.925 |
| Adjusted Goodness-of-Fit Index (AGFI) | ≥ 0.90 | 0.905 |
| Comparative Fit Index (CFI) | ≥ 0.90 | 0.992 |
| Parsimonious Goodness of Fit Index (PGFI) | ≤ 1.00 | 0.726 |
| Standardized Root mean square residual (SRMR) | ≤ 0.08 | 0.033 |
| Normed Fit Index (NFI) | ≥ 0.90 | 0.907 |

**5.3 Measurement model assessment**

In the context of establishing convergent validity, it was generally accepted that items possessed standardized factor loadings exceeding 0.6 (Hair et al., 2019). The average variance extracted (AVE) for the constructs exceeded 0.5, thus providing further support for convergent validity (Hair et al., 2019). The value of composite reliability and Cronbach's alpha were higher than the cutoff value of 0.7 (Hair et al., 2019). Consequently, the statistical outcomes in **Table 5.2** proved reliability and convergent validity for further investigation.

**Table 5. 2 - Results summary of reliability and convergent validity**

| Constructs and operationalization | | Convergent validity | | Construct reliability | | Result |
|---|---|---|---|---|---|---|
| | | Factor Loadings | AVE | Cronbach's Alpha | Composite Reliability | |
| **Technologically vigilant leadership** | **TVL** | | | | | |
| Task-oriented behavior | TO | 0.711 - 0.779 | 0.548 | 0.785 | 0.786 | Retained |
| Relational-oriented behavior | RO | 0.786 - 0.834 | 0.644 | 0.844 | 0.844 | Retained |
| Change-oriented behavior | COH | 0.736 - 0.870 | 0.620 | 0.826 | 0.828 | Retained |
| Digital environmental management accounting | **DEMA** | | | | | |
| Environmental cost | EC | 0.763 - 0.817 | 0.626 | 0.834 | 0.835 | Retained |
| Environmental regulation | ER | 0.753 - 0.854 | 0.638 | 0.839 | 0.841 | Retained |
| Environmental safety | ES | 0.752 - 0.831 | 0.613 | 0.826 | 0.828 | Retained |
| Management commitment | MC | 0.705 - 0.790 | 0.551 | 0.784 | 0.786 | Retained |
| Customer and stakeholder focus | CSF | 0.709 - 0.783 | 0.576 | 0.801 | 0.802 | Retained |
| **Smart sustainable circular supply chain management** | **SSCSCM** | | | | | |
| Circular economy supply chain management design | CESCD | 0.710 - 0.807 | 0.582 | 0.806 | 0.803 | Retained |
| Circular economy supply chain relationship management | CESCRM | 0.726 - 0.812 | 0.614 | 0.825 | 0.827 | Retained |
| Circular economy human resource management | CEHRM | 0.740 - 0.843 | 0.634 | 0.837 | 0.839 | Retained |

The heterotrait-monotrait ratio (HTMT) was a statistical measure used to evaluate discriminant validity in the context of SEM. The HTMT ratio contrasts the average correlation among items that evaluate multiple constructs (heterotrait) to the average correlation among items that evaluate a single construct (monotrait). The statistical outcomes of the HTMT which were notably lower than 0.85 (Henseler et al., 2015) were presented in Table 5.3.

**Table 5. 3 – Results summary for discriminant validity on Heterotrait–Monotrait ratio**

| | CEHRM | CESCD | CESCRM | COH | CSF | EC | ER | ES | MC | RO | TO |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **CEHRM** | | | | | | | | | | | |
| **CESCD** | 0.390 | | | | | | | | | | |
| **CESCRM** | 0.253 | 0.307 | | | | | | | | | |
| **COH** | 0.171 | 0.230 | 0.029 | | | | | | | | |
| **CSF** | 0.173 | 0.239 | 0.179 | 0.136 | | | | | | | |
| **EC** | 0.169 | 0.352 | 0.189 | 0.234 | 0.361 | | | | | | |
| **ER** | 0.194 | 0.133 | 0.196 | 0.066 | 0.285 | 0.292 | | | | | |
| **ES** | 0.120 | 0.147 | 0.148 | 0.131 | 0.176 | 0.301 | 0.188 | | | | |
| **MC** | 0.212 | 0.373 | 0.186 | 0.171 | 0.384 | 0.231 | 0.167 | 0.196 | | | |
| **RO** | 0.113 | 0.181 | 0.173 | 0.069 | 0.095 | 0.140 | 0.089 | 0.098 | 0.185 | | |
| **TO** | 0.337 | 0.399 | 0.334 | 0.371 | 0.223 | 0.334 | 0.260 | 0.174 | 0.295 | 0.345 | |

**5.4 Structural model assessment**

*Direct effect*. To evaluate the hypotheses, we established a structural model using CB-SEM in SmartPLS and PLS-SEM in Warp PLS (Refer to **Table 5.4**, **Fig 5.1** and **Fig 5.2**). Based on the outputs of CB-SEM carried out in SmartPLS 4.1.0.9, TVL had a beneficial and statistically significant effect on SSCSCM ($\beta = 0.415$; p-value < 0.001). In the same vein, the output of PLS-SEM carried out in WarpPLS 7, TVL had a beneficial and statistically significant effect on SSCSCM ($\beta = 0.283$; p-value < 0.001). Thus, H1 was empirically supported. The outputs of CB-SEM carried out in SmartPLS 4.1.0.9 corroborated the positive and significant relationship between TVL and DEMA ($\beta = 0.557$; p-value < 0.001). Likewise, the outputs of PLS-SEM carried out in WarpPLS 7, TVL was verified significantly and positively impact DEMA ($\beta = 0.351$; p-value < 0.001). Thus, H2 was empirically supported. The outputs of CB-SEM carried out in SmartPLS 4.1.0.9 also revealed the significant and positive impact of DEMA on SSCSCM ($\beta = 0.465$; p-value < 0.001). Similarly, the output of PLS-SEM carried out in WarpPLS 7 substantiated that DEMA affected SSCSCM in a significant and positive manner ($\beta = 0.285$; p-value < 0.001). Thus, H3 was empirically supported. The values of $R^2$ for DEMA and SSCSCM were reported to be 0.310 and 0604, respectively, based on the outputs of CB-SEM carried out in SmartPLS 4.1.0.9. However, the outputs of PLS-SEM carried out in WarpPLS 7 highlighted that the values of $R^2$ for DEMA and SSCSCM were 0.120 and 0.220, respectively.

*Indirect effect*. Based on the outputs of CB-SEM carried out in SmartPLS 4.1.0.9, given that the direct effect of TVL on SSCSCM were also supported and that the indirect effect was insignificant ($\beta = 0.259$; p-value < 0.001). Similarly, the outputs of PLS-SEM carried out in WarpPLS 7, the direct effect of TVL on SSCSCM were also supported and the indirect effect was insignificant ($\beta = 0.100$; p-value < 0.001). In the nutshell, it confirmed that DEMA partially mediated the relationship between TVL and SSCSCM. Thus, H4 was empirically supported.

**Table 5. 4 – Hypotheses, and path coefficient for SmartPLS and Warp PLS, and the shape of relationships**

| Relevant path | SmartPLS | | WarpPLS | | |
|---|---|---|---|---|---|
| | Path coefficient | p-value | Path coefficient | p-value | Shape of relationship in Warp PLS |
| Direct effect | | | | | |
| **TVL ➔ SSCSCM** | 0.415 | < 0.001 | 0.283 | < 0.001 | Non-linear S-shaped |
| **TVL ➔ DEMA** | 0.557 | < 0.001 | 0.351 | < 0.001 | Non-linear S-shaped |
| **DEMA ➔ SSCSCM** | 0.465 | < 0.001 | 0.285 | < 0.001 | Non-linear S-shaped |
| Indirect effect | | | | | |
| **TVL ➔ DEMA ➔ SSCSCM** | 0.259 | < 0.001 | 0.100 | < 0.001 | |
| **$R^2$** | $R^2_{DEMA} = 0.310$; $R^2_{SSCSCM} = 0.604$ | | $R^2_{DEMA} = 0.120$; $R^2_{SSCSCM} = 0.220$ | | |

## VI. CONCLUSION

### 6.1. Theoretical implication

To the best of our knowledge, this could be among the first study focus on the impact of TVL on SSCSCM in SME in one developing country. The shift to Industry 6.0 has catalyzed the redefinition of supply chain management towards smarter, more sustainable, and circular approaches. TVL refers to leader behaviors aimed at encouraging people to concentrate on prospective issues related to digital technologies and to prepare for unforeseen setbacks in the future. Leaders who are technologically vigilant and prioritize the anticipation of potential issues in SSCSCM will significantly reduce followers' complacency and foster a sense of duty to implement constructive changes for success in this domain. A statistically significant non-linear (S-shaped) association existed between TVL and DEMA. This suggested that there existed an optimal level of TVL that enhanced the performance of DEMA, with the effect reducing thereafter. It could be among the first study focused on the impact of TVL on DEMA in SME in a developing country. EMA has become essential in directing sustainable company activities (Zeng et al., 2024). Among the numerous environmental

management systems available, the EMA system can be particularly advantageous for the organization in identifying, gathering, employing, and analyzing diverse forms of accounting information pertinent to its environmental management.

Empirical findings provided by Schaltegger et al. (2015) indicated that numerous managers value and analyze diverse types of environmental data. The correlation between DEMA and SSCSCM was statistically significant and exhibited a non-linear S-shaped pattern. As the efficacy of DEMA escalated, its impact on SSCSCM likewise intensified, although there existed a threshold beyond which the effect stabilized. It could be among the first study focus on the impact of DEMA on SSCSCM in SME in a developing country. The supply chain is becoming expensive, complex, uncertain, and susceptible, but managers persist in their pursuit of more economical, expedited, and superior supply networks (Wu et al., 2016). To address these difficulties, supply chains must become more intelligent (Wu et al., 2016) and adopt circular practices. I6.0 technologies can serve as essential facilitators of a circular economy by aiding in the management of goods flow, enabling automatic position tracking and analysis of natural resources, and optimizing waste-to-resource alignment in industrial symbiosis networks through real-time data collection for improved resource management. Nonetheless, despite the inherent flexibility and versatility of a smart sustainable circular supply chain, SMEs must be adequately prepared to address supply chain difficulties and disruptions. In this context, DEMA might serve as helpful tools for addressing these concerns. DEMA can be pondered as the internal management instrument to enable enterprises to recognize potential ecological impacts by serving as a mechanism for implementing financial controls and strategies for environmental management.

**6.2 Practical implications**

The significance of SSCSCM as a strategic environmental initiative that enhances sustainable development can be recognized by managers in Vietnamese SMEs and similar environments. The research results have confirmed the relationship between circular management accounting and technology, so the leaders of an organization can be interested in improving their management accounting system, aiming to integrate information technology into the daily work process. To address the distinctive challenges and opportunities that SMEs and locally held enterprises face, managers should contemplate the development of adaptable and targeted strategies. This entails the adoption of new technologies, the promotion of innovation, and the willingness to take calculated risks in order to enhance the enterprise. Consequently, strategic decisions that are consistent with long-term objectives are made, including the investment in infrastructure that facilitates business growth. The results also corroborate that TVL can provide substantial advantages to SSCSCM. Consequently, managers should concentrate on the strategic advantages of this leadership style. As a result, the development of TVL is a critical factor in guaranteeing the long-term success and sustainability of the circular supply chain of SMEs. Lastly, the results of this study suggest that the SME can effectively acquire useful information to develop SSCSCM, which can contribute to better sustainable performance, through using effective DEMA. Consequently, SME managers should prioritize the establishment, development, and enhancement of the organization's learning capability by investing in resources and assets, as well as increasing their awareness of the importance of DEMA. To facilitate the efficient and systematic learning of employees, managers should integrate, collaborate, and coordinate the knowledge and experiences acquired through the implementation of DEMA within the organization. They should also organize training sessions and apprenticeship programs that prioritize the acquisition of in-depth knowledge in the fields of EMA and digital technology.

**6.2. Limitation and orientation for upcoming studies**

This study encountered numerous limitations that may directly or indirectly affect the outcomes. This study was undertaken in Vietnam, a developing country and emerging economy, to facilitate the generalization of its conclusions to other comparable nations. Consequently, the researchers recommend undertaking future investigations to analyze the study model and its implementation by gathering original data from various countries. Secondly, this study employed a cross-sectional approach for the collection of primary data. It is advisable for researchers to collect primary data longitudinally (i.e., at several phases over time) in future studies to enhance the reliability of the findings. Third, a single respondent from each organization was directed, hence augmenting the likelihood of common bias method manifesting. We utilized statistical methods to reduce common bias methods. Nevertheless, this study cannot entirely rule out the potential for common bias method. To mitigate the incidence of this damage, it is essential to engage many

respondents from each industrial organization to complete the study questionnaire. This study employed stakeholder theory, and future research may incorporate more theories to bolster the model and its findings.

[2] Faculty of Accounting and Auditing, University of Finance – Marketing.
*Corresponding: lbquyen@upt.edu.vn/ hello.iamquinnie@gmail.com

**ABSTRACT**

This study examines the relationship between the level of circular economy disclosure (CED) and the financial performance of listed enterprises in Vietnam. The paper was conducted on a sample of 337 annual reports of listed companies in HOSE and HNX from 2021 to 2023. The study has used a quantitative method with the regression analysis model to test the hypotheses and CE disclosure index with 14 sections of disclosure compiled from Circulation **No.** 96/2020/TT-BTC, Circular No.200/BTC, and Vietnamese Accounting Standards (VAS). The results show that (1) the circular economy disclosure reaches a low level (46.03%), and (2) there is a positive relationship between circular economy disclosure and financial performance of corporations, measured by ROA and ROE.

*Keywords: "Circular economy", "Financial performance", "Information Disclosure", "Corporate sustainability"*

## I. INTRODUCTION

The circular economy (CE) has become a significant global focus, gaining substantial momentum in recent years (Kaipainen, 2022). According to the United Nations Environment Programme (UNEP), the world is facing pressing environmental issues, including intense pollution, resource depletion, and an increasing demand for natural resources that exceeds the Earth's capacity to regenerate (Blomsma, 2017). Without prompt and effective measures, waste production may overwhelm the environment's carrying capacity. Implementing circular economy initiatives provides a viable and impactful strategy to curtail resource usage and waste generation, thereby conserving resources and reducing environmental damage (Bertassini, 2021), (Arranz, 2023).

The circular economy (CE) emphasizes the efficient use of resources by minimizing consumption, waste, and emissions while enhancing the value and lifespan of products and materials. This approach is supported by methods such as innovative product design, routine maintenance, recycling, reuse, repair, remanufacturing, and refurbishing (Geissdoerfer, 2017). Nevertheless, despite significant progress, challenges such as regulatory complexities, financial constraints, cultural barriers, and technological limitations can elevate costs and discourage organizations from adopting circular economy practices (Aarikka-Stenroos, 2022); (de Mattos Nascimento, 2024).

In Vietnam, the intersection of rapid economic growth and escalating environmental issues has created significant pressure on listed enterprises to adopt and disclose circular economy practices. While existing research has emphasized the benefits of circular economy disclosure (CED) in improving corporate reputation and regulatory compliance (Korsunova, 2022), its influence on financial performance remains inadequately explored. This paper aims to address this gap by analyzing the relationship between the level of circular economy disclosure and the financial performance of listed enterprises in Vietnam. Specifically, the study seeks to: (1) Assess the extent to which listed companies' circular economy disclosures comply with Circulation **No.** 96/2020/TT-BTC, Circular No.200/BTC, and Vietnamese Accounting Standards (VAS); (2) Examine the relationship between the level of circular economy disclosure and the financial performance of listed enterprises in Vietnam.

## II. THEORETICAL FRAMEWORK

Circular economy practices, which focus on reducing, reusing, and recycling resources, can profoundly influence the financial performance of businesses and organizations (Neligan, 2023). By promoting efficient resource utilization, these practices can lower material costs and expenses associated with waste disposal (Kwarteng, Simpson, & Agyenim-Boateng, 2022). Reuse and recycling of materials reduce dependence on new raw materials, thereby generating

significant cost savings. Energy efficiency initiatives aligned with circular economy principles can decrease energy expenditures, as highlighted by (MacArthur, 2013). Additionally, recycling or refurbishing products opens up new revenue opportunities, while product-service systems, such as leasing or renting, foster steady income streams and encourage lasting customer relationships. Innovating business models based on circular principles can enhance competitiveness and appeal to environmentally conscious consumers. Streamlined processes that reduce waste and maximize resource use lead to higher operational efficiency and productivity (Yu, 2022). Shifting away from reliance on finite resources and adopting sustainable approaches helps mitigate risks tied to resource scarcity and price volatility. Proactively implementing these practices ensures compliance with environmental regulations, reducing the likelihood of fines or penalties (Uhrenholt, 2022). Furthermore, embracing sustainability can enhance a company's reputation, making it more attractive to customers who prioritize environmental responsibility (Kuo, 2021).

Numerous studies have explored the impact of circular economy (CE) on corporate financial performance and sustainability. (Obeidat, 2023) examined the role of green human resource management and CE in driving sustainable corporate performance, confirming their positive influence on long-term business viability. Similarly, (Kwarteng, 2022) analyzed the moderating role of organizational culture in the relationship between CE initiatives and business performance, demonstrating that a strong organizational culture reinforces the effectiveness of CE strategies. Furthermore, (Dey, 2022) and (Chowdhury, 2022) assessed how organizational factors influence CE adoption and its impact on the financial sustainability of small and medium-sized enterprises (SMEs). Their research confirms that the implementation of CE strategies positively correlates with improved financial resilience and long-term performance. Employing a mixed-methods approach, (Yaoteng, 2022) investigated the effect of sustainable development strategies, including CE, on financial performance using big data analytics. Their findings indicate that sustainability-oriented business practices significantly enhance green finance and financial stability.

Besides, the stakeholder theory provides a robust theoretical foundation for understanding the potential relationship between circular economy (CE) disclosure and financial performance. (Gelb, 2001) highlighted that enterprises are likely to enhance their level of disclosure due to their accountability to stakeholders, framing such disclosure as a form of socially responsible behavior. From this perspective, CE disclosure serves as a critical mechanism for enterprises to manage their relationships with various stakeholder groups. By addressing stakeholders' expectations and concerns, enterprises can secure their approval and support or mitigate opposition and disapproval (Deegan, 2002). Empirical evidence supports the view that CE practices enhance financial performance. However, the financial benefits of circular economy practices may differ depending on factors such as industry type, operational scale, and the nature of implemented initiatives (Rehman Khan, 2022). Transitioning to a circular economy framework often requires upfront investments in infrastructure, technology, and workforce training. While these initial costs may impact short-term profitability, they pave the way for sustainable long-term gains (Mazzucchelli, 2022). Thus, considering the information presented above, we propose the following research hypothesis.

*H: Circular Economy disclosure has a significant positive influence on the financial performance of listed enterprises in Vietnam.*

## III. METHODOLOGY

### 3.1. Sample and data collection

This paper examines the relationship between the level of circular economy disclosure and the financial performance of listed enterprises in Vietnam. We obtain panel data for a set of Vietnam firms listed in HOSE and HNX indexes from 2021 to 2023 to verify from annual reports, and sustainability reports (if any). In addition, the companies listed in the sample do not belong to the financial sector because enterprises in the financial sector are different from typical manufacturing and trading enterprises. Besides, the listing time of the enterprises in the sample is before January 1 2023; as the study uses non-financial information in 2023, enterprises must be listed before January 1, 2023, to ensure data sufficiency and must have an annual accounting period from January 1 to December 31 according to calendar year.

**Table 1. Statistics of research sample**

| | | |
|---|---|---|
| Listed companies as of December 31, 2023 on HOSE and HNX | | 493 |
| Exclude: | Banks, and companies in the financial sector | (43) |

| | | |
|---|---|---|
| | Listed companies after January 1, 2023 | (31) |
| | Companies lacking data at the time of collection | (34) |
| | Outliers | (48) |
| Total number of companies in the sample | | **337** |

*Source: The authors compiled*

As of December 31, 2023, the total number of listed companies in HOSE and HNX indexes was 493 companies. The authors excluded businesses in the field of banking and finance, businesses listed after January 1 2023, businesses of which the authors found it difficult to obtain annual reports, as well as eliminated outliers by 3-sigma method. Finally, the research sample consists of 337 listed companies.

**3.2. Method to score the disclosure index**

The study employs an unweighted method to score a publication to evaluate the disclosure of circular economy information. Under this method, disclosed information within annual reports or other relevant publications is assigned a score of 1, while non-disclosure is scored as 0. The scoring is calculated using the following formula:

$$\text{CED}_{ij} = \frac{\sum_{i=1}^{n} x_{ij}}{n_j}$$

Of which:

– CEDij: Circular economy disclosure index of company j, and $0 \leq \text{CED} \leq 14$

– $x_{ij}$= 1 if the section of circular economy is disclosed, $x_{ij}$ = 0 if the section of circular economy is not disclosed

– $n_j$: The number of circular economy sections that might be disclosed

The authors employed Stata and Excel software to assist in data analysis, utilizing descriptive statistics to calculate the mean, disclosure rate, frequency of disclosure, and standard deviation. This approach enabled the authors to assess the extent of circular economy disclosure among listed enterprises. Through these analyses, they were able to draw conclusions regarding the prevalence and transparency of such disclosures within the companies, helping to identify factors influencing disclosure levels and recognizing trends within the circular economy domain.

**3.3. Regression model**

Based on the assumptions, the regression model on the level of circular economy disclosure and the financial performance of listed enterprises in Vietnam used in the study to test the hypothesis has the following form:

$$\mathbf{Y_t = \beta_0 + \beta_1 CED + \varepsilon}$$

of which:

– Y: Financial performance, measured by ROA and ROE

– β: Partial regression coefficients

– Ɛ: Errors in the model

**Table 2. Measurement of independent variable in the model and its expected sign**

| Variable | Type of variable | Measurement | Expected sign | Sources |
|---|---|---|---|---|
| Return on assets (ROA) | Quantitative | NPAT/Total Asset | +/- | (Clemens, 2006); (Galbreath, 2006) |
| Return on equity (ROE) | Quantitative | NPAT/Total Equity | +/- | (Clemens, 2006); (Galbreath, 2006) |

Circular economy disclosures in Vietnam are governed by a framework of regulations applicable to listed companies. Key regulatory instruments include Circular No. 96/2020/TT-BTC, the Vietnamese Accounting Standards (VAS), and Circular No. 200/2014/TT-BTC, which outlines guidelines for corporate accounting practices. Drawing from these regulations, a group of researchers has meticulously identified and categorized 14 core sections of sustainability accounting information for systematic evaluation and analysis.

**Table 3. Statistics of Circular economy disclosure**

| Information section | Quantity |
|---|---|
| Environmental information | 9 |
| Social information | 3 |
| Corporate governance information | 2 |
| **Total** | **14** |

*Source: Compiled from Circular No. 96/2020/TT-BTC, Circular No. 200/BTC and VAS*

## IV. RESULT AND DISCUSSION

The findings indicate that the level of circular economy disclosure (CED) among Vietnamese listed enterprises remains relatively low, with an average disclosure rate of 46.03% (Table 4)

**Table 4. Descriptive Statistics**

| | N | Minimum | Maximum | Mean | Std. Deviation |
|---|---|---|---|---|---|
| **CED** | 337 | 2 | 27 | 15.45 | 6.31 |
| **CED (%)** | 337 | 5.58% | 86.62% | 46.03% | 25.02% |
| **CED_Env** | 337 | 0 | 9 | 4.21 | 2.24 |
| **CED_Env(%)** | 337 | .00% | 98.11% | 49.55% | 31.75% |
| **CED_Soc** | 337 | 0 | 6 | 3.16 | 1.52 |
| **CED_Soc(%)** | 337 | .00% | 87.71% | 32.78% | 21.25% |
| **ROA** | 337 | .22 | .85 | .051 | .088 |
| **ROE** | 337 | .15 | .65 | .081 | .162 |
| **Valid N (listwise)** | 337 | | | | |

*Source: Results compiled from Stata*

Table 4 shows that the highest score within the sample is 27 out of 29, accounting for 86.62%, whereas the lowest score is 2 out of 29, representing 5.58%. Specifically, the maximum environmental disclosure score reaches 9 out of 9 (98.11%), while the minimum is 0 out of 9 (0%). Similarly, the highest social disclosure score is 6 out of 7 (87.71%), and the lowest is 0 out of 7 (0%).

Table 4 also summarizes the performance of the listed companies in the sample, evaluated using two key metrics: ROA and ROE. The highest ROA is 0.85, while the lowest is 0.22. For ROE, the maximum level reaches 0.65, and the minimum is 0.15. These results highlight significant disparities in both disclosure levels and financial performance across the companies analyzed.

**Table 5. ANOVA[b]**

| Model | | Sum of Squares | df | Mean Square | F | Sig. |
|---|---|---|---|---|---|---|
| 1 | Regression | 0.765 | 3 | 0.140 | 7.029 | .000[a] |
| | Residual | 3.017 | 334 | 0.502 | | |
| | Total | 3.782 | 337 | | | |

a. Predictors: (Constant), ROA, ROE

b. Dependent Variable: CED

The ANOVA analysis results in Table 5 reveal that the significance value (Sig) of the F-test is very small (Sig = 0.000 < 0.05), confirming a statistically significant linear relationship between circular economy disclosure (CED) and firm performance. This suggests that variations in CED can meaningfully influence financial performance indicators, such as return on assets (ROA) and return on equity (ROE).

Moreover, the findings validate the robustness and explanatory power of the regression model in assessing the relationship between CED and financial performance. The model's statistical significance reinforces the argument that

enhanced environmental disclosure contributes to corporate transparency, strengthens investor confidence, and supports sustainable financial growth. These results are consistent with existing literature, which highlights the role of environmental reporting in mitigating corporate risk, improving regulatory compliance, and enhancing firm valuation.

**Table 6. Coefficients[a]**

| Model | | Unstandardized Coefficients | | Standardized Coefficients | t | Sig. |
|---|---|---|---|---|---|---|
| | | B | Std. Error | Beta | | |
| 1 | (Constant) | 13.220 | .451 | | 30.129 | .000 |
| | ROA | 1.686 | 5.306 | .012 | .218 | .022 |
| | ROE | 7.205 | 1.413 | .159 | 2.105 | .031 |

a. Dependent Variable: CED

The company's performance is assessed using two key metrics: ROA and ROE. The regression results in Table 6 indicate that the relationship between circular economy (CE) disclosure and financial performance, as measured by ROA (Sig = 0.022, $p < 0.05$) and ROE (Sig = 0.031, $p < 0.05$), is statistically significant. Furthermore, the findings demonstrate that CE disclosure has a positive impact on the financial performance of listed enterprises in Vietnam. This underscores the importance of enhancing CE disclosure, not only to meet stakeholder demands but also to improve financial performance and foster a sustainable competitive advantage for businesses.

## V. CONCLUSION

An empirical analysis of 337 listed firms assessing the extent of circular economy (CE) disclosure revealed that the actual disclosure level was relatively low, reaching only 46.03% (below the 50% benchmark). This raises significant concerns, particularly given that the industries examined in the sample have direct environmental, social, and corporate governance (ESG) implications. The study further confirms a positive correlation between CE disclosure and corporate financial performance, measured by return on assets (ROA) and return on equity (ROE). This research contributes to the evolving discourse on CE by highlighting emerging trends in CE impact studies. It provides empirical evidence that CE adoption can serve as a strategic mechanism for achieving sustainable competitive advantage through enhanced corporate transparency, operational efficiency, and long-term financial resilience. This shift is particularly critical as businesses align their operations with global sustainability frameworks, including the United Nations Sustainable Development Goals (SDGs). For firms listed on the Vietnamese stock exchange, these findings underscore the necessity of improving CE disclosure practices. Enhancing transparency in CE reporting will not only address the increasing demands of stakeholders but also contribute to strengthening corporate value, market credibility, and long-term financial sustainability.

**ABSTRACT**

This study examines the factors influencing the adoption of Sustainable Development Goal (SDG) solutions by small and medium-sized enterprises (SMEs) in Dong Nai province, Vietnam. SMEs play a crucial role in economic growth and sustainability but face challenges in integrating SDG principles. The research identifies key enablers, including government support policies, increasing consumer demand for sustainable products, and technological advancements. However, major barriers such as limited financial resources, insufficient technical knowledge, and low awareness of SDGs hinder adoption. A quantitative research approach was employed, with data collected from 250 SMEs through structured surveys in 2024. A total of 212 valid responses were analyzed using SPSS, including reliability tests, exploratory factor analysis (EFA), and multiple regression analysis. The findings indicate that stakeholder pressure is the most significant factor driving SDG adoption, followed by leadership awareness, government policies, perceived benefits, and enterprise resources. The study highlights the need for supportive policy frameworks, financial incentives, stakeholder engagement, and leadership training to enhance SDG implementation. These insights provide valuable guidance for policymakers, financial institutions, and SMEs in fostering sustainable development in the region.

## I. INTRODUCTION

Small and medium-sized enterprises (SMEs) play a critical role in global economic development and sustainability, contributing significantly to employment, innovation, and GDP growth (United Nations Development Programme [UNDP], 2024). However, as sustainability becomes a central concern, SMEs are increasingly expected to align their operations with the United Nations' Sustainable Development Goals (SDGs). The SDGs, established in 2015, serve as a comprehensive framework to address global challenges such as poverty, inequality, climate change, and environmental degradation (United Nations, 2020). While large corporations have the resources to implement sustainability initiatives, SMEs often face substantial challenges in adopting SDG-oriented solutions due to financial constraints, limited expertise, and regulatory barriers (Dalampira & Nastis, 2020). In developing economies, including Vietnam, SMEs encounter unique challenges in integrating SDG principles into their business strategies. Unlike multinational corporations, SMEs typically operate with restricted access to financial capital, limited technological capabilities, and a lack of strategic awareness regarding sustainability (Wang, Guo, & Lu, 2021). Government policies play a crucial role in facilitating SDG adoption by providing financial incentives, regulatory guidance, and technical support (Köhler et al., 2022). However, the effectiveness of these policies often varies, depending on their accessibility and alignment with SME needs. Without clear and practical policy frameworks, SMEs may struggle to implement sustainable practices, leading to slow progress in achieving SDG-related objectives (Smith & Torres, 2024).

Stakeholder pressure is another significant factor driving SDG adoption among SMEs. Consumers, business partners, and regulatory agencies increasingly demand corporate transparency, environmental responsibility, and ethical business practices (Freeman, 1984; ElAlfy, Palaschuk, & Weber, 2020). Studies have shown that businesses that align with SDGs can enhance their reputation, improve operational efficiency, and gain competitive advantages in

sustainability-conscious markets (Löwstedt, Sandberg, & Josefsson, 2021). However, many SMEs perceive sustainability initiatives as costly and complex, leading to hesitation in implementation. Addressing these concerns requires a strategic approach, including leadership training, financial incentives, and stakeholder collaboration to make SDG adoption more accessible and beneficial (Green & Parker, 2024).

This study aims to analyze the key factors affecting the adoption of SDG solutions among SMEs in Dong Nai province, Vietnam. Specifically, it examines the influence of five determinants: leadership awareness, enterprise resources, stakeholder pressure, policies and regulations, and perceived benefits. Leadership awareness plays a crucial role in shaping SME engagement with SDGs, as decision-makers with a strong understanding of sustainability are more likely to incorporate SDG principles into their operations (Johnson & Li, 2024). Enterprise resources, including financial capital, skilled employees, and technological infrastructure, determine an SME's ability to adopt sustainability initiatives (Barney, 1991). Stakeholder theory suggests that external pressures from consumers, investors, and regulatory bodies encourage SMEs to implement sustainable practices (Freeman, 1984). Additionally, government policies and financial incentives create an enabling environment for SMEs to transition towards sustainability (Smith & Torres, 2024). Finally, perceived benefits, such as cost savings, improved brand reputation, and expanded market access, influence SME motivation to adopt SDGs (Rogers, 2003).

To examine these factors, this study employs a quantitative research methodology. A structured survey was distributed to 250 SMEs in Dong Nai, resulting in 212 valid responses. Data were analyzed using SPSS, including reliability testing, exploratory factor analysis (EFA), and multiple regression analysis. The findings indicate that stakeholder pressure is the most influential factor, followed by leadership awareness, government policies, perceived benefits, and enterprise resources. These results underscore the importance of strengthening policy frameworks, increasing financial support, and enhancing leadership capacity to promote sustainability among SMEs. By identifying both the enablers and barriers to SDG adoption, this research provides valuable insights for policymakers, business leaders, and financial institutions. The study highlights the need for collaborative efforts to foster a sustainable business ecosystem in Dong Nai, ensuring that SMEs contribute effectively to the global SDG agenda while achieving long-term growth and competitiveness.

## II. RESEARCH OVERVIEW

### 2.1. Overview of related research

The adoption of Sustainable Development Goals (SDGs) by small and medium-sized enterprises (SMEs) has become a growing focus in sustainability research, reflecting their critical role in achieving global sustainability objectives. SMEs, which constitute a significant portion of global enterprises, are uniquely positioned to contribute to the SDGs but face substantial challenges in doing so. These include limited resources, low technical capacity, and a lack of strategic awareness about the benefits of sustainability (Dalampira & Nastis, 2020; Green & Parker, 2024). Research highlights the importance of leadership awareness as a key driver of SDG adoption. Leaders who understand the strategic importance of SDGs are more likely to integrate sustainability into their operations and decision-making processes (Rogers, 2003; Johnson & Li, 2024). Furthermore, external pressures from stakeholders, including consumers, governments, and business partners, serve as significant motivators for SMEs to adopt sustainable practices (Freeman, 1984; ElAlfy, Palaschuk, & Weber, 2020). Adequate resources, such as financial capital, technical expertise, and access to advanced technology, also play a pivotal role in overcoming adoption barriers (Wang, Guo, & Lu, 2021; Löwstedt et al., 2021).

However, research gaps persist in understanding how SMEs in developing regions, particularly under unique local conditions, navigate these challenges. Most studies focus on developed economies or specific industries, leaving the dynamics in resource-constrained contexts underexplored (Köhler et al., 2022; Smith & Torres, 2024). Additionally, while government policies are widely acknowledged as enablers, there is limited empirical analysis on how policy frameworks influence SDG adoption at the SME level in emerging markets.

Addressing these gaps, this study investigates SMEs in Dong Nai province, Vietnam, to provide insights into how local economic, social, and cultural factors influence SDG adoption. The findings aim to bridge the gap between theoretical frameworks and practical solutions, contributing to the broader literature on SME sustainability and SDG

implementation.

### 2.2. Theoretical basis

This study leverages multiple theoretical frameworks to analyze the factors influencing the adoption of Sustainable Development Goals (SDGs) by small and medium-sized enterprises (SMEs). Stakeholder theory highlights the growing pressure from external stakeholders, such as customers, employees, and governments, which compels SMEs to adopt sustainable practices and align their operations with SDG objectives (Freeman, 1984; Smith & Torres, 2024). The resource-based view (RBV) emphasizes the critical role of internal resources—financial capital, human expertise, and technology—in enabling SMEs to implement sustainable practices. Resource constraints often hinder SDG adoption, making access to financial support and technological solutions essential for overcoming these barriers (Barney, 1991; Green & Parker, 2024).

The Theory of Planned Behavior (TPB) further underscores the importance of leadership awareness in shaping organizational attitudes and behaviors. Leaders who understand the benefits of SDG adoption are more likely to integrate sustainability into their strategies (Ajzen, 1991; Johnson & Li, 2024). Additionally, Rogers' Diffusion of Innovations Theory highlights the role of perceived benefits, such as cost savings and enhanced reputation, in encouraging the adoption of new practices. External factors, including government policies and financial incentives, reduce risks and accelerate SDG implementation (Rogers, 2003; UNDP, 2024). Together, these frameworks provide a comprehensive basis for understanding how internal and external factors influence SDG adoption in SMEs, particularly in resource-constrained contexts.

## III. RESEARCH METHODS

### 3.1. Research model

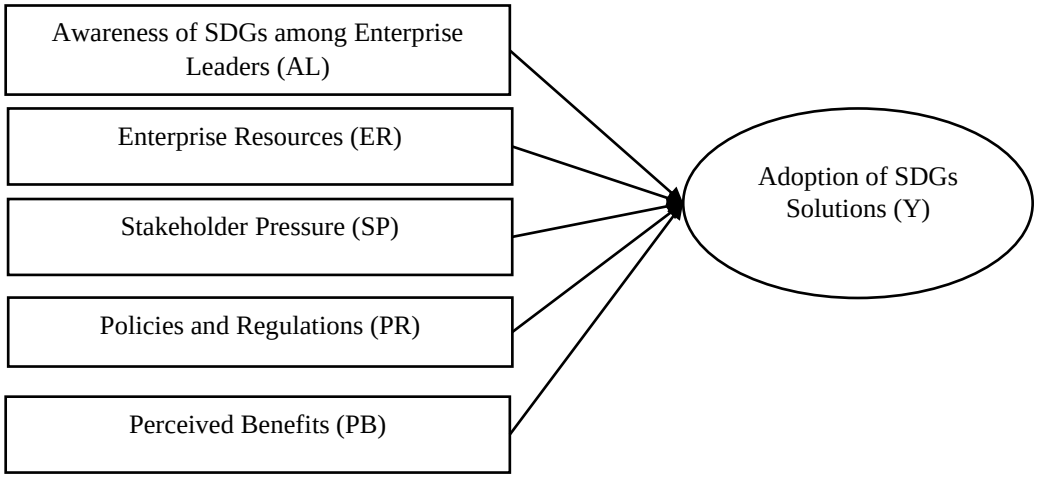

**Figure 1. Research Model**

*Source: Recommended author*

### 3.2. Developing research hypothesis

This study formulates hypotheses based on theoretical frameworks and prior research, examining how key factors—leadership awareness, enterprise resources, stakeholder pressure, policies and regulations, and perceived benefits—affect the adoption of Sustainable Development Goal (SDG) solutions by small and medium-sized enterprises (SMEs)**.**

Leadership awareness is crucial for SDG adoption. Leaders who understand the importance of SDGs are more likely to perceive their strategic value and align organizational goals with sustainability. Research emphasizes that leaders who prioritize SDGs as a strategic objective often recognize their long-term economic and social benefits (Dalampira & Nastis, 2020; Johnson & Li, 2024). For instance, leaders who acknowledge the strategic value of SDGs foster a proactive approach to implementation.

*H1: Leadership awareness of SDGs positively influences the adoption of SDG solutions by SMEs.*

Resources such as financial capital, employee training, and technological access are critical for implementing SDG solutions. Studies show that SMEs with robust resources, including trained employees and suitable technology, are

better positioned to overcome sustainability barriers (Wang, Guo, & Lu, 2021; Green & Parker, 2024). For example, enterprises that invest in employee training for sustainable practices significantly enhance their implementation capacity.

*H2: Enterprise resources positively influence the adoption of SDG solutions by SMEs.*

Stakeholder pressure from customers, business partners, and local governments is a significant driver of SDG adoption. Customers demanding eco-friendly products and business partners advocating for sustainability create a strong impetus for SMEs to implement SDGs (ElAlfy, Palaschuk, & Weber, 2020; White & Ahmed, 2024). For instance, local government policies emphasizing sustainability often shape SME strategies.

*H3: Stakeholder pressure positively affects the adoption of SDG solutions by SMEs.*

Supportive government policies, financial incentives, and clear regulatory frameworks significantly influence SDG adoption. Research highlights that financial incentives, such as subsidies or tax benefits, lower barriers for SMEs in adopting sustainable practices (Köhler et al., 2022; Smith & Torres, 2024). Well-structured policies provide the enabling environment needed for SMEs to integrate sustainability.

*H4: Policies and regulations positively influence the adoption of SDG solutions by SMEs.*

Perceived benefits, including cost savings, enhanced brand reputation, and market access, strongly motivate SMEs to adopt sustainable practices. Studies show that businesses adopting SDGs experience operational efficiencies and improved customer loyalty (Löwstedt et al., 2021; Green & Parker, 2024). For example, SMEs implementing SDGs often report increased access to environmentally conscious markets.

H5: Perceived benefits positively influence the adoption of SDG solutions by SMEs.

### 3.3. Scales

**Table 1: Factors of the scale**

| Number | | Observation variables | Citation |
|---|---|---|---|
| 1 | | Scale of Awareness of SDGs among Enterprise Leaders (AL) | |
| 1.1 | AL1 | Leaders have a clear understanding of the Sustainable Development Goals (SDGs). | Dalampira & Nastis, **(**2020**)**; Johnson & Li, **(**2024**)** |
| 1.2 | AL2 | The enterprise considers SDGs a strategic priority | |
| 1.3 | AL3 | Leaders recognize the economic and social benefits of adopting SDGs | |
| 2 | | Scale of Enterprise Resources (ER) | |
| 2.1 | ER1 | The enterprise has sufficient financial resources to implement SDGs | Wang, Guo, & Lu, **(**2021**)**; Green & Parker, **(**2024**)** |
| 2.2 | ER2 | Employees are trained in sustainable development practices | |
| 2.3 | ER3 | The enterprise has access to technology suitable for SDG solutions | |
| 3 | | Scale of Stakeholder Pressure (SP) | |
| 3.1 | SP1 | Customers demand the adoption of SDG-related solutions | ElAlfy, Palaschuk, & Weber, (2020); White & Ahmed, (2024) |
| 3.2 | SP2 | Business partners encourage sustainable development practices | |
| 3.3 | SP3 | Local government policies emphasize the importance of adopting SDGs | |
| 4 | | Scale of Policies and Regulations (PR) | |
| 4.1 | PR1 | Government policies support enterprises in implementing SDGs | Köhler et al., **(**2022**)**; Smith & Torres, **(**2024**)** |
| 4.2 | PR2 | Legal regulations encourage sustainable practices | |
| 4.3 | PR3 | Financial incentives are available for enterprises adopting SDGs | |
| 5 | | Scale of Perceived Benefits (PB) | |
| 5.1 | PB1 | Adopting SDGs enhances the enterprise’s brand image and reputation | Löwstedt et al., **(**2021**)**; Green & Parker, **(**2024**)** |
| 5.2 | PB2 | SDG implementation reduces operational costs and increases efficiency | |
| 5.3 | PB3 | Sustainable practices expand market access and attract new customers | |

*Source: Self-synthesized author*

### 3.4. Research methods

This study employs a quantitative research approach to analyze factors influencing the adoption of Sustainable Development Goal (SDG) solutions by small and medium-sized enterprises (SMEs). Data were collected through a structured survey administered to 250 SMEs in Dong Nai province, Vietnam. The questionnaire included variables related to leadership awareness, enterprise resources, stakeholder pressure, policies and regulations, and perceived benefits. The data included 212 valid samples and were analyzed using SPSS software to conduct reliability tests, exploratory factor analysis (EFA), and multiple regression analysis. These methods were selected to ensure the robustness of the findings and to identify significant predictors of SDG adoption in SMEs.

## IV. RESULTS AND DISCUSSION

### 4.1. Statistical Description

**Table 2. Data Statistics**

| Variables Mouth | Classify | Suitable research sample | | Sum |
|---|---|---|---|---|
| | | Number of Survey Samples | Proportion % | |
| Years in operation | Less than 5 years | 78 | 36.79% | 212/100% |
| | 5–10 years | 85 | 40.09% | |
| | More than 10 years | 49 | 23.11% | |
| Size of the enterprise | Fewer than 10 employees | 83 | 39.15% | 212/100% |
| | 10–50 employees | 77 | 36.32% | |
| | 50–200 employees | 52 | 24.53% | |
| Sector of operation | Manufacturing | 45 | 21.23% | 212/100% |
| | Services | 54 | 25.47% | |
| | Trade | 89 | 41.98% | |
| | Other | 24 | 11.32% | |

*Source: Extracted from SmartPLS*

Table 2 presents demographic characteristics of the surveyed small and medium-sized enterprises (SMEs), highlighting their years of operation, size, and sectors of activity. The majority of SMEs have been operating for 5–10 years (40.09%), followed by those with less than 5 years (36.79%), and more than 10 years (23.11%). Regarding size, micro-enterprises with fewer than 10 employees constitute the largest group (39.15%), while small (10–50 employees) and medium-sized enterprises (50–200 employees) account for 36.32% and 24.53%, respectively. Sectoral distribution reveals that trade is the most represented sector (41.98%), followed by services (25.47%), manufacturing (21.23%), and others (11.32%). These findings reflect the diversity of SMEs in Dong Nai, aligning with the resource-based view (RBV), which emphasizes the importance of resources in shaping enterprise behavior (Barney, 1991). The prominence of smaller and newer enterprises suggests resource constraints may significantly impact SDG adoption, requiring targeted support mechanisms (Wang, Guo, & Lu, 2021).

### 4.2. Reliability Analysis of the Scale

**Table 3: Results of the Reliability Testing of the Scales**

| Item-Total Statistics | | | | |
|---|---|---|---|---|
| | Scale Mean if Item Deleted | Scale Variance if Item Deleted | Corrected Item-Total Correlation | Cronbach's Alpha if Item Deleted |
| Scale of Awareness of SDGs among Enterprise Leaders (AL): Cronbach's Alpha = 0.883 | | | | |
| AL1 | 7.37 | 4.101 | 0.798 | 0.810 |
| AL2 | 7.34 | 4.274 | 0.778 | 0.829 |
| AL3 | 7.26 | 4.383 | 0.741 | 0.861 |
| Scale of Enterprise Resources (ER): Cronbach's Alpha = 0.849 | | | | |
| ER1 | 6.19 | 2.552 | 0.773 | 0.746 |

| | | | | |
|---|---|---|---|---|
| ER2 | 6.17 | 2.338 | 0.722 | 0.787 |
| ER3 | 6.09 | 2.480 | 0.669 | 0.838 |
| Scale of Stakeholder Pressure (SP): Cronbach's Alpha = 0.826 | | | | |
| SP1 | 7.04 | 4.719 | 0.744 | 0.696 |
| SP2 | 7.02 | 5.336 | 0.719 | 0.734 |
| SP3 | 7.46 | 4.856 | 0.604 | 0.850 |
| Scale of Policies and Regulations (PR): Cronbach's Alpha = 0.804 | | | | |
| PR1 | 7.22 | 2.458 | 0.645 | 0.740 |
| PR2 | 7.15 | 2.220 | 0.662 | 0.721 |
| PR3 | 7.18 | 2.309 | 0.648 | 0.736 |
| Scale of Perceived Benefits (PB): Cronbach's Alpha = 0.784 | | | | |
| A1 | 5.19 | 3.891 | 0.579 | 0.763 |
| A2 | 5.16 | 2.533 | 0.660 | 0.694 |
| A3 | 5.15 | 3.291 | 0.678 | 0.653 |

*Source: Extracted from SPSS*

Table 3 outlines the reliability analysis of scales used to measure key constructs influencing the adoption of Sustainable Development Goal (SDG) solutions among SMEs. The scales for Awareness of SDGs among Enterprise Leaders (AL), Enterprise Resources (ER), Stakeholder Pressure (SP), Policies and Regulations (PR), and Perceived Benefits (PB) all exhibit acceptable reliability, with Cronbach's Alpha scores ranging from 0.784 to 0.883. According to Nunnally and Bernstein (1994), a Cronbach's Alpha above 0.7 indicates high internal consistency, suggesting that the scales reliably measure their intended constructs. Corrected item-total correlations for all items exceed 0.6, demonstrating strong alignment between individual items and their respective scales. Furthermore, no significant improvement in Cronbach's Alpha is observed if any item is removed, confirming the robustness of the scales. These findings validate the reliability of the constructs, enabling their use in exploratory factor analysis and regression testing to identify determinants of SDG adoption in SMEs.

**Table 4: KMO and Bartlett's Test**

| | | |
|---|---|---|
| Kaiser-Meyer-Olkin Measure of Sampling Adequacy. | | 0.746 |
| Bartlett's Test of Sphericity | Approx. Chi-Square | 1490.083 |
| | df | 105 |
| | Sig. | <0.01 |

*Source: Extracted from SPSS*

Table 4 presents the results of the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy and Bartlett's test of sphericity, both critical for assessing the suitability of data for exploratory factor analysis (EFA). The KMO value is 0.746, which exceeds the recommended threshold of 0.6, indicating that the dataset has adequate common variance to support factor extraction (Kaiser, 1974). Bartlett's test of sphericity produces a significant Chi-Square value of 1490.083 ($p < 0.01$), confirming that correlations among variables are statistically significant and non-random (Bartlett, 1954). Together, these results demonstrate the dataset's appropriateness for factor analysis, ensuring reliable identification of underlying constructs. The high KMO value and significance of Bartlett's test validate the robustness of the dataset and its suitability for subsequent analyses. These findings provide a solid foundation for uncovering the latent factors influencing the adoption of Sustainable Development Goal (SDG) solutions among SMEs.

**Table 5: Rotated Matrix of Independent Factors**

| Number | Observed Variables | Independent Factor Loading | | | | |
|---|---|---|---|---|---|---|
| | | 1 | 2 | 3 | 4 | 5 |
| 1 | AL1 | 0.893 | | | | |
| | AL2 | 0.875 | | | | |
| | AL3 | 0.833 | | | | |

| | | | | | | |
|---|---|---|---|---|---|---|
| 2 | ER1 | 0.878 | | | | |
| | ER2 | 0.861 | | | | |
| | ER3 | 0.819 | | | | |
| 3 | SP1 | | 0.882 | | | |
| | SP2 | | 0.831 | | | |
| | SP3 | | 0.799 | | | |
| 4 | PR1 | | | 0.864 | | |
| | PR2 | | | 0.837 | | |
| | PR3 | | | 0.814 | | |
| 5 | PB1 | | | | 0.839 | |
| | PB2 | | | | 0.827 | |
| | PB3 | | | | 0.811 | |

*Source: Extracted from SPSS*

Table 5 provides the rotated factor matrix for independent variables, confirming the presence of five distinct factors: Awareness of SDGs among Enterprise Leaders (AL), Enterprise Resources (ER), Stakeholder Pressure (SP), Policies and Regulations (PR), and Perceived Benefits (PB). Each observed variable demonstrates strong factor loadings exceeding 0.7, a commonly accepted threshold for reliable correlations with underlying constructs (Hair et al., 2010). For instance, variables under AL (AL1 = 0.893, AL2 = 0.875, AL3 = 0.833) and SP (SP1 = 0.882, SP2 = 0.831, SP3 = 0.799) exhibit high loadings, underscoring their alignment with their respective constructs. These results validate the scale's structure, ensuring robust convergent and discriminant validity, meaning that the factors are both internally consistent and distinct from one another. The findings strengthen the reliability of the research model, laying a strong foundation for subsequent regression analysis to assess how these factors influence the adoption of SDG solutions by SMEs.

**Table 6: EFA Results for Dependent Variables**

| Observed Variables | Dependent Factor Loading |
|---|---|
| | 1 |
| Y1 | 0.882 |
| Y2 | 0.854 |
| Y3 | 0.827 |
| KMO and Bartlett's Test | 0.705 |

*Source: Extracted from SPSS*

Table 6 presents the exploratory factor analysis (EFA) results for the dependent variables measuring the adoption of Sustainable Development Goal (SDG) solutions. The analysis reveals high factor loadings for all observed variables: Y1 (0.882), Y2 (0.854), and Y3 (0.827). These values exceed the acceptable threshold of 0.5, indicating strong correlations between the variables and the underlying construct (Hair et al., 2010). The Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy is 0.705, suggesting that the data is suitable for factor analysis (Kaiser, 1974). Bartlett's test of sphericity is significant ($p < 0.01$), confirming the presence of meaningful correlations among variables (Bartlett, 1954). The results also indicate unidimensionality, as all items load onto a single factor, validating the scale's structure. These findings confirm the robustness of the dependent variable scale, supporting its use in regression analysis to evaluate the impact of independent factors on SDG adoption among SMEs.

### 4.3. Correlation Testing

**Table 7: Correlation Matrix**

| Correlations | | | | | | | |
|---|---|---|---|---|---|---|---|

*Source: Extracted from SPSS*

Table 7 presents the Pearson correlation matrix, examining the relationships between independent variables (AL, ER, SP, PR, PB) and the dependent variable (Y), which measures the adoption of Sustainable Development Goal (SDG) solutions. All independent variables show positive and statistically significant correlations with Y at the 0.01 level. The strongest correlation is observed between Stakeholder Pressure (SP) and Y (0.720), highlighting SP as the most influential factor in driving SDG adoption. Leadership Awareness (AL), Enterprise Resources (ER), Perceived Benefits (PB), and Policies and Regulations (PR) also demonstrate moderate to strong positive correlations with Y (ranging from 0.484 to 0.563). Intercorrelations among independent variables, such as SP-ER (0.419) and PB-PR (0.137), are moderate and do not indicate multicollinearity concerns (Hair et al., 2010). These results validate the theoretical framework, showing that each variable significantly contributes to SDG adoption and supporting the use of these factors in regression analysis.

### 4.4. Regression Testing

**Table 8: Regression Analysis Results**

| Modle | | Unstandardized Regression Coefficients | | Standardized Regression Coefficients | t | Sig. | Collinearity Statistics | |
|---|---|---|---|---|---|---|---|---|
| | | B | Standard Error | Beta | | | Tolerance | VIF |
| 1 | Conts | -0.209 | 0.173 | | -1.206 | 0.229 | | |
| | AL | 0.288 | 0.045 | 0.260 | 6.423 | <0,001 | 0.797 | 1.254 |
| | ER | 0.136 | 0.032 | 0.175 | 4.249 | <0,001 | 0.766 | 1.305 |
| | SP | 0.332 | 0.034 | 0.428 | 9.845 | <0,001 | 0.688 | 1.453 |
| | PR | 0.198 | 0.041 | 0.190 | 4.792 | <0,001 | 0.827 | 1.209 |
| | PB | 0.202 | 0.044 | 0.184 | 4.587 | <0,001 | 0.810 | 1.234 |

*Adjusted $R^2$ : 0.725*

*Durbin-Watson: 1.907*

*F(ANOVA): 112.150*

*Sig.(ANOVA): <0.01*

*Source: Extracted from SPSS*

**Regression Equation:**

$$Y = - 0.209 + 0.428*SP + 0.260*AL + 0.190*PR +0.184*PB + 0.175*ER$$

Table 8 presents the regression analysis results, evaluating the influence of independent variables (AL, ER, SP, PR, PB) on the adoption of Sustainable Development Goal (SDG) solutions (Y). The model demonstrates strong explanatory power with an $R^2$ of 0.725, indicating that 72.5% of the variance in Y is explained by the predictors. Stakeholder Pressure (SP) emerges as the most influential factor, with a standardized coefficient (β=0.428), followed by Leadership Awareness (AL) (β=0.260), Policies and Regulations (PR) (β=0.190), Perceived Benefits (PB) (β=0.184), and Enterprise Resources (ER) (β=0.175). All variables are significant at $p < 0.01$, underscoring their critical roles in driving SDG adoption. Collinearity statistics, with variance inflation factors (VIF) below 2, confirm no multicollinearity concerns (Hair et al., 2010). The model's statistical significance ($F = 112.150$, $p < 0.01$) and Durbin-Watson statistic (1.907) validate its robustness.

**Table 9: Total Results**

| Hypothesis | Independent Variable | Standardized β | t-value | Sig. (p-value) | Result |
|---|---|---|---|---|---|
| H1 | Leadership Awareness (AL) | 0.260 | 6.423 | < 0.001 | Supported |
| H2 | Enterprise Resources (ER) | 0.175 | 4.249 | < 0.001 | Supported |
| H3 | Stakeholder Pressure (SP) | 0.428 | 9.845 | < 0.001 | Supported |
| H4 | Policies & Regulations (PR) | 0.190 | 4.792 | < 0.001 | Supported |
| H5 | Perceived Benefits (PB) | 0.184 | 4.587 | < 0.001 | Supported |

*Source: Self-synthesized author*

The regression analysis validates all five research hypotheses, confirming that key factors significantly influence the adoption of Sustainable Development Goal (SDG) solutions by SMEs in Dong Nai. Stakeholder pressure (SP) ($\beta = 0.428$, $p < 0.001$) is the most influential factor, supporting H3, which posits that external forces from customers, business partners, and regulatory bodies drive SDG adoption. This aligns with stakeholder theory (Freeman, 1984), emphasizing the role of external expectations in shaping business practices. Leadership awareness (AL) ($\beta = 0.260$, $p < 0.001$) is the second strongest predictor, confirming H1, which suggests that SME leaders who recognize the strategic value of SDGs are more likely to integrate sustainability into their operations. This finding is consistent with the Theory of Planned Behavior (Ajzen, 1991), which states that awareness and attitudes influence decision-making. The results also support H4, as policies and regulations (PR) ($\beta = 0.190$, $p < 0.001$) significantly impact SDG adoption, highlighting the importance of government incentives and regulatory frameworks in facilitating sustainability. Similarly, H5 is confirmed, with perceived benefits (PB) ($\beta = 0.184$, $p < 0.001$) playing a crucial role in motivating SMEs to adopt SDG solutions by demonstrating tangible advantages such as cost savings, improved brand reputation, and market expansion, aligning with Rogers' Diffusion of Innovations Theory (Rogers, 2003). Finally, enterprise resources (ER) ($\beta = 0.175$, $p < 0.001$), while significant, have the weakest impact, supporting H2 and suggesting that financial and technological constraints, though relevant, are not as decisive as external pressures and leadership commitment. These findings reinforce the need for a comprehensive approach, combining government policies, leadership development, and stakeholder engagement to accelerate SDG adoption among SMEs.

## V. CONCLUSIONS AND RECOMMENDATIONS

This study validated all proposed hypotheses, demonstrating the significant impact of leadership awareness (H1), enterprise resources (H2), stakeholder pressure (H3), policies and regulations (H4), and perceived benefits (H5) on the adoption of Sustainable Development Goal (SDG) solutions by small and medium-sized enterprises (SMEs). Grounded in established theoretical frameworks, these findings highlight the multifaceted nature of SDG adoption and offer practical insights for policymakers and practitioners.

Leadership Awareness (H1)**: "**Leadership awareness emerged as a significant determinant of SDG adoption ($\beta=0.260, p<0.01$). Leaders who recognize the strategic importance of SDGs are more likely to integrate sustainability into their business operations. This aligns with the Theory of Planned Behavior, which underscores the role of attitudes and awareness in shaping organizational decisions (Ajzen, 1991). Training programs, workshops, and case studies that emphasize the economic, social, and environmental benefits of SDGs can further strengthen leadership commitment

(Dalampira & Nastis, 2020; Johnson & Li, 2024)**".**

Enterprise Resources (H2)**: "**Enterprise resources also significantly influence SDG adoption ($\beta$=0.175,$p$<0.01). The resource-based view highlights the importance of financial, human, and technological resources for implementing sustainable practices (Barney, 1991). Many SMEs in developing regions face resource constraints that limit their ability to adopt SDGs. Providing financial aid, improving access to advanced technology, and implementing employee skill development programs can help address these challenges (Wang, Guo, & Lu, 2021; Green & Parker, 2024)**"**.

Stakeholder Pressure (H3)**: "**Stakeholder pressure was identified as the most influential factor ($\beta$=0.428,$p$<0.01), reflecting the critical role of external influences. Customers, business partners, and governments create substantial pressure for SMEs to adopt sustainable practices. Stakeholder theory emphasizes the need to meet these expectations to maintain legitimacy and competitiveness (Freeman, 1984). Collaborative partnerships, public-private initiatives, and sustainability awareness campaigns can enhance stakeholder engagement (ElAlfy, Palaschuk, & Weber, 2020; White & Ahmed, 2024)**"**.

Policies and Regulations (H4)**: "**Supportive policies and regulations significantly impact SDG adoption ($\beta$=0.190,$p$<0.01). Financial incentives, such as subsidies and tax breaks, along with clear regulatory frameworks, reduce barriers to sustainability (Köhler et al., 2022; Smith & Torres, 2024). Policymakers should focus on implementing tailored policies that address the unique needs of SMEs, particularly in resource-constrained regions**"**.

Perceived Benefits (H5)**: "**Perceived benefits, including cost savings, enhanced reputation, and market access, positively influence SDG adoption ($\beta$=0.184,$p$<0.01). SMEs motivated by these tangible advantages are more likely to invest in sustainability initiatives. This finding aligns with Rogers' Diffusion of Innovations Theory, which emphasizes the importance of perceived benefits in promoting the adoption of new practices (Rogers, 2003; Löwstedt et al., 2021)**"**.

To foster the adoption of Sustainable Development Goals (SDGs) among small and medium-sized enterprises (SMEs), this study proposes a comprehensive set of strategies addressing key barriers and leveraging enablers identified in the findings**:**

First, Enhance Leadership Awareness: "Leadership plays a critical role in SDG adoption. SME leaders need targeted education and training programs to understand the strategic importance of SDGs. Workshops, seminars, and online courses should focus on the economic, social, and environmental benefits of sustainability, demonstrating how aligning business operations with SDGs can enhance competitive advantage. Sharing success stories and case studies from other SMEs successfully implementing SDGs can inspire leaders to take actionable steps. Additionally, partnerships with academic institutions and industry experts can provide practical tools and frameworks for integrating sustainability into business strategies".

Second, Strengthen Resource Support: "Limited resources are a significant barrier to SDG adoption. Governments, financial institutions, and industry stakeholders should collaborate to provide financial aid, including low-interest loans, grants, and subsidies for sustainability initiatives. Enhancing access to advanced technologies, such as renewable energy systems and efficient manufacturing tools, can help SMEs implement sustainable practices more effectively. Moreover, employee training programs should be developed to build internal capacity, focusing on sustainability practices, innovation, and efficient resource management".

Third, Engage Stakeholders: "Building strong partnerships with customers, business partners, and governments is vital for fostering SDG adoption. Public-private collaborations can create platforms for knowledge exchange and resource sharing. Encouraging customer participation through green marketing campaigns can generate demand for sustainable products and services. Similarly, engaging local communities and civil society organizations can amplify the social impact of SMEs' sustainability efforts, fostering mutual trust and support".

Fourth, Optimize Policy Frameworks: "Policymakers play a pivotal role in reducing barriers to SDG adoption. Developing targeted incentives, such as tax benefits, financial subsidies, and simplified compliance processes, can encourage SMEs to adopt sustainability practices. Policies should address sector-specific challenges, providing tailored support to industries with higher sustainability potential. Regular stakeholder consultations can help ensure that policy measures are practical and accessible for SMEs".

Fifth, Communicate Benefits Effectively: "Awareness campaigns highlighting the tangible benefits of SDG

adoption—such as cost savings, enhanced brand reputation, and access to environmentally conscious markets—can motivate SMEs to embrace sustainability. Sharing real-world examples and testimonials from SMEs successfully implementing SDGs can further reinforce the value of sustainability. Industry associations and chambers of commerce can collaborate to create guides, toolkits, and outreach programs aimed at demonstrating the advantages of SDG integration**"**.

By implementing these strategies, SMEs can overcome existing barriers, capitalize on sustainability opportunities, and actively contribute to global SDG objectives, enhancing their competitiveness while fostering long-term sustainable development. This study has limitations that must be addressed in future research. First, its geographic focus on Dong Nai province limits the generalizability of findings to other regions. Second, its cross-sectional design prevents analysis of long-term impacts of SDG initiatives. Third, reliance on self-reported data may introduce biases. Additionally, factors such as organizational culture, innovation capacity, and global market dynamics were not explored. Expanding the geographic scope, adopting longitudinal studies, and integrating qualitative methods can further validate findings and enrich understanding of SDG adoption processes (UNDP, 2024).

**ABSTRACT**

This article introduced and conducted an illustrative experiment in the context of Viet Nam to demonstrate the effectiveness of the Technology Readiness Index (TRI) in predicting technology usage trends. Accordingly, the TRI 2.0 measurement study was based on a survey sample of 117 users in Ho Chi Minh City in August 2024. The results showed that with a high average level of technology readiness (TRI = 3.1777 points), users in Ho Chi Minh City belonged to the Pioneer Group. From there, the study showed the feasibility of referring to TRI when deploying new technologies suitable for the masses in Viet Nam through user grouping according to TRI 2.0 and considering the differences in TRI between user groups based on different demographic characteristics.

*Keywords: "TRI 2.0"," Technology Readiness Index", "trends in the use of new technologies"*

## I. INTRODUCTION

In recent years, with the strong digital transformation and the continuous development of advanced technologies, it has become more important than ever to measure the adoption and use of new technologies by users. An individual's technological readiness will reflect their tendency to accept technology in their daily activities (Parasuraman, 2000). To accurately assess this trend, the Technology Readiness Index (TRI) has become a useful tool, helping to measure user psychology, attitudes and behaviors towards technology applications. From there, businesses and researchers can better understand the technology readiness of the target audience, as well as forecast the development trend of the market.

TRI has attracted significant interest from the academic and business communities across the globe, particularly in researching user behavior and the ability to adopt new technologies. Since being developed by Parasuraman in 2000, TRI has become one of the most popular models for assessing the readiness of users for the adoption of technological advancements. Many international studies have applied the TRI to study a variety of fields, including online services, e-commerce, distance education, digital health, and financial technology (Lin & Hsieh, 2007; Liljander & ctg., 2006) as well as examining differences in TRI between groups of users with different demographic characteristics (Rojas-Mendez & ctg., 2015 and Blut & Wang, 2020).

Viet Nam is also in the general trend of strong digital transformation, especially in the banking and finance industry. Therefore, the application of TRI is extremely necessary to better understand the trend of consumer technology use. This supports organizations in building effective customer outreach strategies, differentiating themselves in a competitive market, and promoting the sustainable development of the industry. Yet, research and empirical application of technology readiness of users in Vietnam is still lacking, as evidenced by the limited focus on specific sectors or demographic groups in existing studies. For example, prior research has explored technology readiness among college students (Phung & ctg., 2024), the accounting and auditing industry (Anh & ctg., 2023), and luxury hotels (Huy & ctg., 2019). However, comprehensive studies assessing the broader population's technology readiness remain scarce, highlighting the need for more extensive research to address these gaps.

Therefore, this study examines relevant literature and conducts illustrative experiments in the context of Viet Nam to introduce TRI 2.0 as a strong predictor of technology-related behavioral intentions as well as actual user behaviors. especially for new technology. At the same time, research contributes to helping organizations and businesses in Viet Nam design, manufacture and release new technology products suitable for the masses. The composition of the article has 5 main parts, including (1) Introduction, (2) Literature reviews, (3) Research methodology, (4) Research findings and (5) Conclusions.

## II. LITERATURE REVIEWS

### 2.1. Technology Readiness Index (TRI)

Parasuraman & Colby (2014) argue that technological readiness is a personal trait that is stable, does not change rapidly in a short period of time or is suddenly affected by external stimuli. Accordingly, individuals with higher levels of technology readiness tend to have higher rates of acceptance of advanced technologies, stronger use of technology, and a higher sense of ease of use of these technologies. These people tend to be more confident in approaching and applying technological solutions, leading to higher efficiency in daily activities and professional work (Kuo, 2011; Lin & Chang, 2011).

TRI was built with the aim of better understanding people's tendency to embrace and use advanced technologies. Accordingly, the initial TRI 1.0 structure considers four main aspects, including innovativeness, optimism, insecurity, and discomfort of users in the face of new technology (Parasuraman, 2000).

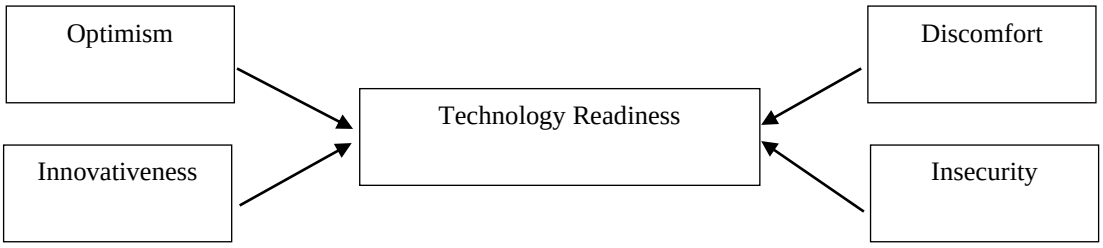

**Figure 1. TRI Model**

*Source: Parasuraman (2000)*

– Innovativeness: This is understood as the trend to be a pioneer in technology and a thought leader. Pioneers tend to easily adopt and use new technology, and they often adapt quickly to constantly updating technology (Parasuraman & Colby, 2014).

– Optimism: A person's belief that technology can provide greater control, increased flexibility, and efficiency in their daily lives or at work (Rinjany, 2020).

– Discomfort: This characteristic is labeled as a person who lacks control over technology. In other words, this aspect represents a lack of technological proficiency, leading to a feeling of inferiority when using technology. This low self-esteem will eventually create an uncomfortable feeling when using technology, causing them to continue to use traditional methods in their daily activities (Parasuraman & Colby, 2014).

– Insecurity: This characteristic is labeled for a lack of trust in technology-based transactions and pessimism about the technology's performance. In other words, a feeling of distrust or doubt that technology can accomplish a task properly. This discomfort is a barrier to technology adoption, such as a lack of confidence in using technology, perceptions of risks and costs, or concerns about security and privacy-related issues (Parasuraman & Colby, 2014).

In order to improve the TRI 1.0 model in the context of drastic and continuous changes in new technologies, researchers have proposed and implemented new development steps. In an effort to update the model, the authors conducted research through two phases, qualitative and quantitative, leading to the birth of TRI 2.0 (Parasuraman & Colby, 2014). The TRI 2.0 model implements significant streamlining when the number of questions is shortened from 36 questions to 16 questions and evenly distributed to the four core elements that remain the same from TRI 1.0.

**Table 1. TRI 2.0 Questionnaire**

| Variables | Code | Descriptions of scale items |
|---|---|---|
| Optimism | OPT1 | New technologies contribute to a better quality of life |
| | OPT2 | Technology gives me more freedom of mobility |
| | OPT3 | Technology gives people more control over their daily lives |
| | OPT4 | Technology makes me more productive in my personal life |
| Innovativeness | INN1 | Other people come to me for advice on new technologies |
| | INN2 | Ingeneral, I am among the first in my circle of friends to acquire new technology when |

| | | |
|---|---|---|
| | | it appears |
| | INN3 | I can usually figure out new high-tech products and services without help from others. |
| | INN4 | I keep up with the latest technological developments in my areas of interest |
| Discomfort | DIS1 | When I get technical support from a provider of a high-tech product or service, I sometimes feel as if I am being taken advantage of by someone who knows more than I do |
| | DIS2 | Technical support lines are not helpful because they don't explain things in terms I understand |
| | DIS3 | Sometimes, I think that technology systems are not designed for use by ordinary people |
| | DIS4 | There is no such thing as a manual for a high-tech product or service that's written in plain language |
| Insecurity | INS1 | People are too dependent on technology to do things for them |
| | INS2 | Too much technology distracts people to apoint that is harmful |
| | INS3 | Technology lowers the quality of relationships by reducing personal interaction |
| | INS4 | I do not feel confident doing business with a place that can only be reached online |

*Source: Parasuraman & Colby (2014)*

The overall TRI score is calculated based on the average score of the four dimensions listed in Table 1 after backcoding the scores for discomfort and insecurity (Parasuraman & Colby, 2014). From there, the five segments are labeled to users according to the TRI score as follows:

– Pioneers tend to hold both strong positive and negative views on technology or are people who want the benefits of new technology but are also more realistic about the difficulties and dangers;

– Hesitators are people with low levels of innovativeness;

– Explorers tend to have a high level of motivation and a low level of resistance;

– Avoiders tend to have high levels of resistance and low levels of motivation;

While TRI 2.0 is easy to use, it also has certain limitations. TRI 2.0 was developed in the context of the United States with outstanding advanced technology while the culture and technology in each different country can create different behavior patterns when researching and applying innovativeness. In other words, not every country can only rely on TRI scores to classify into four fixed groups of people according to the original TRI 2.0 model. Therefore, even if the value of TRI is affirmed and applied in analyzing the trend of using new technology, researchers continue to explore and adjust the TRI model. This is to adapt to developing market conditions and limited technological infrastructure compared to geographical environments that are focusing on TRI to assess the trend of using more advanced technologies such as artificial intelligence.

**2.1. Significance of the application of TRI in the context of Viet Nam**

In the current context of Viet Nam, TRI can become a useful tool in predicting the trend of users to use new technologies for a number of reasons, specifically as follows:

*Competition and innovativeness in the banking and finance sector are taking place strongly and fiercely in Viet Nam*

The banking and finance sector in Viet Nam is a pioneer in actively transforming the model to digital banking in order to effectively apply and exploit the achievements of the 4.0 Industrial Revolution. In order to implement this trend effectively, financial institutions are required to grasp technology consumption trends quickly and accurately. TRI allows to assess consumer readiness for new services, thereby helping financial institutions find opportunities to innovate and develop products in line with market needs (Parasuraman, 2000).

*Financial Technology (FinTech) is growing rapidly in Viet Nam*

Along with the development of the Industrial Revolution 4.0, Viet Nam is witnessing an explosion of products and services from FinTech such as e-wallets, mobile payments, digital banking, and blockchain. However, along with

development opportunities, FinTech in Viet Nam still faces many challenges. For FinTech to be successful, one of the important things is to understand the readiness of users to adopt these technologies (Rogers, 1983). TRI helps measure factors such as user optimism and innovativeness, helping organizations have appropriate strategies for deploying financial products and services.

*Users in Viet Nam still have a risk-averse mentality and lack of trust in new technologies*

In Viet Nam, there are still many consumers who are hesitant to access new technologies in the financial sector, due to security and safety concerns. In 2023, Viet Nam has about 13,900 cyberattacks and more than 83,000 computers and servers have fallen victim to ransomware-related attacks with the aim of extortion (KPMG, 2024). TRI helps assess these concerns through factors such as insecurity and discomfort with technology, helping financial institutions adjust their approach to building trust with customers.

*Over time, users change consumer behavior and preferences in the digital age, especially after COVID-19*

The industrial revolution 4.0 and the digital economy are increasingly popular and are becoming an objective reality trend for many countries and many sectors of the economy. Under the impact of the digital economy, consumers have had a marked change in shopping behavior (Xiong, 2022). TRI not only helps measure the technological readiness of users, but also provides insight into the change in consumer behavior as they transition from traditional services to digital banking services (Naidu & Sainy, 2018). This is especially important in the context that new technology has been pushing Viet Nam closer to a cashless society when smart payments are popular with consumers.

In conclusion, applying TRI to the Vietnamese context in the banking and finance sector not only helps organizations grasp the technological readiness of consumers but also supports in building effective customer access strategies, differentiating themselves in a competitive market and promoting the sustainable development of the industry.

**2.3. Some related studies**

Blut & Wang (2020) conducted a meta-analysis aimed at improving the understanding of TRI by re-examining its aspects as well as investigating the mediating mechanism and regulatory influence in the relationship between TRI and users' use of new technologies. Through 193 independent samples extracted from 163 papers reported by 69,263 individuals, Blut & Wang (2020) found that TRI is best conceptualized as a two-dimensional structure that distinguishes between motivational aspects (innovativeness, optimism) and inhibitors (insecurity, discomfort). The authors also show the indirect impact of these aspects on the use of technology through the intermediaries proposed by the quality-value-satisfaction chain and the Technology Acceptance Model. Moreover, the strength of the relationships between TRI and the use of new technologies depends on the type of technology (for pleasure or pragmatism), the characteristics of the company being evaluated (voluntary or compulsory use; support from the company), and the firm context (gross domestic product; human development index). Finally, the client's age, education, and experience are determined to be relevant to the TRI. These findings enhance regulators' understanding of how TRI affects users' use of technology.

Lin & Hsieh (2007) applied TRI to learn about the technological readiness of 413 consumers in Taiwan for online self-service services, especially in the banking and telecommunications industries. The results show that user optimism and innovativeness have a positive impact on the acceptance of online services.

Liljander & ctg. (2006) explored how 1258 customers of a European airline's loyalty program responded to online customer care services and digital self-service tools using TRI. Data analysis shows that only optimism and creativity form unique personal aspects. Optimism best explains consumer behavior towards self-service technology, while innovativeness has only a small impact on attitudes towards registration via the Internet or mobile phones.

Rinjany (2020) based on the TRI model to simultaneously study the technology readiness and technology acceptance of 225 people in Jakarta, Indonesia with new technology on citizen management in the smart city program. The results showed that the level of technology readiness of Jakarta residents was identified as low (TRI = 2.7 points) and was considered into the Explorers Group. This is because the contribution value of optimism and innovativeness is high in the total TRI value. At the same time, those who are classified into the Discovery Group are individuals who are very open to progress and the adoption of new modern technology in their daily lives.

Rojas-Mendez & ctg. (2015) surveyed the differences in demographics and attitudes about the technology readiness index in the developed country – the United States and the developing country – Chile. The study used TRI to study simultaneously in two countries, with 499 samples in the US and 501 in Chile. The results indicate that there are differences in gender, age, and education across all four aspects of TRI and that there is no significant difference between the indicators in the two countries. Thereby, the authors say that TRI can be used for comparison in different regions and propose to expand research on TRI to other clusters of countries such as Asia and Africa.

In summary, these studies have shown that TRI can be widely applied to analyze the level of technology adoption and use in various sectors and geographical locations, including banking and finance, helping researchers and businesses better understand consumer behavior.

## III. METHODOLOGY

The authors conducted a quantitative study based on the TRI 2.0 framework (Parasuraman & Colby, 2014) through a survey of users in Ho Chi Minh City, employing convenience sampling for data collection. The 5-point Likert scale was used for the variables in the study, which included 5 choices: (1) Completely disagree, (2) Disagree, (3) Neutral, (4) Agree, (5) Completely agree. The authors also collected demographic information of survey participants (gender, age, education level, monthly income, experience using electronic networks, experience in online payments, level of self-assessment of financial literacy, occupation) to look for differences in TRI between groups of users based on other demographic characteristics part with.

According to Hair & ctg. (2006), the minimum sample size is calculated using the formula $n \geq m \times 5$ (n is the sample size, m is the number of observed variables) for exploratory factor analysis (EFA). For 16 observed variables in 4 factors of the TRI 2.0 scale, the minimum sample size must be 80 (guaranteed according to the formula $16 \times 5 = 80$). During the implementation of the survey in August 2024, the number of valid votes collected was 117, meeting this condition. The data is processed via SPSS 20.0 software, with the main steps being (1) Determining the reliability of the scale according to Cronbach's Alpha; (2) Exploratory factor analysis (EFA); (3) Pearson correlation analysis; (4) Statistics describing the TRI score and component variables; (6) Object clustering; (7) Chi-square analysis at a significance level of 10%.

For the classification of the cluster, the authors used a two-stage clustering process, including (1) the Ward Method and the Euclidean distance and (2) the K-means cluster analysis (Yim & Ramdeen, 2015) to divide the individuals in the survey sample into different groups based on TRI scores and 4 aspects of the scale to allow for a deeper understanding of the characteristics and the attitude of each group towards technology.

## IV. FINDINGS

**Table 2. Demographic Profile**

| Demographic variable | Categories | Number of Respondents | Percentage |
|---|---|---|---|
| **Age** | 18-30 | 106 | 90,6 |
| | 31-45 | 0 | 0 |
| | 46-60 | 6 | 5,1 |
| | Above 60 | 5 | 4,3 |
| **Gender** | Male | 41 | 35 |
| | Female | 76 | 65 |
| **Education** | Higher secondary or below | 13 | 11,1 |
| | College | 2 | 1,7 |
| | Bachelor | 100 | 85,5 |
| | Master or higher | 2 | 1,7 |

| | | | |
|---|---|---|---|
| **Monthly income** (in million VND) | Below 10 | 97 | 82,9 |
| | 10–20 | 10 | 8,5 |
| | Over 20–30 | 1 | 0,9 |
| | Over 30–40 | 4 | 3,4 |
| | Above 40 | 5 | 4,3 |
| **Self-assessed financial literacy** | No knowledge or skills | 2 | 1,7 |
| | Limited knowledge and skills | 57 | 48,7 |
| | Sufficient knowledge and skills. | 4 | 37,6 |
| | Good knowledge and skills. | 10 | 8,5 |
| | Excellent knowledge and skills. | 4 | 3,4 |
| **Internet Experience** | No Experience | 1 | 0,9 |
| | 0-2 years | 4 | 3,4 |
| | Over 2-5 years | 25 | 21,4 |
| | Over 5-10 years | 42 | 35,9 |
| | Above 10 years | 45 | 38,5 |
| **Online Payment Experience** | No Experience | 1 | 0,9 |
| | 0-2 years | 27 | 23,1 |
| | Over 2-5 years | 71 | 60,7 |
| | Over 5-10 years | 13 | 11,1 |
| | Above 10 years | 5 | 4,3 |
| **Occupation** | Private employee | 25 | 21,4 |
| | Public employee | 0 | 0 |
| | Self-employed | 0 | 0 |
| | Retired | 0 | 0 |
| | Other | 92 | 78,6 |

*Source: Extracted from analysis results.*

Statistics describing the characteristics of respondents showed that the majority of respondents participating in the survey were young people from 18 to 30 (90.6%), with most respondents not belonging to specific occupational groups listed (78.6%), of which women dominated (65%), had a university degree (85.5%), and earned less than 10 million VND/month (82.9%). have 5 years or more of experience in using the Internet (74.4%), have 2 years or more of experience in using online payments (76.1%). However, nearly half of the respondents (48.7%) self-identified their financial knowledge and skills as limited.

**Table 2. Cronbach's Alpha Coefficient Analysis Results**

| Observed variables | Corrected Item – Total Correlation | Cronbach's Alpha if Item Deleted |
|---|---|---|
| **OPT (Cronbach's Alpha = 0,864)** | | |
| **OPT1** | 0.701 | 0.832 |

| | | |
|---|---|---|
| **OPT2** | 0.726 | 0.823 |
| **OPT3** | 0.718 | 0.831 |
| **OPT4** | 0.729 | 0.819 |
| **INN (Cronbach's Alpha = 0,826)** | | |
| **INN1** | 0.627 | 0.794 |
| **INN2** | 0.737 | 0.739 |
| **INN3** | 0.686 | 0.765 |
| **INN4** | 0.571 | 0.816 |
| **DIS (Cronbach's Alpha = 0,840)** | | |
| **DIS1** | 0.592 | 0.838 |
| **DIS2** | 0.718 | 0.779 |
| **DIS3** | 0.744 | 0.771 |
| **DIS4** | 0.659 | 0.804 |
| **INS (Cronbach's Alpha = 0,810)** | | |
| **INS1** | 0.622 | 0.756 |
| **INS2** | 0.701 | 0.728 |
| **INS3** | 0.689 | 0.732 |
| **INS4** | 0.518 | 0.820 |

*Source: Extracted from analysis results*

Table 2 shows that the observed variables all have a total variable correlation coefficient greater than 0.3, so the observed variables are accepted and satisfactory. In addition, Cronbach's Alpha reliability coefficient is greater than 0.8, proving a suitable scale. Therefore, the 16 observation variables of 4 independent variables all showed a suitable scale and proceeded to proceed to the next step, Exploratory Factor Analysis (EFA).

**Table 3. The Kaiser-Meyer-Olkin Test and Ballet's Test**

| | | |
|---|---|---|
| **Number of KMO sampling appropriateness** | | 0.816 |
| **The Barlett's Test** | **Approximate Chi-Square** | 989.159 |
| | **Degree of freedom** | 120 |
| | **Significance** | 0.000 |

*Source: Extracted from analysis results*

Table 3 presents the results of the Bartlett's test and KMO test, indicating that the observed variables are correlated across the entire dataset. This satisfies the requirement of $0.6 \leq KMO \leq 1$ and a p-value significance level of less than 0.05, confirming the suitability of the data for conducting exploratory factor analysis (EFA) (Hair & ctg., 2006).

**Table 4. EFA Results**

| **Observed varibales** | **Component** | | | |
|---|---|---|---|---|
| | **1** | **2** | **3** | **4** |
| **OPT** | | | | |
| **OPT1** | 0.857 | | | |
| **OPT2** | 0.826 | | | |
| **OPT3** | 0.823 | | | |
| **OPT4** | 0.816 | | | |
| **DIS** | | | | |
| **DIS3** | | 0.841 | | |
| **DIS2** | | 0.839 | | |
| **DIS4** | | 0.681 | | |
| **DIS1** | | 0.622 | | |
| **INS** | | | | |

| | |
|---|---|
| **INS3** | 0.851 |
| **INS2** | 0.791 |
| **INS1** | 0.684 |
| **INS4** | 0.687 |
| **INN** | |
| **INN2** | 0.899 |
| **INN3** | 0.795 |
| **INN1** | 0.758 |
| **Extraction Sums of Squared Loadings** | 70.531 |
| **Eigen value** | 1.008 |

*Source: Extracted from analysis results*

Table 4 presents the EFA results with 15 observed variables after INN4 removal due to the high load factor on the two factors with the difference between the load factors less than 0.2. Accordingly, these 15 observed variables all had a factor load coefficient greater than 0.55, meeting the criterion of statistical significance with a sample number of 117 (Hair & ctg., 2006). The total variance is 70.531% (> 50%).

**Table 5. Pearson correlation coefficient (N = 117)**

| | | **OPT** | **INN** | **DIS** | **INS** |
|---|---|---|---|---|---|
| **OPT** | Rho | 1 | 0.271 | 0.232 | 0.227 |
| | Sig. (2-tailed) | | 0.003 | 0.012 | 0.014 |
| **INN** | Rho | 0.271 | 1 | 0.395 | 0.152 |
| | Sig. (2-tailed) | 0.003 | | 0.000 | 0.101 |
| **DIS** | Rho | 0.232 | 0.295 | 1 | 0.612 |
| | Sig. (2-tailed) | 0.012 | 0.000 | | 0.000 |
| **INS** | Rho | 0.227 | 0.152 | 0.612 | 1 |
| | Sig. (2-tailed) | 0.014 | 0.101 | 0.000 | |

*Source: Extracted from analysis results*

Table 5 shows that the pairs of variables are weakly correlated with each other because the correlation coefficients range from 0.152 to 0.395.

**Table 6. Descriptive statistics of TRI scores and component variables**

| | **Min** | **Max** | **Mean** | **SD** | **Skewness** | **Kurtosis** |
|---|---|---|---|---|---|---|
| **OPT** | 1.00 | 5.00 | 4.3376 | 0.74374 | -2.126 | 6.864 |
| **INN** | 1.00 | 5.00 | 3.2963 | 1.01311 | -0.136 | -0.469 |
| **DIS** | 1.00 | 5.00 | 3.2543 | 0.91620 | -0.213 | -0.393 |
| **INS** | 1.00 | 5.00 | 3.6688 | 0.83229 | -0.510 | 0.705 |
| **Total TRI score** | 2.00 | 4.44 | 3.1777 | 0.42321 | 0.412 | 0.485 |

*Source: Extracted from analysis results*

Table 6 shows that the technology readiness level of respondents in Ho Chi Minh City is at a high average level (TRI = 3.1777), with a high level of optimism (OPT = 4.3376) and a high average level of innovativeness (INN = 3.2963). However, they also felt quite uncomfortable (DIS = 3.2543) and quite insecure (INS = 3.6688). The INN had the largest standard deviation (1.01311), indicating the existence of large differences in the responses, while the remaining variables had a standard deviation lower than 1, indicating a high concentration around the mean. The above results are relatively consistent with the reality of the trend of using new technologies and the effectiveness in converting input resources into innovativeness outputs in Vietnam in general and Ho Chi Minh City in particular.

The World Intellectual Property Organization (WIPO) has published the Global Innovation Index (GII) Report 2024, according to which, Vietnam ranks 44 out of 133 countries and economies and has always had higher innovativeness results than the continuous development level over the past 14 years. Although users are still afraid of

technological risks in the face of great risks of errors, malware and phishing attacks, it can be seen that Vietnam is pursuing a risk-taking policy to encourage technological development and innovativeness (KPMG, 2024). Based on the TRI score, the respondents can be placed in the Pioneer Group.

After conducting a hierarchical cluster analysis with the Ward method and Euclidean squared distance, the authors conducted a K-means cluster with the number of clusters K = 2. Table 7 shows that the data are divided into two separate clusters with a relatively balanced number of observations: Cluster 1 (n = 60) and Cluster 2 (n = 57). Cluster 2 had a higher mean score of each aspect when comparing correlations and the differences were of high statistical significance (Sig. < 0.05) (Table 7).

**Table 7. K-Means Cluster**

| | Cluster 1 | Cluster 2 | F value | Sig. |
|---|---|---|---|---|
| **OPT** | 4.19 | 4.50 | 5.198 | 0.024 |
| **INN** | 2.81 | 3.81 | 37.017 | 0.000 |
| **DIS** | 2.55 | 4.00 | 193.579 | 0.000 |
| **INS** | 3.23 | 4.13 | 48.408 | 0.000 |
| **Total TRI score** | 3.31 | 3.1 | | |
| **N of Valid Cases** | 60 | 57 | | |

*Source: Extracted from analysis results.*

The study found differences in TRI between groups of respondents based on gender. Table 8 shows the gender distribution between the two clusters and the results of the independent examination of gender and clustering. The p-value of the Pearson Chi-Square inspection is 0.051 (< 0.1). Therefore, at a significance level of 10%, it can be concluded that there is a statistically significant association between sex and the two clusters. At the same time, the analysis results show that the Phi value is -0.180 at a significant level of 10%. This suggests that there is an inverse relationship between gender and clustering. Specifically, the results indicate that female respondents are more likely to belong to Cluster 1 – Pioneer Group (with 73.3% female), while male respondents are more likely to belong to Cluster 2 – Pioneer Group with a stronger level of technology readiness (with 43.9% male and a more balanced gender distribution). The results of the analysis also showed that there were significant differences based on gender between the two clusters.

**Table 8. Chi-square Test on gender**

| **Frequencies** | | | |
|---|---|---|---|
| **Gender** | **Cluster 1** | **Cluster 2** | **Total** |
| **Male** | 16 (26.7%) | 25 (43.9%) | 41 (35%) |
| **Female** | 44 (73.3%) | 32 (56.1%) | 76 (65%) |
| **N of Valid Cases** | 60 | 57 | 117 |
| **Chi-square Tests** | | | |
| | **Value** | **df** | **Asymptotic Sig.** |
| **Pearson Chi-Square** | 3.796 | 1 | 0.051 |
| **Likelihood Ratio** | 3.818 | 1 | 0.079 |
| **Linear-by-Linear Association** | 3.763 | 1 | 0.052 |
| **Symmetric Measures** | | | |
| | **Value** | **Approx. Sig.** | |
| **Phi** | -0.180 | 0.051 | |
| **Cramer's V** | 0.180 | 0.051 | |

*Source: Extracted from analysis results.*

Figure 2 shows the final classification results based on the differences in TRI between gender-based respondent groups. Accordingly, the study identified two user clusters with separate levels of new technology readiness, including Cluster 1 as the Pioneer Group and Cluster 2 as the Pioneer Group with a stronger level of technology readiness.

Accordingly, respondents have an average high level of technology readiness, they are optimistic but also have concerns about potential risks in new technologies.

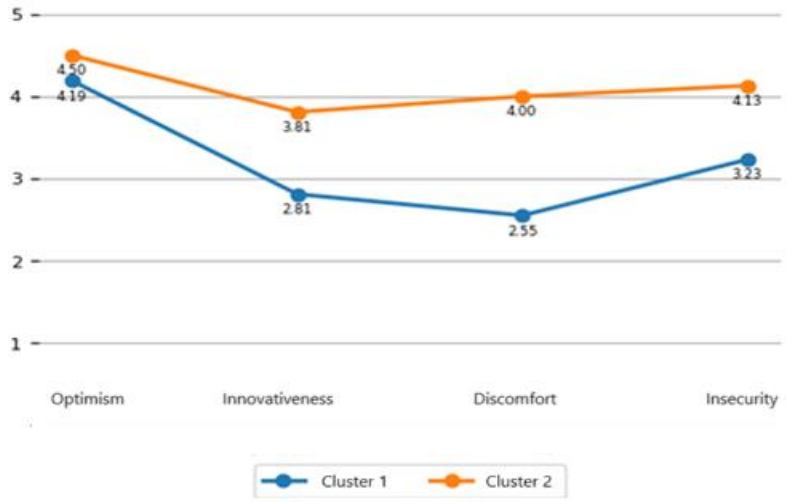

**Figure 2. Technology User Classification (N=117)**

*Source: Extracted from analysis results.*

## V. CONCLUSIONS

Viet Nam has made great strides in promoting digital transformation in the 4.0 revolution, but the reality is that there are still many challenges that need to be solved. With the results of the above study, the authors recognized two interesting information, namely (1) the classification of users based on TRI and (2) the differences in TRI between groups of users based on different demographic characteristics. They can play a useful role in helping organizations in Viet Nam assess users' technology usage trends to deploy new technology products that are suitable for the masses as well as contribute to improving users' awareness of the benefits and risks of using technology. Thus, TRI can be used as a practical way to survey the market, reach target customers, and apply it within the organization; thereby offering a reasonable approach to develop the organization in the digital age. Thereby, strengthening communication activities, promoting, raising awareness, and encouraging the participation of people, authorities and businesses in digital transformation will contribute to accelerating the digital transformation process.

# THE IMPACT OF INFORMATION TECHNOLOGY ON THE IMPLEMENTATION OF MANAGEMENT ACCOUNTING IN THE CIRCULAR ECONOMY: PROPOSED RESEARCH MODEL AND SCALE

**Nguyen Thi Phuong Thao**[1]

[1]Faculty of Economics, Tay Bac University

*Corresponding: phuongthao@utb.edu.vn

**ABSTRACT**

Many enterprises are transitioning from a linear economy model to a circular economy, during which management accounting practices also undergo changes to align with the new paradigm, supported by information technology systems. Using a literature review and expert interviews, this study proposes a research model and a scale to measure the impact of information technology on the implementation of management accounting and the level of participation in the circular economy of enterprises. The theoretical model includes three factors, with a proposed scale comprising 39 indicators. A survey of 228 enterprises in Son La province, a region known for its strong performance in agriculture and potential for circular economy development, was conducted. The scale was validated using Cronbach's Alpha coefficient and exploratory factor analysis. The results indicate three factors: The level of participation in the circular economy with four indicators; Information technology with six indicators; The implementation of management accounting with five indicators. These factors meet the conditions for validation and lay the foundation for future research.

*Keywords*: Circular economy, information technology, management accounting, small and medium-sized enterprises

## I. INTRODUCTION

Many enterprises are currently transitioning from the linear economy model to the circular economy (CE). The typical activities associated with CE include waste recovery, substitution of raw materials and components, investments aimed at reducing the environmental impact of products, ecological design for CE, resource efficiency, waste evaluation, and other related factors. Overall, CE is related to changes in businesses, industries, and economies through shifts in values, norms, behaviors, and societal attitudes (Chizaryfard et al., 2021). Therefore, regardless of the level of involvement in CE, businesses must adapt their production processes, information systems, and management practices. Management accounting practices (MAP) are among the aspects that must change to meet the requirements of CE, such as assessing the financial impact of sustainable practices, ecological design, resource recovery strategies, measuring performance from non-financial perspectives, and providing information to encourage sustainable resource exchange. Consequently, traditional MAP reporting systems will become outdated and must evolve continuously to align with management needs.

With the explosion of science and technology, the application of IT in accounting practices in general, and MAP in particular, is inevitable, bringing significant changes to accounting practices. Even small and micro-enterprises can easily invest in accounting software. However, many software companies today primarily focus on developing products for financial accounting needs, often overlooking the development of features that meet the requirements of management accounting techniques, or at most, only supporting basic techniques. In the context of CE, how should the impacts of IT on MAP in enterprises be measured? This study aims to build a research model, identify measurement scales, and initially test the scale based on a survey of 228 enterprises in Son La province – a region with notable achievements in agriculture and strong potential for CE development. The research results serve as a foundation for future studies.

## II. MATERIAL AND METHOD

The study was conducted through the following steps:

Step 1: The author synthesized relevant studies, then compiled factors and proposed a theoretical research model

and a draft measurement scale.

Step 2: Through in-depth interviews with experts such as chief accountants, directors, and accountants, the measurement scale was further refined to ensure its suitability for the characteristics of enterprises in Son La.

Step 3: A survey was conducted, and data were collected.

Step 4: The reliability of the measurement scale was tested using Cronbach's Alpha and exploratory factor analysis (EFA).

- Testing the reliability of the measurement scale using Cronbach's Alpha: Variables were excluded if their item-total correlation coefficient was less than 0.3. The scale was accepted if Cronbach's Alpha ≥ 0.6 (Nunnally & Bernstein, 1994).
- EFA: Principal Axis Factoring (PAF) and Promax rotation were used. The EFA results must meet the following conditions:

KMO coefficient ≥ 0.5 and Bartlett's test of sphericity significance ≤ 0.05; (2) Factor loadings ≥ 0.5 to ensure convergent validity (Hair et al., 2017); (3) Cumulative variance explained ≥ 0.5; (4) Eigenvalue > 1 (Hair et al., 2017), with the number of factors determined based on the proportion of variance explained by each factor; (5) The difference in factor loadings for an observed variable between factors must be ≥ 0.3 to ensure discriminant validity (Jabnoun & Al-Tamimi, 2003).

The sample size for EFA analysis ensures that the ratio of observations to measurement variables (N/p) is 5:1 (Hair et al., 2017). With a total of 39 observed variables, the minimum sample size is 39x5=195. The study used a non-probability convenience sampling method. The survey participants included directors, chief accountants, and accountants. Each enterprise provided one respondent to complete the survey. The questionnaire distribution and collection process took place in June and July 2024. A total of 243 questionnaires were collected, and 228 valid responses were used after excluding 15 incomplete responses, which exceeds the minimum sample size.

## III. RESULT AND DISCUSSION

### 3.1. Theoretical Basis

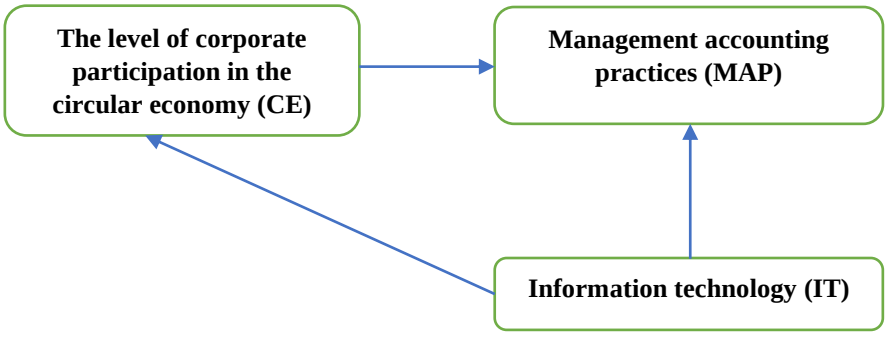
Since the mid-1970s, Information Processing Theory has been developed by Galbraith (Randolph & Richard, 2005). This theory revolves around three key concepts: information processing capacity, information processing requirements, and the alignment between these two factors to optimize organizational performance. Organizations must regulate information to mitigate environmental uncertainty and enhance decision-making processes.

According to Information Processing Theory, the suitability of an organization's information processing capability has a significant impact on its operational effectiveness (Galbraith, 1973). Businesses can adopt two strategic approaches to cope with environmental uncertainty and increasing information demands. The first strategy involves developing factors that minimize the impact of uncertainty, while the second focuses on enhancing information processing capacity to acquire more effective information, thereby reducing uncertainty (Premkumar et al., 2005).

To successfully implement these strategies, organizations need to establish a connection between information requirements and processing capabilities. In the context of rapid technological advancements and deeper integration into CE, businesses should adopt these strategies by either leveraging IT applications or modifying MAP to enhance information efficiency. This, in turn, enables MA to better serve corporate information needs within the CE framework. Based on this rationale, this study adopts Information Processing Theory as the foundation for designing MAP content. Only when MA is effectively conducted—ensuring quality, alignment with objectives, and adherence to CE principles—can it provide relevant and high-quality MA information.

### 2. Research Model and Measurement Scales

### 2.1. Research Model



The extent of participation in CE significantly influences MAP, as confirmed by various studies. Integrating CE principles requires changes in the MA framework to support sustainable decision-making and resource efficiency. For instance, regenerative MA provides tools for cost control and value maximization while emphasizing sustainability from the early stages of production. Additionally, CE participation often leads decision-makers to bypass formal

accounting systems in favor of informal methods and life cycle analyses, fostering multi-stakeholder dialogue and new organizational configurations (Aureli et al., 2023). This transition enhances accountability and transparency in waste management and recycling (Luminita et al., 2024). Furthermore, sustainable accounting and integrated reporting are essential for measuring impacts and risks related to waste management, thereby improving competitiveness and innovation in CE (Ionescu & Andronie, 2024). Innovations in MAP due to CE participation include activity-based costing and environmental MA, which facilitate sustainable cost management by improving cost allocation and environmental cost tracking (Hossain & Hasan, 2024). Additionally, CE challenges businesses with supply chain restructuring, indirectly affecting MAP (Shiva, 2024). Overall, research agrees that CE participation impacts MAP either directly or indirectly.

The impact of Information Technology IT on MAP is profound, reshaping processes, enhancing decision-making, and improving efficiency. Integrating advanced IT tools such as Enterprise Resource Planning (ERP) systems and cloud computing has become essential, especially for small and medium enterprises (SMEs). IT's influence on MAP has been a critical topic in accounting research. Shields (1998) provided deep insights into MAP, while Granlund et al. (2002) examined ERP's impact on MAP, questioning whether the effects are immediate or long-term. By 2011, Granlund expanded this research to encompass accounting information systems and MAP control (Granlund, 2011). Alves (2010) contributed to understanding how IT affects accounting task execution, highlighting its significant implications for research and MAP.

IT adoption has evolved beyond simple financial management systems to enterprise resource planning (ERP) and large-scale accounting information processing systems (Zheng et al., 2011). This shift has streamlined accounting functions and enhanced managerial decision-making quality through real-time data access and improved accuracy (Putro, 2023; Omar, 2023). These changes impact various business aspects, including performance and operational efficiency. However, IT adoption also poses challenges. Continuous IT advancements bring numerous benefits but also raise integration issues and ongoing training demands, particularly for SMEs (Omar, 2023; Zafar et al., 2024). Businesses must adapt their regulations and organizational structures to successfully implement IT in accounting (Putro, 2023) to maintain competitive advantage.

Numerous studies confirm that digitalization drives sustainable activities and CE (Antikainen et al., 2018). Specific IT contributions include product-sharing models in Scandinavia (He et al., 2021) and blockchain technology's impact on CE, emphasizing IT's role in sustainability and corporate social responsibility (Kumar et al., 2022). Optimized information flows and actor integration are critical for CE participation (Berglund-Brown et al., 2022), particularly in promoting circular consumption behavior (Gomes et al., 2023). These factors provide significant development opportunities for businesses engaged in sustainable and innovative activities.

*Source: Proposed by the author*

**Figure 1 - Research model**

Research Hypotheses:

H1: The level of corporate participation in CE influences management accounting practices.

H2: Information technology affects the level of corporate participation in the circular economy.

H3: Information technology influences management accounting practices.

**2.2. Measurement Scale**

### 2.2.1. Level of Corporate Participation in the Circular Economy

The level of corporate participation in CE is typically assessed based on various aspects, including waste recovery, substitution of raw materials and components, investments aimed at reducing the environmental impact of products, eco-design for CE, resource efficiency, and waste assessment, along with other related variables. Based on expert opinions, six indicators have been slightly adjusted in wording to align with the language and context of Sơn La.

**Table 1 - Summary of Measurement Scale for the Factor Level of Corporate Participation in the Circular Economy**

| Code | Indicator | Source |
|---|---|---|
| **CE1** | The company has consulted stakeholders on environmental management issues | Alhamdi Mohammed, Suzana Sulaiman, Norlaila Md Zin (2022) |
| **CE2** | The company has implemented waste recovery/recycling | |
| **CE3** | The company has sold recycled products | |
| **CE4** | The company has reused waste materials | |
| **CE5** | The company has focused on energy efficiency | Smol, M., Kulczycka, J., & Avdiushchenko (2017) |
| **CE6** | The company has used renewable energy | |

*Source: Compiled by the author*

The level of corporate participation in CE is measured using a 5-point Likert scale with the following conventions: 1.Never; 2. Rarely; 3. Occasionally; 4. Frequently; 5. Very frequently.

### 2.2.2. Management Accounting Practices

MAP aims to assess the extent to which profit expectations are met in business activities and, more importantly, to explore ways to improve future profitability (Waymire, 2009). The core tasks of MA include planning, cash flow forecasting, and performance goal setting. Building upon the research of Shields and Shelleman (2016) and in accordance with Section 1, Part I, Circular 53/2006/TT-BTC, which provides guidelines on MA in enterprises, MAP involves collecting, processing, analyzing, and providing economic and financial information as required for management and economic decision-making within an accounting entity.

MAP provides information on internal business activities to support management, control, and economic decision-making, including: cost allocation for individual departments, tasks, and products; analysis and evaluation of actual performance against planned revenue, costs, and profits; selection of relevant information for short- and long-term investment decisions; and the preparation of production and business budgets. Accordingly, MAP consists of four key activities: Planning, Execution and Control, Evaluation, and Decision-Making.

CE revolves around five main components: waste recovery, recycling, energy consumption reduction, renewable energy use, and eco-conscious activities. When a company engages in CE, MAP must integrate environmental and social factors, helping businesses adjust their operations to minimize environmental impact and sustain resources, thereby enabling a more comprehensive value assessment system.

Based on MAP's primary functions in implementing CE-related activities, the author has developed 20 indicators, categorized as follows: Planning (07 indicators), Execution and Control (06 indicators), Evaluation (03 indicators), Decision-Making (04 indicators). According to expert opinions, indicators 2 and 3 have been refined for clarity, reflecting the distinct characteristics and objectives of CE. A 5-point Likert scale is used with the following values: 1. Never; 2. Rarely; 3. Occasionally; 4. Frequently; 5. Very frequently. These indicators were designed to solicit expert opinions on their relevance and the ability of respondents to provide information. The summary of in-depth interview results is presented in the following table:

**Table 2 - Summary of Measurement Scale for the Factor Management Accounting Practices Implementation**

| Code | Indicator | Notes |
|---|---|---|
| | **A. PLANNING** | |
| | **I. Cost Budgeting** | |

| Code | Indicator | Notes |
|---|---|---|
| MAP1 | Budgeting costs for waste recovery | |
| MAP2 | Budgeting costs for waste treatment for recycling | Added phrase: "for recycling" |
| MAP3 | Budgeting costs for material replacement/improvement to reduce energy consumption | Added phrase: "to reduce energy consumption" |
| MAP4 | Budgeting costs for renewable energy exploitation | |
| | **II. Revenue Budgeting** | |
| MAP5 | Budgeting revenue from waste reuse within the enterprise | |
| MAP6 | Budgeting revenue from material replacement/improvement to reduce energy consumption | |
| MAP7 | Budgeting revenue from renewable energy exploitation | |
| | **B. IMPLEMENTATION AND CONTROL** | |
| MAP8 | Accounting for detailed monitoring of waste recovery and treatment costs | |
| MAP9 | Accounting for detailed monitoring of material replacement/improvement costs | |
| MAP10 | Accounting for detailed monitoring of renewable energy exploitation costs | |
| MAP11 | Accounting for detailed monitoring of revenue from waste reuse | |
| MAP12 | Accounting for detailed monitoring of revenue from reduced energy consumption | |
| MAP13 | Accounting for detailed monitoring of revenue from renewable energy exploitation | |
| | **C. EVALUATION** | |
| MAP14 | Accounting for comparing actual costs with budgeted costs | |
| MAP15 | Accounting for comparing actual revenue with budgeted revenue | |
| MAP16 | Accounting for variance analysis to determine causes | |
| | **D. DECISION-MAKING** | |
| MAP17 | Accounting for preparing variance reports on costs and causes | |
| MAP18 | Accounting for preparing variance reports on revenue and causes | |
| MAP19 | Managers frequently use cost information for decision-making | |
| MAP20 | Managers frequently use revenue information for decision-making | |

*Source: Compiled by the author*

**2.2.3. Information Technology**

To measure the IT variable, studies often consider two aspects: Information System Quality and User Satisfaction (Petter et al., 2008). In-depth interview results reveal the following insights:

Information System Quality is evaluated based on the following factors: Accuracy, Security, Responsiveness to User Needs, and Technical Capability.

Experts agreed that Responsiveness to User Needs is a fundamental requirement of any IT system. However, enterprises and even IT providers today are increasingly focusing on technologies that support financial accounting rather than MA. This is understandable since financial accounting is mandatory. Therefore, to ensure clarity, this indicator should be explicitly stated as: Responsiveness to Management Accounting Technical Requirements to ensure that respondents evaluate the IT system's capability in supporting MA rather than financial accounting.

Technical Capability was also unanimously recognized as an important indicator. However, since most interview respondents are not IT specialists, it is challenging for them to assess the technical capacity of an IT system at a given

time. Moreover, since respondents include business managers who are not direct IT users, they typically evaluate the technical capability of accounting technology solutions based on publicly available information rather than firsthand experience.

Therefore, experts agreed to refine the indicator as: Publicly Recognized Technical Capability. User Satisfaction is measured through two key dimensions: Satisfaction with reports generated by the IT system and Satisfaction with IT support services. Experts reached a consensus on refining the first indicator to: Satisfaction with Management Accounting Reports to ensure the focus remains on MA rather than general IT reports. Additionally, in the context of small and medium-sized enterprises (SMEs), which often face financial constraints, the cost-effectiveness of IT implementation is a crucial factor influencing investment decisions. Business owners prioritize IT systems that offer reasonable implementation costs. As a result, experts agreed to introduce an additional indicator: Reasonable Implementation Cost.

Thus, in this study, the IT variable is measured using the following seven indicators:

**Table 3 - Summary of Measurement Scale for Information Technology Factor**

| Code | Indicator | Source |
|---|---|---|
| IT1 | Accuracy | Petter et al. (2008) |
| IT2 | Security | |
| IT3 | Responsiveness to Management Accounting Technical Requirements | |
| IT4 | Publicly Recognized Technical Capability | |
| IT5 | Satisfaction with Management Accounting Reports | |
| IT6 | Satisfaction with Support Services | |
| IT7 | Reasonable Implementation Cost | Added based on expert interviews |

### 3. Scale Reliability Testing

#### 3.1. Results of Scale Reliability Testing Using Cronbach's Alpha

Based on the complete dataset collected and processed using **SPSS 26**, the author conducted **Cronbach's Alpha** reliability testing to eliminate irrelevant variables from the scale. The analysis results are as follows:

The reliability assessment of the **CE scale** showed **Cronbach's Alpha = 0.724** (greater than 0.6), with all item-total correlations exceeding 0.3, except for **CE6.** After removing **CE6,** another reliability test was conducted, revealing that **CE5** had an item-total correlation below 0.3. After two rounds of testing, **Cronbach's Alpha increased to 0.800**, ensuring the reliability of the scale.

The **MAP scale** reliability assessment yielded **Cronbach's Alpha = 0.890** (greater than 0.6), with all item-total correlations exceeding 0.3, except for **MAP17** and **MAP18**. These items were removed, and after re-running the test, **Cronbach's Alpha increased to 0.901**. However, additional items (**MAP6 and MAP10**) were identified as potential outliers that, when removed, would further enhance reliability. After their removal, **Cronbach's Alpha reached 0.906**, confirming the scale's reliability.

The **IT scale** reliability assessment resulted in **Cronbach's Alpha = 0.854** (greater than 0.6), with all item-total correlations exceeding 0.3, ensuring scale reliability. However, **IT7** was identified as an item whose removal would increase Cronbach's Alpha. After removing **IT7** and re-running the test, **Cronbach's Alpha improved to 0.863.**

**Table 4 - Cronbach's Alpha Coefficients of the Measurement Scales in the Study**

| | Scale Mean if Item Deleted | Scale Variance if Item Deleted | Corrected Item-Total Correlation | Cronbach's Alpha if Item Deleted |
|---|---|---|---|---|
| **Level of Corporate Participation in the Circular Economy** (CE): Cronbach's Alpha = 0.800 | | | | |
| CE1 | 9.50 | 4.968 | .540 | .788 |

| | | | | |
|---|---|---|---|---|
| CE2 | 9.27 | 5.242 | .577 | .768 |
| CE3 | 9.45 | 4.452 | .660 | .727 |
| CE4 | 9.39 | 4.859 | .692 | .715 |
| Management Accounting Practices (MAP): Cronbach's Alpha = 0.906 | | | | |
| MAP1 | 54.99 | 61.260 | .382 | .906 |
| MAP2 | 54.90 | 58.021 | .727 | .896 |
| MAP3 | 55.15 | 60.785 | .391 | .906 |
| MAP4 | 54.94 | 58.072 | .699 | .896 |
| MAP5 | 54.95 | 57.909 | .734 | .895 |
| MAP7 | 54.96 | 58.294 | .658 | .898 |
| MAP8 | 54.77 | 57.269 | .713 | .895 |
| MAP9 | 54.95 | 59.632 | .514 | .902 |
| MAP11 | 54.86 | 59.263 | .576 | .900 |
| MAP12 | 54.67 | 57.189 | .712 | .895 |
| MAP13 | 55.11 | 59.058 | .508 | .903 |
| MAP14 | 54.81 | 57.411 | .720 | .895 |
| MAP15 | 54.80 | 58.355 | .624 | .899 |
| MAP16 | 54.93 | 59.401 | .456 | .905 |
| MAP19 | 54.81 | 58.139 | .572 | .900 |
| MAP20 | 54.85 | 60.630 | .412 | .906 |
| Information Technology (IT): Cronbach's Alpha = 0.863 | | | | |
| IT1 | 16.34 | 10.860 | .599 | .849 |
| IT2 | 16.05 | 10.244 | .738 | .825 |
| IT3 | 16.15 | 9.869 | .699 | .832 |
| IT4 | 15.86 | 10.453 | .691 | .834 |
| IT5 | 15.88 | 10.246 | .683 | .835 |
| IT6 | 16.32 | 11.046 | .534 | .861 |

*Source: Author's calculations*

**3.2. Results of Scale Testing Using Exploratory Factor Analysis**

After assessing the reliability of the measurement scale using Cronbach's Alpha, nine observed variables were eliminated. Subsequently, the author continued evaluating the remaining observed variables using EFA to uncover the latent factor structure among the observed variables and identify low-quality variables.

Several observed variables were removed due to the following reasons: Low factor loadings (below the research threshold of 0.5), indicating that the variable contributed minimally to the study. Loading on a single factor in isolation, suggesting that the observed variable represented a distinct concept unrelated to the theoretical foundation. Cross-loading on two or more factors with a difference in factor loadings greater than 0.3, implying that the variable exhibited characteristics of multiple constructs and lacked clarity, which could create obstacles in evaluating discriminant validity of the scale.

Following this stepwise variable elimination process, the results were as follows: KMO value = 0.821, satisfying the condition $0.5 < 0.821 < 1$, indicating sampling adequacy. Bartlett's test result showed p-value = $0.000 < 0.05$, confirming the suitability of EFA for the dataset. The analysis identified three extracted factors, with Total Variance Explained (TVE) exceeding 50%, ensuring that these three factors account for a significant portion of variance in the data.

The three factors identified are:

Factor 1 (MAP): Consisting of five observed variables MAP8, MAP13, MAP14, MAP15, MAP19.

Factor 2 (CE): Consisting of four observed variables CE1, CE2, CE3, CE4.

Factor 3 (IT): Consisting of six observed variables IT1, IT2, IT3, IT4, IT5, IT6.

**Table 5 - EFA Analysis Results**

| Pattern Matrix[a] | | | |
|---|---|---|---|
| | Factor | | |
| | 1 | 2 | 3 |
| IT5 | .751 | | |
| IT6 | .749 | | |
| IT3 | .737 | | |
| IT2 | .734 | | |
| IT4 | .704 | | |
| IT1 | .530 | | |
| MAP8 | | .873 | |
| MAP14 | | .751 | |
| MAP19 | | .735 | |
| MAP15 | | .645 | |
| MAP13 | | .625 | |
| CE3 | | | .773 |
| CE4 | | | .769 |
| CE2 | | | .691 |
| CE1 | | | .619 |
| Extraction Method: Principal Axis Factoring. Rotation Method: Promax with Kaiser Normalization. | | | |
| a. Rotation converged in 5 iterations. | | | |

*Source: Author's calculations*

## IV. CONCLUSION

The level of participation in CE and information technology is expected to influence the implementation of MAP in enterprises. The measurement scales for each variable were developed and refined based on a literature review and expert interviews, comprising 39 observed variables. A survey was conducted in Sơn La province with 228 participants, and the scale validation process retained 20 observed variables across the three aforementioned constructs. The research findings serve as a foundation for subsequent analyses, providing further insights into MAP within the context of CE.

# BIG DATA, BIG DATA ANALYTICS FOR AUDITING ACTIVITIES IN THE CURRENT PERIOD

**Ngo Nhat Phuong Diem**[1]
[1] University of Finance – Marketing, Vietnam
*Corresponding : ngodiem@ufm.edu.vn

**ABSTRACT**

In recent times, big data and big data analytics have achieved some achievements and had a certain impact on business fields, including accounting and auditing. Big data and data analytics bring some benefits, new opportunities and at the same time face many challenges. Therefore, this study was conducted with the desire to provide an overview of big data, big data analytics in financial statement auditing activities. The study uses a systematic document review method and has provided some results according to the objectives. The article mentions the reasons for applying big data, big data analytics; the role of big data, big data analytics in auditing activities and the study also mentions the challenges when applying big data, big data analytics in financial statement auditing

*Keywords*: "Big Data", "Big data analytics", "financial statement auditing".

## I. INTRODUCTION

In the present stage, big data (BD) and big data analytics (BDA) have made significant advances in many fields from business to scientific research (Ajana, 2015). The use of large datasets that can reveal individual or group behavioral patterns along with the promising applications of BDA have attracted the attention of researchers (Mikal et al., 2016). BD promises to solve a number of challenges in the world, and it is prevalent in most disciplines: social sciences, psychology, geography, humanities, and healthcare (Favaretto et al., 2020). Therefore, the accounting and auditing field is no exception when companies must use and manage huge volumes of semi-structured and unstructured data to be innovative, efficient, and competitive (Dagilienė & Klovienė, 2019). Therefore, ICAEW identified big data as the heart of the accounting profession. Big data is expected to be used extensively in business in the future (Hartmann et al., 2016; Li Yan, 2022). Big data can be used to improve efficiency in accounting activities such as management accounting, financial accounting (Warren, 2015) and improve auditing activities (Brown-Liburd & Vasarhelyi, 2015; Iqbal et al., 2020). At the same time, professional organizations have emphasized that BDA can play a major impact in changing audit practices and increasing the quality of financial audits. Similarly, Wang & Cuthbertson (2015) also argued that BD, BDA is of great significance to improving auditing practices. Many studies have been conducted to evaluate the areas of activities related to BD and BDA in auditing (Ajana, 2015; M. G. Alles, 2015; Earley, 2015). Audit firms can use data analytics to reduce the risk of making inappropriate conclusions and gain a better understanding of their clients' business environments (Yoon et al., 2015). Studies (Brown-Liburd & Vasarhelyi, 2015; Dagilienė & Klovienė, 2019; Dubey & Gunasekaran, 2015; Vasarhelyi et al., 2015) acknowledge that the use of BDA can ensure audit quality. The effectiveness and efficiency of financial statement audits are enhanced through the use of BDA (Cao et al., 2015; Gepp et al., 2018; KPMG, 2017; Yoon et al., 2015) and reduce audit risk (Li Yan, 2022). Furthermore, BD, BDA can help auditors comply with auditing standards and increase the overall level of assurance, reducing audit risk by collecting more relevant and complete audit evidence (Moffitt & Vasarhelyi, 2013; Yoon et al., 2015). At the same time, BD also allows auditors to test 100% of the whole, so the audit risk will be reduced to almost zero (Brown-Liburd & Vasarhelyi, 2015). In addition, big data, data analytics and artificial intelligence have enabled accountants and auditors to increase business value, increase revenue and optimize operations (Bose et al., 2023).

Despite these claims, Austin et al. (2021), Gepp et al. (2018) acknowledge that BD and BDA are not yet as widely used as in other business sectors, possibly due to a lack of legitimacy (De Santis & D'Onza, 2021). Studies investigating the motivations for auditing firms to use BDA in auditing practice are limited (Dagilienė & Klovienė, 2019). Therefore, the study needs to answer the question of why it is necessary to apply BD, BDA in auditing activities? What benefits do auditing firms bring when investing in BD, BDA in the process of auditing financial

statements? Therefore, to clarify this issue, the article systematically summarizes articles published in prestigious journals from 2010 to 2023 to answer the above questions.

Although the research perspective is only through a brief review and analysis of previous studies, this study also contributes in the following aspects: (1) providing a comprehensive picture of the relevance of BD and BDA to financial statement auditing activities as well as the impact of BD and BDA on innovation in auditing activities; (2) assessing the role of BD and BDA in the steps of the auditing process in the new period; (3) Commenting on the challenges involved in applying BD and BDA in auditing.

The structure of the article is arranged as follows: Part 1 mentions the introduction for research. Part 2 presents an overview of the research including related background theories, concepts and related studies. Part 3 is the research method and part 4 is the results of the systematization process of related documents. The final part is the conclusion and related challenges when researching big data, big data analytics in auditing financial statements.

## II. DEFINITIONS ABOUT BIG DATA AND BIG DATA ANALYTICS

Big Data : Although the concept of big data has been popularized, the concept is still young and has uncertain origins (Gandomi & Haider, 2015). Ernst & Young (2024) suggested that BD is a huge spatial dimension of structured and unstructured data originating from various sources. Structured data refers to organized information stored in an organization's database, while unstructured data refers to data from unorganized sources such as photos, videos, presentations, social media posts, but makes up 85% of the world's information today (Mills, 2014). Previously, BD had 3 characteristics: volume (large quantity), velocity (high-speed processing), variety (heterogeneous data) (Laney, 2001). According to Gartner, Inc., BD is defined as volume, high-velocity, and diverse information assets that require innovative, cost-effective forms of information processing to enhance insights and decision making. Volume refers to the size of the data and is measured in terabytes, petabytes. A data larger than a terabyte is considered big data and a terabyte stores 1500 CDs or 220 DVDs or about 16 million photos stored on Facebook and a petabyte is equal to 1,024 terapytes. However, the standard of big data volume is relative and varies depending on factors (Gandomi & Haider, 2015). Therefore, the definition of big data also depends on the industry and determining a specific threshold for big data volume is impractical. Variety is the second characteristic of big data. Data is structured, semi-structured and unstructured with the structured portion accounting for only 5% of the total data (Cukier, 2010). Text, images, audio and video are examples of unstructured data while language with XML, a text language for data interchange on the web is semi-structured data (Gandomi & Haider, 2015). In addition, a defining feature of big data is the velocity of data. The increasing popularity of digital devices has led to unprecedented data generation rates, with Wal-Mart processing over a million transactions per hour (Cukier, 2010), so traditional data management systems are not capable of handling such huge data sources instantly. Hence, BD technology comes into play and enables companies to create real-time insights from large volumes of data. However, as larger amounts of data became available, the concept of big data was expanded and developed to include additional dimensions such as authenticity (IBM, 2024); value (Ishwarappa & Anuradha, 2015), variability (Fan & Bifet, 2013) or also comprehensiveness (Mayer-Schönberger, 2013) extensibility (Warren, 2015), and complexity (Perry, 2014).

*Big data analytics* : Big data itself does not provide meaning (Gandomi & Haider, 2015), it only provides value when used for decision making. Therefore, to be able to make decisions based on big data, companies need to have a processing process to transform big data from diverse, constantly changing data into meaningful and valuable data (Gandomi & Haider, 2015). Therefore, BDA can be defined as the processes by which detailed information is collected and processed from operations, financial transactions, and other forms of electronic data within or outside an organization (KPMG, 2017). The three distinct characteristics of data analytics are data, analysis, and presentation of results that provide commercial value (Gantz, 2012). Furthermore, Furthermore, BDA is also the process of visualizing big data and presenting BD through the use of tools and methods to better understand BD (Mikalef et al., 2015). Another definition of big data analytics is the process of examining, cleaning, transforming, and then modeling large amounts of data to discover and communicate useful information for decision making (Cao et al., 2015). Various techniques are used in BDA such as statistical analysis, quantitative methods, explanatory models and extrapolation models to investigate structured and unstructured data to provide useful informationto for decision making. Typically, executives and senior managers apply data analytics to evaluate operational performance or tax professionals analyze

data to detect tax fraud (DaBruzzo, 2013).

BDA techniques for analyzing structured and unstructured data in real time proposed by Gandomi & Haider (2015) include:

– Text analysis: This is a technique for extracting information from text data such as emails, online forums, blogs, social networks, diaries, etc. This technique allows converting large volumes of text into meaningful summaries, supporting decision making (Chung, 2014). Text analysis uses methods such as: (1) information extraction techniques to extract structured data from structured and unstructured text; (2) text summarization techniques to create concise summaries of one or more documents; (3) question answering techniques; (4) sentiment analysis techniques.

– Audio analytics is a technique for analyzing and extracting information from unstructured audio data. Call centers and healthcare are the main application areas of audio analytics. This technique follows two common technological approaches: transcript-based and phonetic-based (Gandomi & Haider, 2015).

– Video analytics is a technique for monitoring, analyzing, and extracting meaningful information from video streams (A. S. Das Abraham, 2010) and is still in its infancy compared to other techniques. According to Manyika et al. (Manyika, 2011), one second of high-definition video is equivalent to 2,000 pages of text, so the huge size of video is a challenge for video analytics. However, big data technology turns this challenge into an opportunity (Gandomi & Haider, 2015) by automatically screening and extracting important information from thousands of hours of video. Therefore, big data technology is a factor contributing to the development of video analytics. Therefore, video analytics is used in automated security and surveillance systems.

– Social media analytics is one of the BDA techniques. This technique uses structured and unstructured data collected from social media channels. Social media is a broad term that includes many online platforms that allow users to create, exchange content and is classified into many different types such as: social networks, blogs, social news, media sharing, social bookmarking, wikis, Q&A sites, etc. Social media analytics is characterized by being data-centric, spanning many fields, including: psychology, sociology, anthropology, computer science, mathematics, physics, and economics.

– Predictive analytics is used to predict future outcomes through the analysis of historical and current data. Predictive analytics uses a variety of techniques to discover data patterns and thereby predict relationships within the data. For example, through linear regression results, it is possible to understand the dependence relationship between outcome variables and explanatory variables and thereby make predictions.

## III. BIG DATA AND BIG DATA ANALYTICS IN FINANCIAL STATEMENT AUDITING

### 3.1. The context of big data analytics in financial statement auditing

The development of auditing technology is considered a technique to improve audit quality (M. K. Power, 2003) so the auditing process has gone through many processes of objectification, formalization and rationalization (Fisher et al., 2002; Newton, 1989). With the risks and economic characteristics of the company, there is pressure to establish many methodologies to promote efficiency and cost savings (Newton, 1989). Previous studies have argued that the introduction of auditing methods such as statistical sampling, audit risk models, business risks ...Matthews (2006) acknowledged that statistical sampling methods in the early 1960s were considered effective in solving the lack of evidence due to evidence collection methods at a time when there was a significant growth in transaction volume. The rise of statistical sampling has provided auditors with the opportunity to legitimize the reduction in the amount of audit evidence. At the same time, the use of confidence levels in statistical sampling applications provides data on which auditors can draw conclusions that are convincing enough to the client (Carpenter & Dirsmith, 1993; Elliott, 1987; Matthews, 2006) as well as protects auditors from potential risks when drawing conclusions (Sully, 1974). Similarly, auditing has evolved with the advent of the audit risk model and then the business risk approach, so the audit process has changed towards increased legitimacy (Curtis & Turley, 2007; Hansen & Messier, 1986; M. Power, 1999; Robson et al., 2007). Typically, in the late 1990s, leading auditing firms made efforts to change the public's perception of the business risk approach as a method of auditing. New methods increase audit efficiency (Curtis & Turley, 2007) and are the best way for auditors to recognize management fraud and business failure risks. Therefore, the application of data analytics in auditing should be understood in the historical context of the desire for audit technology to develop for the

sake of maintaining the legitimacy of the audit function.

Although the development of BDA in the auditing field is still in its early stages, the use of analytics in the auditing process is not a new phenomenon. Audit firms have been using computer-based analytical tools since the early 1960s when firms developed computer-assisted audit techniques (CAAT) in audit sampling (Cushing, 1986) and auditors used 100% automated equipment to evaluate computer processes, software, and hardware (Byrnes et al., 2018). Then in 1990, the Enterprise Resource Planning (ERP) system was introduced, which could combine different databases into one large integrated repository (Rashid, 2002). In the following years, analytical tools such as audit logs (ACLs) became available; Interactive Data Extraction and Analysis (IDEA) is used largely in audit firms. The ACL and IDEA tools may have been the prototypes of BDA, paving the way for current BDA.

According to KPMG's 2014 Transparency Report, Big 4 audit firms have invested significant amounts of money to develop BDA tools through a partnership with technology company McLaren Technology Group to establish a $100 million company to develop data analytics capabilities to significantly change audits and create value for clients. Similarly, EY committed to spending $400 million to develop audit innovation through BDA (Ernst & Young, 2024) . Or as PwC announced that they developed an internal analytics tool Halo to replace ACL and IDEA and Halo will be the tool that uses analytics software and ensures data through algorithms. Meanwhile, smaller audit firms often use existing analytics tools such as Spotlight, Lavatorm and Alteryx to take advantage of BDA capabilities.

In the modern and complex environment where information technology and big data dominate, the evidence auditors collect has changed in nature and capacity (D. Appelbaum, 2016; Warren, 2015). Therefore, PwC stated that big data analytics is changing the way the audit process is performed, auditors have new tools to extract and visualize data, allowing machine learning to access large and non-traditional data sets. Therefore, in response to the above-mentioned developments in auditing methods and practices, recent audit literature reviews reveal some initial assessments of the potential relevance of BDA in auditing, particularly in the areas of risk assessment and performance of analysis and evaluation activities (M. G. Alles, 2015; M. Alles & Gray, 2016; D. Appelbaum, 2016; Cao et al., 2015; Yoon et al., 2015). BDA provides the opportunity for auditors to process various data at a faster pace to provide a visual picture of the risks associated with the entity in order to assess their magnitude (Cao et al., 2015). DBA is seen as a form of evidence that complements traditional evidence that is evaluated according to criteria such as reliability, completeness, relevance, and cost-benefit (Yoon et al., 2015)[14]. At the same time, Yoon et al (2015) study suggests that BDA technology applied in auditing can also be a challenge when a large amount of information can affect the auditor's professional judgment. Earley (2015) acknowledges that BDA used in auditing helps auditors analyze larger amounts of data, detect fraud more easily, and conduct quality audits based on strong evidence. Therefore, BDA creates opportunities to add value to the audit and increase the auditor's confidence (IBR, 2018). However, the ambiguous, overloaded, and difficult-to-navigate nature of information can reduce the benefits of using BDA in auditing, although BDA provides auditors with many different ways to analyze data (Brown-Liburd & Vasarhelyi, 2015). Therefore, there is a need to address the need for BDA to be considered as a formal auditing standard in approved documents to eliminate uncertainty in judgment (Krahel & Titera, 2015). Therefore, auditing regulators at the national and international levels have also acknowledged the potential impacts of big data on auditing activities.

### 3.2. Research methods

To achieve the objectives of the study, the author used a systematic literature review method. This method is a valuable strategy for identifying, evaluating, and synthesizing research data comprehensively to gather a complete picture of related studies to identify the central problem (Cook, 1997; Petticrew, 2008).

According to Agustí & Orta-Pérez (2023), the PRISMA statement addresses the problems of poor reporting in studies using systematic literature reviews. Therefore, PRISMA 2020 is a methodology for identifying, selecting, evaluating, and synthesizing articles (Page et al., 2021) and through this method, the study will explore the benefits, roles, and challenges of using big data analytics in auditing. Therefore, the steps taken in a systematic literature review include (Page et al., 2021): (1) step 1: Identify the research problem; (2) step 2: identify the research question; (3) step 3: identify keywords; (4) step 4: identify and search for documents by keywords; and (5) step 5: read and access publications; and step 6: publish the findings.

Thus, to solve the problems according to the systematic literature review method (Page et al., 2021), the study searched for articles focusing on three important contents: keywords, screening information and meeting the conditions. With the keywords big data analytics, analysis in auditing, future auditing practice, accounting - auditing profession, the study searched for studies related to data analysis in auditing from the websites of prestigious journals. Therefore, the articles must satisfy the criteria:

- Criterion 1: The research must be related to data analytics in auditing.
- Criterion 2: studies published from 2010 to 2024
- Criterion 3: Research in English
- Criterion 4: Research published in prestigious journals with high citation rates.

Therefore, after collecting the initial sample of 116 articles, the author filtered all the archives and deleted 7 duplicate archives. Next, the author briefly read the titles and abstracts and eliminated 11 articles because they did not meet the above 4 criteria (3 articles were not related to data analytics in auditing, 4 articles did not answer the research questions; 2 were published before 2010; and 2 articles were not published in reputable journals). Therefore, the number of articles that fully met the 4 criteria was determined to be 45 articles that were eligible for summary and 53 articles that were not included in the above requirements but could be used to mention the basic theories as well as concepts related to the research problem.

## IV. RESEARCH RESULTS

### 4.1. Reasons for applying big data and big data analytics in financial statement auditing

With the rapid advancement of technology, companies are continuously developing technology to improve their business strategies and daily operations. Among these technologies, big data and big data analytics have become popular in many organizations, from businesses to governments, from science and academia including accounting and auditing (Dagilienė & Klovienė, 2019). Therefore, businesses are also implementing big data to gain more valuable insights into the business processes of the unit. Internal auditors are using BDA to provide better and faster services. According to M. G. Alles (2015) and D. Appelbaum (2016) , external auditors also apply BD and BDA to financial statement audits for two reasons: pressure and opportunity.

(1) Pressure: The first reason why BD and BDA are applied to audit financial statements is external pressure. As the Enterprise Resource Planning (ERP) system evolves the way businesses are run and records are kept, computer-based auditing is no longer an optimal option, and computer-based auditing is a natural choice (M. G. Alles, 2015). With the increasing demands in today's technologically advanced world, auditors must provide more insights, quality, and value to users of financial statements (Ramlukan, 2015). Therefore, auditors must implement BD and BDA into their own audit procedures.

(2) Opportunities: In addition to external pressure forcing auditors to apply BD and BDA to financial statement audit processes, the application of BD and BDA also creates many opportunities. M. Alles & Gray (2016) believe that when auditors use BD and BDA, the audit will be more effective and of higher quality, and the value of BD and BDA will be clearly understood. When using BD and BDA, the possibility of errors can be reduced because auditors can analyze evidence more carefully (Larcker & Zakolyukina, 2012; Yoon et al., 2015). The use of BDA helps detect unusual transactions, reduces false positive results, and thus increases audit efficiency (Cao et al., 2015).

The application of BDA in financial statement audits not only maximizes the efficiency of audit activities but also involves human factors (IBR, 2018). When applying BDA to audits, the automation of the audit process has increased, so auditors have more time to focus on audit procedures, focus more on complex operations, and on risk areas. Moreover, the automation process thanks to the integration of BDA helps auditors have time to focus on judgments and analysis, creating time to focus on other aspects of the client's business operations.

### 4.2. The role of BD and BDA in financial statement audit

The way businesses are run is being transformed to become more agile, customer-oriented and efficient with the use of big data (Rydning, 2018) and big data analytics is also recognized as a potential tool that can transform the way financial statement audits are conducted more effectively (Arnold, 2018; Gepp et al., 2018; Krahel & Titera, 2015;

Zhang et al., 2015). The discrepancy between diverse accounting and reporting standards is eliminated with the help of BDA (Warren, 2015). The use of BDA to improve the auditing process is a convergence of significant advances in data science, increased computing power and access to large amounts of data and information. Stewart (2015) argues that such convergence has created a favorable environment for the adoption of BDA, stimulating transformation in the auditing industry.

For the pre-audit stage, auditors can use text mining techniques to examine press releases and social media posts to assess the reputation of potential clients and their leaders. At the same time, in this stage, auditors can use clustering techniques to compare the financial statements of potential clients with those of companies in the same industry to get a preliminary assessment of the financial situation of potential clients and from there can make a decision whether to accept the client or not (D. A. Appelbaum et al., 2018; Rose et al., 2017). Furthermore, auditors can use BDA techniques to estimate audit fees (De Santis & D'Onza, 2021).

During the audit planning stage, BDA tools with clustering techniques, descriptive analysis and regression techniques replace traditional analysis techniques to obtain a detailed visual image of the client's business environment to assess related risks and determine overall materiality as well as determine implementation materiality (Cao et al., 2015; Earley, 2015). In addition, using BDA helps audit firms better understand the client's business environment, thereby reducing the risk of making incorrect conclusions (Balios et al., 2020).

During the audit implementation phase, BDA is used to evaluate the internal control system. According to Jans et al (2013) process mining tools can be used to conduct compliance checks on control procedures and can detect deviations from the issued control procedures. BDA contributes to expanding the scope of the audit (Dai & Vasarhelyi, 2016). The use of BDA allows auditors to automate the audit of transactions, the entire audited data, or in other words, the entire audit population and the visualization analysis of the entire transaction to detect anomalies (Brown-Liburd & Vasarhelyi, 2015; Capriotti, 2014); Outlier detection should provide sufficient, relevant, and real-time evidence thus providing more opportunities for auditors to detect accounting fraud and errors (Cao et al., 2015; Gamage, 2016; Gray & Debreceny, 2014; Lin et al., 2015; Yoon et al., 2015).

In addition, the BDA tool enhances audit activities, supporting the identification and assessment of audit risks including bankruptcy risks and financial reporting risks (Cao et al., 2015). Furthermore, BDA provides the potential for continuous auditing. Continuous auditing is considered useful to ensure continuous monitoring and ensure continuous data (M. Alles et al., 2006). At the same time, automated internal audit processes at companies allow them to save costs, conduct frequent audits, and reduce the involvement of independent auditors (M. G. Alles et al., 2002; Balios et al., 2020).

In addition to the view of considering the impact of BDA on the audit process at each stage, Yoon et al (2015) believes that a successful audit must meet two factors: "adequacy and relevance". Meanwhile, big data provides rich information in many forms and in large quantities (Russom, 2011). Big data is more reliable and relevant than data from traditional sources, so it meets the relevance requirement (Russom, 2011; Yoon et al., 2015). Moreover, some big data can also contribute to assessing the reliability of information from traditional audits (Dhillon & Modha, 2001) . Big data can provide important non-financial evidence to assess the financial situation of a typical entity such as information on social networks mentioning negative comments about a product but the sales of that product on the financial report are quite good, it can be an abnormal sign (Yoon et al., 2015). Similarly, relevance is also a requirement related to suitability. In a global financial environment with new business models such as e-commerce, big data can be a useful evidence (Yoon et al., 2015) and big data provides independent, timely evidence so they become relevant (Cao et al., 2015). BDA can be used to evaluate different types of businesses and can also evaluate different forms of evidence.

Thus, BD and BDA with their diverse tools have made great contributions in all stages of auditing activities, contributing to increasing audit quality through continuous auditing, risk assessment and detecting abnormalities when checking 100% of the whole.

**4.3. Auditing challenges when applying BD and BDA in financial statement auditing**

*(a) Challenges in information processing* : M. Alles & Gray (2016) acknowledge that BD transforms structured data into unstructured data, from financial data to non-financial data, and from data obtained from within the enterprise

to data from external sources. This shows that auditors face the challenge of processing external data whose reliability and relevance are difficult to ensure. The completeness and accuracy of data obtained from third parties are also difficult to ensure (IAASB, 2016), which is in contrast to the traditional method of data collection because evidence obtained from third parties is often highly reliable. The development of BD as well as the completely computerized auditing has led to doubts about the authenticity and origin of data (D. Appelbaum et al., 2017; Rydning, 2018). Therefore, IAASB (2016) believes that auditors when using external data need to satisfy: (1) The audit evidence obtained is accurate and complete; (2) the information must be accurate and detailed for the auditor's purposes. For big data, auditors need to collect, extract, and process information in a useful way from the data warehouse, and this creates new challenges in information processing such as: information overload, relevance, pattern recognition, and privacy and security issues.

Although BDA allows for the extraction of large volumes of data, it is difficult to analyze and process a large amount of information (Brown-Liburd & Vasarhelyi, 2015). Auditors find it difficult to track every error finding (Krahel & Titera, 2015), hindering the identification of fraud (D. Appelbaum et al., 2017) if the information is overloaded. Similarly, the increased volume of information can make it difficult for auditors to distinguish patterns, leading auditors to spend significant time investigating irrelevant or ineffective information (Brown-Liburd & Vasarhelyi, 2015; Rose et al., 2017). At the same time, BD includes both structured and unstructured data, financial and non-financial data where auditors only use financial and structured data when forming opinion on the financial statements. Because it may be impossible for the auditor to separate relevant data from irrelevant data, whether internal or external (Brown-Liburd & Vasarhelyi, 2015).

Furthermore, there is a concern about security and privacy due to the availability of big data (Cao et al., 2015). M. G. Alles (2015) argue that auditors must ensure the confidentiality of sensitive information that needs to be protected related to customers such as complaints, proprietary information in the supply chain, employee data, customer data, health care records. Meanwhile, according to the law of a country, certain data may be prohibited from leaving the jurisdiction of an entity (IAASB, 2016). Therefore, this is also a challenge for auditors when auditors need to transfer data to a location that is outside the jurisdiction of an entity. Therefore,Dai & Vasarhelyi (2016) propose solutions to create a strict policy for data security, encrypt sensitive information, use secure channels to communicate information, and assess security and privacy risks over time.

*(b) Challenges due to technological changes* **:** this is also a challenge when applying BD, BDA to auditing. Technology in auditing procedures needs to be adjusted to suit the change of big data (Yoon et al., 2015). Two issues related to technological changes: BDA tools and audit scope.

*Changes in audit tools* : Audit tools have changed from the initial stages of stage 1.0 with pencil and abacus to the current stage 4.0 (Dai & Vasarhelyi, 2016). According to Dai & Vasarhelyi (2016) four generations of audit using different tools are illustrated in the table 1

**Table 1: Stages of development of auditing**

| **Audit 1.0** | **Audit 2.0** | **The generations of the Audit Audit 3.0** | **Audit 4.0** |
|---|---|---|---|
| **Manual audit Tools: pencils, calculators** | IT audit Tools: Excel, CAAt software | Inclusion of Big Data in audit analytics Tools: analytical apps | Semi – and progressive automation of audit Tools: sensors, CPS, IoT/IoS, RFID, GPS |

*Source: from Dai et al., (2016)*

In the audit phase 1.0, the main tools used for auditing activities were pencils and spreadsheets. In the audit phase 2.0, two tools, Excel software and CAAT, were used in auditing financial statements. CAAT is all the techniques and support tools that allow auditors to access and view system data or software operations using their own computers. CAAT includes features specifically designed for auditors with the characteristics of not modifying source data, all commands can be tracked and repeated, and used for all data, even in text format (DeKroon, 2013). Meanwhile, audit 3.0 uses advanced technologies such as data mining. Data mining uses various techniques to search through large amounts of data to identify unknown information, unknown patterns, and unknown relationships; build predictive

models (Gray & Debreceny, 2014). Data mining techniques help auditors analyze external data to assess business risks, fraud risks, internal controls, and business continuity (Brown-Liburd & Vasarhelyi, 2015) with tools such as Excel, IDEA, ACL, and SAS. These tools are also commonly used for BDA, but auditors must have controls and follow a certain process to ensure proper operation with controlled changes (IAASB, 2016). The final stage – audit 4.0 stage is the semi-automated or automated audit stage. In this stage, auditors use sensors, GPS systems, and the Internet of Things (IoT) during the audit process.

*Changing sampling methods:* Auditors traditionally access historical data and test it once a year, and this approach is considered completely obsolete with the advancement in CAAT computer software (Byrnes et al., 2018). CAAT supports the analysis of the entire population (D. Appelbaum et al., 2017), leading to the collection of more relevant and higher quality evidence, thus providing professional confidence to auditors (Ramlukan, 2015). However, analyzing the entire population is a challenge for auditors because it can negatively impact audit procedures (AICPA, 2015). For example, during a comprehensive audit of the entire population to search for unusual transactions and operations, the results of collecting a large number of unusual and outlier points can discourage the auditor from analyzing and processing a large volume of unusual points at the beginning (AICPA, 2015). At the same time, this leads to even more judgment and professional skepticism than with non-100% comprehensive audit techniques.

*(c) Challenges related to regulations*

M. G. Alles (2015) argues that regulations and standards have not been established for data analytics in financial statement auditing although current standards do not restrict the implementation of data analytics in auditing. A pressing issue today is that there is no specific law for the use of data analytics (Dubey et al., 2018). Current standards do not provide clear guidance on how to use BDA to conduct audits (M. G. Alles, 2015), (Cao et al., 2015) and improve audit quality. The lack of standards will negatively affect the legitimacy of using BDA in auditing (De Santis & D'Onza, 2021). The promulgation of standards and laws can take time, limiting the willingness to use BDA and potentially reducing the growth of big data in auditing (Manson et al., 2007).

## V. CONCLUSION

With the aim of assessing the impact of big data and big data analytics on auditing activities in the new trend, the study through a systematic review of documents has drawn important conclusions. The study emphasizes that BD and BDA make great contributions to the stages of auditing activities, contributing to increasing audit quality through continuous auditing, risk assessment and detecting abnormalities when checking 100% of the whole. In addition, the study also mentions the challenges related to information processing, technology and regulations when applying BD and BDA in auditing financial statements.

Although the study used a systematic overview method to achieve the set objectives, the study still could not make more general comments on other aspects related to BD, BDA in financial statement auditing. Therefore, future studies can consider additional issues that have not been mentioned when studying the impact of BD, BDA in financial statement auditing such as political institutions, characteristics of auditing companies, leaders' perspectives, etc.

# RISK SPILLOVER BETWEEN BITCOIN AND TRADITIONAL STOCK MARKET: EMPIRICAL EVIDENCE FROM EMERGING MARKET INDEX

**Pham Huong Tra**[1]

[1]Faculty of Financial Investment, Academy of Finance.
*Corresponding: phamhuongtra@hvtc.edu.vn

**ABSTRACT**

This paper investigates the dynamic volatility transmission between the emerging stock index and Bitcoin by applying the multivariate BEKK-GARCH and DCC-GARCH models. For this purpose, I collect the daily data from Bitcoin and Morgan Stanley Capital International (MSCI) Emerging Markets Index covering the period from January 2017 to November 2024, including the COVID-19 outbreak and the recent Ukraine-Russia war. Before and during the coronavirus pandemic, the results provided compelling evidence of the existence of the unidirectional spillover effect from the emerging traditional equity market to the crypto market; however, the transmission is mostly found in the long term. On the other hand, for the Ukraine-Russia war subperiod, most element estimations are insignificant statistically, which emphasizes the safe-haven property of Bitcoin to emerging equity. These research implications are useful for investors interested in investing in the two markets and for public and regulatory authorities concerned about the fluctuation of Bitcoin and its potential spillover into the traditional investment market.

*Keywords*: "Bitcoin", "cryptocurrency", "emerging market index", "volatility spillover".

## I. INTRODUCTION

Cryptocurrency is likely to be a financial market innovation and has arguably reformed the conventional sector. According to Nakamoto (2008), in a whitepaper titled "Bitcoin: A Peer-to-Peer Electronic Cash System", cryptocurrencies are attributed to an alternative means of exchange to fiat currency within the electronic transaction system, but more commonly serve as a financial instrument. Conceptually, both the Bitcoin and traditional equity markets involve trading financial instruments and facilitate the transactions between those with excess capital and those who need capital. However, the centralized traditional funding system is opposite to the cryptocurrency trading system, which is mostly decentralized and aims to support crowdfunding at a cheaper transaction cost (Ghorbel et al., 2012). This situation indicates that capital circulation can go beyond the control of the government and other regulatory authorities (Halaburda et al., 2020). All these above-mentioned features lead to cryptocurrencies' rapid growth in trading volume, prices, and volatility (Corbet et al., 2019).

Cryptocurrencies' uncertainty could threaten the whole financial system, which may be also harmful to the world economy, given interdependence with conventional assets and the surge in their trading volume led by Bitcoin (International Monetary Fund, 2022). This paper aims to investigate the interconnectedness between Bitcoin and stock in emerging markets, because of the growing popularity of cryptocurrency in emerging countries. As a matter of fact, a recent report by Chainanalysis indicates that eighteen of the top twenty in the 2024 Global Crypto Adoption Index (CAI) are emerging countries. In other words, emerging markets rank above advanced markets regarding cryptocurrency adoption, thus the former have higher exposure to cryptocurrency risk. As a result, financial investors must be concerned about hedging emerging market risks to maintain global financial stability. For the sake of coherence, the literature review can be divided into two specific aspects. The first focuses on identifying the evidence of whether Bitcoin is a diversifier, hedger, or safe haven against other financial systems. The second strand of literature investigates the spillover effect between Bitcoin and stock markets.

**Diversification, Hedging, and Safe Haven Roles of Bitcoin for Traditional Financial Market**

Investors naturally want to manage the risk of their investment portfolio through diversification. Conventional emerging and developed markets have become substantially interdependent in the last twenty years (see Arouri et al., 2012; Narayan et al., 2014; Aftab et al., 2021). Bitcoin is considered as an alternative financial instrument against equity, which comes from the fact that the changing returns volatility of Bitcoin and the equity market facilitates the use

of Bitcoin as a potential diversifier (Bouri et al., 2020). A variety of studies like Okorie and Lin (2020); Majdoub et al. (2021); Kozak and Gajdek (2021); and Lavelle et al. (2021) determine the diversification property of Bitcoin for the investment portfolio of stock and other financial instruments, as return of Bitcoin have low but positive correlation with that of traditional assets. Likewise, Sebastian and Alenka (2020) employ the Pearson correlation coefficient to document the interconnection of leading cryptocurrencies with the confirmation of the effective diversification role of cryptocurrency in decreasing the risk of a portfolio. On the other hand, a study carried out by Iyer (2022) reveals that the correlation between the two markets of Bitcoin and equity assets is initially low, but has witnessed a rapid growth of 20% which makes it difficult to consider cryptocurrency as a diversifier.

There is also a rising strand of literature examining Bitcoin's hedging and safe haven properties rather than diversification role, but the results differ from study to study. For example, before the recent COVID-19 pandemic, using US stock data, Baur et al. (2018) conclude that Bitcoin is neither a safe haven nor a hedging tool against fiat currencies. Similarly, the studies by Conlon and McGee (2020) and Prichat et al. (2023) confirm that during the crisis outbreak, Bitcoin's price dropped dramatically in the same direction with the stock price, thus rejecting the existence of safe haven role of Bitcoin, and its inclusion in an investment portfolio increase the downside risk. This supports the findings of Lavelle et al. (2021) who estimate the interconnectedness between the aggregate cryptocurrency market and other traditional assets like stocks, bonds, commodities, real estate, gold, and the US dollar during the pandemic. They derive the conclusion that there is no evidence confirming a strong or weak safe haven for cryptocurrency. On the other hand, despite Bitcoin's extreme volatility, portfolio managers have considered this cryptocurrency as an investable asset given the ability to offer a high rate of return (Ji et al., 2019). Besides that, a considerable amount of research in 2020 has been carried out in the context of the US market with the S&P 500 index. Studies by Bouri et al. (2020a, 2020b, 2020c, 2020d, 2020e) and Mariana et al. (2020) attempt to analyze various types of cryptocurrency and come up with different results. While Bouri et al. conclude that Bitcoin presents safe haven role, Mariana et al. discover that both Bitcoin and Ethereum act as haven instruments in the short run, with Ethereum being a better hedger than Bitcoin. These contradictory findings lead to doubt surrounding Bitcoin's financial role, which requires further investigation to refine the conclusion.

**Spillover effect between Bitcoin and stock markets**

Various studies have dwelt on validating the degree of transmission between Bitcoin and equity in different methodologies and contexts. However, a significant number of different conclusions have to be presented. Zhang et al. (2018) find an insignificant bidirectional spillover effect between Bitcoin and the Dow Jones Industrial Average. Likewise, after utilizing the multivariate GARCH for Bitcoin, Ripple, and G20 equity markets, Omane-Adjepong and Alagidede (2020) argue that the two cryptocurrencies are unrelated to stock market indices. At about the same time, Bouri et al. (2020a) apply the wavelet analysis to investigate the financial dependence between Bitcoin, commodity index and gold, and the developed and emerging stock indices. One of their empirical results provides an insignificant stock market dependence on Bitcoin.

However, Ünvan (2021) investigates the bidirectional financial contagion between Bitcoin and Japan, Turkey, China, and the USA's stock indices covering weekly data from 2016-2018 using Granger causality estimation. The findings indicate that only two-way dependence was found between Bitcoin and Borsa Istanbul 100 (BIST 100). Moreover, Jiang et al. (2021) examine the cross-correlations between six developed and emerging markets and major cryptocurrencies through a generalized orthogonal GARCH model over the period 2015-2020. The study finds that Bitcoin negatively influences the equity market indices and the relationship is also held in reverse.

On the other hand, other studies well pronounce the asymmetric spillover from cryptocurrency to conventional assets in different contexts. For example, Hsu et al. (2021) and Umar et al. (2021) conclude that a moderate information flow was found from Bitcoin to global equities under different economic conditions. On the other hand, Symitsi et al. (2018) and Bouri et al.(2020) confirm a unidirectional spillover effect from traditional assets to Bitcoin rather than a financial outbreak transmission from Bitcoin to conventional equity. Similarly, Asafo-Adjei et al. (2021) find that returns of global equities are negatively affected by those of cryptocurrencies.

Within the context of emerging stock markets, a number of empirical studies conducted focus on specific regions.

For example, after using the GARCH model covering daily data from 2010 to 2017, Bouri et al. (2019) find a state-dependent time-varying link between the emerging equity markets and the Bitcoin market. Likewise, in a multidimensional study, Mensi et al. (2019) analyze financial contagion between Bitcoin and twelve Middle East and North Africa (MENA) stock markets for the 2014-2017 period. Their empirical results show a lingering relation between stock market indices and Bitcoin. In a different setting, Azza et al. (2023) present compelling evidence of dynamic interdependence between Gulf stock market indices and digital assets, especially during health and geopolitical turbulence. Furthermore, several studies have been conducted in the context of ASEAN equity markets (see Mand and Thaker, 2020; Karim et al., 2021; Parichat et al., 2023). Their results confirm a significant volatility spillover between ASEAN stocks and Bitcoin returns in both directions.

Nonetheless, despite the extensive works on emerging economies done, those studies mainly tackle the issue within geographic regions, and thus the investigation of whole emerging economies remains relatively under-explored. After using DCC-GARCH estimation, a study by Bouri et al. (2018) confirms asymmetric spillover effects between returns of BTC and MSCI emerging market index in both bullish and bearish markets from 2010 to 2017. Later, enriching the literature regarding the contagion between BTC and emerging market index, Iyer (2022) uses VAR and finds the growing volatility transmission between the pre-COVID and post-COVID periods from 2017 to 2021. Overall, there is a lack of literature focusing on the overall emerging stock index, especially with the inclusion of the Ukraine-Russia war.

This study intends to examine the interconnectedness between Bitcoin and the emerging stock index, which then indicates whether Bitcoin can be utilized as a hedge for investment risks in emerging markets and how extreme events like the COVID-19 pandemic and the Ukraine-Russia war affect its hedging capacity.

Overall, this present study contributes in two ways to the extant academic debate about the cryptocurrency market and financial contagion. The first novelty is an analysis of the integration between Bitcoin and MSCI emerging stock market index and the degree of dynamics volatility spillover effect between them. To the best of my knowledge, most previous studies accounted for dynamic linkages between Bitcoin and stock market indices at the country level. Therefore, this study's purpose is to fill the gap by examining the index representing the whole emerging countries. Secondly, our sample data covers the period from the first of January 2016 till November 2024, witnessing shocks of the Covid-19 crisis and the ongoing Russia- Ukraine War that led to economic uncertainty and financial markets turbulences (Gupta et al., 2021; Shahzad et al., 2021). In fact, despite a few works for economic break covering the period before and after COVID-19 and immense rationales put forward (Abakah et al., 2020; Ji et al., 2018; Balcilar et al., 2022; Parichat et al., 2023), the Russia- Ukraine war does not draw sufficient attention. Therefore, this paper tackles structural breaks caused by these two extreme financial disruption events, which hit the market since Bitcoin was launched. As a result, we will determine whether Bitcoin could effectively serve as a diversifier against conventional assets, more particularly, stocks in emerging countries region (Akhtaruzzaman et al., 2021; Conlon & McGee, 2020; Conlon et al., 2020; Corbet et al., 2020; Maasoumi & Wu, 2021; Yoshino et al., 2021).

The rest of this paper is structured into 3 sections. Section 2 " Material and Methodology" presents the data sample and model and research approach of analysis. The empirical results and further discussion are stated in Section 3 "Result and Discussion" section. The last section concludes the research paper and contextualizes the policy implications, followed by references.

## II. MATERIAL AND METHODOLOGY

### 2.1. Data and sources

This study selects the daily data of Morgan Stanley Capital International Emerging Markets Index (EM). MSCI Emerging Market Index is a capitalization-weighted index made up of 23 emerging country indices in the MSCI classification. The index is adopted because it represents overall emerging stock market performance, thus ensuring the generalizability of research. I source the data of daily EM from the MSCI website (https://www.msci.com/), and the prices of Bitcoin (BTC) extracted from the Coin Market Cap website (https://coinmarketcap.com/). The coinmarketcap should be used by scholars as a cryptocurrency data source, as stated in the study by D. Vidal-Tomas (2022), which results from the consistency between its data and main exchange platforms. Following Kumar et al. (2022) and Bouri et

al. (2021), this paper examines daily frequency data to obtain sufficient observations, which derives deeper and more reliable empirical results.

The sample period covers from January 1st, 2017 to November 25th, 2024. This yields a total of 2061 time series observations. The sample period is selected based on the fact that by January 2017, the market capitalization and price of Bitcoin witnessed insignificant fluctuation (Joseph et al., 2024). Furthermore, to investigate the effect of two major outbreaks of COVID-19 and Russia-Ukraine war, this study splits the data into three subperiods: The pre-COVID-19 period (January 1st, 2017 to December 30th, 2019), the post-COVID-19 period (December 31st, 2019 to February 23rd, 2022), beginning on the day of the first case of COVID-19 being reported in China, and the Ukraine-Russia war (February 24th, 2022 to November 25th, 2024), starting on the day when Russian military forces entered the country from Belarus, Russia and Crimea.

The daily closing prices of the index and the Bitcoin (BTC) are used as sample data. The data spans 5 days a week (Monday to Friday) excluding weekends when the stock market is closed. This paper examines the fluctuation of the two markets, taking the daily rate of return as the inspection time series variable. As stated in a paper by Mensi et al. (2020), the measure of the daily rate of return is defined as follows:

The return in period t, $R_t = \ln(P_t) - \ln(P_{t-1})$ (1)

where $R_t$ is daily returns for day t, $P_t$ and $P_{t-1}$ are daily closing prices for day t and t-1, and ln is natural logarithm.

**Data description**

Table 1 reports some descriptive statistics and preliminary tests related to the daily returns under three subperiods. It is worth noting that, the mean daily returns of both the MSCI Emerging Markets (EM) Index and Bitcoin (BTC) present positive values before the COVID-19 pandemic and then increase with the outbreak of COVID-19. Nevertheless, during the stage of the Russia-Ukraine war, the mean index returns of both assets drop dramatically, with the average return of the EM index becoming negative. This clearly shows the homogeneous reaction between the emerging stock market and the Bitcoin market to the different unprecedented health and political crises. The negatively skewed return distribution of both the BTC and EM index implies recurrent small wins and a few large losses during turbulent periods. With the positive kurtosis being larger than that of a normal distribution in all sub-periods, the time series of daily return have leptokurtic distribution. In other words, the investor can experience broader fluctuations. The null hypothesis that data for all series are normally distributed is rejected by the Jarque–Bera test. A unit root is not present in all samples given that the Augmented Dickey-Fuller (ADF) test and the Phillips–Perron (PP) test statistics are significant at a 1% level.

Figure 1 shows the price volatility in the price of Bitcoin, MSCI EM index. Up until 2020, Bitcoin prices remain stable. In the advent of COVID-19, the price of BTC increased sharply and hit the highest point at the end of 2021. After the Ukraine-Russia war began, BTC witnessed a drop to the bottom in 2022, followed by significant growth given that the price continues pushing boundaries. Regarding the stock index, during the reporting period, there were notable movements. However, in 2024, unlike BTC, the EM index keeps fluctuating around 1200. A return series is revealed in Figure 2, clearly capturing the volatility clustering, which refers to the phenomenon that high volatility tends to be followed by high volatility. This characteristic advocates the use of GARCH models to investigate the dynamic conditional volatility of the return series accurately. Moreover, in line with the findings of Joseph et al. (2022), Fig. 2 and Table 1 also plot the evidence of higher volatility witnessed in the Bitcoin market compared to the stock market.

### 2.2. Model and research approach

#### 2.2.1. BEKK-GARCH model

The primary purpose of this paper is to investigate whether Bitcoin may act as a diversifier for Vietnam stock markets and/or a safe haven for investors during stock market turmoil, which needs to be analyzed by an appropriate model to capture the volatility transmission between Bitcoin and Vietnam stock market. For this aim, the two most widely used multivariate estimation techniques of conditional and dynamic covariances and correlations between different assets are BEKK-GARCH (Baba, Engle, Kraft, and Kroner) and DCC-GARCH (Dynamic Conditional Correlation GARCH) model, first used by Engle and Kroner (1995) and Engle (2002), respectively. These models also capture the volatility clustering of time-series return of assets as a univariate model. Some of the recent papers mention a pertinent question: which model outperforms in estimation, DCC-GARCH or BEKK? with inconclusive debate. Huang et al. (2010) report the superiority of the BEKK model thanks to the goodness of fit, which comes from the larger number of estimated parameters. Regarding computational complexity, the paper of Caporin and MacAleer (2012) indicates that constraints imposed in the DCC model with "targeting" are similar to those in the Scalar BEKK model. The "targeting" is defined as a tool to reduce substantially the number of coefficients estimated and applied to both BEKK and DCC. Therefore, to gain a better result, the bivariate BEKK approach is employed in this study.

The simplest BEKK class with both ARCH and GARCH lag set to 1 is given below:

$$H_t = C^T C + A^T y_{t-1} y_{t-1}^T A + B^T H_{t-1} B \quad (2)$$

where $H_t$ denotes the multivariate conditional variance-covariance matrix, $y_{t-1}$ denotes the matrix of the error term with t-1 time dimension, and C, A, and B are coefficient matrices represented as:

$$C = \begin{bmatrix} c_{11} & 0 \\ c_{21} & c_{22} \end{bmatrix}, A = \begin{bmatrix} \alpha_{11} & \alpha_{12} \\ \alpha_{21} & \alpha_{22} \end{bmatrix}, B = \begin{bmatrix} \beta_{11} & \beta_{12} \\ \beta_{21} & \beta_{22} \end{bmatrix} \quad (3)$$

where C is a lower triangular matrix of constants, whereas A and B are 2x2 parameter matrices.

While the coefficient $\alpha_{11}$ and $\alpha_{22}$ capture the effect of lagged shock on the current conditional volatility of the respective market returns, the coefficient $\beta_{11}$ and $\beta_{22}$ capture the dependence of the current volatility and its lagged value. Furthermore, $\alpha_{12}$ and $\alpha_{21}$ represent the spillover effect of shock news between two assets, while $\beta_{12}$ and $\beta_{21}$ describe the information regarding volatility co-movement between two assets.

The maximum likelihood of the BEKK model is calculated using the BFGS (Broyden- Fletcher-Goldfarb-Shanno) algorithm with an assumption of generalized error distribution of residuals. The conditional covariance $h_{12,t}$ between the return of Bitcoin and EM index ($r_1$ and $r_2$) can be calculated as in Eq. (4):

$$h_{12,t} = \tilde{c}_{12} + \alpha_{11}\alpha_{22} y_{1,t-1} y_{2,t-1} + \beta_{11}\beta_{22} h_{12,t-1} \quad (4)$$

where $\tilde{c}_{12}$ represents element of $C^T C$ matrix.

Finally, the correlation between two time-series variables is indirectly given as

$$r_{12,t} = h_{12,t} / \sqrt{h_{11,t} h_{22,t}}$$

#### 2.2.2. DCC-GARCH model

In contrast with Huang et al. (2010), Bauwens et al. (2006) and Katsiampa et al. (2022) report that DCC is preferred to BEKK because the latter suffers from the curse of dimensionality given that the number of parameters in BEKK increases exponentially associated with more variables. Therefore, following a recent study on the level of spill-over effect between cryptocurrency and stock markets, this paper employs the DCC model to come up with a dynamic correlation (following: Wang et al. 2021, Ali et al. 2021, 2022; Parichat et al. 2023, Joseph et al. 2024).

The DCC-GARCH process includes two-stage regression. The first step empirically analyze the single GARCH(1,1) equation. Let the return in Bitcoin and Vietnam stock market be ($r_{1,t}$) and ($r_{2,t}$), respectively. Let $r_t$ be a 2x1 vector of log return at time t such that $r_t = (r_{1,t}, r_{2,t})^T$. Thus, the GARCH(1,1) is expressed as follows:

$$r_t = \mu_t + y_t \quad (5)$$

$$y_t = h_t^{1/2} \varepsilon_t \quad (6)$$

$$y_t \mid \psi_{t-1} \sim N(0, h_t)$$

$$h_{i,t} = \gamma_{i0} + \gamma_{i1} y_{i,t-1}^2 + \gamma_{i2} h_{i,t-1} \quad (7)$$

where μt is the expected value of the conditional mean of the market return (rt), yt is the error terms vector, $\varepsilon_t$ is the vector of standardized residual, ψt-1 is the information set at time t-1, and ht is conditional variance of yt

The second step estimates the parameters driving DCC-GARCH process:

$$H_t = D_t R_t D_t \quad (8)$$

where $H_t$ is conditional variance matrix of return, $D_t$ is diagonal matrix of conditional standard deviation of fitted univariate GARCH model of each asset, s.t. Dt = [diagonal·$(h_t)$]$^{1/2}$. Similarly, $R_t$ is a 2*2 matrix of conditional correlation between 2 assets.

$R_t$ is on the form:

$$R_t = \begin{bmatrix} 1 & \rho_{12t} \\ \rho_{21t} & 1 \end{bmatrix} \quad (9)$$

Further, Rt can be expressed as in Eq. (10).

$$R_t = Q_t^{*-1} Q_t Q_t^{*-1} \quad (10)$$

where $Q_t$ denotes a matrix of time-varying conditional variance-covariances of error terms, and $Q_t^{*-1}$ denotes the inverted matrix of diagonal element square root of $Q_t$, thus is given as:

$$Q_t^{*-1} = \begin{bmatrix} 1/\sqrt{q_{11t}} & 0 \\ 0 & 1/\sqrt{q_{22t}} \end{bmatrix} \quad (11)$$

Thus, the process of DCC-GARCH is illustrated as in Eq. (12)

$$Q_t = (1 - \alpha - \beta)\bar{Q} + \alpha \varepsilon_{t-1} \varepsilon_{t-1}^T + \beta Q_{t-1} \quad (12)$$

where α and β are non-negative DCC-GARCH parameters to ensure positive definitive requirement of $R_t$ with α + β <1, and $\bar{Q}$ represents unconditional variance matrix of $y_t$.

Therefore, the DCC conditional correlation is estimated as in Eq. (13):

$$\rho_{12,t} = q_{12,t} / \sqrt{q_{11,t} q_{22,t}} \quad (13)$$

**2.2.3. Diagnostic tests**

**2.2.3.1. Univariate model diagnostics**

Ljung- Box test (Q(m) test): This test is used to investigate the serial correlation in the residuals of univariate GARCH(1,1) models and the Q statistic is computed as:

$$Q(m) = T(T+2) \sum_{l=1}^{m} \frac{\hat{\rho}_l^{\,2}}{T-1} \quad (14)$$

where $\hat{\rho}_l$ represents the autocorrelation function (ACF) of standardized residual at lag l, m is the number of lags being tested.

Under H0 the Q-statistics follow a $\chi_{(m)}^2$. With the Ljung-Box statistics, we can test whether the residuals after GARCH process behave like a white noise.

Q2(m) test: It is used to test for the autocorrelation in the squared residuals series, thus checking whether the residuals show ARCH behavior. If the variance equation is fitted, no serial dependence should remain in the standardized residuals.

Lagrange multiplier (LM) test: This test is one of the principal tools to detect the significant of ARCH effects. The test statistic is calculated as LMm=T$R_m^2$. If the LM statistic excess critical value at order m of ARCH effect , i.e. $\chi_{(m)}^2$, we reject the null hypothesis (Greene, 2012)

**2.2.3.2. Multivariate model diagnostics**

In order to test the adequacy of fitted DCC-GARCH and BEKK-GARCH models, there is a critical requirement of investigation on serial correlation in squared residual (i.e. ARCH effect) (Minovic', 2007; Tse, 2002). This paper use a multivariate approach of the Ljung-Box test proposed by Bauwens (2003) to test for residual diagnostics.

Let $\varepsilon_t$ be the vector of standardized residuals, and be given as εt $=h_t^{-1/2}$ yt. The Ljung-Box statistic can be expressed as follows:

$$HM(M) = T^2 \sum_{t=1}^{M} (T-j)^{-1} tr\{C_{E_t}^{-1}(0) C_{E_t}(j) C_{E_t}^{-1}(0) C_{E_t}'(j)\} \qquad (15)$$

where Et =VECH($\varepsilon_t$ $\varepsilon_t'$) and $C_{E_t}(j)$ implies the matrix of autocovariance of order j, thus is illustrated by:

$$C_{E_t}(j) = T^{-1} \sum_{t=j+1}^{n} (E_t - \bar{E})(E_{t-j} - \bar{E})', \text{ j=0,1,2,…, T-1} \qquad (16)$$

where $\bar{E}$ = (E1 + E2 + …+ ET)/T.

The test statistic has an asymptotical $\chi^2$ -distribution with N2M degrees of freedom under the null hypothesis of no ARCH behaviors (Bauwens et. al., 2006).

## III. RESULT AND DISCUSSION

### 3.1. Modeling of BEKK-GARCH and DCC-GARCH

In this section, we present the estimation of DCC-GARCH and BEKK-GARCH models. First, the estimation results from the BEKK model for three sub-periods are presented in Table 2. The data from all periods confirm the significance of $\alpha_{11}$, depicting that structural breaks in the Bitcoin market significantly and positively affect its current variance. Similarly, the significant $\alpha_{22}$ in all stages implies that Bitcoin's current price fluctuation is primarily influenced by its lagged shock with the interdependence level having gradually increased over stages. The GARCH effects $\beta_{11}$are significant for three stages, which demonstrates that the emerging stock market is greatly influenced by its past volatility, accounting for about 92.5%, 77.03%, and 61.42% for each period. The estimate of $\beta_{22}$ of around 0.98, except for the post-COVID-19 period, reveals that around 98% of past volatility in MSCI EM persists until the next day. In short, Table 2 reveals that the lagged shock and volatility of both assets mainly influenced their own current volatility.

In terms of the magnitude of cross-market shock and volatility spillover, the empirical results provide persuasive evidence of a unidirectional relationship between emerging stock index and Bitcoin price. It follows that the volatility transmission originates from the emerging stock markets rather than the Bitcoin market. Taking into account the short-run volatility impact, $\alpha_{12}$ and $\alpha_{21}$ are either insignificant or negligibly significant (0.0233), except for $\alpha_{21}$ in the pre-COVID-19 period (0.6156***). In most of the cases, this study does not find evidence of shock spilled between two markets in the short term. Besides that, $\beta_{21}$ is significant in all cases, meaning that all three investigated stages witness the tendencies of volatility to spill in the long-run from the emerging stock market to Bitcoin. However, the coefficient $\beta_{12}$ has an insignificant value, indicating that the BTC market is not strong enough to spill volatility to the market of emerging stocks. Bitcoin ($\beta_{12}$) after the coronavirus outbreak appears significant at 1%, with negligible and around 10% of its volatility negatively influencing emerging markets.

This finding is opposite to copious empirical researchers, who confirm the spillover effect from the cryptocurrency market to the emerging stock market (Joseph et al., 2024, Frankovic et al., 2022). Meanwhile, this study is partially similar to the findings of Parichat et al. (2023) and Bouri et al. (2020), who find bidirectional cross-market movement between cryptocurrency and the stock market; however, only transmission from BTC to traditional stock to be confirmed in this paper. This spillover effect can be explained by the global financial integration and contagion, such that shocks and fluctuations in one market can spill to others. Additionally, unstable macroeconomic conditions, such as high inflation, political uncertainty, or exchange rate crises, in emerging economies have led to a shift in investors' portfolios to cryptocurrency in order to safeguard their wealth.

Other than that, it is especially worth noting that the cross-market coefficients in the third stage become either insignificant or lower compared to the previous stage, which states higher independence between the assets. In other words, after investigation of the BEKK cross-market coefficient, BTC could effectively act as safe haven, given its uncorrelation with the MSCI EM index during times of the Ukraine-Russia war.

**Table 2: BEKK-GARCH estimation results between Bitcoin and EM index**

| | Pre COVID-19 | COVID-19 | Ukraine-Russia war |
|---|---|---|---|
| $c_{11}$ | 0.0109*** | 0.0214*** | 0.0196*** |

| | | | |
|---|---|---|---|

| $c_{22}$ | 0.0009** | -0.0000 | -0.0000 |
| $\alpha_{11}$ | 0.2967*** | 0.1578*** | 0.3477*** |
| $\alpha_{12}$ | 0.0048 | 0.0233** | -0.0196 |
| $\alpha_{21}$ | 0.6156*** | 0.1215 | 0.2352 |
| $\alpha_{22}$ | 0.1564*** | 0.4512*** | 0.7214*** |
| $\beta_{11}$ | 0.9250*** | 0.7703*** | 0.6142*** |
| $\beta_{12}$ | -0.0024 | -0.1009*** | -0.0149 |
| $\beta_{21}$ | 0.1181* | 1.1532*** | 0.3216*** |
| $\beta_{22}$ | 0.9805*** | 0.8022*** | 0.9785*** |

*Note: ***, **, * denote the significant level at 1%, 5% and 10%*

Next, this study represents the evidence from the DCC-GARCH estimation in Table 3 to support BEKK-GARCH. The conditional mean is represented by "$\mu$", while the constant in the univariate GARCH model is denoted by $\gamma_0$. Besides that, in the first stage of DCC-GARCH estimation, we capture the effect of past news by the term "ARCH", while the impact of previous volatility is captured by the term "GARCH". Additionally, DCC(α) and DCC(β) depict conditional correlation in DCC estimation. Table 3 suggests that the existence of interconnection and volatility transmission are found to be, more or less, consistent with the BEKK model. For instance, this paper observes the significant ARCH and GARCH parameters for all three periods, which indicates that the volatility of both markets is affected by their own past news and lagged volatility. In the first two stages, the DCC(α) appears insignificant while the DCC(β) is significant. It implies that there is no information transmission between BTC and emerging markets in the short run, where the lingering transfer of information is significantly high. Conversely, in case of spillover after the invasion of Russia into Ukraine in 2022, only moderate short-run volatility impact between BTC and emerging markets is found, given significant DCC(α) with under 10% of spilling and insignificant DCC(β). In other words, BTC fails to maintain influence on emerging markets after the Ukraine-Russia war.

**Table 3: DCC-GARCH estimation results**

| | | **Pre-COVID-19** | **COVID-19** | **Ukraine-Russia war** |
|---|---|---|---|---|

### 3.2. Diagnostic tests

For residual diagnostic checking, this paper employs Ljung-Box tests, where we extract the statistics of residuals, squared residuals, and residuals of cross-return series. Table 4 exhibits the Q(m) and Q2(m) statistics for each return series. From Table 4, it is evident that the Q-statistics for residuals and squared residuals for Bitcoin are not significant, except for the pre-COVID-19 period on lag 36, which ignores the presence of ARCH effects in its variance equation. Under diagnostic check of the log returns on the MSCI index over three sub-periods, the insignificant Q-statistics across all lag lengths in conditional residuals squared infer no ARCH effects in variance, but significant Q-statistics in residuals suggest that the model's residuals exhibit serial correlation. In other words, the models have autocorrelation structures left in residuals in the variance equation of the MSCI index. On the other hand, the ARCH-LM test exhibits no ARCH effect up to order 5 for both series across all phases with both F-statistics and LM-statistics being strongly

insignificant (see Table 5).

| | **$Q^2$(2)** | **$Q^2$(5)** | **$Q^2$(9)** | **$Q^2$(36)** | **$Q^2$(2)** | **$Q^2$(5)** | **$Q^2$(9)** | **$Q^2$(36)** | **$Q^2$(2)** | **$Q^2$(5)** | **$Q^2$(9)** | **$Q^2$(36)** |
| BTC | 0.2497 | 0.6769 | 2.2206 | 51.329* | 1.0332 | 10.950 | 14.349 | 40.564 | 0.2782 | 0.6560 | 4.5435 | 31.675 |
| EM | 1.1154 | 2.4552 | 3.4536 | 24.640 | 1.1557 | 3.3020 | 5.2215 | 22.766 | 0.1469 | 7.7112 | 9.4549 | 36.504 |

*Note: * denotes the significant level at 5%*

**Table 5: ARCH-LM(5) test for standardized residuals of Bitcoin and MSCI Emerging Market Index**

| | Pre-COVID-19 | | COVID-19 | | Ukraine-Russia war | |
|---|---|---|---|---|---|---|
| | **F-statistics** | **LM-statistics** | **F-statistics** | **LM-statistics** | **F-statistics** | **LM-statistics** |
| BTC | 0.1252 | 1.5181 | 2.0881 | 12.3435 | 0.1416 | 1.5231 |
| EM | 0.4821 | 4.3563 | 0.7137 | 4.0280 | 1.6153 | 13.7164 |

*Note: * denotes the significant level at 5%*

**Table 6: The Ljung-Box statistics (Q-statistics) of cross-product of standardized residuals for returns of Bitcoin and MSCI Emerging Market Index**

| **$Q^2$(36)** | **Pre-COVID-19** | **COVID-19** | **Ukraine-Russia war** |
|---|---|---|---|
| BEKK-GARCH | 32.976 | 27.311 | 47.675 |
| DCC-GARCH | 30.429 | 32.340 | 69.310 |

*Note: * denotes the significant level at 5%*

We see from Table 6 that autocorrelation in cross-product residuals is insignificant for BEKK-GARCH and DCC-GARCH models across all sub-periods. These above-mentioned test results emphasize the appropriation of both models for describing the autocorrelation structure of the sample data.

## IV. CONCLUSION

The present study examines the interdependence and volatility transmission between the Bitcoin market and the emerging stock market. For econometric estimations, this paper has employed the BEKK-GARCH and DCC-GARCH models for selected daily returns from January 2nd,2017 to November 25th,2024. These models enable us to take into account volatility clustering arising in return times series. The results of both models reveal strong proof of the dependence of the current conditional volatility of BTC and MSCI EM on the lagged volatility and past shock in their respective markets. The empirical results also offer evidence that the correlations between Bitcoin and equity markets diminished after the war outbreak in Ukraine. Another notable feature is that, after considering cross-market BEKK parameters, the volatility long-run transmission is found to be in one direction from Emerging stock returns to Bitcoin returns.

To financial investors seeking to protect themselves under unpredicted disruption events, our findings reveal the diversifier property of Bitcoin, given the high positive spillover between Bitcoin and traditional equity in emerging economies especially in the long run before and after the COVID-19 pandemic. However, after the emergence of geopolitical uncertainty, i.e. Ukraine- Russia war, Bitcoin appears to be uncorrelated or weak positively correlated to emerging market stock, which indicates that Bitcoin can be considered as a hedge or safe haven. Such information enables stock market participants in the emerging equity market to alter their portfolio optimization strategies and hedging techniques.

To financial regulators in emerging economies, this empirical finding of spillover effects and co-movement between assets points to the development of regulatory and legal frameworks to monitor the digital currency business. Other than that, the Governments in these countries can utilize the data to set up their own central bank digital currencies.

Research on how health and political crises, especially the COVID-19 pandemic and the recent Ukraine-Russia war, may have an effect on asset allocation has only recently started to develop. More investigation should be directed at the determination of how the government put together a stimulus package to lessen the drawback effect of these abovementioned outbreaks on investment optimization. This paper only endeavors to analyze how Bitcoin acts as a diversifier or hedge for traditional equity indices. Future studies could expand to the comparison between emerging and developing market indices with the same objectives or include cryptocurrencies other than Bitcoin, fixed-income instruments, and other financial assets, e.g. gold and derivatives.

# THE IMPACT OF INFORMATION AND COMMUNICATION TECHNOLOGY APPLICATION DEVELOPMENT ON BANKING STABILITY IN VIETNAM

**Ta Thu Hong Nhung[1*], Phan Dien Vy[2], Nguyen Manh Hung[2]**

**ABSTRACT**

The application of Information and Communication Technology (ICT) has long been adopted by banks worldwide, including in Vietnam, in their business operations. The implementation of these technologies is expected to bring high efficiency, reduce operational costs, improve system operations, mitigate risks, and ensure that banks operate more stably and securely. This study analyzes the impact of ICT development on banking stability in Vietnam, using data collected from 24 commercial banks in Vietnam between 2011 and 2023 through the FEM, FGLS, SGMM regression method. The study also proposes solutions to help stabilize the operations of commercial banks when applying ICT.

*Keywords:* "ICT", "banking stability", "Digital transformation", "operational efficiency"

## I. INTRODUCTION

### 1.1. Background of the study

Information technology infrastructure is one of the main pillars of the economy, supporting organizations, individuals, and governments in enhancing their competitiveness (Nustini, 2003). To strengthen the development of information technology infrastructure and seize opportunities in the 4.0 revolution, The State Bank of Vietnam has issued several directives to facilitate the development and application of technology in Vietnam's banking sector, specifically: Developing an action plan for the banking sector to implement the Prime Minister's Directive (2017) on strengthening the capacity to access the 4.0 technology revolution by 2020 and the orientation toward 2025. Decision No. 810/QD-NHNN on the Digital Transformation Plan for the banking sector by 2025, with a vision toward 2030. This is considered a significant milestone in the digital transformation process of the banking sector (Trang et al., 2022.). This reflects a strong commitment to investing in the banking sector's technological infrastructure. Information technology infrastructure can positively impact the stability of commercial banks, as using this infrastructure helps facilitate fast and secure electronic payments. Additionally, the application of electronic devices, cloud storage, blockchain technology, and fintech innovations enhances labor productivity, ensures smoother integration across various operational areas, reduces information asymmetry, and leads to more stable operations (Erumban & Das, 2016).

Financial stability is a concept discussed in many studies. According to the Bank of England, "Financial stability is identifying risks in the system and taking actions to mitigate these risks" (Kim & Mehrotra, 2017). According to Crockett (1997), a financial organization is stable when no risks emerge that could have severe consequences in the financial market. Duisenberge (2001) compared financial stability with monetary stability. While monetary stability reflects the overall sustainable price level, financial stability is much harder to define. In general, financial stability occurs when the components of the financial system function stably. Expanding this, financial stability in banking operations, or banking stability, refers to when the components within banking activities operate stably. The study uses the ZScore index to measure the risk of insolvency, an indicator widely used in literature Laeven & Levine (2009); Samet et al., (2018).

In the banking sector, there have been numerous studies focusing on the impact of information technology on the profitability and stability of banks, with varying results. The first viewpoint suggests that information technology helps reduce operational costs, expand distribution channels, and allows banks to operate more efficiently, with more transparent and stable information. Daud et al., (2022) studied the relationship between financial stability and technology adoption in several countries. The study indicated that technologies such as artificial intelligence and cloud computing help increase financial stability. According to Aduba, Asgari & Izawa, (2023), they also discovered the positive impact of technology on financial development in developing countries with modern financial markets. Elsayed

et al., (2024) stated that combining financial technology with blockchain technology can help identify and stabilize financial organizations in the rapidly changing financial environment of the United Arab Emirates (UAE). Puri et al.,(2023) in their study of the impact of digital transactions on banking stability in India from 2011 to 2020, also found a positive effect of information technology on banking stability. Specifically, the research showed that digital transactions, including mobile banking, national electronic funds transfer (NEFT), and real-time gross settlement (RTGS) systems, are very important in establishing stable banking operations in both the public and private sectors in India. Syed et al., (2022) found greater complexity in their study, which collected data from India and the United States from 2004 to 2018. The study pointed out that in India, in the short term, the expansion of digital financial services in the form of internet transactions and mobile money transactions has a negative and significant impact on banking stability. However, in the long run, digital financial services enhance the stability and efficiency of banks in India. In the United States, both in the short and long term, the expansion of digital financial services improves the efficiency and stability of banks.

On the opposite side, there is a viewpoint that the development of information technology may affect regulations that impact stability and trust in the financial system. DeYoung et al., (2007) researched the impact of digital financial technology in a sample of 55 developing countries between 2000 and 2020. The results showed that the use of digital financial technology through mobile phone registrations does not promote stability in the banking sector and creates instability. Furthermore, DeYoung (2005) studied the impact of the internet on banking services in the U.S. by comparing the performance of traditional banking with e-banking. The research results showed that e-banking increased commissions for deposit services but had no impact on credit operations. Additionally, banks incur significant costs, from operations to staff and management expenses, and this investment cannot replace the traditional branch and transaction office systems. (Li et al., 2020) conducted a study focused on the risk diffusion of technology to traditional financial institutions. The study showed that systemic risk can spread quickly during the development of information technology, especially in the traditional financial sector. Nguyen & Dang (2022) found that the development of information technology and financial technology could have a negative impact on financial stability in Vietnam when studying data from 37 Vietnamese commercial banks from 2010 to 2020. Thus, information technology infrastructure can have varying effects on the stability of commercial banks. Therefore, this research provides additional empirical evidence on the impact of the application of information and communication technology on banking stability in Vietnam.

### 1.2. Research Questions and Objectives

The objective of this research is to assess how ICT affects the stability of Vietnamese commercial banks from 2011 to 2023 and, from this, to provide management implications for the future stable operation of commercial banks in Vietnam as they apply ICT. To achieve the research objectives, the study raises the following specific research questions:

– How do ICT indicators affect the stability of commercial banks' operations in Vietnam?

– What policy implications can be proposed for banks to develop and apply appropriate ICT systems to ensure that commercial banks in Vietnam operate more stably in the era of the technology revolution?

## II. MATERIAL AND METHOD

### 2.1. Data in the Study

The research sample includes 24 joint-stock commercial banks in Vietnam with the most complete data from 2011 to 2023. As of September 30, 2024, the commercial banking system in Vietnam consists of 31 non-state joint-stock commercial banks, 4 state-owned banks, 9 100% foreign-owned banks, and 2 joint-venture banks. The study excludes state-owned banks, 100% foreign-owned banks, and joint-venture banks due to insufficient data. The independent variable on IT infrastructure is taken from secondary data sources, specifically the Report on the Readiness Index for the Development and Application of Information and Communication Technology by the Ministry of Information and Communications. The dependent variable for banking stability is calculated using the LnZ-score, and the control variables are collected and calculated from the audited financial statements of the commercial banks, gathered from the banks' websites. The list of 24 banks in the research sample is arranged with stock codes as shown in Table 1:

**Table 1. List of Banks in the Research Sample**

| List | Stock symbol | List | stock symbol | List | stock symbol | List | stock symbol | List | stock symbol | List | stock symbol |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 1 | ABB | 5 | BVB | 9 | KLB | 13 | OCB | 17 | STB | 21 | VBB |
| 2 | ACB | 6 | CTG | 10 | LPB | 14 | SEA | 18 | TCB | 22 | VCB |
| 3 | BAB | 7 | EIB | 11 | MBB | 15 | SGB | 19 | TPB | 23 | VIB |
| 4 | BID | 8 | HDB | 12 | NAB | 16 | SHB | 20 | VAB | 24 | VPB |

*Source: Author's compilation*

The research model is based on the model of Adusei (2015), and the author constructs the regression model as follows:

$$\text{LnZ-Score}_{it} = \alpha + \beta_1 ICT_{it} + \beta_2 SIZE_{it} + \beta_3 LEV_{it} + \beta_4 LDR_{it} + \beta_5 CR_{it} + \beta_6 HHI_{it} + \beta_7 GDP_t + \beta_8 INF_t + \varepsilon_{it}$$

**Variables in the Model**

**Dependent Variable: LnZ-score**

$$LnZscore = \left( \frac{ROA + \frac{E}{A}}{\sigma(\text{ROA})} \right)$$

In which:

– ROA is the Return on Assets ratio, calculated as Profit / Total Assets.

– E/A (Equity-to-Assets ratio) is measured as Shareholder's Equity / Total Assets.

– The standard deviation of ROA is calculated for the period from 2011 to 2023.

– The independent variable ICT is the index taken from the report on the readiness for the development and application of Information and Communication Technology by the Ministry of Information and Communications.

Additionally, the study uses control variables, including:

– SIZE: Bank size is measured by the logarithm of total assets. It is expected that larger banks tend to be more stable in operations (Abuzayed et al., 2018; Lepetit et al.,2008).

– LEV: Financial leverage is calculated by Total Debt / Equity. Organizations with higher equity and lower leverage tend to operate more stably Lepetit et al., (2008); Abuzayed et al., (2018).

– LDR: Loan-to-deposit ratio, measured by the ratio of outstanding loans to total mobilized capital. Bourkhis & Nabi, (2013) found that the net lending ratio has an inverse relationship with the stability of banks.

– CR: Credit risk is calculated by the ratio of credit risk provision to total outstanding loans. High provisioning is a sign of credit risk and thus has an inverse relationship with banking stability.

– HHI: The index measuring income diversification. Income diversification indicates the extent to which income is derived from non-interest activities of commercial banks. Based on the research of (Abuzayed et al., 2018), this study uses the Constructing Index method with the Herfindahl Hirschman Index (HHI) to measure the income diversification level of Vietnamese commercial banks.

The HHI index is calculated using the formula:

$$HHI = \left( \frac{NON}{NOI} \right)^2 + \left( \frac{NII}{NOI} \right)^2$$

Where: **NON** is the non-interest income of commercial banks; **NII** is the net interest income from loans; **NOI** is the net operating income. This index ranges from 0.5 and above. When HHI = 0.5, it indicates that the bank has fully diversified its income, with non-interest income being approximately equal to interest income. The higher the HHI value, the lower the bank's income diversification.

Additionally, the study measures the impact of macroeconomic factors through the GDP growth rate index and the inflation index (INF) measured by the consumer price index. According to the research by Abuzayed et al., (2018);

Trung et al., (2021), GDP positively impacts banking stability, while the consumer price index, reflecting inflation, has a negative effect. The macroeconomic indicators are collected from the World Bank's data.

### 2.2 Research Methodology

The study uses the Fixed Effects Model (FEM) panel data regression method, followed by regression with the FGLS (Feasible Generalized Least Squares) model to address heteroscedasticity and autocorrelation issues in the FEM regression model. It then continues with regression using the SGMM (System Generalized Method of Moments) model on a panel dataset of 24 commercial banks in Vietnam from 2011 to 2023, resulting in 312 observations.

## III. RESULTS AND DISCUSSION

Table 2 presents the descriptive statistics of the variables in the regression model, showing the number of observations in the sample, the mean value, standard deviation, minimum value, and maximum value of the variables in the study. The highest ICT coefficient is 0.8114 for BIDV bank in 2015, while the lowest is 0, as some banks have not updated complete data for the year 2023.

**Table 2. Descriptive Statistics of Variables in the Study**

| Variable | Observation | Mean | Standard Error | Min | Max |
|---|---|---|---|---|---|
| LnZscore | 312 | 5.154361 | 0.801588 | 2.970675 | 6.512176 |
| ICT | 312 | 0.4721 | 0.1760 | 0 | 0.8114 |
| LEV | 312 | 11.4915 | 4.0351 | 3.1950 | 23.61981 |
| CR | 312 | 1.2727 | 0.4773 | 0 | 2.78 |
| LDR | 312 | 0.8048 | 0.1776 | 0 | 1.7703 |
| SIZE | 312 | 32.6223 | 1.1963 | 30 | 35.3721 |
| HHI | 312 | 0.724286 | 0.158479 | 0.503633 | 1.653516 |
| GDP | 312 | 5.748462 | 1.53052 | 2.6 | 8.1 |
| INF | 312 | 4.851692 | 4.481752 | 0.631 | 18.678 |

*Source: Author's calculations using Stata 17.1*

When analyzing the correlation between the variables in the model, the variable most strongly correlated with the LnZscore index is size, while the leverage ratio (LEV) has the weakest correlation with the LnZscore index. Upon examining the correlation between the variables, all correlation coefficients are less than 0.8. However, to assess whether the variables in the model are suitable and to determine if multicollinearity exists, a multicollinearity test needs to be conducted.

**Table 3. Correlation Matrix of Variables in the Model**

| | LnZscore | ICT | LEV | CR | LDR | size | HHI | GDP | INF |
|---|---|---|---|---|---|---|---|---|---|
| LnZscore | 1 | | | | | | | | |
| ICT | 0.1037 | 1 | | | | | | | |
| LEV | 0.0411 | 0.1639 | 1 | | | | | | |
| CR | 0.0485 | 0.0336 | -0.0648 | 1 | | | | | |
| LDR | 0.1642 | 0.0929 | 0.0467 | -0.0986 | 1 | | | | |
| SIZE | 0.4703 | 0.1123 | 0.4784 | 0.0434 | 0.1361 | 1 | | | |
| HHI | -0.1568 | -0.0268 | -0.0361 | 0.0129 | 0.1068 | -0.3193 | 1 | | |
| GDP | -0.0603 | 0.0345 | 0.0382 | -0.1036 | 0.0293 | -0.0556 | 0.0845 | 1 | |
| INF | 0.0906 | 0.0538 | -0.1904 | 0.0999 | 0.0636 | -0.2827 | 0.2478 | -0.0137 | 1 |

*Source: Author's calculations using Stata 17.1*

When testing for multicollinearity in Table 4, the results show that the VIF coefficient = 1.19 < 2, indicating that there is no multicollinearity between the variables in the model and that the variables used are appropriate.

**Table 4. Multicollinearity Test for the Variables in the Model**

| Variable | VIF | 1/VIF |
|---|---|---|

| | | |
|---|---|---|
| SIZE | 1.60 | 0.626813 |
| LEV | 1.38 | 0.724680 |
| HHI | 1.21 | 0.825186 |
| INF | 1.16 | 0.859499 |
| LDR | 1.08 | 0.926889 |
| CR | 1.05 | 0.950371 |
| ICT | 1.05 | 0.952571 |
| GDP | 1.02 | 0.975710 |
| Mean VIF | 1.19 | |

*Source: Author's calculations using Stata 17.1*

First, the author runs the fixed effects model (FEM) and random effects model (REM) sequentially. Then, the study uses the Hausman test to assess whether FEM or REM is the appropriate model for examining the impact of IT infrastructure on the stability of commercial banks' operations. The results show a Prob value of 0.00 < 0.05, indicating that FEM is the suitable model. Next, the study conducts tests for heteroscedasticity and autocorrelation, using the Wooldridge test and Wald test, both of which yield a Prob value of 0.000 < 0.05. Therefore, heteroscedasticity and autocorrelation exist, and the study proceeds with regression using the FGLS model to address these issues.

**Table 5. FGLS Regression Results for Factors Affecting Banking Stability**

| LnZscore | Coefficient | Std. err. | z | P>z |
|---|---|---|---|---|
| ICT | 0.168291 | 0.125163 | 1.34 | 0.179 |
| LEV | -0.04459 | 0.007405 | -6.02 | 0.000 |
| CR | -0.05598 | 0.053588 | -1.04 | 0.296 |
| LDR | 0.42997 | 0.140591 | 3.06 | 0.002 |
| SIZE | 0.437647 | 0.023451 | 18.66 | 0.000 |
| HHI | -0.27499 | 0.202488 | -1.36 | 0.174 |
| GDP | -0.00626 | 0.015234 | -0.41 | 0.681 |
| INF | 0.043224 | 0.0058 | 7.45 | 0.000 |
| _cons | -8.89403 | 0.81738 | -10.88 | 0 |

*Source: Author's calculations using Stata 17.1*

According to the results of the FGLS regression model, LEV has a negative impact on banking stability, while the variables LDR, SIZE, and INF have a positive impact on banking stability. The remaining variables, ICT, CR, HHI, and GDP, are not statistically significant. However, in regression models involving economic factors, endogeneity is an unavoidable issue. Therefore, the study uses the SGMM regression method to address this issue and provide more reliable results.

**Table 6. Results of the SGMM Regression Model on Factors Affecting Banking Stability**

| LnZscore | Coefficient | Std. err. | P>t |
|---|---|---|---|
| LnZscore L1 | 0.529762*** | 0.039653 | 0.000 |
| ICT | 0.476442*** | 0.083629 | 0.000 |
| LEV | 0.032969 | 0.031277 | 0.303 |
| CR | 0.098848 | 0.158944 | 0.540 |
| LDR | 1.262791* | 0.663656 | 0.070 |
| SIZE | 0.324151*** | 0.063239 | 0.000 |
| HHI | -1.18319** | 0.466798 | 0.019 |
| GDP | 0.014734* | 0.008329 | 0.090 |
| INF | 0.014492 | 0.013675 | 0.300 |
| _cons | -9.26973*** | 2.292833 | 0.001 |
| AR(1) p-value | | 0.001 | |

| | |
|---|---|
| AR(2) p-value | 0.191 |
| Sargan test | 0.786 |
| Number of groups | 24 |
| Number of instruments | 24 |
| Second stage F-test p-value | 0.000 |

*(***, **, * denote statistical significance at the 1%, 5%, and 10% levels, respectively.*

*Source: Author's calculations using Stata 17.1*

The research results satisfy the p-value condition for AR(1) which is 0.001 < 0.05, and the p-value for AR(2) is 0.191 > 0.05. This indicates that the model has first-order autocorrelation but no second-order autocorrelation of residuals, which meets the necessary condition. Additionally, the number of instrumental variables is 24, equal to the number of groups, which satisfies the condition that the number of instrumental variables is less than or equal to the number of groups. Furthermore, the Sargan Test result is 0.786, and the F test result is 0.001, indicating that the variables in the model are appropriate.

The research results show that the lag variable of lnZscore, LnZscore L1, ICT, LDR, SIZE, HHI, and GDP have statistical significance at different levels. The remaining variables, LEV, CR, and INF, are not statistically significant. Specifically, LnZscore L1, ICT, and SIZE have a significance level of 1%; HHI has a significance level of 5%; LDR and GDP have a significance level of 10%. Most of the variables have a positive impact on bank stability. LnZscore, ICT, LDR, SIZE, and GDP have positive effects, while HHI has a negative effect on bank stability. The variables with the strongest effects, in order, are LDR with a regression coefficient of 1.262791, HHI with a coefficient of -1.18319, LnZscore L1 with a coefficient of 0.529762, ICT with a coefficient of 0.476442, SIZE with a coefficient of 0.324151, and GDP with a coefficient of 0.014734.

## IV. CONCLUSION

The research results indicate that the application of information and communication technology (ICT) positively impacts bank stability. Indeed, the use of technology makes banking operations more transparent and efficient, reducing intermediary steps and operating costs, thus helping banks maintain greater stability. This finding is consistent with the research of Trang et al. (2022), Daud et al. (2022), Puri et al., (2023), Elsayed et al., (2024) and Aduba, Asgari & Izawa (2023).

Therefore, the study recommends that banks invest in technical infrastructure, such as increasing the internet bandwidth ratio to support Internet banking services, providing internal users with better access, and increasing the number of ATMs and POS machines. The network infrastructure must ensure high safety, security, and good transmission capacity. Additionally, with the rapid growth of the banking system and increasing data volume, central banks must invest in infrastructure, hardware, software, and management skills for monitoring and inspection. This will allow central banks to regularly monitor and check for quick and efficient resolution of issues (such as communication errors or the lack of customer information security.

At the same time, banks need to strengthen their workforce in the field of information technology with qualified and experienced personnel. This is crucial in the context of digital transformation today. Banks should have a strategy for managing high-quality human resources both in the short term and long term, in alignment with modern technologies, and increase cooperation with training institutions to help employees keep pace with new technological products and services.

Furthermore, banks should implement ICT systems such as core banking systems, internal software systems, online banking services, and electronic payments.

Moreover, the financial stability from the previous year, the credit-to-deposit ratio, and the size of the institution also positively impact bank stability. The study recommends that banks can benefit from increasing their scale and expanding credit activities in their operations. However, diversification has an inverse effect on bank stability, which goes against expectations, but reflects that diversification in recent banking operations has not been effective. When investing in non-interest activities, fixed costs rise, leading to an increase in overall leverage, making the bank riskier. This study emphasizes that banks still benefit from focusing on credit activities and should carefully consider

investment activities, avoiding spread investments or chasing trends.

Additionally, with regard to the macroeconomic factor, GDP has a positive impact, indicating that banks operate more stably during periods of economic growth, as expected and in line with the studies of Abuzayed et al., (2018); Trung et al., (2021).

# DISCUSSING PROPERTY TAXES ON REAL ESTATE IN VIETNAM - SOME PROPOSALS FOR DEVELOPING AND IMPROVING LEGAL REGULATIONS

**Le Huynh Phuong Chinh[1*], Ngo Thi Khanh Linh[2]**

[1]PhD Candidate in Economic Law - University of Economics and Law - Vietnam National University HCMC; Lecturer, Faculty of Law, Can Tho University.

[2]Graduate Student in Economic Law, Can Tho University.

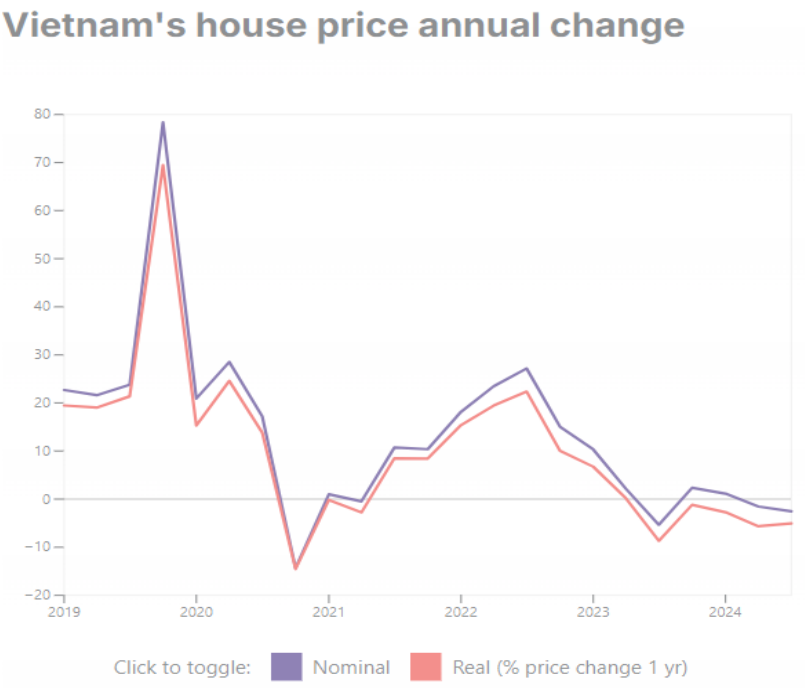
**ABSTRACT**

In many countries around the world, property taxes have existed and play an important role in providing stable revenue for the state budget. They are also one of the effective tools for combating real estate speculation, thereby macro-managing the economy, and contributing to ensuring social equity. Observing the tax system in Vietnam, property taxes currently only include taxes on non-agricultural land use, agricultural land use, and income tax on real estate transfers. However, the role of these taxes remains limited, especially in terms of mobilizing resources for the state budget. This reflects a tax system and policies related to real estate that are still incomplete, inconsistent, and sometimes cause difficulties for individuals and organizations involved. In fact, property taxes have been discussed for many years. To date, property taxes are still under research and development, with the draft law still being refined. In early February 2023, in the Draft Law and Ordinance Building Program for 2024, with amendments for 2023, the Ministry of Justice solicited opinions on the proposal to issue a Real Estate Tax Law. At present, with the introduction of the 2023 Real Estate Business Law, the 2023 Housing Law, and the 2024 Land Law, addressing the construction and improvement of regulations on property taxes related to real estate in line with modern trends is an urgent issue.

*Keywords*: “property tax”, “real estate”, “land tax”



## I. INTRODUCTION

### 1.1 Background of the study

#### 1.1.1 The real estate market situation and property taxes related to real estate in Vietnam

The real estate market in Vietnam in recent years has undergone many challenges, especially during the recent pandemic, but has gradually recovered and made significant contributions to the national economy. However, alongside this recovery and development, the market still faces several unresolved negative issues that are not effectively managed, such as speculation and lack of transparency. One of the clearest signs of the volatility in the real estate market is the prices of properties over different periods. According to the chart showing housing prices below, it can be seen that housing prices in Vietnam have fluctuated significantly over the past 5 years (from 2019 to 2024). After experiencing crises due to the Covid-19 pandemic, the market has seen some recovery, but it has not been substantial, and there have even been significant downward fluctuations. This also indicates that the housing market in particular, and the real estate market in general in Vietnam, do not yet have a solid foundation to remain stable in the face of economic fluctuations.

One of the causes of these issues is related to the legal framework for property taxes on real estate. The current tax policy system related to real estate includes taxes on non-agricultural land use and taxes on agricultural land use. Essentially, the tax policies on non-agricultural and agricultural land have helped strengthen state management over land. However, due to the rapid fluctuations in global political economy as well as Vietnam's economy, the current real estate tax policies remain limited (such as not covering all sources of revenue, with low mobilization levels...). Therefore, the development and improvement of property taxes need to continue to be reviewed and refined to make more appropriate adjustments in each context.

### 1.1.2 The role of property taxes in the economy and the real estate market

Property taxes play an important role in regulating the economy and providing stable revenue for the state budget. Property taxes on real estate contribute significantly to stabilizing the real estate market. In a modern economy, property taxes can reduce speculation and increase fairness and transparency in wealth distribution. A comprehensive legal framework regulating property taxes related to real estate will encourage the rational and efficient use of assets, helping to minimize issues such as real estate bubbles. In reality, property tax laws, primarily concerning housing and land, directly affect the economic interests of entities within the economy. Property taxes linked to real estate are significant in the economy, impacting various economic, political, and social aspects. This is because real estate, which includes land—the most important asset of a country (manifested through factors such as area, natural advantages, mineral resources, and increasing value)—and buildings and structures tied to the land, are assets with considerable value in the total wealth of their owners. Land and buildings have their own market—the real estate market. The real estate market of a country is always interconnected with other key markets in the economy, such as the capital market and the labor market. Real estate policies also reflect the political views of a country, such as land use planning policies and real estate business policies.

### 1.1.3 International experience in developing property tax regulations related to real estate

Around the world, many countries have developed and implemented property tax regulations related to real estate as an important part of their tax systems. Most countries do not enact a separate property tax that covers all types of taxes related to assets, nor is there a unified model for property taxes. Each country has a different tax policy system for assets, depending on their policy objectives. However, the common taxable assets in most countries are houses and land. Developed countries such as the United States, the United Kingdom, Japan, and Singapore all have property tax regulations. The types of property taxes in these countries include real estate property taxes (such as taxes on land and buildings), taxes on real estate transactions, and taxes related to the use of land and other real estate assets, including homes and structures, etc

Some property tax systems in these countries are quite transparent and detailed for all real estate assets that are owned and used, including land and housing, with tax rates depending on the value of the assets. This not only helps the government attract revenue from the real estate market but also helps stabilize prices, curb speculation, and ensure fairness in the distribution of assets.

### 1.1.4 Current issues in developing property tax regulations related to real estate in Vietnam

Although Vietnam has regulations on property taxes related to real estate, this system still has many shortcomings and may no longer be suitable for the current fluctuations in the real estate market. The current regulations mainly focus on taxes related to real estate transfers. The taxes regulating the ownership and use of real estate assets primarily exist in the form of taxes on agricultural and non-agricultural land use. As a result, the level of oversight aimed at ensuring transparency and a healthy real estate market, as well as increasing revenue for the state budget from the tax authorities in the real estate sector, has not been very effective. The current application of property taxes on real estate also lacks fairness, especially for owners of large assets. Furthermore, Vietnam's tax legal system does not cover all types of assets subject to property taxes according to international practices.

Therefore, the law on property taxes, primarily those impacting real estate, needs to be developed and applied based on the principles of proper, adequate taxation, and balancing the interests of society, the economy, the state, and the taxpayers. In practice, the issue of developing and improving property taxes on real estate must address several legal issues, including: (i) how to establish property taxes on residential ownership to achieve the goal of preventing speculation and regulating the real estate market, while not eliminating the investment potential of market participants, (ii) criteria for determining property taxes on real estate to generate revenue for the state budget while ensuring fairness, (iii) the effectiveness of property tax laws arising from real estate transactions and the level of tax compliance. Additionally, the current trend of developing and enacting property taxes also leads to disputes over the identification of taxable subjects between personal income taxes and property taxes on real estate.

### 1.1.5 Significance of the Study

This research also contributes to clarifying the role and necessity of developing property tax regulations related to real estate in Vietnam. At the same time, the authors propose several recommendations for the development and improvement of property tax regulations related to real estate in Vietnam. Therefore, this study also serves as a reference for legislators, researchers, and policymakers in Vietnam to consider when building and refining property tax laws in the coming period (from 2025 onwards). Through this, the study aims to contribute to improving tax management effectiveness, combating speculation, and maintaining a healthy, transparent real estate market for sustainable development.

### 1.2 Research Questions and Objectives

To clarify the issues related to property taxes on real estate in Vietnam, this study has several main objectives:

- RO1: Assess the regulations related to property taxes on real estate in countries around the world.
- RO2: Examine the process of developing property tax regulations and determine the necessity of creating property tax laws related to real estate in Vietnam.
- RO3: Propose issues related to the development of property tax regulations on real estate in Vietnam.
- To achieve these objectives, the following key research questions will be addressed:
- RQ1: How do countries around the world regulate property taxes related to real estate?
- RQ2: What is the process of developing property tax regulations in Vietnam?
- RQ3: What is the necessity of creating property tax laws related to real estate in Vietnam today?
- RQ4: What proposals are needed to improve property tax regulations related to real estate in Vietnam?

## II. MATERIAL AND METHODOLOGY

### 2.1 Conceptual Foundation

According to the Cambridge Dictionary, property tax is a type of tax levied on buildings and land, based on their value. International research on taxes offers various perspectives on property taxes. Specifically, the Organisation for Economic Co-operation and Development (OECD) defines property tax as follows: "*A tax on property is defined as a periodic or non-periodic tax on the use, ownership, or transfer of property. This includes taxes on real estate or net wealth, taxes on changes in property ownership through inheritance or gifts, and taxes on financial and capital transactions*." (Tax on property, n.d.). Alternatively, *property tax is a type of tax levied on the ownership rights of assets. Simply owning property is the determining condition for the taxpayer to fulfill their legal obligation regarding*

*property tax."* (Holbert, 1980). Thus, property tax on real estate is often interpreted as a tax levied on assets, primarily real estate owned by individuals or organizations. This tax can also be understood as a financial obligation of individuals or organizations owning real estate to the state.

In general, property tax is a type of tax imposed on ownership rights, mainly on real estate, including houses, land, land use rights, buildings, and other assets attached to the land. Typically, governments in various countries set relatively high tax rates on real estate, based on the area or value of the property. In principle, the taxpayer is the entity that owns or has the right to use the real estate. Additionally, some countries further differentiate tax rates based on the purpose of the property (for residential use or business investment, etc.) or based on the number of properties owned (there may be differences between tax rates on the first property and subsequent ones).

### 2.2 Research method

The study is based on the following methods:

**Analytical method**: This method is used to study and evaluate property tax regulations related to real estate in countries around the world, including taxable subjects, taxpayers, tax rates, etc. The analytical and synthetic methods are also applied to examine the property tax regulations in the Draft Property Tax Law in Vietnam, clarifying the necessity of enacting regulations on property taxes related to real estate. Proposals for improving property tax regulations in Vietnam are also clarified through this method.

**Comparative method**: This method is used to compare property tax regulations related to real estate between countries worldwide and Vietnam. Through this, the authors are able to evaluate and draw lessons from other countries in developing and refining property tax laws, which play an important role in regulating markets, ensuring social equity by balancing the income of different population groups, and reducing income inequality. The comparative method is also applied to learn from the experiences of other countries in developing and refining property taxes, which allows the authors to conclude that property tax is an effective tool to curb speculation in real estate and contribute to stabilizing, developing, and ensuring the sustainability and health of the real estate market.

**Synthesis method**: Based on the evaluation of property tax regulations related to real estate in countries around the world and in the Draft Property Tax Law in Vietnam, this research applies the synthesis method to systematize the limitations of the regulations compared to practical realities. From there, the study synthesizes recommendations for improving legal regulations related to taxable subjects, taxpayers, tax rates, and property tax management for real estate, contributing to improving the general tax legal system in Vietnam.

## III. RESULT AND DISCUSSION

### 3.1 Property tax laws in some countries around the world

Currently, over 90% of countries worldwide impose property taxes under various names. According to statistics from the Ministry of Finance, property taxes account for 3-4% of the total tax revenue in developed countries, with some places, such as Japan, reaching as high as 8%. (Loan, 2018) It can be seen that property tax on real estate not only plays a role in ensuring government revenue, regulating the macroeconomy, and serving as an effective tool to combat land speculation, but also creates opportunities for many people to access land and housing, contributing to social equity. The common taxable subjects in most countries are houses and land. A brief overview of property tax regulations in some countries is as follows:

In the United States, property taxes are heavily levied on house sales and second homes. When taxing house sales, the U.S. Internal Revenue Service (IRS) clearly distinguishes between homes for personal use and homes for investment. For property tax, which is levied once when purchasing a house, the tax rate varies from state to state but does not exceed 2.35% of the property's value. However, for a primary residence, state governments in the U.S. will levy very low taxes, or even exempt tax on properties valued under $250,000 for individual ownership, or under $500,000 for household ownership. The Housing Assistance Act of 2008 in the U.S. also ended tax exemptions for second homes, as these properties are primarily for profit-driven investment. According to U.S. property tax laws, taxable property includes land, buildings, houses, parking lots, parks, gardens, etc. Property tax is based on the net value of the property and its market value, with the taxable value of the property, tax rate, and progressive tax rate serving as the bases for calculation. (Dung, 2023).

In the United Kingdom, property tax, or Stamp Duty Land Tax (SDLT), is divided into two categories: tax for first homes and tax for second homes and beyond. For first homes, the current tax rate in the UK is progressive with 5 levels based on the property value, ranging from 2% to 12% for properties valued from £125,001 and above. The UK government announced that, starting from April 1, 2016, anyone purchasing a second home or land that is not a first home will be required to pay a 3% tax rate. The aim is to increase the availability of housing for first-time buyers by reducing competition from landlords. (Kath Scanlon, Christine Whitehead, Fanny Blanc)

In Sweden, taxable property is defined by the country's laws as personal property and real estate. The form of taxation and the basis for taxing real estate is based on the value of the house and land, where the tax is proportional to the value, with no starting threshold like in some other countries. Thus, real estate (houses and land) is taxed twice: first, through property tax (if the net value of the property is 800,000 SEK or more), and second, when tax is levied on the house and land itself.

In Germany, property tax was first introduced in 1893. However, since 1997, Germany has not imposed property taxes. The tax rate in 1997 was based on the value of the property minus unpaid debts, with an exemption of 120,000 DM (at that time, before the Euro was introduced) for one family member, and a tax rate of 1% for individuals and 0.6% for legal entities. In Germany, property tax on second homes is aimed at covering local government expenses related to the property (according to Article 105 of the German Constitution, tax is levied on individuals who register their second home, whether rented or owned). The tax rate varies by location, ranging from 5% to 23% per year, with the most common rate being 10% of the property's value. (Theoretical and practical basis for property tax construction in Vietnam, 2019)

In Asian countries, similar property tax regulations are also applied. For example, South Korea implements a tax rate that varies according to the type of real estate. Specifically, the tax rate for residential properties ranges from 0.1% to 0.4%, for buildings it ranges from 0.25% to 0.5%, excluding buildings in golf clubs or luxury recreational facilities, and for land, the tax rate ranges from 0.2% to 0.5%. (Applicable Taxes, n.d.)

In Singapore, the country has been very successful in implementing a tax on second properties, and this tax is even levied at a very high rate. The additional property tax, which has been in effect since 2013, applies to second properties at a rate of up to 7% of the purchase price, and 10% for the third property, starting from 2013. (Property Tax on Residential Property, 2023) . In China, buyers of a second home are subject to a tax rate of 1.2% on the value of the property. China has also proposed a draft law for a property tax that would apply to industrial, commercial properties, and individual residences, based on the assessed value of the property. (Xinhua, 2024)

In Thailand, on November 16, 2018, the Thai Parliament passed the Land and Building Tax Act, which came into effect on January 1, 2020. The purpose of this reform was to promote more efficient land use and the construction of buildings on land, as well as to allocate tax revenue to local governments. Previously, land development tax in Thailand was based on a progressive tax rate according to land area. Now, Thailand has enacted the Land and Building Tax Law, which applies a progressive tax rate based on the assessed value of the property and categorizes properties based on their intended use, such as agricultural land, residential properties, commercial properties, and unused properties, etc. (Pham Thi Thu Hong, Nguyen Thi Hoa, 2020)

Overall, it can be observed that property taxes in some countries mainly focus on real estate, including houses, land, and structures on land. These types of properties are subject to relatively high tax rates. Many countries tend to apply an additional tax rate for owners of a second or subsequent property, with the clear goal of preventing land and housing speculation, regulating the real estate market, and providing greater access to housing for a larger group of people in society. The regulations regarding property taxes on real estate in countries around the world can be summarized as follows:

Taxable property: The commonly taxed property is real estate, including houses, buildings on land, and land itself. For each type of property, it is generally subdivided into categories based on its intended use. These are assets that are closely regulated through registration procedures and oversight by various government agencies. Typically, owners prove their ownership or usage rights through documentation issued by the relevant authority.

Taxpayer: The taxpayer for property taxes is generally the owner of the property. However, in some countries, the tax liability extends to those who have the right to use the property (for example, in cases where land is publicly owned

and managed by the state, such as in Vietnam). In cases where ownership is unclear, the person directly using the property is required to pay the tax (as seen with Taiwan's land tax) according to provisions outlined in Article 4 of Taiwan's Housing Tax Act.

Tax basis: The tax base for property taxes is typically based on the market value of the property at the time of taxation. In cases where determining the market value is difficult, a tax value set by the government is applied, adjusted periodically according to the economic and social development phase.

**3.2 Overview of the formation and development of property tax law in Vietnam**

In Vietnam, property taxes have been in place for a long time and are regulated by laws such as the Agricultural Land Use Tax Law and the Non-Agricultural Land Use Tax Law. However, over time, alongside changes in national policies and the market economy, these property taxes have not seen significant changes. This has sometimes led to outdated regulations that no longer align with the current realities. The amount of tax collected from property use only accounts for about 0.036% of GDP (while the property tax/GDP ratio in developing countries in the Asia region is around 2% of GDP), meaning that this figure is hundreds of times lower than that of other countries in the region. (Trung, 2018)

Recognizing the importance of establishing a Property Tax Law, especially for real estate, over the past years, many drafts of the Property Tax Law in Vietnam have been introduced. However, the approach has not been unified, and many aspects still need to be reviewed and refined. Therefore, the enactment of the Property Tax Law in Vietnam has not yet been realized. Specifically, since 2008, the Ministry of Finance has drafted the Property Tax Law, but it was unable to present it to the National Assembly due to receiving many conflicting opinions. At the end of 2009, the Ministry of Finance introduced the Land and Housing Tax Law draft for public opinion with the expectation that the government would review and discuss it in the August 2009 meeting. If passed by the National Assembly, the law would have taken effect from January 1, 2011. However, for various reasons, the land and housing tax law project was not enacted. (Minh, 2022)

Following that trajectory, at the beginning of 2018, the Ministry of Finance once again announced a proposal for the Property Tax Law draft. However, this draft was once again left unresolved. Experts argue that the issue with the 2018 Property Tax Law draft was not related to its complexity, sensitivity, or difficulty, but rather to some of the provisions being inappropriate. Moreover, the proposed tax rates in the draft were significantly higher than the existing laws at the time. According to Article 8 of the draft Property Tax Law, for non-agricultural business production land and non-agricultural land used for business purposes, the draft presents two options: First, non-agricultural business production land used for restaurant construction would have a tax rate of 0.52%; other non-agricultural business production land would have a tax rate of 0.3%. Second, non-agricultural business production land and non-agricultural land used for business purposes would be taxed at a rate of 0.3%. Meanwhile, the current law applies a tax rate of 0.03% for non-agricultural business production land and non-agricultural land used for business purposes, as stipulated in Article 2 of Circular 153/2011/TT-BTC. Therefore, increasing the tax rate to such a high level immediately without a clear roadmap would be difficult to implement in practice, particularly as it would be hard to gain societal consensus on the new regulation. This is an issue that the legislative body must thoroughly research and assess to find a suitable figure that balances the interests of the state and taxpayers. Additionally, the draft Program for Law and Ordinance Development for 2024, adjusted in 2023 by the Ministry of Justice, includes a proposal for the enactment of a Real Estate Tax Law. As of now, property taxes are still under research and development, and the draft law is still being refined.

Thus, Vietnam has also begun developing regulations on property taxes related to real estate, similar to other countries around the world. However, to date, the regulations still face some obstacles and have not yet been fully implemented. Overall, the proposed property tax rates for real estate are nearly equivalent to the tax rates applied in many countries worldwide, meeting the integration requirements. Other issues, such as determining taxable entities and taxpayers, are also relatively compatible with current tax laws and the regulations of other countries. Regarding property values for tax assessment, Vietnam uses market prices and the size of the property, which is similar to most countries worldwide. However, a difference compared to many countries is that Vietnam does not distinguish between

taxes on first-time properties and subsequent properties.

Overall, the draft laws regarding property taxes for real estate have initially recognized the correct direction for taxing the necessary real estate. Factors such as the legal basis for the law and taxable entities have been studied and developed based on many theoretical grounds. However, in practice, these drafts face challenges in being passed because they have not yet clarified the purpose, the appropriate regulatory approach, or laid out a specific roadmap for increasing tax rates. Therefore, these drafts have remained at the research and commentary stage for a prolonged period without being passed or implemented. Meanwhile, the enactment of the Property Tax Law is becoming increasingly urgent.

### 3.3 Assessment and recommendations on the development of the Law on Property Tax on real estate in Vietnam

#### 3.3.1 The necessity of establishing property tax laws related to real estate

Currently, property taxes on real estate are common in most countries around the world and are an important part of the tax legal system in each country. This is linked to the role of property taxes in generating stable revenue for the state budget, regulating the market, and ensuring social fairness, especially in contributing to the fight against property speculation. In Vietnam, researchers and policymakers argue that a property tax law should be developed soon to address socio-economic issues. Specifically:

*Firstly, the regulation of property taxes on real estate helps improve the national tax system, aligning it with international standards in the field of taxation.* The establishment of a Property Tax Law for real estate would not only meet the requirements of management and social regulation but also help harmonize with tax laws in most countries around the world. As of 2018, 174 out of 193 countries worldwide apply this form of tax, with different names, including: Property Tax (in 65 countries such as India, South Korea, Japan, Serbia, Slovenia, Canada, Puerto Rico, France, the United States, Switzerland, etc.); Real Estate Tax (51 countries); Land Tax (30 countries); Land Use Tax; House and Land Tax... and these are usually levies applied during the land use process. (Theory, practice of countries on property tax and policy orientation for Vietnam, 2018)

*Secondly, property taxes contribute to increasing revenue for the state budget*. In many countries around the world, property taxes play an important role in the structure of public revenue. This is a stable source of income, and the monitoring and control of revenue are easier compared to other types of taxes. Property taxes related to real estate do not require competition or are limited by international agreements, making it easier for regulatory agencies to plan the projected budget revenue. Therefore, the establishment and application of property taxes should also be considered and recognized in Vietnam. Additionally, due to its stability, this type of tax helps fill gaps in other tax structures, such as import and export taxes. This is because import and export taxes in each country are currently dependent on many objective factors, such as the regional and global market economy, cooperation among parties, and membership in global economic organizations.

*Thirdly, property taxes on real estate contribute to regulating the real estate market.* The urgency of applying property taxes becomes clearer when the gap between the wealthy and the middle- and low-income groups in society continues to widen. Currently, some individuals with substantial resources are accumulating property, particularly land and houses, which increases real estate prices and makes it harder for the poor to access housing. The reality of low tax rates leads to economic consequences such as: (1) people are inclined to save money by investing in real estate, leading to increased land speculation and higher property prices, which both weakens the economy's competitiveness and makes it difficult to solve housing problems for low-income individuals. An unstable real estate market, coupled with an economy unable to channel funds into productive investment, occurs because people prefer to store savings for speculation. However, considering the impact of taxes on land and housing prices, in the short term, when other factors remain unchanged, taxing will increase property prices. In the long term, theoretically, when speculators exit the real estate sector, the supply of property for those with genuine needs will increase, and prices will decrease. In reality, however, property prices may not decrease significantly and may even rise in some countries that have implemented high property tax rates. Nevertheless, property taxes have a stabilizing effect and help limit excessive increases in land and housing prices. (Poghosyan, 2016) In addition, if a high tax rate is applied to vacant properties, it will also help bring these properties into use and reduce resource wastage.

*Finally, property taxes contribute to ensuring social equity*. This is both a role and a goal of property tax laws, aiming to ensure fairness among organizations and individuals regarding the right to own and use property. Fairness is reflected in the fact that taxpayers will pay the same tax rate for the same type of property, regardless of the quantity or intended use of the property. This includes considering and calculating the circumstances and conditions of the taxpayer, especially during times of economic hardship and a heated real estate market, as is the case today. Property taxes ensure social equity by redistributing income across different social classes, thus reducing income inequality.

**3.3.2 Some proposals for developing property tax laws on real estate**

Based on the analysis, evaluations, and references to the experiences of other countries in developing and applying property tax laws, the authors propose the following content regarding property taxes on real estate:

*First, regarding the taxable objects*

As identified, the taxable objects under the property tax law on real estate will mainly include houses, land, and buildings for commercial purposes. Countries can choose to tax land and houses as a unified asset or as two separate assets; they may tax all land and buildings or only tax the second house or property, as a pilot example in China. Some countries tax only land, not houses, such as Jamaica, Kenya, and New Zealand, or conversely, tax only houses, not land, as seen in Tanzania, Ghana, and Haiti. (Kelly, Roy; White, Roland; Anand, Aanchal, 2020)

In addition, property tax policies should clearly define which objects are exempt or not subject to tax. Most countries exempt properties used for public purposes, such as land for national defense, religion, education, healthcare, transportation infrastructure, cemeteries, etc. To support economic sectors, some countries also exempt agricultural or tourism-related properties from tax.

The basis for calculating property tax is typically based on the area and/or value of the property. When setting the tax threshold, countries can choose area, for example, taxing land with an area of 60m² or more, or value, such as taxing houses with a value of 1 billion VND or more. The property tax calculation can also combine both area and value, meaning it is based on the land size and adjusted according to factors like location, characteristics of the property, and its intended use to determine the tax amount. Although this method is simple, very few countries tax purely based on area. This is because taxing based on area equates the value of the asset and does not ensure fairness (Lan, 2022).

In Vietnam, the current trend in the development of property tax is to determine the tax payable based on the area and the purpose of using the real estate, with consideration given to separately assessing taxes for houses, land, and construction works. From the authors' perspective, this approach is reasonable given the current real estate market situation and the economic-social conditions in Vietnam. However, the determination of taxable and exempted entities should be based on one of two methods: (1) clearly specifying a list of types of houses and land not subject to tax, or (2) setting a tax exemption threshold, which should consider other exempted entities, such as religious heritage. Regulations on this issue need to reference the new provisions in the 2023 Housing Law, the 2023 Real Estate Business Law, and the 2024 Land Law to ensure consistency. The 2018 Property Tax Bill already provides a fairly complete list of taxable entities in the direction mentioned above. However, the bill needs to consider a new category of construction works with mixed-use functions serving multiple purposes (as per Clause 2, Article 5 of the 2023 Real Estate Business Law). In this case, the determination of taxable and exempted entities should clarify whether the tax should be based on the general purpose of the entire structure or separately for each section of the structure.

In general, the key issue in determining taxable entities is clarifying which entities are subject to property tax and which are exempt. The draft law should define the tax base based on the purpose or area of the real estate and whether to impose taxes separately on each entity, such as houses, land, and construction works, or treat them as a unified entity. This issue is crucial for property tax. It helps avoid overlapping tax responsibilities and enhances the effectiveness of the tax when applied in practice.

*Second, regarding the taxpayer*

Countries around the world generally define the taxpayer for property tax on real estate as the owner, user, or the person entrusted with the use or benefits of the property. However, the 2018 Draft Property Tax Law does not clearly define the entrusted party as a taxpayer. It is suggested that lawmakers consider adding this category to the group of taxpayers to align more closely with international practices. This provision would also cover cases where someone

bears the burden of the property tax.

In addition, in item b, clause 3, Article 4 of the 2018 Draft Property Tax Law, it is stated that if there is an agreement, the tenant may be the taxpayer. This provision is inherited from the tax regulations on non-agricultural land use. However, there is a flaw in this approach. The taxpayer may exploit the tax threshold provisions to avoid tax. Specifically, if the value of the property exceeds the taxable threshold, the property owner could rent to multiple tenants, and each tenant's rental value would not exceed the taxable threshold. This method is easily applicable to properties that can be divided, such as houses with many rooms or floors. This leads to unfairness in the property tax regulation system. (Nam, 2018). Thus, the draft law needs to consider adding provisions to address this issue, contributing to the effective application of the regulation in practice.

*Third, regarding the tax valuation*

Most countries today apply market value, rental value, or a value set by the government for tax purposes. According to the 2018 Draft Property Tax Law, Vietnam applies the land price table issued by the provincial People's Committees at the time of tax calculation. With the change in the land price table cycle under the 2024 Land Law from a five-year schedule to an annual schedule, it will better reflect market prices in accordance with economic conditions over time. Additionally, the inclusion of new methods for determining land value in the 2024 Land Law may play an important role in perfecting the tax valuation for the Property Tax Law related to land. For houses and buildings, the draft law determines the tax valuation based on the grade and type of the property. However, given the practical realities and characteristics of real estate, the draft law should also consider other factors, such as land structure and the materials used in construction, to better align the valuation with the actual value of the property. (Phan Phuong Nam, Tran Minh Hiep, 2018)

*Fourth, about tax rates*

The determination of the tax rate must ensure a balance between the need to mobilize resources for the state budget, the tax-paying ability of different groups, and the overall development of the economy. Additionally, lawmakers may choose to adopt a progressive tax rate system based on the value of the property, applying higher tax rates to vacant or unused properties in order to optimize the actual use of real estate. (Tuan, 2018) To prevent speculation and ease the tax burden on low-income groups, different tax rates could be considered for various regions across the country, with tax policies targeting properties starting from the second house or those exceeding a certain value. For regions experiencing high property speculation or prolonged housing price inflation, the draft law may include specific provisions that apply higher tax rates in these areas when certain pre-identified conditions are met. Thus, criteria for real estate speculation behavior should be defined in order to apply taxes that prevent speculation, such as: owning multiple properties, holding properties for less than five years, owning vacant properties, or owning properties by high-income individuals. Additionally, the tax policy should consider introducing a capital gains tax on real estate transactions. Individuals who generate significant profits from real estate transactions would be subject to higher capital gains taxes. (Son, 2022) The draft law proposes a 1% tax rate on unused land and houses (combined with land used for improper purposes). However, this rate should be aligned with international standards to foster social consensus and effectively limit speculation. Furthermore, for houses and buildings, the implementation of property tax should be gradual, as immediately imposing a high tax rate could destabilize the economy and society. A more suitable approach would be to start with a lower tax rate on houses and buildings, with a progressive tax rate based on the value or area of the property or building. This would help regulate the market and ensure social equity while promoting economic growth.

*Fifth, regarding tax collection management*

Property tax is a type of tax that requires coordinated efforts in the construction and management of data information. Identifying taxable assets and their owners (or other individuals responsible for paying taxes) is often linked to the land registration system. Furthermore, to apply property tax, the infrastructure related to real estate data must be thoroughly prepared; there must also be an effective coordination mechanism between relevant agencies in collecting, updating, and sharing information about houses and land. A current challenge for many countries, particularly developing ones, including Vietnam, is that information about houses and land is often stored and managed

by different agencies. Additionally, the system for storing information related to asset transfers is incomplete and not standardized.

Moreover, to enhance tax management efficiency, mechanisms to encourage and facilitate voluntary tax compliance should be strengthened through raising awareness among taxpayers. This requires tax authorities to clarify the connection between the tax obligations that taxpayers must fulfill. Improvements in infrastructure and public services funded by this revenue should also be implemented in parallel. (Tuan, 2018)

## IV. CONCLUSION

In conclusion, property taxes on real estate play a significant and necessary role in generating government revenue, regulating the real estate market, and ensuring social balance. Therefore, Vietnam can refer to the legal experiences of property taxes in countries worldwide, while considering the economic and social context, to develop and apply the Property Tax Law on real estate. Based on evaluations and observations of the actual situation regarding the development and implementation of property taxes on real estate in Vietnam, as well as property tax regulations in various countries, the authors propose several suggestions for improving the legal framework of property taxes on real estate.

# ENHANCING FINANCIAL TRANSPARENCY TOWARDS SUSTAINABLE DEVELOPMENT GOALS: THE ROLE OF DIGITAL ACCOUNTING WITH SUPPORT FROM LEADERS

**Ha Thi Thuy[1]**

[1]Faculty of Finance and Accounting, Ho Chi Minh City University of Economics and Finance.
* Corresponding: thuyht@uef.edu.vn

**ABSTRACT**

This study aims to examine the relationship among leadership support, digital accounting, and financial transparency, thereby testing how these factors contribute to sustainable development. A total of 200 small and medium enterprises (SMEs) in Ho Chi Minh City, Vietnam were selected as the sample for the study. Structural equation model is applied to test the research relationships. The research findings indicate that leadership support has a positive effect on the level of digital accounting adoption and financial transparency. While the level of digital accounting adoption has a positive effect on sustainable development and financial transparency and financial transparency has a positive effect on sustainable development. Findings from this research are expected to provide valuable insights for organizations seeking to leverage digital accounting for improved financial transparency and sustainable development.

*Keywords*: “Digital Accounting”, “Financial Transparency”, “Leadership Support”, “Sustainable development”.

## I. INTRODUCTION

Small and medium-sized enterprises (SMEs) are the backbone of Vietnam's economy, playing a vital role in job creation, fostering innovation, and contributing significantly to the nation's GDP. However, in today's competitive landscape, financial transparency is paramount for sustainable growth. This is where digital accounting emerges as a game-changer for SMEs in Vietnam. By embracing digital tools, SMEs can automate processes, minimize errors, and gain real-time access to financial data. This enhanced transparency strengthens trust with stakeholders, improves resource allocation, and facilitates informed decision-making (Troshani, I et al, 2019). Ultimately, digital accounting empowers Vietnamese SMEs to navigate the market effectively, achieve their financial goals, and contribute to a more sustainable future, aligning with Vietnam's overall development trajectory (Pham, Q. H., & Vu, K. P, 2022).

Financial transparency is a cornerstone for sustainable growth of SMEs in Vietnam. This transparency fosters trust with stakeholders, including investors, creditors, and customers. When stakeholders have clear and reliable financial information, they are more likely to invest in the SME, offer favorable credit terms, and choose the SME's products or services. This translates into increased access to capital, improved financial stability, and ultimately, a stronger foundation for long-term growth (Jaffar, N et al, 2012) . Additionally, financial transparency allows SMEs to identify areas for improvement in resource allocation and cost management (Francis J et al, 2004). By making data-driven decisions based on accurate financial information, SMEs can optimize their operations, reduce waste, and ultimately achieve more sustainable growth (Je zovita, A., 2015). In essence, financial transparency empowers Vietnamese SMEs to not only expand their businesses but also do so in a responsible and efficient manner, contributing to a more sustainable future for themselves and the Vietnamese economy.

Leadership support plays a pivotal role in driving the adoption and successful implementation of digital accounting for sustainable growth. Strong leadership commitment fosters a culture of innovation and creates the necessary buy-in from all levels of the organization. Leaders who champion digital transformation empower their teams to embrace new technologies and processes (Northouse PG, 2010). This includes allocating resources for training, infrastructure, and software. Additionally, leadership support ensures clear communication and strategic alignment between digital accounting initiatives and overall sustainability goals (Breuer, S et al, 2019). By demonstrating strong leadership and a commitment to both digitalization and sustainability, organizations can position themselves for long-term success and contribute meaningfully to a more responsible and environmentally conscious future (Yuki G, 2006).

To further clarify the influence of factors such as leadership support on the level of digital accounting application

and the effect of this result on financial transparency and sustainable development, the following sections of this study will clarify the research theory, research methods and research results achieved along with discussions related to the research results.

## II. LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

This study employs a multi-theoretical approach to explain the relationship of factors in research model. The Resource-Based View (RBV) can provide a deeper understanding of how digital accounting capabilities can contribute to sustainable competitive advantage. By examining digital accounting as a strategic resource, we can analyze its role in enhancing organizational performance and creating value. RBV allows us to explore how firms can leverage their digital accounting capabilities to differentiate themselves from competitors and achieve sustainable development. Agency theory is incorporated to explore the potential conflicts of interest between management and shareholders, and how digital accounting can mitigate these issues. Finally, institutional theory is employed to analyze the external pressures and industry norms that shape the adoption and implementation of digital accounting practices.

### 2.1 Leadership support in relationship with Digital accounting and Financial transparency

Leadership support is a critical factor influencing on digital accounting and sustainable development. Strong leadership is essential in driving the adoption and effective implementation of digital accounting systems. By championing digital transformation and allocating necessary resources, leaders can create an organizational culture that embraces innovation and efficiency. Moreover, effective leadership ensures that digital accounting initiatives are aligned with overall sustainability goals. Conversely, a lack of leadership support can hinder the adoption and utilization of digital accounting technologies, limiting their potential effect on financial (House, R et al, 2004).

- H1: Leadership support has a positive effect on Digital accounting
- H2: Leadership support has a positive effect on Financial transparency

### 2.2 Digital Accounting in relationship with transparency and Sustainable development

Digital accounting has emerged as a powerful tool for enhancing financial transparency within organizations. By automating manual processes, improving data accuracy, and providing real-time insights, digital accounting systems enable organizations to generate more comprehensive and reliable financial information. This increased transparency is facilitated through features such as automated data capture, robust reporting capabilities, and advanced analysis. Moreover, digital accounting systems often employ robust internal controls and audit trails, reducing the risk of errors and fraud, thereby further bolstering financial transparency (Troshani, I et al, 2019). Consequently, stakeholders, including investors, creditors, and regulators, can access and analyze financial data more efficiently, fostering trust and confidence in the organization's financial health (Amanamah, R. B et al, 2016). Digital accounting also plays a pivotal role in achieving sustainable growth by providing organizations with the data and insights necessary to make informed decisions. By automating financial processes and generating real-time reports, digital accounting systems enable organizations to identify areas for efficiency improvements, reduce waste, and optimize resource allocation (Shan, 2021).

- H3: Digital accounting has a positive effect on Financial transparency
- H4: Digital accounting has a positive effect on Sustainable development

### 2.3 Financial transparency in relationship with Sustainable development

Financial transparency is important for sustainable growth by fostering trust, accountability, and informed decision-making (Shuraki, M. G et al, 2021). When organizations openly disclose their financial performance, including environmental and social effects, they build credibility with stakeholders, including investors, customers, and communities. This trust can lead to increased investment, stronger partnerships, and a positive reputation (Nguyen, T. H et al, 2020). Furthermore, financial transparency enables organizations to identify areas for improvement, allocate resources effectively, and mitigate risks. By providing a clear picture of the company's financial health, transparency empowers organizations to make strategic decisions that align with long-term sustainability goals (Shaughnessy & Goulding, 2021)

- H5: Financial transparency has a positive effect on sustainability development.

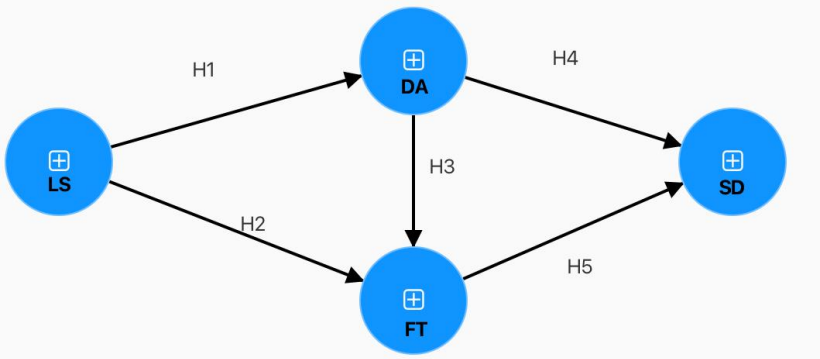

**Fig1. Research Model**

## III. RESEARCH METHODS

### 3.1. Sample and Data Collection Procedure

This research focused on SMEs in Ho Chi Minh City, Vietnam. The participants who responded to the survey including: accounting staff, chief accountants and managers at all levels related to the use of accounting information to make decisions. A total of 200 questionnaires were distributed, resulting in 165 usable responses, yielding an effective response rate of approximately 82,5%. This response rate is considered satisfactory (Hilali, W. E et al, 2020).

### 3.2. Measurement

To measure the research variables, a 5-point likert scale was used for latent variables such as: leadership support, financial transparency and sustainable development. For digital accounting variable, it is measured by scoring in the following order: Score 1 if the company only uses Excel for accounting; Score 2 if the company uses separate accounting software; score 3 if the company uses cloud accounting; Score 4 if the company uses enterprise resource management software (ERP) and score 5 if the company uses AI in accounting processing. Leadership support was evaluated through a six-item scale that examined the support of leadership for using digital accounting. Financial transparency was evaluated through a five-item scale to examine characteristics related to financial transparency such as full disclosure, ease of access, objectivity, honesty and auditing. Sustainable development was evaluated through a six-item scale that examined factors related to sustainable development such as: increasing sales, reducing operating costs, improving compliance, increasing investor's trusting, easy access to capital in society and improve the effectiveness of decisions.

### 3.3. Data Analysis

Data analysis for this study employed Partial Least Squares Structural Equation Modeling (PLS-SEM), conducted using SmartPLS 4.0 software. PLS-SEM was selected due to its suitability for examining complex relationships between latent variables, which are represented by multiple indicators. This method is particularly advantageous when dealing with models involving exogenous, moderating, and endogenous variables (Hair et al., 2017; Nitzl, 2016).

## IV. RESULTS AND DISCUSSION

### 4.1 Measurement Model analysis

The initial step in the PLS-SEM process involves assessing the measurement model to confirm its reliability and validity (Hair et al., 2017; Kock, 2020). As indicated in Table 1, outer loading Matrix require indicators in each latent variable should be higher than 0.7 (Hair et al., 2017). The results show that variable FT2 has an outer loading index less than 0.7, so this variable will be removed and ask the diagram to run again a second time.

**Table 1. Outer loading Matrix**

| | DA | FT | LS | SD |
|---|---|---|---|---|
| **DA** | 1 | | | |
| **FT1** | | 0.900 | | |
| **FT2** | | 0.499 | | |
| **FT3** | | 0.903 | | |

| | | | |
|---|---|---|---|
| **FT4** | 0.900 | | |
| **FT5** | 0.788 | | |
| **LS1** | | 0.871 | |
| **LS2** | | 0.852 | |
| **LS3** | | 0.906 | |
| **LS4** | | 0.806 | |
| **LS5** | | 0.836 | |
| **LS6** | | 0.736 | |
| **SD1** | | | 0.820 |
| **SD2** | | | 0.836 |
| **SD3** | | | 0.788 |
| **SD4** | | | 0.845 |
| **SD5** | | | 0.810 |
| **SD6** | | | 0.841 |

After removing the FT2 variable, the next step will be to test the reliability and discrimination values of the scales. As indicated in table 2 and table 3, the model demonstrates satisfactory reliability, with both composite reliability and Cronbach's alpha exceeding the recommended threshold of 0.70 (Hair et al., 2017; Kock, 2020). Convergent validity is also established, as all item loading surpass 0.70 and are statistically significant ($p < 0.01$). Furthermore, the Average Variance Extracted (AVE) values for all constructs exceed the 0.50 criterion, providing additional evidence of convergent validity.

**Table 2: Reliability and validity test results**

| | Cronbach's alpha | Composite reliability (rho_a) | Composite reliability (rho_c) | Average variance extracted (AVE) |
|---|---|---|---|---|
| **FT** | 0.919 | 0.939 | 0.943 | 0.806 |
| **LS** | 0.914 | 0.922 | 0.933 | 0.699 |
| **SD** | 0.905 | 0.908 | 0.927 | 0.678 |

**Table 3: Discriminant Validity - Fornell Larcker Criterion**

| | DA | FT | LS | SD |
|---|---|---|---|---|
| **DA** | 1 | | | |
| **FT** | 0.228 | 0.898 | | |
| **LS** | 0.816 | 0.430 | 0.836 | |
| **SD** | 0.402 | 0.533 | 0.603 | 0.824 |

To check whether observed variables have multicollinearity or not, the VIF coefficient test is used (Hair et al., 2017), if the observed variable has VIF>= 5, multicollinearity will occur. Accordingly, it needs to be eliminated before continuing to test the structural model. According to the results shown in table 4, there are two variables LS1 and LS2 with VIF index is higher than 5, so these two variables will continue to be eliminated from the research model.

**Table 4: Multicollinearity statistics (VIF)**

| | VIF |
|---|---|
| **DA** | 1 |
| **FT1** | 4.286 |
| **FT3** | 4.684 |
| **FT4** | 3.573 |
| **FT5** | 2.050 |
| **LS1** | 5.502 |
| **LS2** | 5.036 |

| | |
|---|---|
| **LS3** | 4.236 |
| **LS4** | 2.932 |
| **LS5** | 4.516 |
| **LS6** | 2.532 |
| **SD1** | 3.679 |
| **SD2** | 3.608 |
| **SD3** | 2.170 |
| **SD4** | 2.859 |
| **SD5** | 2.657 |
| **SD6** | 3.077 |

### 4.2 Structural model analysis

After FT2; LS1; LS2 variables was removed from the research model due to insufficient standards for scale quality. The remaining variables will be tested in the structural model to test hypotheses. Table 5 below shows the results that all 5 hypotheses are accepted (Pvalues <0.05) which means that leadership support has a positive effect on the level of digital accounting and financial transparency, at the same time digital accounting has a positive influence on sustainable development and financial transparency, finally financial transparency positively affects the sustainable development of small businesses and medium in Ho Chi Minh City, Vietnam.

This result is consistent with the theory of RBV and stakeholder theory, because if businesses know how to take advantage of resources to improve technology in accounting processing, they will create a competitive advantage in the future through information transparency, thereby contributing to increasing the trust of stakeholders and helping businesses access capital more easily and help businesses develop more sustainably (Al-Dmour, A.H, 2018).

**Table 5. Path coefficients and P-value results**

| | Original sample (O) | Sample mean (M) | Standard deviation (STDEV) | T statistics (\|O/STDEV\|) | P values | Conclusion |
|---|---|---|---|---|---|---|
| **DA -> FT** | 0.209 | 0.215 | 0.088 | 2.371 | 0.0180 | H4 Supported |
| **DA -> SD** | 0.297 | 0.301 | 0.075 | 3.95 | 0.0000 | H3 Supported |
| **FT -> SD** | 0.465 | 0.457 | 0.076 | 6.09 | 0.0000 | H5 Supported |
| **LS -> DA** | 0.686 | 0.691 | 0.055 | 12.588 | 0.0000 | H1 Supported |

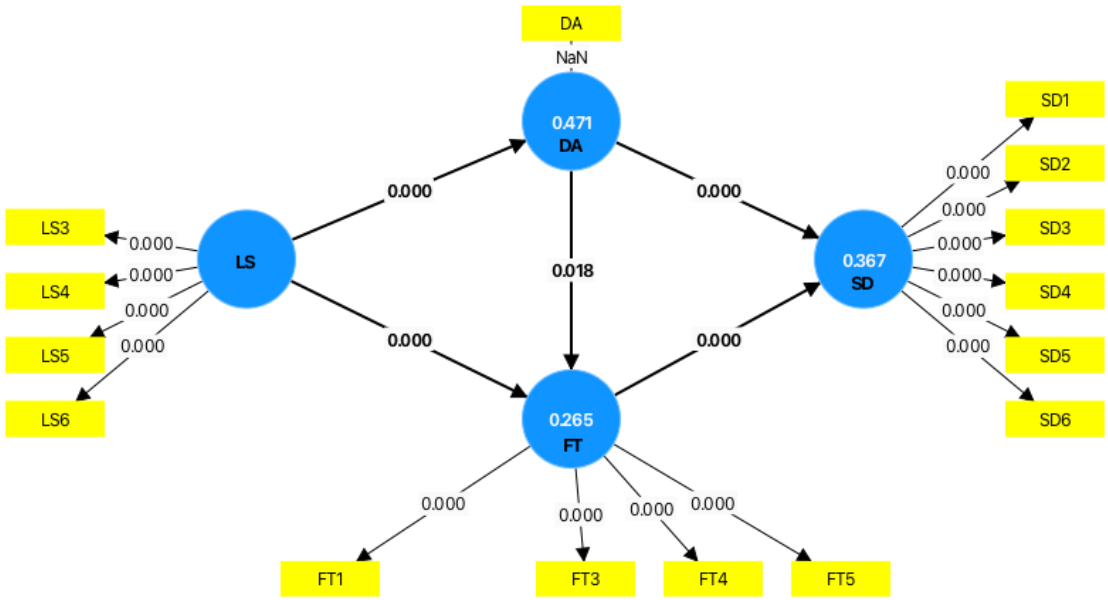

**Fig2. Structural model result**

## IV. CONCLUSION

This study has demonstrated a clear and positive relationship between leadership support, digital accounting, financial transparency, and sustainable development. The findings underscore the critical role of managerial backing in driving the adoption of digital accounting systems. Furthermore, the study reveals that digital accounting significantly contributes to both financial transparency and sustainable development. Importantly, enhanced financial transparency is shown to positively effect sustainable development outcomes. Improve their financial performance and contribute to a more sustainable future. By investing in leadership development, fostering a supportive environment for digital accounting, and prioritizing financial transparency, organizations can unlock the full potential of these interconnected factors.

Future research could explore the moderating effects of organizational size, industry, and geographical context on the relationships examined in this study. Additionally, investigating the long-term effects of these factors on sustainability performance would provide valuable insights for policymakers and practitioners.

# SESSION 5: TOURISM AND ENVIRONMENTAL MANAGEMENT

# VALUING THE CARBON STORAGE CAPACITY OF MANGROVES IN KIM SON DISTRICT, NINH BINH PROVINCE

**Nguyen Thi Thu Ha[1*]**

[1] Faculty of Environmental Sciences, University of Science, Vietnam National University, Ha noi.
*Corresponding: hathu.ihgeo@gmail.com

## ABSTRACT

Based on the value transfer method, the study applies the carbon accumulation results for Trang trees (Kandelia obovata); the carbon accumulation results for Ban trees (Sonneratia caseolaris). For the carbon storage capacity in mangrove sediments, the study applies the carbon sequestration coefficient in global mangrove sediments through the study of MacKenzie et al., 2016. Combining the market price method, the study estimates the $CO_2$ reduction value of Kim Son mangrove forest at 99 thousand USD/ha/year. In Kim Son mangrove forest, through this study, there have been quantitative calculations for carbon sequestration services, so it is recommended that localities continue to study and calculate more closely to meet the needs of fair exchange as a basis for applying the payment mechanism for mangrove environmental services.

*Keywords*: "carbon sequestration", "carbon storage", "mangrove forest", "Kim Son district"

## I. INTRODUCTION

### 1.1. Background of the study

Mangroves are highly productive tropical and subtropical ecosystems characterized by the important ecosystem services and functions they provide, central to the welfare of many coastal communities (McNally et al., 2011). Mangroves are also regarded as disproportionately important to global carbon sequestration and storage, given the small area they cover 147.000 $km^2$ and account for a majority of carbon stored in estuarine ecosystems (McLeod et al., 2011). Their role as carbon storers has been further highlighted by studies stating that mangroves should be an integral part of policy initiatives that seek to reduce carbon emissions through reductions from forest emissions.

It found that between 1996-2020, global mangrove coverage decreased by 3.4 per cent – or 5,245 km2 – however, encouragingly in recent years mangrove decline has stabilised, with gains around many of the world's large rivers, estuaries and deltas offsetting further losses (Understanding how mangrove loss threatens biodiversity - UNEP-WCMC). In Vietnam, mangrove forests decreased rapidly in the period 1943-2000 from 450,000 ha to 155,290 ha, mainly due to war, conversion of forest land to agricultural production, aquaculture and urbanization (Sam et al., 2005).

The decline in both quantity and quality of mangrove forests is due to causes such as industrialization, urbanization, conversion of land use purposes, exploitation of timber and charcoal, especially large-scale aquaculture development (Balsco, 2001).

The Kim Son coastal mangrove forest has an area of 719 hectares (Kim Son District Statistical Yearbook, 2023) and is a green wall to protect the environment, break waves to protect sea dykes, stabilize coastal mud, increase nutrients for marine animals, a habitat for many migratory birds, and provide seafood for humans, etc. In particular, the Kim Son coastal area with a diverse ecosystem is an important part of the buffer zone and transition zone of the Red River Delta Interprovincial Coastal Wetland World Biosphere Reserve. The mangrove forest area decreased the most in the period 2000-2015 (decreased by 438.48 hectares, equivalent to 47.9%) due to conversion to aquaculture (Nguyen Thi Thu Ha, 2024).

According to a field survey, in 2024, when the mangrove forest area decreased significantly, people in the coastal area of Kim Son district were always worried every time the rainy season began. At that time, high tides submerged many areas of crops, ponds raising aquatic products, and some households had to evacuate... Currently, mangrove forests are of interest to the state, many domestic and international organizations have supported localities to plant mangrove and parrot trees to prevent waves and sea winds, so people can live and produce with peace of mind.

The loss of this valuable ecosystem largely arises from both market and policy failures, the non-market nature of the public benefits provided by mangrove forests (Bann, 1998). To solve this problem, it is necessary to understand the values of different types of resources. Economic valuation of resources is an effective solution to "monetize" the value of resources, which is an important basis for policy makers, authorities, and managers to choose the optimal solution for sustainable use of resources in the relationship between protection, exploitation, and use.

This paper initially studies the carbon accumulation potential in mangrove forests of Kim Son district using the value transfer method. In the mangrove forest area of Kim Son district, there is a study by Tran Duc Tuan and colleagues (2022) studying the accumulated carbon stock based on experimental methods (arranging survey lines, establishing standard plots, and analyzing in the laboratory). Experimental methods have the advantage of high accuracy, but are difficult to implement in limited conditions of time and budget. Beside that, there is also a study by Nguyen Thi Thu Ha, 2023 determining the $CO_2$ absorption value by the value transfer method applying carbon storage coefficients in the mangrove and Sonneratia trees from the documents of Nguyen Viet Thanh et al (2018) in Xuan Thuy mangrove forest, Nam Dinh, but there has not been a transfer according to the actual conditions of Kim Son mangrove forest. The present study applied carbon accumulation coefficients for K. obovata and Sonneratia caseolaris according to the documents of Nguyen Hong Hanh, 2015 with some similarities in the physiological characteristics of plants in Kim Son mangrove forest. In addition, this study also estimated the carbon storage capacity of mangrove sediments per year per unit area through the research results of Daniel M. Alongi, 2012 (based on data from 139 research sites worldwide). The research results of the article serve as a basis for effective management and use of mangrove resources in Kim Son district.

### 1.2. Research Questions

This study addresses 02 research questions:

- RQ1- What is the estimated (monetary) value of carbon sequestration by plants in Kim Son mangrove forest ?
- RQ2 - What is the estimated (monetary) value of carbon sequestration by soil in Kim Son mangrove forest ?

## II. MATERIAL AND METHOD

The forest type selected for research is pure Kandelia obovata and pure Sonneratia caseolaris.

The research object is the amount of carbon accumulated in 3 reservoirs: Carbon in plant biomass (stems, branches, leaves, roots) and the amount of carbon accumulated in the soil of the mangrove forest Kandelia obovata coastal planting in Kim Trung commune, forest Sonneratia caseolaris in Kim Hai commune, Kim Son district.

**Method of analysis and synthesis of documents**

The main method used in the topic is the method of collecting and processing information, studying secondary documents. The documents used in the study include studies on mangrove valuation in the world and in Vietnam, documents on Kim Son mangrove forests provided by the locality, Statistical Yearbook of Kim Son district in the years 2000, 2010, 2020, 2023.

**Value transfer method**

The value transfer method is a shortened method for estimating economic or monetary values based on the use of results from studies conducted elsewhere. This method can be applied to estimate all ecosystem services, but the use of this method depends on the location of the research site and the objective of the valuation.

The strength of this method is generally lower cost than primary data collection evaluation studies, is conducted relatively quickly and can be used as a rapid assessment technique before considering conducting larger-scale studies. The limitation of this method is that it depends heavily on the results of existing studies that are suitable or similar to the research site. To overcome this limitation, the study considered coefficients in areas with similar natural conditions and geographical proximity to Kim Son, Ninh Binh.

Carbon accumulation in mangrove biomass depends on tree type, tree age and trunk diameter (Nguyen Thi Hong Hanh, 2015, 2017, Tran Duc Tuan, 2022), so the study applied the calculation results of Nguyen Thi Hong Hanh, 2015, the amount of carbon accumulated in the biomass of mangrove trees and Sonneratia trees according to similar ages.

Assess the carbon accumulation rate of mangrove forests according to IPCC (2006), based on surveys to determine carbon reserves in reservoirs, calculate the average increase and decrease of carbon content according to the formula (1):

$$\Delta B = \frac{\Delta t2 - \Delta t1}{t2 - t1} \quad (1)$$

In which

ΔB: Carbon accumulation rate

Δt1: Carbon stock studied at study time t1

Δt2: Carbon stock studied at study time t2

Calculate the average amount of carbon dioxide (CO2) absorbed by the mangrove forest in a year using the formula (2) based on the study of IPCC (2006):

Total amount of CO2 absorbed (ton/ha) = Total accumulated carbon (ton/ha) x 3.67 (2)

In which: 3.67 is the conversion factor calculated for all forest types.

## III. RESULT AND DISCUSSION

### 3.1. Overview of Kim Son mangrove forest

The coastal mangrove forest of Kim Son district was formed in the delta of the Day and Can rivers. This place and the entire land south of the 20th parallel of Ninh Binh were honored to be recognized by UNESCO as the buffer zone and transition zone of the Red River Delta Biosphere Reserve. Kim Son mangrove forest was planted by the Vietnamese government, Japan and the Ninh Binh Forest Protection Management Board since 1995. It is mainly planted on coastal alluvial plains. The total forest area according to the Statistical Yearbook of Kim Son district in 2023 is 719 hectares. The entire area is currently contracted by forest owners to protect with contracted households according to the provisions of Decree 168/2016/ND-CP of the Government regulating the contracting of forests, orchards and water surface areas in special-use forest management boards, protection forests and State-owned agricultural and forestry single-member limited liability companies.

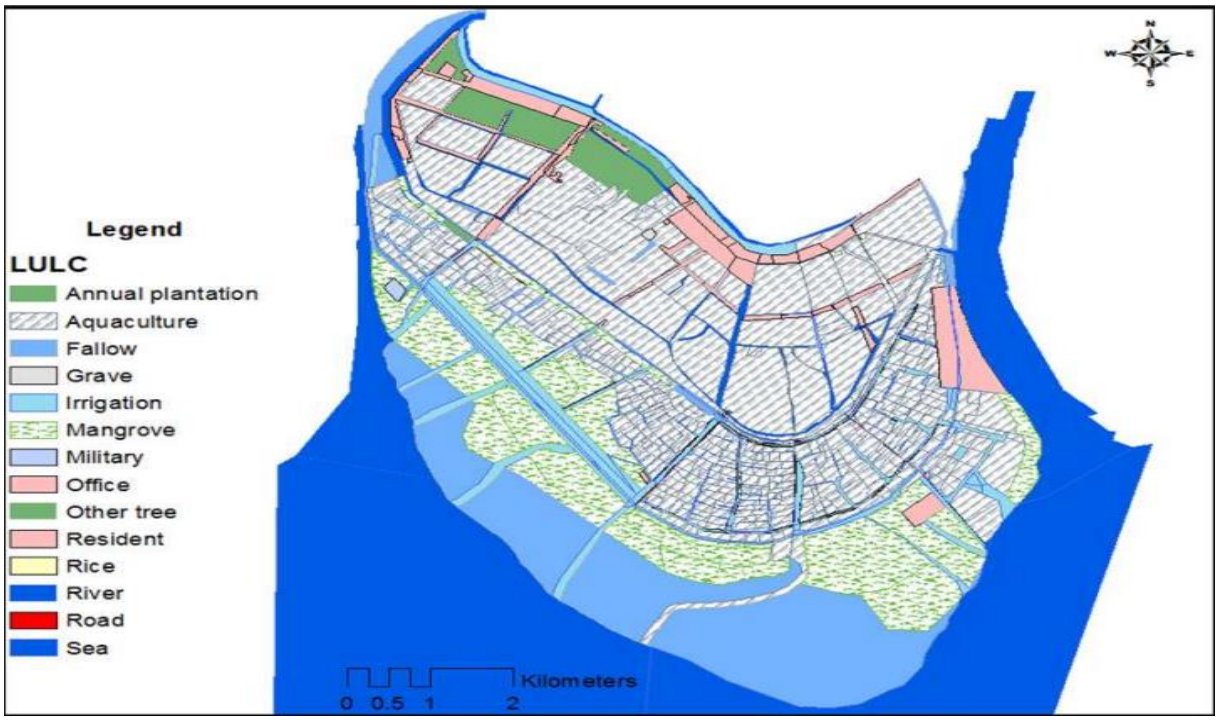

**Fig 1. Map of mangroves in Kim Son district, Ninh Binh province (Hong quang nguyen et al., 2019)**

The Kim Son coastal alluvial plain is a new land, and economic activities often take place, so the composition of mangrove species is not diverse. On the other hand, when the mangrove forest matures, the alluvial plain has encroached far into the sea and the sea encroachment activities have occurred. Therefore, the mangrove vegetation has

not changed much in terms of ecological succession in the community. That is the reason why the composition of mangrove species in Kim Son is lower than in neighboring areas and compared to the whole country. Sonneratia and Acanthopanax are considered suitable plants for the site conditions of the Kim Son coastal alluvial plain. Acanthopanax is grown a lot on the Can River side and reeds are concentrated on the Day River side.

Economically significant species in Kim Son mangrove forest include goby, cobia, halibut, nymph fish, wind crab, crab, shrimp, tiger prawn, clam, octopus, don, seaweed, curtain crab... used as food and water birds with biodiversity value. The rich food source for aquatic species is organic matter in the form of granular plants, which is the product of the decomposition process of plant matter, including: leaves, branches, buds, roots, flowers, fruits... of mangrove trees. Fallen branches, leaves, flowers, and fruits are used by many species, including crabs, which play an important role in decomposing leaves by tearing them into pieces so that the leaves decompose faster under the influence of fungi and bacteria (Nguyen Thi Thu Ha, 2023).

The Kim Son coastal mangrove forest has attracted a large number of people from coastal communes to exploit natural aquatic products and dig ponds for hire to make a living in different ways such as catching crabs, clams, crabs, and clams by hand, and setting up nets to catch small shrimp and fish. However, this form of destructive exploitation is a threat to the development and growth of newly planted forest areas (Nguyen Thi Thu Ha, 2023).

### 3.2. Determining the carbon storage capacity of mangrove forests in Kim Son district

Based on the IPCC guidelines (2006), assessing the carbon storage capacity of forests through 3 reservoirs: (1) carbon storage in above-ground biomass; (2) carbon storage in below-ground biomass; (3) carbon storage in soil is equivalent to (i) determining the carbon storage capacity of mangrove plants and (ii) determining the carbon storage capacity in mangrove sediments.

#### 3.2.1. Determining the carbon storage capacity of mangrove plants

To determine the carbon storage capacity of mangrove plants, it is necessary to first calculate the carbon storage capacity of mangrove trees. Kim Son mangrove forest has 02 main dominant communities, which are the Kandelia obovata and Sonneratia caseolaris communities.

In the coastal mangrove forests of Kim Son district, according to data analysis from the Statistical Yearbook of the years 2000, 2005, 2010, 2015, 2020, 2023, it was found that the most mangrove forests were planted in the periods 1995-2000 (1,686 ha of concentrated trees, 538,000 scattered trees), 2001-2005 (716 ha of concentrated trees, 295,000 scattered trees) and 2006-2010 (664 ha of concentrated trees, 311,000 scattered trees).

**Table 1. Results of coastal afforestation in Kim Son district through stages**

| | 1995-2000 | 2001-2005 | 2006-2010 | 2011-2015 | 2016 - 2020 | 2021-2023 |
|---|---|---|---|---|---|---|
| Concentrated new forest planting (ha) | 1.686 | 716 | 664 | 0 | 110 | 123 |
| Scattered tree planting (1000 trees) | 538 | 295 | 311 | 230 | 332 | 354 |

*Source. Statistical yearbook of Kim Son district for the years 2000, 2010, 2020, 2023*

Assuming that Kim Son mangrove forest was completely planted in 2010, the average age of the forest by 2023 is 13 years old. According to Tran Duc Tuan et al., 2022 in the study of accumulated carbon stocks of coastal mangrove forests planted in Kim Son district, Ninh Binh province, the parameters of mangrove trees in the standard plots of forest age 12 are as follows:

Applying the calculation results of Nguyen Thi Hong Hanh, 2015, the amount of carbon accumulated in the biomass of mangrove and mangrove trees according to the ages and carbon accumulation rates for these two types of trees (apply formula (1)) is as table 2:

**Table 2. Result of carbon accumulation rate in plant biomass from research Nguyen Thi Hong Hanh, 2015**

| | 10 year | 13 year | Carbon accumulation rate |
|---|---|---|---|

| | | | by tree type |
|---|---|---|---|
| Kandelia obovata | 1.60 kg/tree | 2.39 kg/tree | 0.263/kg/tree/year |
| Sonneratia caseolaris | 23.22 kg/tree | 37.23 kg/tree | 4.67/kg/tree/year |

*Source: Nguyen Thi Hong Hanh, 2015 and caculated by author*

According to the research results of (Tran Duc Tuan et al., 2022), the tree density in the pure mangrove and pure mangrove forests planted in 2010 (13 years old in 2023) is 7067 trees/ha and 2067 trees/ha, respectively. Carbon accumulation in mangrove biomass depends on the type of tree, tree age and trunk diameter (Nguyen Thi Hong Hanh et al.,2017; Tran Duc Tuan et al., 2022).

**Table 3. Average carbon accumulation rate per hectare and per year**

| | Density | Carbon accumulation rate per hectare and per year | Average carbon accumulation rate per hectare and per year in both biomes |
|---|---|---|---|
| Community Kandelia obovata | 7,067 tree/ha | 1.86 tons/ha/year | 5.76 tons/ha/year |
| Community Sonneratia caseolaris | 2,067 tree/ha | 9.65 tons/ha/year | |

*Source: Tran Duc Tuan et al, 2022 and caculated by author*

This result is lower than the research results of Tran Duc Tuan et al., 2022. In the study of Tran Duc Tuan et al., the carbon accumulation capacity of pure mangrove plantations is 14.80 - 15.38 tons/ha/year, the carbon accumulation capacity of pure mangrove plantations is highest at 28.87 - 51.56 tons/ha/year. This may be because the plant biomass in the study of Nguyen Thi Hong Hanh, 2015 is smaller than the plant biomass in the study of Tran Duc Tuan et al. 2022. Therefore, when inheriting the carbon accumulation coefficient of Nguyen Thi Hong Hanh, 2015, the carbon accumulation value of the current study is lower than the carbon accumulation value of Tran Duc Tuan et al. 2022 (the same research object is Kim Son mangrove forest).

**3.2.2. Determining the carbon storage capacity in mangrove sediments**

Through an overview of domestic and foreign documents, the value of carbon sequestration rate in mangrove soil is shown in the following table (Table 4).

**Table 4. Carbon sequestration rate in mangrove soil in some studies**

| Research location | Mangrove carbon accumulation rate (gram C/m2/year) | Reference |
|---|---|---|
| Mangroves in Vietnam (8 mangrove locations in Vietnam) | 121.0 ±6,1 – 602.7 ± 30.3 | (MacKenzie et al., 2016) |
| Mangrove forest in Hau Loc, Thanh Hoa, Vietnam | 632 - 994 | (Nguyen Thi Hong Hanh, Tran Hoang Anh Ngoc, 2017) |
| Mangroves in the world (139 locations in the world) | 174 | (Daniel M. Alongi, 2012) |
| Mangroves of the World (205 locations in the world) | 179.6 | Daniel M. Alongi, 2020 |

Through the above table, it can be seen that the carbon accumulation rate in mangrove soil in the study of MacKenzie et al., 2016 is the smallest (lower limit is 121 g $C/m^2$/year). The study applied the result of 121.0 g $C/m^2$/year to Kim Son mangrove soil, equivalent to 1.21 tons/ha/year.

**3.2.3. Estimation of carbon accumulation value in mangrove forests of Kim Son district**

The total amount of carbon stored in Kim Son mangrove forest (in soil and in plant biomass) per hectare is:

5.76 tons/ha/year + 1.74 tons/ha/year = 7.50 tons/ha/year

Calculate the average amount of carbon dioxide (CO2) absorbed by the mangrove forest in a year using the formula (2) based on the study of IPCC (2006). The $CO_2$ reduction of 1 ha the mangrove ecosystem of Kim Son district:

7.50 tons C/ha/year * 3.67 = 27.50 tons $CO_2$/ha/year

$CO_2$ reduction of the mangrove ecosystem of Kim Son district (719 ha):

27.50 tons $CO_2$/ha/year * 719 ha = 19,772 tons $CO_2$/year.

The price of 1 carbon credit as 5 USD ((Hai Hoa Nguyen et al., 2021), the value of carbon accumulation in the mangrove forest of Kim Son district in 1 year is: 98,862 USD/year equivalent to 99 thousand USD/year.

This study initially estimated the carbon accumulation value of mangrove forests in Kim Son district using the value transfer method. The research results can be used as a reference in decisions related to resource management. However, due to time and budget constraints, the study only considered vegetation at the age of 13 and did not take into account all factors affecting carbon accumulation in soil and in plant biomass. These issues are expected to be clarified in subsequent studies.

### 3.3. Some policy recommendations

Firstly, through the overview of the study, it is known that the carbon accumulation capacity of mangrove forests depends on the type of tree, age of the forest, tree density, and tree biomass, so it is necessary to study the design of mangrove belts so that the tree planting capacity is suitable for the site conditions of the study area.

Secondly, in Kim Son mangrove forest, through this study, there have been quantitative calculations for carbon sequestration services. Localities need to continue to study and calculate more closely to meet the needs of fair exchange as a basis for applying the payment mechanism for mangrove environmental services. Especially in the current context, Vietnam has a legal basis for implementing payment for environmental services (PES), which are the Law on Forest Protection and Development (2016) and the Law on Biodiversity (2018). PES has been widely recognized as a successful policy tool for natural resource management in more than 60 countries. These schemes have been applied to various ecosystem services internationally, including biodiversity conservation, river basin services, carbon sequestration and landscape beauty. In addition, a carbon payment mechanism is being piloted in Vietnam under Decree 156 and its extension to mangroves would make a positive contribution to the completion of a PFES policy for carbon. Furthermore, the carbon market and interest in carbon credits have been established for a long time, so potential buyers have a clear knowledge base and interest.

## IV. CONCLUSION

Mangrove forests are distributed in tropical and subtropical coastal estuaries, are one of the ecosystems with high biodiversity, they play an important role in coastal ecosystems, especially in low-lying coastal areas of developing economies. Regulating services of wetland ecosystem services are identified as maintaining air quality, regulating climate, filtering water and treating waste; regulating erosion, minimizing damage caused by storms, floods and sea level rise in coastal areas; carbon fixation.

Based on value transfer methods, combining the replacement value method and market price, the task of estimating the $CO_2$ reduction value of Kim Son mangrove forest is 99 thousand USD/ha/year. Currently, the payment for forest environmental services for mangrove forests in Vietnam is initially applied to 3 types of services: Maintaining landscapes for ecotourism business; providing spawning grounds, food sources, and seeds for aquaculture; carbon sequestration. In Kim Son mangrove forest, through this study, there have been quantitative calculations for carbon sequestration services, so it is recommended that localities continue to study and calculate more closely to meet the needs of fair exchange as a basis for applying the payment mechanism for mangrove environmental services.

**ABSTRACT**

This article delves into the current situation of cruise tourism in Ho Chi Minh City (HCMC), Vietnam, offering a comprehensive SWOT analysis to identify its strengths, weaknesses, opportunities, and threats. It evaluates the potential of boat tourism, examining the infrastructure and the government's role in fostering the growth of this industry. By synthesizing official statistical data and survey results from a small-scale study involving 50 participants from various countries, the article analyzes the current situation, highlighting certain shortcomings in the development policies related to cruise tourism in HCMC. Furthermore, the article provides recommendations aimed at enhancing the industry's capabilities, leveraging its strengths, and improving the quality of cruise tourism services in HCMC.

*Key words*: cruise tourism, cultural and historical places

## I. INTRODUCTION:

### 1.1 Background of the study

As highlighted by Sun et al. (2019), cruise tourism holds a pivotal position in the worldwide tourism sector, with notable expansion observed in Asia. This form of tourism also constitutes a substantial component of the global leisure passenger transportation industry, involving journeys by sea with scheduled stops at multiple ports, as per the definition provided by the Collins English Dictionary (2018).

Historically, cruising has been perceived as customarily designed for individuals in their retirement years and those with substantial wealth. Nowadays, an increasing number of travelers are seeking new routes that involve exploring exotic oriental cultures, attractive destinations, native wildlife, abundant tourism resources, and geographical proximity to neighboring nations with similar climates, all of which are available in the Asia region. In HCMC, various waterway travel companies have developed numerous tours, such as paddleboarding on the Saigon River, traversing the brackish mangrove forest in Can Gio, enjoying sunset views on the Saigon River, experiencing night river bus tours, and more. However, there are still limitations in terms of the diversity of waterway tourism products. With its geographical advantages, infrastructure, as well as distinctive cultural and historical features, HCMC holds significant potential to capitalize on the strengths of the boat industry and river tourism. This presents an opportunity to showcase the city's image to both domestic and international tourists. As HCMC positions itself on the global cruise tourism stage, understanding its internal dynamics is paramount.

This article is divided into 5 sections. Section 1 introduces cruise tourism. Following that, Section 2 presents the potential of cruise tourism in HCMC with an analysis of infrastructure and a SWOT analysis. Then, it analyzes the supporting role of government policies in developing cruise tourism. Section 4 specifically addresses issues related to river tourism in HCMC through a survey of a small group of participants. Finally, Section 5 presents conclusions and recommendations to leverage strengths and address current weaknesses.

### 1.2 Research Questions and objectives

Cruise tourism is increasingly recognized as a significant component of the global tourism industry, particularly in Asia, where demand for river and boat tourism is rising. HCMC with its extensive river network and strategic location, presents considerable potential for developing a thriving boat tourism sector. However, despite its advantages, the sector faces several challenges that hinder its growth and competitiveness.

This study aims to achieve the following research objectives:

– To evaluate the current status and development potential of boat tourism in HCMC.

– To identify key issues affecting the growth and sustainability of river tourism in the city.

– To analyze tourists' perceptions and preferences regarding boat tourism in HCMC.

– To propose practical and managerial recommendations to enhance the quality and efficiency of boat tourism services.

By addressing these objectives, the research seeks to contribute to a deeper understanding of the boat tourism industry in HCMC and offer insights into strategies that can optimize its development.

## 2. TOURISM POTENTIAL OF BOAT TOURISM IN HO CHI MINH CITY (TPHCM)

### 2.1 Infrastructure

With a total area of over 2,095 km2, the city is divided into 19 districts and 5 districts, comprising 322 wards and communes. As the focal point of Southeast Asia, HCMC serves as a crucial transportation hub, encompassing significant road, waterway, and air routes. Thanks to this strategic position, the city has effectively connected provinces within the region, establishing itself as an extremely vital international gateway. HCMC holds the advantage of connecting the largest economic center in the south with the provinces of the Southeastern region. Its extensive river system allows the city to develop robust waterway transportation, establishing trade and cargo terminals, and facilitating convenient tourism exploitation with 251 ports, including 73 ports and terminals catering to passenger and tourist transport. The city benefits from four major rivers - Saigon, Dong Nai, Long Tau, and Soai Rap - forming an interconnected waterway network linking neighboring provinces such as Binh Duong, Tay Ninh, Dong Nai, Long An, Tien Giang, Ba Ria - Vung Tau, and particularly the Mekong Delta region. Consequently, Ho Chi Minh City can leverage both waterway transportation and the potential for various types of domestic water tourism. The Saigon River, in particular, holds a strategically significant position within the city's transportation network, featuring 101 routes with a total length of 913 km and approximately 135 resources serving water tourism. This presents numerous opportunities and values for commercial exploitation, logistics services, tourism, and other related services. In terms of economic development along the riverbanks, there are various historical and cultural landmarks along the Saigon River, including the Nhà Rồng Wharf, the ancient area of Chợ Lớn (Chinatown), the Thủ Ngữ Flagpole (Saigon River), and Bình Đông Wharf. Some modern structures have also become new symbols of Ho Chi Minh City, such as Bạch Đằng Park, Ba Son Bridge (Thủ Thiêm 2 Bridge), the 68-story Bitexco Tower, the 81-story Landmark 81 Tower, and more. According to Lau & Yip (2020), Vietnam encounters a hurdle in establishing itself as an outstanding destination for cruise vacations, primarily due to inadequate infrastructure. The absence of dedicated cruise ports capable of accommodating large vessels has led numerous tour operators to exclude Vietnam from their cruise itineraries. Additionally, the limited availability of city tours with considerable distances between cruise ports and shopping/entertainment venues obstructs Vietnam's potential as a home port for cruises in the Southeast Asian region. The fact remains that Vietnam is considering streamlining immigration policies, enhancing port infrastructure, championing environmental management, and introducing innovative tourism services. The feasibility of Vietnam emerging as a cruise home port remains a subject of uncertainty.

### 2.2 SWOT analysis

| Strengths | Weaknesses |
|---|---|
| **Cultural Riches**: HCMC boasts a wealth of cultural heritage, providing a unique and authentic experience for cruise tourists.<br>**Diverse Culinary Scene**: The city's diverse and flavorful cuisine is a significant strength, catering to the growing demand for culinary tourism.<br>**Infrastructure Development**: Ongoing investments in infrastructure, including modern terminals, showcase the city's commitment to facilitating smooth cruise operations. | **Environmental Impact**: The rapid growth of cruise tourism poses environmental challenges, requiring sustainable practices to mitigate its impact.<br>**Infrastructure Gaps**: Despite progress, certain infrastructure aspects, such as transportation networks, need further development to accommodate increasing cruise traffic.<br>**Seasonal Dependency**: The city's cruise tourism is currently reliant on specific seasons, potentially leading to fluctuating visitor numbers. |

| | |
|---|---|
| | **Operations**: In the context of boat tours, travelers have to purchase tickets directly at the pier, which means they cannot manage their time efficiently if the tickets are sold out. There is a lack of utilization of information technology in the operation process. |
| **Opportunities** | **Threats** |
| **Economic Boost**: Cruise tourism presents a substantial opportunity for economic growth, fostering job creation and contributing to the local economy.<br>**Cultural Exchange:** The city's cultural richness provides a platform for meaningful cultural exchange, enhancing its global reputation as a tourist destination.<br>**Emerging Markets**: Tapping into emerging cruise markets and establishing partnerships with cruise liners can further amplify tourism. | **Environmental Concerns**: Failure to address environmental concerns could result in reputational damage and potential restrictions on cruise operations.<br>Competition from Neighboring **Destinations**: Nearby destinations may pose competition, emphasizing the need for unique selling propositions to distinguish HCMC. |

**III. THE ROLE OF THE GOVERNMENT/CITY IN THE DEVELOPMENT OF BOAT TOURISM.**

HCMC has implemented the project "Developing Riverbank and Riverside Economy and Services in HCMC from 2023 to 2024" with the goal of efficiently and intelligently exploiting the commercial, service, transportation, and tourism values of the Saigon River while still preserving its robust historical and natural values. Specifically:

– Reviewing construction planning and land use planning within the protective corridor along the Saigon River.

– Proposing planning ideas for the Saigon River corridor in the direction of developing green infrastructure, effectively exploiting land values along the riverbanks.

– Implementing policies to support investors prioritizing the development of public works, commercial and service projects, and parks.

– International cooperation to research planning strategies and development management, proposing green infrastructure models for the corridor along the Saigon River.

HCMC has issued a plan for developing water tourism products for the 2023-2025 period. In the 2023-2024 phase:

– Improving and enhancing the quality of existing water tourism products, including short-range tourism products (within a radius of less than 10 km):

+ Tourism route to Binh Quoi (from Bach Dang Wharf - Saigon River - Thanh Da Canal - Thanh Da Wharf, Binh Quoi... and vice versa).

+ Inner-city tourism route Nhiêu Lộc - Thị Nghè (from Thị Nghè Wharf upstream to Candaransi Pagoda on Nhiêu Lộc - Thị Nghè Canal and vice versa).

+ Medium-range tourism products (radius from 10 km to less than 60 km):

+ Tourism route to Cu Chi (from Bach Dang Wharf - Saigon River - Thanh Da Canal - Saigon River - Đình Wharf, Dược Wharf in the Cu Chi Tunnels Historical Site).

+ Tourism route to Can Gio (from Bach Dang Wharf - Saigon River - Nhà Bè River - Lòng Tàu River - Dinh Ba River - Lò Rèn River - Vàm Sat River - Soài Rạp River).

– Building a standard presentation about water tourism routes to provide additional information about the history, culture, and characteristics of the river systems, channels, and ditches associated with water tourism routes in HCMC.

– Introducing existing water tourism products in the city.

– Developing maps of water tourism routes and destinations using GIS technology.

In the 2024-2025 phase:

– Investing in the construction and development of new water tourism products.

– Short-range tourism products (radius of less than 10 km):

+ Tourism route to District 7 (from Cau Mong Wharf/Bach Dang Wharf - Saigon River - Te Canal - Ong Lon Ditch - Dia Ditch).

+ Domestic wharves on the route: Cù Lao Nguyễn Kiệu Wharf, Tôn Đức Thắng University Wharf, Trung Son Residential Area Wharf, Him Lam Park Wharf...

– Developing new tour programs on the route:

+ Starting point: Bach Dang Wharf (District 1)/Cau Mong Wharf (District 4) - Endpoint: Ngoi Sao Viet Wharf (District 7).

+ Tourism route to District 1, 4, 5, 6, and 8 (from Bach Dang Wharf/Cau Mong Wharf - Saigon River - Te Canal - Ben Nghe Canal - Tau Hu Canal to Binh Dong Wharf or continuing along Doi Canal - Binh Dong Market).

– Medium-range tourism products (radius from 10 km to less than 60 km): Tourism route to Thu Duc City (from Bach Dang Wharf - Saigon River - Chiếc Ditch - Trau Trau Ditch - Ong Nhiêu Ditch - Tac River - Dong Nai River - Hoi Son Pagoda Wharf).

– Long-range tourism products (from Ho Chi Minh City to provinces in the region):

+ Water routes originating from the central area of the city, such as Saigon Port, Bach Dang Wharf, Cau Mong Wharf... to provinces like Ba Ria - Vung Tau, Binh Duong, Dong Nai, Tien Giang, Ben Tre, Vinh Long, Can Tho, and the Chau Doc - An Giang route connecting through Cambodia.

In the 2024-2025 phase:

– Continuing to leverage the attractions of the Cu Chi Tunnels Historical Site, Can Gio Mangrove Biosphere Reserve for international tourists, developing tours related to sources, cultural history combined with enjoying the Saigon River, visiting craft villages, gardens, and ecological areas, attracting various domestic tourist groups.

– Strengthening riverside tourism services and diversifying entertainment services on water vehicles.

– Planning specialized routes for exploitation in the 2025-2030 period:

+ History-themed route from Bach Dang Wharf - Đình Bình Nhan/Đình Hanh Phu - Đền Ben Duoc/Revolutionary Tradition Zone Saigon - Cholon - Gia Dinh.

+ Culture-themed route from Bach Dang Wharf - Ky Quang 2 Pagoda, Khanh Anh Monastery - (Thủ Dầu Một Ferry - Bà Bình Duong Pagoda) or Phu Chau Floating Temple (Gò Vấp).

+ Urban development-themed route from Bach Dang Wharf – Ba Son Bridge – Landmark 81 – Van Phuc Urban Area...

## IV. SOME ISSUES RELATED TO THE BOAT TOURISM SITUATION IN HCMC.

### 4.1 Research Methodology

This study employs a qualitative research approach to examine the challenges associated with boat tourism in HCMC. The primary data were collected through a structured survey involving 50 participants from various nationalities, selected based on their experience with river tourism in the city. The questionnaire comprised both closed-ended and open-ended questions, allowing for a comprehensive analysis of tourists' perceptions, preferences, and concerns.The data analysis process followed a thematic coding approach to identify recurring themes in participant responses. The coding process involved three stages:

Open Coding: Responses were categorized into broad themes, such as infrastructure, service quality, environmental concerns, and cultural engagement.

Axial Coding: Relationships between themes were analyzed to determine underlying issues affecting boat tourism in HCMC.

Selective Coding: The final themes were synthesized to form key insights, which informed the recommendations presented in Section 5.

**Table 1: Coding structure for qualitative data analysis**

| Main Themes | Sub-Themes | Example Participant Responses |
|---|---|---|
| **Infrastructure & Accessibility** | Poor docking facilities | "The piers are not well maintained, and it's hard to board the boats safely." (N4) |
| | Lack of transportation links | "Does not have complete ecosystem links tour, people, accomodation." (N34) |
| **Service Quality** | Tour guide professionalism | "Tour guide capacity: boatman should be trained to act as an ambassador to introduce to tourists" (N21) |
| | Pricing concerns | "The tours are expensive compared to the service provided." (N22) " It is usually boring on tour with expensive prices without many nice views for sightseeing" (N11) |
| **Tourism Experience** | Lack of entertainment | "Poor activities for tourist. The tour gets boring after some time; there should be more activities on the boat." (N8) |
| | Limited cultural engagement | "Not many cultural activities in the city, should include more cultural performances or storytelling." (N11) |
| **Environmental Issues** | Water pollution | "The river is dirty, and it affects the experience." (N12, N13, N50) |
| | Lack of eco-friendly initiatives | "They have not been able to balance between mass tourism and ecotourism, leading to the incorporation between local authority and local communities." (N2) |
| **Marketing & Information Accessibility** | Lack of online booking options | "I could not find a reliable source on the internet" (N38) |
| | Limited promotional efforts | "Many tourists don't even know that HCMC has river tours." (N43) |
| **Safety & Regulation** | Unclear safety guidelines | "Not safety and clean enough. Sometimes there many rip off venders" (N13) |
| | Need for better regulations | "There should be stricter policies to maintain boat quality, service standards and supports" (N45) |

**4.2 Results**

**Table 2: Information about the age group of survey participants.**

| Age (n; percentage %) |
|---|
| 18-26 (18; 36%) |
| 27-46 (23;46%) |
| 47 and above (9; 18%) |

**Table 3: Information about the nationalities of the survey participants**

| Nationality (n; percentage %) |
|---|
| Vietnamese (37;74%) |
| Ugandan (1;2%) |
| British (4; 8%) |
| Swiss (1; 2%) |
| Hongkong (1;2%) |
| Korean (1;2%) |
| Singaporean (2; 4%) |
| Laos (1; 2%) |
| Indonesian (1; 2%) |
| Australian (1;2%) |

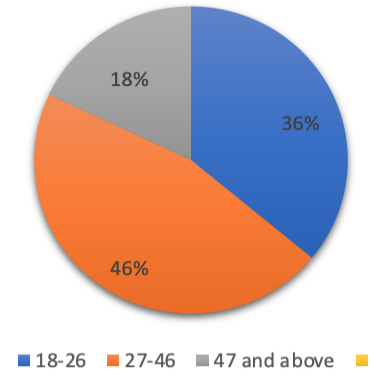

**Figure 1: Age group of participants**

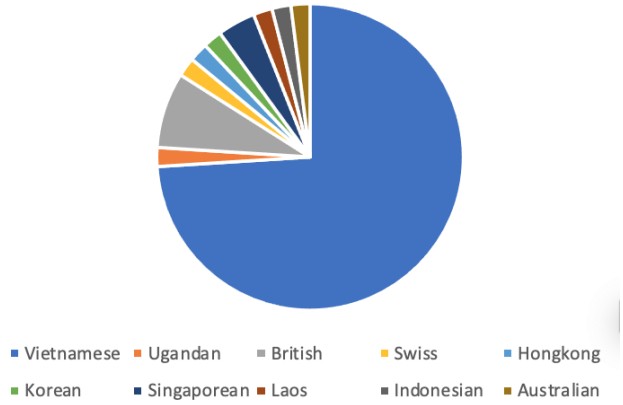

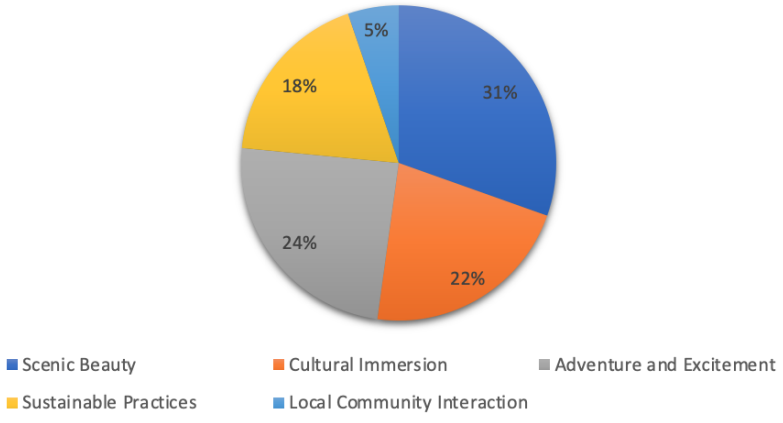

**Figure 2: The nationalities of participants**

When asked about the types of river tourism activities they were most interested in (*What types of river tourism activities are you most interested in? (e.g., river cruises, water sports, cultural tours*), (question number 5), a significant 30% responded that they were interested in Natural Exploration. Additionally, 28% of survey participants expressed interest in River Cruises, while Water Sports (e.g., kayaking, rafting) and Cultural Tours along rivers garnered respective percentages of 20% and 22%. According to Người Lao Động (2023), it is observed that when comparing river tourism products with other parts of the world such as France, Italy, China, and Thailand, HCMC appears to have not invested significantly in the landscape along both sides of the river. There is a lack of beautiful architectural structures, attractive entertainment points, and more. Notably, in Thailand, which attracts billions of dollars annually through vigorous exploitation of entertainment activities for tourists, such as enjoying cuisine on boats along the Chao Phraya River in Bangkok or participating in the Songkran water festival. Furthermore, in recent times, HCMC has engaged in various promotional activities for river tourism, such as the HCMC Water Festival and organizing survey teams to introduce waterway tourism, which have gained considerable interest from tourists, especially programs featuring artistic performances. Many travel companies have been deploying a series of river tourism products to welcome visitors. However, compared to other product categories, the city's river tourism has not fully tapped into its potential. HCMC has welcomed over 2.3 million international tourists, primarily from the South Korean, Chinese, and American markets, in the first half of 2023. Currently, the city organizes around 10 major tourism events each year, with an average of one event per month, serving both residents and tourists to stimulate tourism demand.

The most crucial factors influencing participants to choose a river tourism experience in Vietnam are Scenic Beauty, constituting 30.4%, followed by Adventure and Excitement at 24.35%, Cultural Immersion at nearly 22%, and Sustainable Practices at 18.26%. However, the factor of Local Community Interaction is relatively low, accounting for 5.21%. This represents an area for improvement to diversify tourism products in the future. Furthermore, over 70% of participants seek information from friends or family, while 60% have visited travel websites and social media platforms.

**Figure 3: The important factors when choosing a river tourism experience in Vietnam**

Based on the survey information with question “From your perspective, what challenges do you think river tourism operators face in Vietnam?”,, the majority of survey participants responded that water quality, pollution, and environmental issues are the challenges faced by river tourism operators in Vietnam. Specifically, participant N21 mentioned, "Tour guide capacity: boatmen should be trained to act as ambassadors to introduce tourists." Participant N11 expressed, "Not many cultural activities in the city; it is usually boring on tour with expensive prices without many nice views for sightseeing." Meanwhile, participant N34 raised concerns about, "Does not have a complete ecosystem linking tours, people, accommodation."

**Table 4: Importance of Incorporating Sustainable Practices in River Tourism**

| | |
|---|---|
| Very important | 30; 60% |
| Somewhat important | 14; 28% |
| Neutral | 5; 10% |
| Not important | 1;2% |

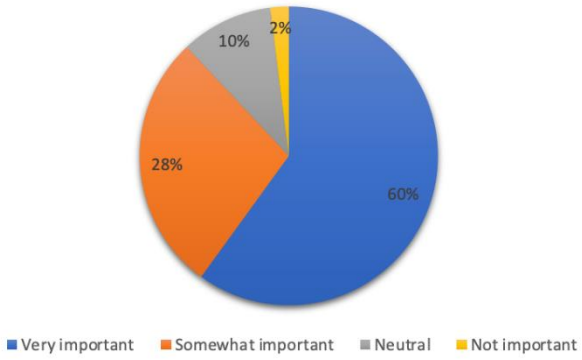

**Figure 4: Importance of Incorporating sustainable Practices in River Tourism**

When asked about previous challenging experiences when participating in river tours in Vietnam, survey participant N1 mentioned, *"Maybe just to get the local community more involved in the sustainable practice of river tourism."* Participant N4 suggested, *"Create more activities during the time tourists are on the boat, make it more interesting and worth the price, improve services and English skills for staff."* On the other hand, participant N15 expressed a desire for an official website where they could easily find information and make payments. Additionally, some participants mentioned that the experience was good but emphasized the need for more promotion and marketing efforts.

## V. CONCLUSION AND RECOMMENDATIONS

Ho Chi Minh City's journey into cruise tourism can be steered towards success by leveraging its strengths, addressing weaknesses, and capitalizing on opportunities while mitigating threats. A strategic marketing approach that focuses on sustainable practices, unique experiences, and collaborative partnerships will not only attract cruise tourists but also ensure the long-term prosperity of this burgeoning industry in Vietnam's vibrant southern metropolis. To enhance the effectiveness of the recommendations, this section distinguishes between practical implications for tourism operators and managerial implications for policymakers and regulatory authorities.

### 5.1 Practical Implications (For tourism operators and local businesses)

*Diversification of tourism products*: Expanding the range of river tourism activities, such as themed cultural cruises, dining experiences, and eco-tourism packages, to attract a broader audience.

*Improvement of service quality*: Enhancing staff training programs, particularly in hospitality and language skills, to improve the overall customer experience.

*Integration of digital technologies*: Developing an official online platform for booking river tours, providing detailed tour descriptions, real-time availability, and secure payment options.

*Sustainability initiatives*: Implementing eco-friendly measures, such as reducing plastic waste on boats and

improving waste management systems along the riverbanks.

**5.2 Managerial Implications (For government authorities and tourism policymakers)**

*Infrastructure enhancement*: Investing in the modernization of river ports, docking facilities, and transportation links to improve accessibility and efficiency.

*Policy support for sustainable tourism*: Establishing regulations to minimize environmental degradation while promoting sustainable business practices among tourism operators.

*Strengthening promotional efforts*: Launching international marketing campaigns and forming strategic partnerships with global cruise operators to position HCMC as a premier boat tourism destination.

*Community involvement*: Encouraging local engagement in tourism development through community-based tourism initiatives, ensuring that economic benefits are distributed equitably.

By addressing these practical and managerial aspects, HCMC can leverage its geographical advantages and cultural heritage to develop a competitive and sustainable boat tourism industry. Indeed, community-based tourism is considered a form of tourism that brings many benefits for sustainable economic development for local residents. This form not only helps people protect ecological resources but also preserves and promotes the unique cultural aspects of the locality, especially in HCMC, which has strengths in natural landscapes, historical values, indigenous cultures, customs and lifestyles, rich culinary culture, etc. In the current digital age, integrating information technology into business activities is essential. We aim to make it easier for people to look up information about the timing of tours/routes, make online payments safely, and apply communication promotion if needed. Tourists are also very concerned about the environment and sustainability.

# SUSTAINABLE FASHION: RETHINHKING MATERIALS FOR A GREENER FUTURE

**Quach Thuy Duong**[1]

[1]Faculty of Textile and Fashion, University of Economics - Technology for Industries.

* Corresponding author: qtduonguneti@gmail.com

**ABSTRACT**

Textile production involves numerous steps, from spinning raw fibers into yarn, then weaving or knitting the yarn into fabric, and finally finishing processes such as dyeing, printing, and finishing. Traditionally, these manufacturing processes have violated the principles of environmental sustainability. Coupled with the ever-increasing demand for clothing, manufacturers have paid less attention to environmentally friendly and sustainable production methods. Moreover, the rapid changes in fashion trends and the shortening of fashion cycles have contributed to disrupting the ecological balance. Currently, the growing green consciousness of consumers demands a change in the textile supply chain. Numerous studies on the materials used in the fashion industry have been conducted, focusing on eco-friendly and sustainable options that cause minimal harm to the environment. Furthermore, sustainability in the textile industry encompasses not only environmentally friendly supply chains but also the creation of a cost-effective and socially responsible production setup. This article will delve into the negative impacts of materials traditionally used in the fashion industry and explore the trend towards using green, environmentally friendly materials. Based on pressing real-world issues, the author proposes several recommendations for fashion businesses seeking to achieve greater sustainability in the future.

*Key words:* “Fashion materials”, ” Green transition”, “Sustainable fashion”, “Sustainable living”.

## I. INTRODUCTION AND THEORETICAL FRAMEWORK

Along with the development of the economy and society, environmental pollution has become a serious issue not only in urban areas but also in rural regions. According to the Ministry of Natural Resources and Environment, Vietnam generates 23 million tons of household waste, over 7 million tons of industrial solid waste, and over 630,000 tons of hazardous waste annually. Meanwhile, waste treatment faces many difficulties, severely impacting people's lives (Gazzola et al., 2020).

Today, businesses worldwide are under growing pressure to reconcile environmental stewardship with economic expansion. This challenge is particularly acute for the manufacturing and fashion sectors. The fashion industry, while influential in shaping trends and culture, also exerts a substantial impact on our planet (Lee & Huang, 2021).

Driven by the growing consumer preference for sustainable living, the fashion industry has been undergoing a transformation. By adopting eco-friendly practices in production and commerce, the industry is working towards minimizing its ecological footprint and conserving resources. This shift is a testament to the power of consumer consciousness in shaping the future of fashion.

Sustainable living is a way of living that minimizes negative human impacts on the environment by using resources wisely, reducing waste, and prioritizing nature-friendly choices (Cairns, et. al., 2022). Environmental Stewardship refers to the protection of natural resources and the maintenance of ecological balance for the benefit of present and future generations (AMSilk, 2022).

Some theories related to sustainability and environmental economics in textile production include:

The first is the theory of sustainable development. Sustainable development is defined as development that meets the needs of the present without compromising the ability of future generations to meet their own needs. In the textile industry, this concept involves balancing three factors: economic, environmental, and social. Sustainable textile businesses need to find ways to maximize profits while minimizing negative impacts on the environment and improving working conditions for workers (Lee & Huang, 2021). This requires the adoption of green technology, the use of recycled materials, reduced water and energy consumption, and ensuring fairness in the supply chain.

The second is the circular economy theory. The circular economy is a model that aims to reduce waste and maximize resources by extending the product life cycle through recycling, reuse, and remanufacturing. In the fashion industry, the application of the circular economy includes the use of recycled materials (such as organic fibers or polyester from plastic bottles), designing products that are easy to recycle, and implementing a business model that is "rent instead of buy" (Shu Zhong et al., 2023). In addition, sustainable fashion brands also apply the "cradle to cradle" model to ensure that products can return to the production cycle without harming the environment.

Third, environmental economics theory focuses on assessing and pricing the environmental impacts of production activities, thereby developing policies to minimize negative impacts. In the textile industry, this theory emphasizes the application of environmental taxes, emission licensing systems, and mechanisms to encourage businesses to reduce pollution. For example, taxing wastewater and $CO_2$ emissions from textile factories can encourage businesses to switch to cleaner technologies (Thompson and Roberts, 2022). In addition, incorporating environmental costs into product prices also helps raise awareness of sustainable consumption, thereby reducing waste in the fashion industry.

The fourth is the theory of sustainable supply chains. Sustainable supply chains emphasize optimizing production and distribution processes to reduce negative impacts on the environment and society. For the textile industry, this includes using transparently sourced materials, ensuring fair working conditions in factories, and minimizing waste during transportation. The application of digital technologies, such as artificial intelligence (AI) and blockchain, can help track and monitor the supply chain, ensuring that fashion brands adhere to sustainability standards from production to the moment the product reaches the consumer (Neumann, et. al., 2021).

The fifth is the theory of sustainable consumption. In addition to corporate responsibility, consumers also play an important role in promoting sustainable development in the textile industry. The theory of sustainable consumption refers to changing shopping behavior towards more responsible, such as prioritizing eco-certified products, limiting unnecessary purchases and supporting brands committed to environmental protection. Models such as "slow fashion" encourage consumers to buy less but choose high-quality products with a long lifespan, thereby reducing negative impacts on the environment (Shu Zhong et al., 2023).

In sum, applying sustainability and environmental economics theories to the textile industry not only helps to minimize negative impacts on the environment but also creates new business opportunities, promoting the development of a green economy.

In the field of fast fashion, many domestic and foreign studies have focused on the use of different materials, aiming to assess environmental impacts and find sustainable solutions.

In the study by Jones et al. (2018), the article "Recycling in Fast Fashion" published in the Fashion and Sustainability Journal, the authors investigated the development of recycled materials such as recycled PET fabrics and bio-based fibers. The aim of the study was to promote the use of recycled materials to reduce textile waste. They found that although some types of recycled materials are gradually being used in the fast fashion industry, the main problems remain the cost and complexity of the production process.

A typical study is "The global environmental injustice of fast fashion" (2018) by Rachel Bick et al., published in the journal Environmental Health. This study analyzes the negative impacts of the fast fashion supply chain on the environment and society, especially the use of materials such as polyester and cotton. The purpose of the study is to highlight the global environmental injustice caused by fast fashion and call for measures to reduce it.

A study by Smith et al. (2019) in their article "Sustainable Textiles in Fast Fashion" published in the Journal of Fashion Technology & Textile Engineering focused on analyzing synthetic fabrics such as polyester and nylon, two materials commonly used in the fast fashion industry. Their study found that although these materials are cheap and can be mass produced quickly, they have a major negative impact on the environment when not recycled effectively.

Nguyen Thi Lan Anh (2020) in her book New Materials in the Fast Fashion Industry studied natural and synthetic fibers, especially the development of recycled cotton and recycled polyester. The aim of the study was to find material options that could minimize environmental impact while still maintaining properties that fit the needs of the fast fashion industry. She emphasized that the use of recycled materials can reduce the amount of waste from the fashion industry.

Research by Hong Que (2021) in the article Characteristics of Materials in Fast Fashion: Challenges and Solutions

published in the Vietnam Textile and Garment Industry Journal has shown that materials such as polyamide and spandex are dominating the fast fashion industry thanks to their elasticity and wrinkle resistance. However, the study also shows that the production and processing of these materials consume a lot of energy and water, creating significant environmental impacts.

Another study by Thompson and Roberts (2022) in the article “Sustainable Materials in Fast Fashion” published in Sustainable Fashion Journal focused on examining the use of biomaterials such as fabrics from mushrooms and algae in the fast fashion industry. This study highlighted the potential of these materials to replace synthetic materials, to reduce negative environmental impacts and save natural resources.

In Vietnam, the article "Fast Fashion and its Environmental Hazards" in the Environment Magazine (2022) pointed out that global clothing production has doubled in the past 15 years, with the average garment being worn less and discarded faster than ever. The article highlighted the use of toxic chemicals in the dyeing process, causing serious water pollution.

Research by Hoang Minh Tam (2023) in the article “The Development of Fast Fashion Materials and Environmental Impact” published in the Journal of Textile Science and Technology has shown that the fast fashion industry is gradually shifting towards the use of ecological materials such as linen and fabrics from natural fibers. The aim of the research is to find out how to apply these materials in fast fashion production to minimize the negative impact on the environment during the production and consumption process.

Additionally, the study “Fast Fashion and Its Environmental Impact in 2025” published on Earth.Org (2025) also mentioned that fast fashion consumes large amounts of water and is responsible for about 10% of global CO2 emissions. This study focused on materials such as polyester and nylon, emphasizing their negative impact on the environment.

All in all, the above studies all show that, although fast fashion materials such as polyester, nylon, or spandex can meet the needs of fast and cost-effective production, finding and applying sustainable and recycled materials is essential to minimize negative impacts on the environment. However, up to now, no research has been conducted on this content. Therefore, the author's research is a highly urgent research.

## II. METHODOLOGY, CURRENT SITUATION AND SCIENTIFIC RESULTS

### 2.1. Methodology

In order to accomplish the stated research goals, this study relies on secondary data such as documents and articles pertaining to the effects of fast fashion. Data collection, synthesis, analysis, and statistical techniques were employed to analyze the secondary data.

### 2.2. Current situation

#### 2.2.1. The negative impacts of materials used in fast fashion on the current environment

The fashion industry, especially fast fashion, is really hurting our planet. Can you believe that in just one year, it's responsible for 10% of the world's carbon emissions, uses up a whopping 93 billion cubic meters of water, and creates a mountain of 92 million tons of waste (Su et al., 2019)? And get this: it takes us a whole 12 years to even try to recycle all the stuff the fashion industry produces in a single day! For example:

– Air pollution: The production of synthetic fibers is a major contributor to greenhouse gas emissions, releasing significant amounts of carbon dioxide into the atmosphere. The fashion industry is responsible for 8-10% of global carbon emissions (Chen et al., 2021).

– Water pollution: The textile dyeing industry is a significant contributor to water pollution due to its extensive use of water and hazardous chemicals (Chen et, al., 2021). The direct discharge of these substances into water bodies contaminates water sources, harms aquatic life, and poses risks to human health (Watchravesringkan, Zhou & Gil, 2019).

– Fashion waste: The fast fashion industry promotes frequent consumer purchases, resulting in a significant amount of clothing being thrown away after a short time. Synthetic materials such as polyester and nylon are highly resistant to decomposition, leading to pollution of soil and marine environments (Lundblad & Davies, 2016).

– Resource wastage: The fashion industry is the second largest consumer of water among all industries. The processes of manufacturing, dyeing, transportation, and garment processing consume a significant amount of energy, primarily from fossil fuels.

– Biodiversity impact: Cotton cultivation requires large tracts of land, leading to deforestation, reduced biodiversity, and soil erosion. Chemical substances released from production and dyeing processes pollute the habitats of animals and plants.

**2.2.2. The growing trend of using sustainable materials in the fashion industry**

In recent times, there has been a lot of research done on the materials used in fast fashion. Specifically as follows:

**Table 2.1. Summary of studies on materials used in fast fashion**

| Author | Article | Year | Materials used |
|---|---|---|---|
| Senelisile Moyo et al. | Use of bacterial isolates in the treatment of textile dye wastewater: A review | 2022 | Using bacteria to treat textile dyeing wastewater |
| Shu Zhong et al. | TextileNet: A Material Taxonomy-based Fashion Textile Dataset | 2023 | Classification of textile materials in fashion |
| Nguyen Hoang An et al. | Nghiên cứu các yếu tố ảnh hưởng đến quyết định chọn mua sản phẩm thời trang được sản xuất bằng nguyên vật liệu tái chế tại khu vực Thành phố Hồ Chí Minh | 2024 | Fashion products from recycled materials |
| AMSilk AMSilk | Develops Spidersilk, a Biocompatible Material for Use in Cosmetic Formulations | 2022 | Synthetic spider silk |
| Clara Rodríguez Fernández | Watch Strap Made of Recombinant Spider Silk Launches in Europe | 2019 | Recombinant spider silk |
| Huw Hughes | H&M x Good News launch sneaker collection made with Bananatex | 2021 | Bananatex |
| Clara Rodríguez Fernández | These Spider Silk Sneakers from Adidas Are Biodegradable | 2016 | Biosteel fibers from spider silk |
| Amy Feldman | Spider Silk In Airplanes? Germany's AMSilk Inks Deal With Airbus To Develop A New High-Performance Material | 2018 | Spider silk materials for the aviation industry |
| Simon Glover | Biotech pioneers to partner on protein fibres | 2023 | Bio-protein fibers |
| Roxana Gheorghita Puscaselu et al. | Alginate: From Food Industry to Biomedical Applications and Management of Metabolic Disorders | 2020 | Alginate from brown algae |

Source: Author's summary

In 2023, the fashion industry witnessed significant changes, especially in the post-COVID-19 era, with consumers increasingly gravitating towards sustainable fashion. In response to this demand, many fashion businesses have stepped up their production of apparel made from natural, environmentally friendly materials. Popular green materials include: (1) Natural materials such as organic cotton, linen, silk, bamboo, and hemp, which are grown and produced using methods that minimize the use of chemicals, protecting the environment and human health. (2) Recycled materials: Fabrics made from recycled PET bottles, textile scraps, and old clothing help reduce waste and conserve energy. (3) Bio-based materials: Materials produced from biomass sources such as seaweed, fungi, and fruit peels are emerging as innovative and promising options (Kang, Liu & Kim, 2013).

According to a recent report by Coherent Market Insights, the global sustainable fashion market is currently valued at $7.8 billion in 2023 and is growing rapidly, projected to surge to $33.05 billion by 2030 (Chen et al., 2021). A notable trend within this market is circular fashion, which promotes the reuse and recycling of clothing to reduce waste and minimize environmental impact.

A report on the Global Sustainable Fashion Market published by The Business of Fashion predicts a compound

annual growth rate (CAGR) of 22.9% from 2023 to 2030 due to increasing consumer demand and a growing preference for environmentally friendly fabrics (Polajnar Horvat & Šrimpf Vendramin, 2021).

Since then, more and more designs have emerged using eco-friendly materials like organic cotton and recycled polyester to meet the growing demand for sustainable fashion. A British biotechnology company has recently developed a sustainable material from bacterial fermentation, aiming to create a lower-carbon fabric alternative to traditional ones.

In Japan, printing company Seiko Epson plans to establish a clothing recycling business based on the company's paper recycling technology next year, when the European Union's (EU) ban on the destruction of unsold clothing comes into effect. Traditional clothing recycling involves using rotary blade cutters to separate fibers and requires a large amount of fresh cotton to maintain durability. This technology achieves a fiber recovery rate of around 10%. Seiko Epson's new method is said to be able to recover more than 50% of fibers, but the company aims to eventually recover 100% (Park & Lin, 2020).

The green shift in materials is also a trend pursued by high-end fashion brands. Dior and Burberry have said no to deforestation to reduce emissions, while Prada offers its iconic Hobo bag in recycled nylon, and Versace has banned the use of fur.

Regardless of pricing strategies, sustainability has also reached fast fashion brands. Zara has pledged to use recycled or more sustainable materials such as cotton, linen, and polyester, aiming for 100% of its garments to be made from these fabrics by 2025.

Primark has also adopted a similar approach in their latest campaign titled "Time for Change. A Better Future," introducing a wide range of products made from sustainable materials. Uniqlo has decided to create a capsule collection called "Dry-Ex," which is produced by recycling plastic bottles and allows for the use of innovative washing techniques that reduce water usage by up to 99%.

In addition, the secondhand market signals a new cycle for fashion products. Globally, according to data from Statista, the used clothing market is projected to reach a value of $351 billion by 2027, nearly double the $177 billion recorded last year (Cairns, Ritch & Bereziat, 2022).

In Vietnam, the sustainable fashion trend is gradually emerging, especially against the backdrop of the still prevalent fast fashion. Creating and choosing sustainable clothing has become an integral part of the fashion industry. Sustainable fashion in Vietnam is also being promoted, and more and more brands are following this trend (Neumann, Martinez & Martinez, 2021).

### 2.3. Recommendations for fashion businesses in the future

The green transformation in production is an inevitable trend. In the future, a macro-level change in the fashion industry is urgently needed, namely:

– To choose sustainable materials: Prioritizing the use of natural fibers such as organic cotton, wool, silk, jute, hemp, etc., as they are biodegradable and minimize environmental impact. Prioritizing the use of new bio-based materials or recycled fabrics with clear traceability.

– To apply clean production process: Implementing advanced technologies such as natural dyeing, efficient wastewater treatment, and minimizing energy consumption during production. Reducing long-distance transportation by producing closer to the point of consumption, thereby minimizing carbon emissions. Building partnerships with suppliers and manufacturers committed to social and environmental responsibility.

– To apply sustainable design: Designing products that can be easily repaired, recycled, or upgraded to extend their lifespan. Optimizing cutting and sewing processes to minimize fabric waste and overproduction. Designing products that can be combined with various other outfits, increasing their versatility and reducing the need for new purchases.

– To carry out marketing and education: Providing detailed information on the origin of materials, production processes, and the environmental impact of products. Organizing events and workshops to raise consumer awareness of sustainable fashion. Collaborating with non-governmental organizations and participating in community projects to create positive change in the fashion industry.

– To boost investment in research and development: Investing in research and development of new technologies to create more sustainable fashion products. Searching for and developing new types of biodegradable and recyclable materials. Building new business models such as clothing rental and buying back old clothes to reduce waste.

## III. CONCLUSION AND MANAGEMENT IMPLICATIONS

In the context of climate change and a growing environmental consciousness, the trend of using green materials in the fashion industry is becoming a significant factor. The shift towards eco-friendly fabrics not only minimizes negative impacts on the planet but also meets the increasing demand of consumers for sustainable products.

As a producer, designer, distributor, or consumer, using sustainable materials is not only a collective action to protect the environment and conserve Earth's resources but also has long-lasting significance for future generations. Although there are still many challenges to overcome, sustainable fashion has truly become an inevitable trend of the future. Sustainable fashion has awakened the global garment industry. And it has also awakened the "responsibility of consumers".

# INTEGRATING SUSTAINABLE TOURISM INDICATORS INTO URBAN PLANNING AND PLACEMAKING IN VIETNAM

**Le Hoang Tien[1*], Nguyen Van Cuong[2], Chau Ngoc Han[2], Than Thi Ha Phuong[2], Le Thi Thuy Linh[2]**

[1] Faculty of Economics, Ho Chi Minh City University of Economics and Finance.
[2]EMMIEEDU Center, ECOHAUS Construction Management and Design Company Limited.
* Corresponding: tienlh@uef.edu.vn

**ABSTRACT**

Tourism has significantly contributed to Vietnam's economy, but rapid development has also posed social, environmental, and cultural challenges. In response to global issues like climate change, heritage conservation, and urbanization, the concept of sustainable tourism has emerged as a solution to balance economic growth, environmental protection, and social equity. This study explores how urban planning and placemaking can integrate sustainable tourism indicators to address these challenges effectively. By examining Vietnam's current urban planning system and successful placemaking case studies, the research identifies strategies for aligning tourism development with sustainability goals. It highlights the need for collaboration among governments, consultants, and stakeholders to create resilient tourism infrastructure, enhance local identity, and achieve net-zero emissions. The proposed framework aims to provide actionable solutions for integrating sustainability into urban development, supporting long-term tourism growth while preserving Vietnam's cultural heritage and natural resources.

*Key words:* Sustainable tourism, Urban planning, Place-making, Net-zero emissions, Vietnam

## I. INTRODUCTION

Vietnam's economy witnessed a significant contribution from the tourism industry sector in the country's development. The tourism industry is known as the smokeless industry because this is an industry that exploits available natural resources to attract tourists to visit. However, in the modern world, Tourism development has characteristics of interdisciplinary and comprehensive, as it has close connections with many other fields and professions: transportation, environment, entertainment, and real estate. That requires the contributions of various stakeholders among the development process, in order to balance the targets of multiple aspects (financial, environmental, social development) and maintain the sustainable development capability.

Urban planning and place-making are two effective tools for the government to manage the development of urban complexion (physical wealth), demography, destination soul, marketing, and cultural recognition, these factors influence the development of the tourism industry (Camilleri, 2017) and the ability to pursue sustainability concepts in tourism (Grabara K. Janusza, Paula Bajdora, 2013). Firstly, urban planning (Kennedy, 2011) covers all tourism indicators that are related to infrastructure, environment, facilities, public space, population, and socioeconomic aspects. Additionally, place-making (Wyckoff, 2014) takes over creating and operation processing, bringing a sense of local culture to international tourists. From a marketing perspective (Nguyen Hoang Tien, Ho Tien Dung, Nguyen Van Tien, 2020), place-making is considered the branding process and helps local destinations retain their own attraction for the long run. It requires more cooperation between consultant agencies, tourism enterprises, and the local community than government regulations. Based on certain levels and phases in the urban planning and placemaking process such as region planning, master planning, and landscape design, sustainable tourism criteria groups could be filled or considered as the main priority. Following the framework of sustainable tourism (Grabara K. Janusza, Paula Bajdora, 2013), multiple benchmarks to evaluate sustainable tourism, Vietnam's urban planning regulations, existing issues as well as case studies of sustainable tourism destinations, and activities in Vietnamese tourism cities. The study has 5 parts including reviewing the concept of sustainable tourism, urban planning, place-making, current planning systems in Vietnam, the proposed framework of applying sustainable tourism indicators into VN urban planning phrases, the concept of place-making and its effect on sustainable tourism in the context of some successful case studies in Vietnam, and conclusion at the end.

## II. LITERATURE REVIEW

### 2.1. Sustainable Tourism in Vietnam

According to Vietnam tourism development strategy to 2030 of Prime Minister, tourism development is a spearhead economic sector playing a vital role in modern economic structure. Sustainable tourism development bases on green growth platform and maximizes tourism contribution on United Nation sustainable development objective. Furthermore, culture tourism growth, attaching tourism to conservation, heritage value and ethnic culture enhancement is significantly concentrated as a main point in sustainable tourism development. Besides that, professional tourism with 4.0 industrial renovation application is highly promoted (Vietnam.gov.vn).

Objectives in sustainable tourism program base on three main pillars: economy, environment and society with twelve supportive points (Handbook on sustainable tourism development, Science Council – Tourism Department, 2005). In economic aspect, guaranteeing economy efficiency for tourism entrepreneurs having profit and growing for long terms plays a crucial role and be a foundation for local development through tourists' expenditure as well as creating jobs and raising income levels. Additionally, socioeconomic equity by sufficient allocating economic benefits among society which are profited from tourism activities is a vital goal in balancing between economic and social elements of sustainable tourism development. Furthermore, tourists' satisfaction and tourism organizations' enhancement are also a closely interactive couple and one of the most important strategies in tourism promotion. Moreover, developing tourism industry must be associated with social security to maintain the neatness and attractiveness of community in tourist destinations. No less important, cultural value conservation is one of four main sustainable tourism development strategies to 2030 of Prime Minister to create unique and indigenous attractiveness especially to foreigner tourists. Last but not least, environment pillar is always a fundamental factor of sustainable development in general. Natural protection along with efficient use of resources in reducing precious and non-renewable resource usage rate for tourism activities are the key objectives in environment goal besides environmental protection during tourism development periods.

In order to get basic aims on sustainable tourism development, several straightforward principles regarding environment, socio-economy, community relations, and education. Firstly, rational resource use and exploitation, and reducing natural resource overconsumption are intensely essential to ensure long-term growth as well as maintain, and conserve natural diversity. Secondly, socio-economy principles involve tourism development in overall socio-economy plan and local economy support. Tourism growth tactic should be appropriate to local area and plan together with backing related local businesses, leading to support local economic statement. Moreover, community relation principles in sustainable tourism development include engaging local communities and getting opinions from citizens and relevant organizations to consult and impose policies ensuring balance advantages during implementation. Finally, educational principles in sustainable tourism development relating to human resource training and scientific research need to be considered as an effective solution for not only enhancing economic benefits but also exalting tourism quality.

**Case Study: Hoi An, Vietnam**

Hoi An stands as a prominent example of successfully integrating sustainable tourism indicators into urban planning and placemaking. The city's UNESCO-recognized Old Town has maintained its cultural integrity through strict heritage conservation policies, pedestrianized streets, and eco-friendly tourism initiatives (Long et al., 2021). Infrastructure improvements, such as underground electrical wiring and waste management systems, have enhanced environmental sustainability. Moreover, community-based tourism programs have empowered local artisans and small businesses, ensuring equitable economic distribution. Hoi An's green tourism initiatives, including bicycle-friendly streets and eco-tourism villages, demonstrate a holistic approach to sustainable tourism development.

### 2.2. The international framework of Sustainable tourism

The Sustainable tourism framework is generated to ensure the balance between three main pillars and play as a guideline for not only tourism agencies, and local governments but also local communities, and stakeholders in the whole stages to achieve the main goals of sustainable tourism (Grabara K. Janusza, Paula Bajdora, 2013). All the following basic core indicators of sustainable tourism also are determined based on three important dimensions the environmental, Social, and Economic (Francisco Javier Blancas, Macarena Lozano Oyola, Mercedes González, Rafael,

2017). Dynamic sustainable tourism evaluation system helps participating objects measure sustainability in a certain tourist destination and improve solutions and change to adapt to the existing conditions in the planning and operating process.

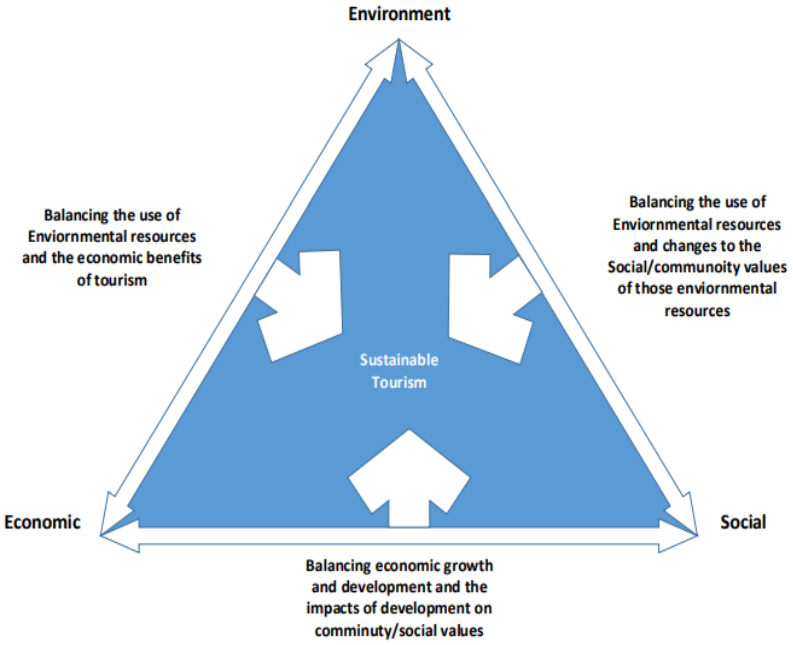

**Figure 1. Dimensions of Sustainable Tourism**

*Source: www.sustainabletourismonline*

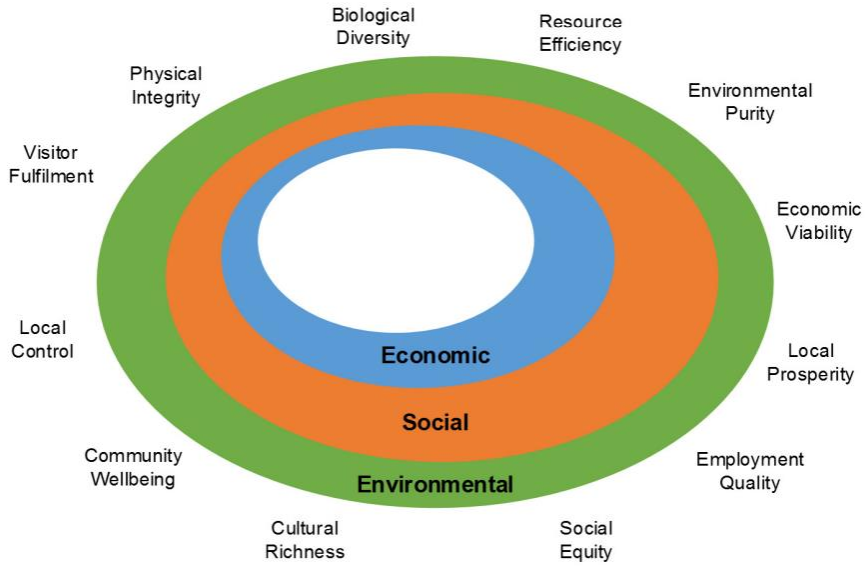

**Figure 2. Framework for Sustainable Tourism**

*Source: www.tourismlandscapes.wordpress.com*

ASEAN framework on sustainable tourism development bases on the balance between three factors: environment, economy and socio culture with five key pillars including sustainable economic growth; social inclusiveness employment and poverty reduction; resource efficiency, environmental protection, and climate change; cultural values diversity, and heritage; mutual understanding and peace, health, safety, and security (ASEAN, 2023)

World Tourism Organization (UNWTO) and its work with a wide range of partner agencies and governments of six countries during and following the preparation of the document, namely Kenya, India, Vietnam, Senegal, Botswana and Timor-Leste to present five key pillars of sustainable tourism in developing countries: Tourism policy and governance;

trade, investment, data, and Competitiveness; employment, docent work and capacity building; poverty reduction and social inclusion (UNWTO, 2013)

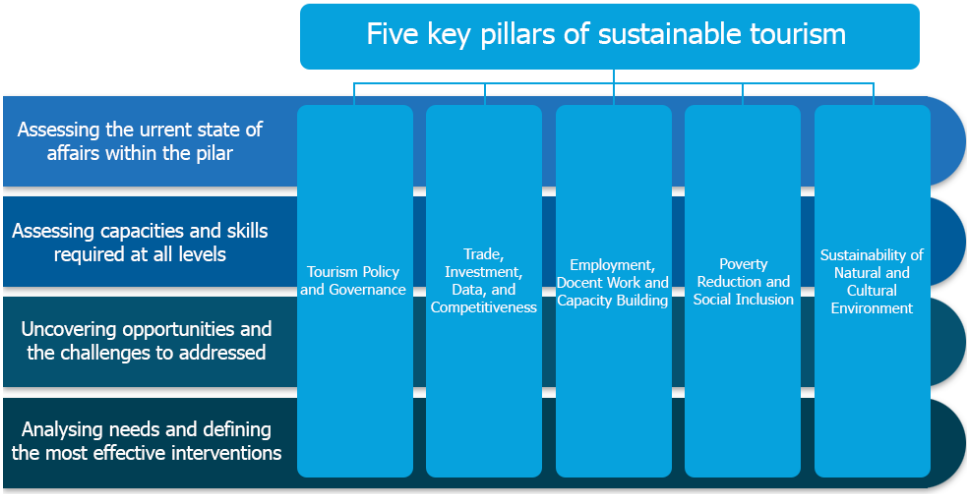

**Figure 3. Key pillars of Sustainable tourism**

*Source: www.unwto.org*

**Figure 4. Pacific Sustainable Tourism Policy Framework**

*Source: www.southpacificislands.travel*

Case Study: Copenhagen, Denmark

Copenhagen provides a leading example of sustainable urban tourism planning. The city has implemented carbon-neutral strategies, green transportation networks, and sustainable architectural designs that align tourism with broader urban planning goals (Gehl, 2016). Smart city initiatives, including data-driven tourism management and congestion control, have optimized visitor experience while minimizing environmental impact. Copenhagen's commitment to sustainable hospitality—such as energy-efficient hotels and local food sourcing—has made it a global benchmark for integrating sustainability into tourism.

Case studies from the Pacific region also provide valuable insights. Republic of Fiji, an island country in Melanesia, is famous for one of the best marine life in the world and its tourism industry. Fiji national sustainable tourism framework 2024 to 2033 shares the vision and goals of the Fijian tourism industry with four priorities derived

from the Pacific Sustainable Tourism Policy Framework (PSTPF): prosperous visitor economy, thriving and inclusive communities, visible and valued cultures, healthy islands and oceans (MTCA, The Fiji Ministry of Tourism and Civil Aviation, 2023)

### 2.3. Urban Planning and Placemaking

Vietnam belongs top 10 most vulnerable countries affected by climate change in the long run ( David Eckstein, Vera Künzel, Laura Schäfer, Maik Winges , 2019). Currently, many tourist destinations are suffering natural disasters (rising sea levels, typhoons, flooding) and problems in tourism operations. Urban development strategies and place-making practices are expected to solve existing issues of physical wealth and tourism destination branding. Furthermore, Urban planning and Place-making determine new solutions to improve infrastructure facilities, and policies to bring satisfying experiences, and profits for both international tourists and residents, ensuring the ability to create an adaptable city (David Drakakis-Smith and Chris Dixon, 1997).

Urban planning systems (Van Phuc Ma, Trung Vinh Tran, 2018) in Vietnam are managed by the Ministry of Planning and Investment, the Ministry of Construction, the Ministry of Natural Resources and Environment, and Others, and Political Systems through the legal, and regulation systems.

**Table 1: Planning System in Vietnam - Alteration of Vietnam's Urban Planning System by the Law of Urban Planning**

| ORGANIZATIONS | Regional Level | Urban Level | Zoning Level | Detailed level |
|---|---|---|---|---|
| **Ministry of Natural Resources and Environment and Others** | Land-use and specialized planning | | | |
| **Ministry of Planning and Investment** | Overall Planning of socio-economic development | Planning of socio-economic development | | |

*Sources: (Van Phuc Ma, Trung Vinh Tran, 2018)(Shigehisa MATSUMURA, Nguyen Trong Hoa, Truong Trung Kien, 2017)*

Place-making: The theory of Placemaking is formed in the urban design process, as it brings questions for urban planners, governments, and citizens about how a place can be described and make this destination become unique with another one, and create a strong sense of place (Quality places) (Wyckoff, 2014). That kind of requirement is more difficult in the modern world, when urbanization is happening fast, then creating mass construction, the same urban structure, and loss of identity (culture, landscape, history monument). More seriously the extent and rate of global environmental changes affect human behavior, urban ecology (green space, forest, water) (Grimmond, 2016).

Placemaking process has strong connection with the destination context, environment resources (Carlos Smaniotto Coasta, Mastourech Fathi and Juan A. Garcia-Esparza). Especially for hictoric cities, placemaking have to based on the

context of historical sites, cultural heritages, which dircectly linked to the tourism development. But the conflicts of benefits and strategies between two side of tourism development and historical preservation create challenges (Marija, 2010), that require placemaking approach to determine the balance solutions, and identify the significant role of heritage in local identity.

Case Study: Singapore's Marina Bay

Singapore's Marina Bay exemplifies the integration of sustainable tourism within urban planning. Through strategic master planning, Marina Bay incorporates green spaces, water-sensitive urban design, and sustainable transport systems. The district hosts iconic eco-friendly developments such as Gardens by the Bay, which combines urban biodiversity with tourism appeal (Chang, 2019). The integration of smart technology for energy conservation and waste management further cements its role as a model for sustainable tourism and placemaking.

Case Study: Da Nang, Vietnam

Da Nang is another example of a successful integration of urban planning with sustainable tourism. As Vietnam's most livable city, Da Nang has implemented coastal management programs, green city initiatives, and infrastructure investments to support sustainable tourism growth. Efforts such as renewable energy adoption, public transportation improvements, and sustainable beach tourism management contribute to its growing reputation as a model city for urban sustainability (Anh Vu Mai et al., 2020).

Besides that, many destinations lack management and investment from the government, local people, and stakeholders in all aspects of tourism development to solve multible challenges in tourism development (Anh Vu Mai, Kim Chi Nguyen Thi, Thanh Nga Nguyen Thi, Truong Le, 2020) waste their locally available resources (landscape, atmosphere, traditional villages). As a result, these problems make tourism destinations become less attractive for tourists and less prefer to return.

## III. RESEARCH METHODOLOGY

The study employs a multi-phase approach to investigate how sustainable tourism indicators can be integrated into urban planning and placemaking within the Vietnamese context. The first phase involves a comprehensive review of Vietnam's existing urban planning system. This analysis examines current structures, policies, and practices that influence tourism development. National and regional planning documents are analyzed to identify key elements that could support the integration of sustainable tourism concepts.

The second phase focuses on a case study analysis of successful placemaking and sustainable tourism initiatives in Vietnam and internationally. By examining these case studies, the research identifies best practices and strategies that can be adapted to Vietnam's unique socio-economic and cultural conditions. This comparative analysis helps uncover effective methods for balancing tourism development with environmental protection, cultural heritage preservation, and social equity.

In the third phase, the study identifies and evaluates key sustainable tourism indicators, such as environmental conservation, cultural heritage preservation, net-zero emissions, and community engagement. These indicators are assessed for their feasibility in the Vietnamese context based on criteria such as policy compatibility, financial viability, stakeholder support, and infrastructure readiness. This evaluation ensures that the proposed indicators can be realistically integrated into urban planning and placemaking practices.

Finally, the feasibility of integrating these indicators is thoroughly assessed. The study considers factors such as existing infrastructure, resource availability, and alignment with current urban planning frameworks. This multi-faceted assessment aims to provide actionable insights and practical recommendations for integrating sustainable tourism indicators into urban development. By doing so, the research supports Vietnam's goal of fostering resilient, culturally rich, and environmentally sustainable tourism infrastructure.

## IV. RESULTS AND DISCUSSION

### 4.1. Current urban planning systems in Vietnam

Vietnam's urban planning system is undergoing significant transformations to address the challenges posed by rapid urbanization, economic expansion, and climate change. Governed by the Law on Urban Planning (2009), the

system operates across multiple levels: national, regional, urban, zoning, and detailed planning. Key instruments guiding this process include the National Urban Development Master Plan, regional plans, urban master plans, and zoning frameworks.

Despite improvements, Vietnam's urban planning system faces several challenges, including fragmented governance, inconsistent policy implementation, and limited integration of climate resilience strategies. Enhancing coordination among government agencies, leveraging technology for data-driven decision-making, and fostering participatory planning are critical for a more adaptive and inclusive urban development framework. Additionally, sustainable urban design principles must be embedded in planning strategies to strengthen resilience against climate change and ensure long-term environmental sustainability

### 4.2. Place-making and sustainable tourism

Placemaking and sustainable tourism are interconnected approaches aimed at creating dynamic, resilient, and culturally rich destinations while maintaining environmental and social sustainability. Placemaking in tourism focuses on designing spaces that reflect the distinct character of a destination, enhance visitor experiences, and improve the well-being of local communities. This approach prioritizes public space enhancement, cultural authenticity, and active community involvement.

Sustainable tourism development seeks to mitigate the adverse effects of tourism while optimizing its social and economic benefits. Its core principles include environmental conservation, economic viability, cultural heritage preservation, and equitable community engagement. However, challenges such as overtourism, inadequate regulatory enforcement, and short-term economic priorities often undermine sustainability efforts.

Integrating placemaking with sustainable tourism requires participatory planning, where local communities, businesses, and policymakers collaborate to ensure tourism initiatives align with sustainability goals. Eco-cultural tourism, which emphasizes both natural and cultural heritage, supports authenticity and environmental stewardship. Smart technologies can be employed to manage visitor flows, track environmental impacts, and optimize tourism infrastructure. Capacity-building initiatives can also empower local stakeholders to actively engage in sustainable tourism management. Strong governance frameworks and policy enforcement are essential to balance development with conservation efforts.

### 4.3. Proposed Model for Integrating Sustainable Tourism Indicators

Based on the existing planning system of Vietnam with the participation of individuals and expertise organizations. The proposed Model for Integrating Sustainable Tourism Indicators is generated to analyze, identify, and achieve targets in each planning stage. Following these principles, not only urban planners but also policy makers, tourism organizations, and communities can understand and actively take part in the place-making process. This model facilitates a structured and inclusive approach to sustainable tourism development by embedding key indicators at multiple planning levels. The incorporation of participatory governance, environmental safeguards, and smart urban solutions ensures that tourism contributes positively to urban resilience, cultural vibrancy, and economic stability.

**Table 2. Integrating Sustainable Tourism indicators in the Urban Planning Process**

## V. CONCLUSION

In this new phase of development, significant challenges require an innovative approach to tourism development strategies through urban planning and placemaking perspectives. These strategies not only enhance physical infrastructure and foundational elements but also preserve existing cultural values and explore future potential, contributing to the national tourism branding process. Vietnam's tourism development strategy has established a

sustainable criteria framework that aligns with international standards. The case studies presented demonstrate global best practices and their feasible adaptation to the Vietnamese context.

Urban planning plays a crucial role in managing spatial factors such as infrastructure, land use, landscape, policy, and regulation. Based on Vietnam's planning system, sustainable tourism principles and indicators can be systematically integrated into different planning phases with the active participation of relevant organizations, communities, and stakeholders. Meanwhile, placemaking has a strong influence on community engagement, tourism marketing, and cultural identity by fostering a sense of place, preserving cultural values, promoting environmental responsibility, and encouraging collaborative design approaches.

The integration of urban planning and placemaking not only accelerates tourism industry development but also fosters cross-sector collaboration among domestic institutions and international conferences. This interdisciplinary approach—encompassing economics, scientific research, energy, and education—ensures that sustainable tourism development aligns with national sustainability goals, including Vietnam's commitment to achieving net-zero emissions.

# SOME ISSUES OF FESTIVAL MANAGEMENTASSOCIATED WITH CULTURAL ECONOMIC DEVELOPMENT IN HO CHI MINH CITY IN THE DIGITAL TRANSFORMATION PHASE

**Tran Anh Dung[1]**

[1]Faculty of Culture and Tourism, Saigon University, Vietnam
* Corresponding : tadung@sgu.edu.vn

**ABSTRACT**

In recent years, Ho Chi Minh City (HCMC) has emerged as a dynamic cultural festival center, contributing significantly to the development of the cultural economy. However, with the strong impact of digital transformation, festival management within the framework of cultural economic development and sustainable growth in HCMC remains a major challenge. This article explores the intersection of festival management and cultural economics, analyzing their roles, functions, and relationships in the digital transformation era. It aims to propose solutions for festival management aligned with cultural economic development. The research findings will offer new perspectives for cultural policymakers, stakeholders, and efforts to promote sustainable initiatives in the current context.

*Keywords:* **"**cultural economics", "digital transformation", "festival management", "cultural economic development"

## I. INTRODUCTION

### 1.1. Background of the study

On Ho Chi Minh City's bustling streets, the Tet Festival's vibrant colors and rhythms unite generations. Yet behind the spectacle lies a transformation—centuries-old traditions reshaped by digital innovation. As technology reshapes festival management, its role grows both crucial and complex. Digital transformation is reshaping HCMC's festivals, proving that technology and culture can coexist. Virtual reality, live streaming, and digital ticketing now enhance traditions, yet some cultural legacies risk fading amid this rapid change.

At the heart of this shift lies a mystery—how can the city manage the delicate balance between honoring its cultural past and embracing digital innovation without sacrificing the authenticity that defines these festivals? This study examines HCMC's festival management to uncover challenges and opportunities, showing how digital transformation can shape cultural celebrations while preserving their traditional essence.

As Vietnam's leading cultural and economic hub, HCMC blends heritage with modernity, drawing strength from its history, diverse population, and rich network of cultural institutions. Furthermore, The city's cultural economy thrives on creative industries like arts, fashion, and entertainment, driving both local and national economic growth.

Firstly, HCMC is home to a rich tapestry of cultural heritage, including museums, theaters, and traditional festivals. The city also serves as a conduit for global cultural exchange, hosting international art exhibitions, music festivals, and fashion events. This reinforces the city's role in connecting Vietnam's heritage to a global audience, making it a key player in the international cultural arena.

In addition to its historical significance, the cultural industries in HCMC play a critical role in Vietnam's broader cultural economy. These industries contribute to job creation, tourism revenue, and urban development. As a result, the city's creative sectors account for a substantial share of its GDP, reflecting the growing importance of cultural assets in economic strategies.

Recently, HCMC has also embraced digital tools to modernize its cultural infrastructure. Online platforms and virtual events have expanded access to cultural experiences, fostering greater inclusivity and international reach. This development aligns with global trends in cultural economics, where digital transformation plays a pivotal role in enhancing cultural production and consumption.

Moreover, festivals in HCMC play a critical role in shaping cultural tourism, reinforcing local identity, and driving

economic growth. Notably, festivals such as the Tet Festival and the Ao Dai Festival not only celebrate traditions but also attract international tourists, contributing significantly to the local economy. Cultural festivals serve as a magnet for tourism, offering unique experiences that showcase the region's heritage.

As Richards (2018) notes, "Cultural festivals act as a magnet for tourism, creating an immersive environment where visitors can engage with local traditions and lifestyles" (p. 12). This highlights how these festivals become platforms for storytelling, allowing communities to present their culture authentically to a global audience.

In the context of local identity, festivals also reinforce communal bonds and foster pride. According to Quinn (2009), festivals are "mechanisms of cultural expression that enable communities to define and celebrate their identity" (p. 176). In HCMC, this is evident in how both traditional and contemporary elements are blended during major events, showcasing the city's dynamic character and fostering a sense of belonging among residents and visitors alike.

Economically, festivals stimulate growth through increased spending on accommodation, dining, and transportation. They also generate employment and support local businesses. As reported by Getz and Page (2016), "Festivals contribute to economic vitality by attracting tourists, encouraging local spending, and boosting regional branding efforts" (p. 227). This highlights the broader economic impact festivals have in the city, influencing various sectors and contributing to a more robust local economy.

This digital integration aligns with the observation by V. Grover et al. (2022) that Digitalization has fundamentally changed organizational structures and processes and affects how people interact with each other, thereby impacting organizational culture.

The second Ho Chi Minh (HCM) City River Festival in 2024 was a great success with impressive numbers, said the city Department of Tourism on June 12. From May 31 to June 9, the southern city attracted more than 1.3 million visitor arrivals, including 121,000 international visitors and 1.18 million domestic visitors. Tourism and service revenue reached 4.25 trillion VND. The average room capacity at accommodation establishments in District 1 increased by 20% compared to normal. (BAT, 2024).

In conclusion, the cultural and economic contributions of festivals in HCMC are clear. By blending tradition with innovation, they offer a platform for cultural expression, drive tourism, and support economic growth.

**1.2. Research Questions and Objectives**

This study aims to explore the multifaceted role of festival management in Ho Chi Minh City, focusing on its impact on cultural economic development, heritage preservation, business growth, and digital transformation In light of these considerations, the following research questions have been identified, including:

– How does festival management contribute to the cultural economic development of Ho Chi Minh City?

– How do festivals in Ho Chi Minh City contribute to the preservation and promotion of cultural heritage?

– How does digital transformation impact festival management in Ho Chi Minh City in terms of organization, audience engagement, and economic outcomes?

*Research Objectives*

The research aims to explore the complexities of festival management in HCMC, particularly in the context of **C**ultural **E**conomic **D**evelopment (CED)[1] during the digital transformation phase. This research seeks to fill the gaps in the literature by: (1). *Analyze the Role of Festivals in CED:* Investigate how festivals contribute to HCMC's cultural economy through tourism, community engagement, and heritage promotion. Assess the economic impact of festivals on local businesses, creative industries, and employment. (2). *Examine the Challenges of Festival Management in the Digital Transformation Era:* Identify the technological, logistical, and cultural challenges faced by festival organizers during the digital shift. Explore the implications of digital tools on festival planning, promotion, and execution. (3). *Evaluate the Impact of Digital Tools on Festival Operations:* Assess how digital tools enhance the efficiency of festival operations, including logistics, ticketing, and crowd management. Investigate the role of digital technologies in improving coordination among stakeholders, including organizers, performers, and vendors. (4). *Develop Strategic Recommendations for Enhancing Festival Management*: Propose innovative approaches to festival management that leverage digital transformation for improved cultural and economic outcomes. Suggest strategies for balancing cultural

authenticity with modern technological advancements.

## II. METHODOLOGY

### 2.1. Conceptual Theoretical Framework of The research

*Cultural Economics Theory*: Cultural Economics Theory explores the intersection of culture and economics, focusing on how cultural values, goods, and activities influence economic behavior and outcomes. It recognizes that cultural goods are unique because they carry both economic value (measurable in monetary terms) and cultural value (symbolic, aesthetic, or social significance).

Pierre Bourdieu, in his influential work Distinction: A Social Critique of the Judgement of Taste (1984), introduced the concept of cultural capital, which refers to the non-economic social assets, such as education, knowledge, and cultural awareness, that individuals use to gain social mobility. Cultural goods and services, according to Bourdieu, are not just economic commodities but also represent the social status of individuals and groups. The consumption of cultural products (like art, literature, and performances) is often linked to class distinctions, making cultural participation an avenue for signaling taste, identity, and social belonging. Bourdieu argued that alongside economic and social capital, cultural capital plays a crucial role in determining a person's social position and access to opportunities. "Cultural capital is convertible, on certain conditions, into economic capital and may be institutionalized in the form of educational qualifications" (Bourdieu, 1986, p. 243).

Bourdieu's theory emphasizes that the appreciation of cultural goods is highly influenced by societal norms and class dynamics, suggesting that culture is a tool for social distinction. However, it may overlook how broader shifts in global society—such as digital access and democratization of cultural content—are reshaping how people value and consume culture.

The Two-Sector Model of cultural economics, developed by David Throsby, divides the cultural economy into two key sectors: the commercial sector and the non-market sector. The commercial sector includes cultural products and services that are traded in the market, such as concerts, films, or cultural tourism. The non-market sector encompasses cultural goods and services that are funded by public or private philanthropic support, such as public museums, educational programs, or community arts initiatives. David Throsby (2001) emphasized this dual nature: "Cultural goods are valued not only for their economic significance but also for their cultural and symbolic meanings." and "Cultural value derives from the symbolic, aesthetic, and spiritual attributes of cultural goods, whereas economic value is measured by the market price or other monetary indicators." (Throsby, 2001, p. 44). However, this model might underplay the increasingly blurred lines between commercial and non-commercial cultural activities, especially in the context of digital transformation where many cultural products now straddle both sectors (e.g., online streaming platforms).

### 2.2 Research method

This study adopts qualitative methodologies to explore the cultural and economic dimensions of festival management in HCMC. Specifically, a case study analysis is conducted on prominent festivals, such as the Tet Festival, Ao Dai Festival, and HOZO music Festival, to examine their management strategies and cultural significance. Additionally, thematic analysis is employed to identify recurring themes from interviews and focus groups with key stakeholders, including organizers, policymakers, and attendees. To further contextualize the strategic integration of culture and economics, document analysis is carried out, reviewing cultural policies, festival reports, and promotional materials. Collectively, these approaches provide in-depth insights into the role of festivals in shaping cultural identity and driving economic development, especially in the context of a rapidly modernizing city. Finally, Data is gathered through interviews, participant observation, and archival research, ensuring a comprehensive and nuanced understanding of the local festival landscape.

## III. RESEARCH RESULTS

### 3.1. Role of Cultural Festivals in CED

Festivals play a significant role in CED by acting as catalysts for cultural preservation, community engagement, and economic stimulation. In addition, they contribute to the creative economy by promoting cultural products,

enhancing tourism, and supporting local industries.

Festival economics refers to the study of the economic impact and financial dynamics of festivals, including their role in stimulating local economies, creating employment opportunities, and promoting cultural tourism. Specifically, this field examines the monetary benefits festivals generate, such as direct spending on tickets, food, and merchandise, as well as indirect effects like increased demand for accommodations and transportation. For example, Throsby (2001, p. 56) argues that "festivals are crucial in CED as they create opportunities for cultural expression, generate economic value, and contribute to the sustainability of cultural industries." Similarly, Getz (2010, p. 45) emphasizes that "festivals serve as platforms for cultural tourism, attracting visitors and creating economic benefits for host communities. Building on this, Frey (1994) defines festival economics as the study of how festivals influence economic activity, emphasizing expenditure patterns, revenue generation, and their broader impact on host communities.

This definition underscores the dual role of festivals in delivering immediate financial benefits and fostering long-term economic growth and community well-being. Similarly, Getz (2007) expands this perspective, describing festival economics as "a subfield of event studies that investigates the economic dimensions of festivals, encompassing cost-benefit analyses, funding strategies, and the return on investment for stakeholders." This highlights the importance of strategic financial planning and sustainability in festival management.

Moreover, Gibson and Connell (2012, p. 79) argue that "festivals serve as significant drivers of cultural economies, acting as platforms for showcasing local heritage, creativity, and cultural products while stimulating local businesses and tourism industries. This dual impact, involving cultural enrichment and economic growth, further underscores the essential role of festivals in supporting both local heritage and economic activity. Likewise, Getz (2010) emphasizes the dual benefits by stating, "By attracting tourists and fostering local participation, cultural festivals contribute to economic growth, create employment opportunities, and enhance the cultural identity of host communities."

In developing economies, Richards (2007) highlights the transformative power of festivals, asserting that "festivals are a powerful tool for the cultural economy as they provide a space for cultural exchange and commercialization of cultural goods, creating direct and indirect economic benefits" (p. 11).

In summary, festivals are not only celebratory events but also vital mechanisms for driving cultural, social, and economic progress. Through strategic planning and an emphasis on sustainability, festivals can become even more impactful in shaping cultural economies and fostering community development.

*Key Contributions to CED:*

Festivals play a pivotal role in driving tourism and economic revenue, creative industries growth, and community development, making them key contributors to cultural and economic sustainability. For instance, festivals attract both domestic and international visitors, significantly boosting spending on accommodation, food, and transportation. According to the HCMC Department of Tourism, the River Festival (May 31 - June 9) welcomed a total of 1,301,000 visitors, including 121,000 international guests and 1,180,000 domestic attendees. As a result, tourism and service revenue reached VND 4,250 billion, with the average room occupancy rate in District 1 increasing by 20% compared to normal.

In addition to economic benefits, festivals also stimulate the growth of creative industries by providing a vibrant platform for artists, artisans, and performers to showcase their work. This not only enhances the cultural vibrancy of a region but also fosters local creative economies.

Moreover, festivals contribute significantly to community development. They strengthen social cohesion by bringing people together, while also offering opportunities for skill development and volunteering. In this way, festivals serve as multifaceted tools for economic growth, cultural preservation, and community empowerment.

**3.2. Festival management and CED in HCMC**

Ho Chi Minh City, a bustling metropolis with a rich tapestry of Cultural festival resources, boasts immense potential in festival management. As Vietnam's economic and cultural hub, the city is home to a diverse range of festivals, from traditional celebrations like Tet Nguyen Dan (Lunar New Year) to contemporary events such as international music and art festivals. Its abundant resources, including vibrant cultural institutions, skilled artisans, and

dynamic creative industries, provide a strong foundation for organizing world-class festivals. These events not only preserve and promote local traditions but also serve as significant drivers of tourism and economic growth, positioning the city as a leading cultural destination.

Ho Chi Minh City hosts a wide variety of festivals, including traditional Vietnamese festivals, international cultural events, and music festivals. For example, key events such as the Tet Nguyen Dan (Lunar New Year), Mid-Autumn Festival, HCMC Tourism Festival, and the Festival of International Music, among others, cater to both local and international audiences. As a result, these festivals promote the city's cultural vibrancy and contribute to its economic growth. In line with this, the viewpoints and policies of the Party Committee and the Government of HCMC regarding the organization of festivals, cultural, and sports events are outlined in the Project "Organizing typical festivals, cultural, and sports events in HCMC, period 2020 - 2030." This project is associated with the goal of comprehensive development for the city.

Moreover, festivals stimulate local economies by increasing tourism and supporting industries such as hospitality, food, and crafts. For instance, events like the HCMC Tourism Festival and the International Tourism Expo connect local businesses with global markets, creating opportunities for long-term growth. According to the HCMC Department of Tourism, the 2nd HCMC River Festival in 2024, held over 10 days (from May 31 to June 9), with nearly 20 activities, attracted 4.5 million HCMC residents and tourists. As a result, tourism and service revenue reached 4,250 billion VND (equivalent to 170 million USD).

*Legal basis related to festival management at HCMC:*

The work of festival management and organization is currently having certain achievements and advantages due to the policies, strategies, projects and implementation plans for both the festival and cultural sectors. The work of festival management and organization in HCMC is currently being carried out on the following basis at Table 3.3:

**Table 3.1 - Festival management legal documents**

| Legal documents | Description |
|---|---|
| Resolution No. 31-NQ/TW | Direction and tasks for developing HCMC to 2030, with a vision to 2045. |
| Directive No. 41-CT/TW (Feb 5, 2015) | Strengthening the Party's leadership in festival management and organization. |
| Decree No. 110/2018/ND-CP | Regulations on festival management and organization. |
| Decree No. 144/2020/ND-CP (Dec 14, 2020) | Regulating performing arts activities, effective from February 1, 2021. |
| Decision No. 1755/QD-TTg | Approving the Strategy for developing Vietnam's cultural industry to 2020, with a vision to 2030. |
| Circular No. 04/2023/TT-BTC | Guiding management and financial revenue/expenditure for festival organization and sponsorship activities. |
| Decision No. 4853/QD-UBND (Oct 25, 2023) | Approving the Project on developing HCMC's cultural industry for the period 2020-2030. |
| Plan No. 425/KH-UBND (Feb 14, 2022) | Organizing activities to celebrate major holidays and important historical/political events in 2022 in HCMC. |
| Plan No. 846/KH-UBND (Mar 21, 2022) | Implementing the Project "Organizing typical festivals, cultural, and sports events in HCMC, period 2020-2030". |

*Source: Prepared by author, 2024*

### 3.3. Festivals are a driving force for tourism and cultural economic activities in HCMC

Festivals serve as vital catalysts for cultural preservation, economic development, and community engagement, significantly enhancing local economies and creative industries. By attracting both domestic and international tourists, festivals generate substantial economic benefits for host communities.

For example, the Huế Festival in Vietnam, renowned for its traditional music, art, and cuisine, draws thousands of visitors annually, contributing to the local economy through tourism revenue, job creation, and increased demand for services like hospitality and transportation (Nguyen & Nguyen, 2020).

Similarly, the HCMC River Festival underscores the potential of festivals to serve as cultural and economic powerhouses. In addition to promoting the city's image, cultural identity, and unique tourism offerings, the festival captivated audiences with a breathtaking drone display involving over 1,000 drones lighting up the southern metropolis's sky, drawing thousands of spectators to the banks of the Saigon River (VNA, 2024). This event not only enriched the cultural tapestry of HCMC but also fueled tourism-related spending, reinforcing the festival's role as a driver of economic growth. Beyond tourism, festivals also provide fertile ground for the growth of creative industries, including art, music, and fashion.

The relationship between festivals and the cultural economy can be understood through the lens of supply and demand. On the supply side, festivals offer cultural experiences, performances, and products that attract both local and international audiences. These offerings create a diverse supply of cultural goods and services, from food and crafts to performances and artworks, which are tailored to meet various consumer preferences.

On the demand side, festivals generate interest from consumers who seek unique cultural experiences. This demand drives tourism, local attendance, and spending on accommodation, food, entertainment, and souvenirs. As demand increases, it creates economic opportunities for local businesses, artisans, and service providers to cater to festival-goers. The interplay between the supply of cultural offerings and the demand for those experiences helps drive growth in the cultural economy, benefiting both creators and consumers while boosting local economies (see Fig 3.3). On the contrary, the cultural economy not only provides a diverse range of goods and services but also plays a crucial role in shaping the identity and sustainability of cultural festivals. It encompasses traditional crafts, performances, heritage tourism, creative industries, and digital cultural content, all of which contribute to enriching festival experiences, attracting audiences, and driving economic activity.

Beyond economic contributions, the cultural economy fosters innovation by blending tradition with modern creative expressions. Festivals serve as platforms for artisans, musicians, and performers to showcase their work, helping preserve intangible cultural heritage while adapting to contemporary trends. The integration of digital technologies—such as virtual reality, live streaming, and interactive exhibits—further expands audience engagement, making cultural experiences more accessible to both local and international participants. (see Fig 3.3)

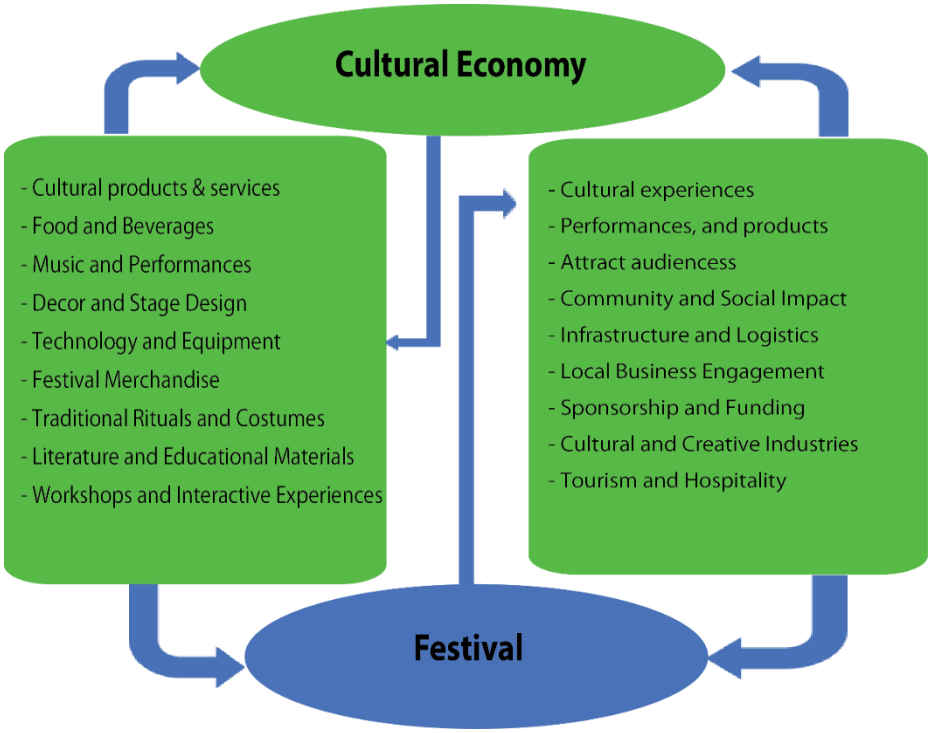

**Fig 3.3 - Diagram of the relationship between festivals and cultural economy**

*Source: Prepared by author, 2024*

In essence, festivals act as both suppliers and demand generators in the cultural economy, creating a cyclical relationship that fosters cultural and economic exchange.

### 3.4. Festivals Preservation and Promotion of Cultural Heritage in HCMC

Festivals play a critical role in preserving and promoting cultural heritage, ensuring its transmission to future generations. In particular, traditional festivals such as the Tet Lunar New Year celebrations in Vietnam are integral to cultural identity and attract international recognition. Moreover, many of HCMC's festivals are rooted in ancient Vietnamese traditions, with hidden layers of symbolism and forgotten rituals that have been passed down through generations. For example, celebrations such as Tet Nguyen Dan (Lunar New Year) and the Mid-Autumn Festival carry with them the secrets of past practices—ancient music, dances, and foods—whose meanings may be lost to many but are carefully upheld by those who understand their true significance. In this way, these festivals maintain and pass on cultural customs to younger generations, ensuring that the mystical essence of these traditions endures.

Festivals in Ho Chi Minh City are vital for preserving and promoting Vietnam's cultural heritage. They showcase local traditions, reviving arts and fostering cultural tourism. Each festival, such as the Tet Festival, not only celebrates cultural practices like ancestor worship and traditional cuisine but also adapts these customs to modern contexts (Nguyen & Tran, 2021). The Ao Dai Festival, for example, highlights Vietnam's iconic attire, blending tradition with contemporary fashion, and renewing interest in traditional textiles and craftsmanship (Pham, 2019). These festivals play a crucial role in maintaining the city's cultural identity while keeping its history alive.

Meanwhile, the Nghinh Ong Festival, celebrated by the fishing communities in HCMC, not only honors the Whale God (Ca Ong) for protection and good fortune but also reinforces communal bonds. According to Do and Vu (2020), "The Nghinh Ong Festival reflects the intergenerational transmission of marine folklore, uniting communities in both spiritual and cultural practices" (p. 45).

In addition, festivals like the International Music Festival and the Ao Dai Festival position HCMC on the global cultural map. Truong and Nguyen (2020) highlight, "Through these events, the city not only celebrates its heritage but also asserts its identity as a cosmopolitan hub blending tradition and innovation" (p. 93).

### 3.5. Impact of Digital Transformation on Festival Management in HCMC

Digital marketing has revolutionized the way festivals are promoted in HCMC. Through the use of social media platforms, websites, and mobile apps, event organizers are now able to reach larger and more diverse audiences, both locally and internationally. For instance, festivals in HCMC actively utilize platforms like Facebook, Instagram, and YouTube to promote their events, allowing them to connect with a global audience. Moreover, digital marketing campaigns enable organizers to engage with attendees both before the event and during the festival itself, building excitement and anticipation. As a result, virtual participation now constitutes a significant portion of audience engagement. In fact, virtual attendance accounted for 15% of total engagement in hybrid events such as the Ao Dai Festival (HCMC Cultural Affairs Report, 2023).

In addition to marketing improvements, digital transformation has significantly enhanced festival management in HCMC. Specifically, these advancements have increased marketing efficiency, boosted audience engagement, and fostered the creation of sustainable, inclusive cultural events.

One key area of improvement has been online ticketing and registration processes, which have become more efficient, accessible, and user-friendly. For example, major festivals such as the HCMC Ao Dai Festival, Tet Festival, and International Tourism Festival have greatly benefited from these innovations. According to the HCMC Department of Tourism (2023), 65% of tickets for the 2023 International Tourism Festival were sold online, representing a 30% increase compared to 2022. Furthermore, the adoption of online registration for the Ao Dai Festival in 2023 resulted in a 40% reduction in on-site registration times, thereby enhancing overall attendee satisfaction.

Impact of Digital Transformation on Festival Management are shown in Table 3.2 as below:

**Table 3.2: Impact of Digital Transformation on Festival Management**

| Aspects | Traditional Festival | Digital Era Festival |
|---|---|---|
| **Event Planning** | Manual scheduling, paper-based workflows. | Digital tools for festival management, online, enhance communication, collaboration platforms. |

| | | |
|---|---|---|
| **Marketing** | Flyers, posters, local radio/TV ads. | Social media campaigns, digital marketing, SEO, and data-driven targeting. |
| **Ticket Sales** | On-site or physical ticket outlets. | Online ticketing platforms, mobile apps, e-ticketing systems. |
| **Audience Engagement** | Limited to event duration, in-person experiences. | Virtual and hybrid events, livestreaming, interactive social media polls. Post-Festival Archives and Engagement |
| **Data Collection** | Anecdotal feedback, manual surveys. | Real-time analytics, online surveys, and audience tracking tools. |
| **Revenue Streams** | Ticket sales, vendor fees, sponsorships. | In-app purchases, crowdfunding, online merchandise sales, digital ads. |
| **Logistics and Operations** | Physical communication with vendors and stakeholders. | Automated communication, inventory management systems, and digital tools. |
| **Festival Planning** | Manual scheduling, paper-based workflows. | Digital tools for project management, online collaboration platforms. |
| **Accessibility** | Limited by geographic and physical constraints. | Global reach through online platforms, virtual attendance options. |
| **Cultural Preservation** | Risk of losing relevance among younger audiences. | Digital archives, multimedia storytelling, and gamification. |
| **Economic Efficiency** | High costs for physical marketing and logistics. | Reduced costs through digital marketing, support creative industries and cultural industries |

### 3.6. Challenges of Digital Transformation in Festival Management in HCMC

Digital transformation in festival management presents several challenges, requiring careful navigation to fully realize its potential. One major obstacle is limited access to resources and technology infrastructure, particularly for smaller festivals, which often struggle with financial constraints. As Getz and Page (2016) note, "Smaller festivals face significant hurdles in adapting to technological advancements due to financial and operational limitations" (p. 223). Furthermore, the digital divide continues to marginalize certain communities, creating inequities in participation and access.

Adopting digital tools, such as event apps, live streaming, and online ticketing platforms, often demands significant upfront costs, which can be prohibitive for festivals with limited budgets. Additionally, ongoing expenses, including software updates, licenses, and technical support, add to the long-term financial burden. Richards (2018) highlights that "the ongoing costs of digital tools can strain festival budgets, particularly for grassroots and community-driven events" (p. 45).

Moreover, technical reliability is a pressing concern, as issues such as internet connectivity problems or software glitches can disrupt the festival experience for both organizers and attendees. Another challenge lies in integrating new digital tools with existing festival management systems, such as scheduling and ticketing platforms, a process that can be both complex and time-consuming. Despite these hurdles, addressing these challenges is essential to successfully balance innovation with cultural preservation in festival management.

Digital transformation is considered one of the key, long-term tasks and the main driving force to improve and enhance the quality of service in the tourism sector in HCMC (Decision No. 749/QD-TTg of the Prime Minister: Approving the "National Digital Transformation Program to 2025, with a vision to 2030").

The Department of Tourism has issued a Plan to implement the Smart Tourism Development Project in 2024 with

3 key contents:Raising awareness of smart tourism, Building infrastructure, data centers, and deploying information technology activities; Plan to build a tourism service database system; Plan to implement the Program "Digital transformation of the tourism sector of the Ho Chi Minh City Department of Tourism". (Tcdulichtphcm.vn, 2024)

**3.7. Discussion and recommendations**

The integration of digital tools into festival management is transforming CED in HCMC, enhancing both cultural preservation and economic growth. This discussion highlights key aspects of this transformation, its implications, and challenges.

*Enhancing Cultural Economy and Creative Industries*

Cultural festivals stimulate local creative industries by promoting art, music, and performance, helping regions brand themselves as cultural hubs. For instance, the Montreux Jazz Festival supports the Swiss music industry while drawing significant international audiences. Showcasing local talent can open global markets and create a sustainable cultural economy. "The festival is estimated to generate around CHF80 million in economic income for Montreux and Vevey. During the two-week festival Montreux hotel owners earn around 20% of their annual turnover." (Bradley, 2024)

Digitalization has improved operational efficiency and boosted economic outcomes. For instance, automated systems reduce administrative burdens, while data analytics provide insights into audience preferences, enabling targeted marketing strategies. According to a 2023 report by the HCMC Department of Tourism, festivals adopting digital solutions reported a 30% increase in sponsorship and a 25% rise in visitor spending compared to traditional formats.

Moreover, festivals such as the Ho Chi Minh City Tourism Festival directly boost local economies. According to the Ho Chi Minh City Department of Tourism (2024), "The 2nd Ho Chi Minh City River Festival in 2024 attracted 4.5 million participants and generated tourism revenue of 4,250 billion VND (equivalent to 170 million USD)."

*Enhanced Accessibility And Engagement Through Digital Platforms*

Digital transformation has revolutionized the way festivals are managed and experienced. Online ticketing, virtual events, and social media marketing have made festivals more accessible to a global audience. For instance, the HCMC International Music Festival (HOZO), with its hybrid format, attracted over 100,000 attendees both online and offline in 2022. These tools not only expand audience reach but also generate additional revenue streams through advertisements, live-streaming fees, and digital merchandise sales.

*Preservation Of Cultural Heritage Through Digital Documentation*

Digital tools enable the documentation and archiving of cultural festivals, ensuring the preservation of intangible heritage. Virtual reality (VR) and augmented reality (AR) are now being used to create immersive cultural experiences, such as re-enactments of traditional rituals during the Nguyen Hue Flower Street Festival. Such practices promote cultural awareness among younger generations while attracting international tourists seeking unique cultural experiences.

*Recommendations*

To foster digital innovation in festival management, collaboration between the government, cultural institutions, and private enterprises is essential. Public-private partnerships can drive innovation by combining resources, expertise, and technology.

For instance, the government could facilitate collaborations by offering grants or subsidies to private enterprises developing digital solutions for the cultural sector. Additionally, training programs for festival managers and staff are crucial to enhance their digital skills and knowledge. These programs should focus on the latest tools for event planning, digital marketing, and virtual experiences to improve festival operations.

Furthermore, government policies supporting digital transformation, such as tax incentives or partnerships with tech companies, can create an ecosystem conducive to innovation. Promoting digital inclusivity is also vital, ensuring that small festivals and marginalized communities can benefit from technological advancements. By offering support such as affordable digital platforms or training, these groups can engage with the digital transformation.

Finally, the digital shift must be sustainable. Balancing the adoption of technology with environmental and social responsibility is essential, and festivals should consider eco-friendly technologies, such as energy-efficient digital systems, to minimize their carbon footprint. In this way, digital innovation can not only enhance festival management but also contribute to the broader goals of sustainability and inclusivity.

## IV. CONCLUSION

Festival management plays a pivotal role in the cultural and economic development of Ho Chi Minh City (HCMC), a vibrant urban hub renowned for its rich heritage and growing creative economy. More than just cultural celebrations, festivals serve as powerful economic drivers, promoting local traditions, attracting tourism, and stimulating creative industries.

This article examines the impact of digital transformation on festival management in HCMC, emphasizing how technology enhances the intersection of cultural heritage and economic growth. Festivals are not only a means of preserving tradition but also a platform for innovation, crucial to the city's development. However, challenges such as resource constraints and the digital divide must be addressed. The study advocates for strategic investments in technology, education, and public-private partnerships to ensure sustainable growth.

In conclusion, aligning cultural and economic priorities through digital innovation can position HCMC as a global leader in cultural creativity and sustainable development. This study provides valuable insights into festival management, though a comprehensive review of the broader theoretical framework lies beyond its scope. Future research is needed to further explore these dynamics and their long-term implications.

## NOTE:

[1]According to Throsby (2001), Cultural Economic Development refers to "the process through which cultural assets, activities, and industries are leveraged to generate economic growth, enhance social cohesion, and contribute to the sustainability of cultural resources" (p. 56).

## ABBREVIATION:

[1] HCMC: Ho Chi Minh City

[2] CED: Cultural Economic Development

# THE ROLE OF VIRTUAL REALITY (VR) TECHNOLOGY IN INNOVATION AND SUSTAINABLE DEVELOPMENT OF INDOCHINE HERITAGE TOURISM IN THE INTERIOR OF HUE ROYAL PALACE

**Nguyen Thi Thuy Ha[1]**

[1]Interior Design Department, Faculty Design and Art, Hoa sen University, Ho Chi Minh city, Viet Nam
* Corresponding Author: ha.nguyenthithuy@hoasen.edu.vn

**ABSTRACT**

This study explores the role of Virtual Reality (VR) technology in preserving and enhancing the Indochina heritage tourism experience, focusing on the interior of the Hue Royal Palace. A mixed-methods approach was used, including a visitor survey (n = 122), expert interviews (n = 12). The results show that 87% of participants reported having a deeper understanding of cultural heritage thanks to VR, and experts emphasized the potential of VR in minimizing physical damage to monuments. The study proposes solutions to integrate VR into heritage conservation.

Keywords: "Virtual Reality (VR) technology", "heritage conservation", "sustainable tourism", "Hue Royal Palace", "Indochine architecture".

## INTRODUCTION

### 1.1 Research Context

#### 1.1.1. The Huế Imperial City and Its Importance in Heritage Conservation

The Huế Imperial City, once the capital of the Nguyễn Dynasty from 1802 to 1945, is one of Vietnam's most significant historical sites. With its unique architectural style that blends traditional Vietnamese craftsmanship with Indochinese influences, this complex deeply reflects the history, culture, and royal lifestyle, as well as the political landscape of Vietnam over nearly 150 years. Among Vietnam's ancient capitals, Huế is the only one that has preserved its architectural and artistic integrity to a remarkable extent, retaining invaluable historical, cultural, and artistic values.

In 1993, UNESCO designated the Complex of Huế Monuments as a World Cultural Heritage site, underscoring its importance in preserving Vietnamese and Southeast Asian culture. However, over the past century, many structures within the Huế Imperial City have suffered damage or destruction due to wars, natural disasters, and the passage of time.

#### 1.1.2. The Degradation and Loss of Monuments in the Huế Imperial City

Despite being recognized as a World Heritage site, the Huế Imperial City faces numerous challenges in conservation, particularly concerning the degradation and loss of interior architectural elements. The Huế Monuments Conservation Center has preserved numerous archival photographs documenting the monuments from decades ago, revealing the loss of many distinctive structures and the severe deterioration of others. The Imperial Citadel now retains only 62 structures, a significant reduction from the original 130 buildings. During the wars of the early 20th century, many structures within the Huế Imperial City suffered extensive damage from bombings. Indochinese-style interior spaces, such as Kiến Trung Palace (which was recently restored and opened to the public in 2024), An Định Palace, and the Cửu Tư Đài Theater, were either severely damaged or completely lost. Each year, the ancient capital of Huế also faces heavy rainfall and flooding, which cause significant damage to heritage sites, some of which date back hundreds of years. Additionally, the high humidity levels accelerate the deterioration of traditional materials such as wood, lacquerware, gilded ornaments, and ceramic tiles. Furthermore, the large number of visitors each year increases the risk of wear on stone flooring, damage to wall paintings, artifacts, and structural elements. To prevent further deterioration, the Huế Monuments Conservation Center has had to restrict access to certain areas to limit direct human impact.

Over time and due to historical upheavals, many structures have faded into obscurity, making restoration efforts increasingly difficult due to the loss of original architectural elements. Some interior spaces now exist only in photographic archives, which are often incomplete or lacking in detail, with no physical remains available for reference.

Moreover, the disappearance of traditional building materials, construction techniques, and skilled artisans presents significant challenges in researching and restoring these cultural heritage sites.

#### 1.1.3. VR Technology and Solutions for the Conservation of Hue Heritage

In the context of globalization, cultural tourism in the Hue Imperial City faces significant challenges in heritage conservation due to natural disasters, urbanization, and war. According to Staff Researcher (2022), virtual reality (VR) technology plays a crucial role in reconstructing and preserving endangered heritage, helping to retain historical information and create an immersive educational environment. VR presents opportunities to restore the lost interiors of the Hue Imperial Palace, where many structures have deteriorated over time. The application of VR in conserving the Hue Imperial City not only aids in the reconstruction of architectural spaces but also enhances visitor experiences, safeguards heritage, and promotes sustainable tourism. The digitalization of architectural heritage has become a crucial trend. Zhang et al. (2023) highlight that converting heritage into a digital environment not only preserves it but also reconstructs lost structures such as Kien Trung Palace and An Dinh Palace, enabling visitors to experience their original spatial context. VR minimizes physical impact on heritage sites while enriching visitor engagement, allowing them to explore the Nguyen Dynasty's imperial citadel without direct contact with artifacts.

Metaverse technology— a virtual space built upon VR, augmented reality (AR), artificial intelligence (AI), blockchain, and the Internet of Things (IoT)— expands the potential for heritage conservation and interaction. Buragohain et al. (2023) emphasize that the metaverse not only reconstructs architecture but also creates an interactive environment where the public can participate in conservation efforts. This is particularly valuable for deteriorated or partially lost monuments. Heritage conservation goes beyond architectural digitalization—it also involves recreating historical contexts, rituals, and court life. He et al. (2024) argue that VR enables users to actively experience history rather than passively observe it. Furthermore, VR serves as an effective tool for heritage education, helping younger generations better understand imperial architecture and culture through immersive simulations.

### 1.2. Research Gap

The application of virtual reality (VR) technology in heritage conservation is a global trend, with numerous studies conducted on famous heritage sites. However, in Vietnam—specifically in the Hue Imperial City complex—research on VR applications in architectural and Indochinese interior conservation remains limited. This paper identifies existing research gaps and proposes new directions for implementing VR in the conservation of Hue's interior heritage.

#### 1.2.1. Lack of Research on VR Applications in the Conservation of Indochinese Heritage Interiors in Vietnam

According to the Ministry of Culture, Sports, and Tourism (2023), VR-related studies in Vietnam primarily focus on museum exhibitions and virtual tourism. Although major museums—such as the Vietnam National Museum of History, the Thang Long Imperial Citadel, and the Hue Imperial Citadel—have implemented heritage digitalization (BVHTTDL, 2022), there has been no in-depth research on reconstructing lost imperial interiors. Most studies remain limited to an architectural overview (Journal of Architecture, 2021) and lack comparative analysis of VR's impact on visitor experiences versus traditional tours. This study analyzes visitor experiences between physical and VR-based visits to assess the feasibility of VR projects in preserving interior heritage.

#### 1.2.2. Lack of Research on the Challenges of Implementing VR in Vietnam

The implementation of virtual reality (VR) technology in heritage conservation in Vietnam faces numerous challenges, including high investment costs, complex technology maintenance, a shortage of skilled professionals, and limited visitor acceptance. According to VR360 (n.d.), adopting VR technology requires significant financial resources for purchasing equipment, developing content, and maintaining systems, which can pose a major barrier to heritage conservation projects. Additionally, VR system maintenance is complex and demands continuous investment to ensure stable operation (VR360, n.d.). This study assesses the barriers to VR application in the Hue Imperial City and proposes solutions to make VR an effective tool in a sustainable heritage conservation strategy in Vietnam.

### 1.3. The Need for Research on the Effectiveness of VR in Hue's Heritage Conservation

Although VR has been successfully implemented in many international museums, Vietnam has yet to fully research and deploy this technology in Indochinese heritage conservation. Currently, there are no VR projects that have

accurately reconstructed the interior of the Hue Imperial City or evaluated the impact of VR on visitor perception. Challenges such as costs, workforce training, and technology maintenance have not been addressed in cultural tourism projects. This study examines the role of VR in heritage conservation and sustainable tourism development at the Hue Imperial City, comparing visitor satisfaction levels between VR experiences and traditional tours. Additionally, through expert interviews, the study proposes effective VR application solutions for the conservation of imperial interiors.

### 1.4. Research Objectives

This study has two main objectives:

– To explore visitors' perceptions of the VR experience in Hue and compare it with traditional sightseeing experiences.

– To investigate VR implementation strategies in heritage conservation and education from an expert perspective.

By evaluating the challenges of VR implementation in Vietnam, the study aims to propose a model integrating VR with sustainable heritage conservation.

## II. MATERIALS AND METHODS (RESEARCH OVERVIEW)

### 2.1. Conceptual Foundation

#### 2.1.1. Concept of Virtual Reality (VR)

Virtual Reality (VR) is a technology that creates simulated 3D environments, allowing users to explore and interact with virtual spaces through devices such as VR headsets, headphones, and controllers. This technology provides an immersive experience using 3D visuals, surround sound, and motion simulation, effectively recreating realistic spaces (ELCOM, n.d.). Augmented Reality (AR), on the other hand, overlays digital content onto the real world, combining images, sounds, and data to enhance experiences. Unlike VR, which creates a fully virtual environment, AR operates through smartphones, AR glasses, and smart wearables. It is widely applied in gaming, shopping, training, and interior design.

Post-pandemic, VR and AR have introduced new approaches to heritage conservation. While VR recreates heritage sites in vivid detail, AR allows visitors to interact more intuitively, offering enriched and engaging experiences.

#### 2.1.3. Applications of VR in Heritage Conservation Worldwide

Although still emerging, the application of VR in cultural heritage conservation at various museums and historical sites worldwide has achieved significant success.

**The Forbidden City VR Project (China):** The project, titled *"The Forbidden City Across Time and Space,"* utilizes VR technology to reconstruct palace structures that were destroyed during the Ming and Qing dynasties. Thanks to this project, millions of visitors have had the opportunity to explore a virtual version of the Forbidden City, helping to alleviate the overwhelming number of physical visitors to the site. Since its inception in 2008, the virtual Forbidden City has not only allowed users to observe the architecture but also to interact with AI-generated characters representing different historical roles in the royal court. This enables visitors to gain a deeper understanding of the historical, cultural, and ceremonial contexts in an engaging and interactive manner.

**VR at the Louvre Museum (France):** The Louvre has implemented VR to create high-resolution 3D models of its precious artifacts, allowing visitors to explore iconic masterpieces and paintings in a virtual environment while learning about their historical and artistic backgrounds.

**The Mogao Caves VR Project (China):** The *Dunhuang Digital Heritage Museum* has been developing VR applications since the 1980s to reconstruct the ancient Buddhist cave paintings and statues as they existed over 120 years ago. By utilizing VR, the project preserves the murals and sculptures, preventing them from further deterioration. Visitors can immerse themselves in the cave environment, appreciating its architectural details, colorful sculptures, and wall paintings while interacting with historical figures.

The application of VR in heritage conservation not only accurately restores historical structures but also allows visitors to engage with heritage sites in an interactive manner. According to Chen (2023), VR has been successfully implemented in China to digitize ancient architecture, such as the Forbidden City, aiding in cultural heritage

preservation and promotion by providing immersive experiences that enhance public engagement. This suggests VR's potential for preserving the **Huế Imperial City**, where many interior structures have been lost and are difficult to reconstruct using traditional methods. Furthermore, "Integrating haptic feedback into VR experiences enables users to interact with cultural artifacts more realistically, enhancing engagement and understanding of cultural heritage." (Krumpen et al., 2021). Thus, applying VR to heritage conservation is not only a global trend but also a necessary solution to protect the **Huế Imperial City** from damage.

### 2.1.4. The Impact of Virtual Reality Technology on Tourists, Researchers, and Heritage Conservation

VR technology is driving significant changes across various fields, particularly in cultural heritage conservation. According to Rigby & Smith (2013), "Recent advances in AR research and the rapid adoption of today's powerful mobile devices mean that AR systems are a viable option for heritage organizations." VR helps recreate historical sites, supports education, and expands access to heritage for tourists and researchers. This study analyzes the impact of VR on visitors and researchers while assessing the opportunities and challenges of integrating VR into this field.

#### Applications of VR in cultural heritage preservation

VR recreates damaged or inaccessible cultural heritage, aiding in the preservation and storage of historical structures in virtual spaces without affecting real artifacts. This technology introduces a new tourism experience, allowing remote visits to heritage sites, particularly beneficial when access is restricted due to weather, security, or conservation concerns. According to LaViola et al. (2009), "The ability of immersive virtual reality to let users 'be inside' their data and interact directly through body-centric interaction accelerates the processes of perception and interpretation." VR contributes to sustainable heritage preservation by digitizing and reconstructing cultural structures lost due to natural disasters, war, or time, protecting cultural values without harming the original heritage. Additionally, VR expands accessibility and promotes cultural tourism, enabling visitors to explore heritage sites without being limited by geographical distance or site conditions. As noted by Rigby & Smith (2013), advances in AR technology and the rapid adoption of powerful mobile devices make VR a viable tool for heritage institutions. VR also enriches visitor experiences by allowing interaction with artifacts, historical spaces, and re-enacted past events. This technology supports individuals with disabilities in accessing cultural heritage more easily. Moreover, VR enhances learning experiences, helping students, researchers, and scholars gain deeper insights into cultural and historical contexts, fostering emotional engagement and increasing participation.

#### The Impact of VR on Tourists and Researchers

For researchers, VR enhances heritage research and preservation by enabling detailed analysis of architecture, art, and historical contexts without risking damage to real artifacts. It also fosters international collaboration, allowing experts from different countries to share resources and knowledge more efficiently. As Rigby & Smith (2013) note, "AR allows experts from different countries to share resources and collaborate on research more effectively."

Furthermore, VR contributes to the development of new analytical tools. Advanced 3D tools support heritage space research, offering deeper insights into how historical sites were constructed and used.

#### Challenges in Applying VR to Cultural Heritage Preservation

To maximize the benefits of VR, challenges related to cost, data, and accessibility must be addressed. Developing high-quality VR systems requires significant investment in hardware, software, and skilled personnel, especially when aiming for high-precision heritage reconstructions, which substantially increase costs. Accurate and complete data is crucial but often lacking, affecting the quality of VR simulations. As Koebel et al. (2020) note, cultural heritage data is often incomplete, imprecise, and heterogeneous, requiring careful processing to avoid misrepresenting the original information. Additionally, technological accessibility remains limited, particularly in remote or economically disadvantaged areas where VR devices are not widely available. High technical requirements and the need for realism in simulations present further obstacles. Inaccurate reconstructions can distort historical values, necessitating collaboration among historians, architects, and technology experts to ensure precision.

## 2.2. Research Methodology

This study employs a mixed-methods approach, integrating quantitative research (visitor surveys) and qualitative

research (expert interviews and VR document analysis) to ensure accuracy and objectivity in evaluating the application of VR in the preservation of Hue Imperial Heritage.

The data collection process involves three main methods:

**A. Visitor Survey**

This method assesses visitor satisfaction with VR experiences in Hue heritage preservation and compares real-life visits with VR experiences to determine whether VR enhances heritage awareness. The survey targets 122 visitors who experienced VR at the Hue Imperial City test zone, ranging in age from 18 to 65, ensuring insights from both younger and older audiences.

**Survey Content**

- Personal information (age, experience with VR).
- Heritage knowledge before and after the VR experience.
- Satisfaction level with the VR experience.
- Comparison between VR and real-life visits.

**Survey Methods:**

- Questionnaire distribution at the VR experience zone and real-life heritage sites.
- Online survey for visitors who used VR at home.

**Data Collection and Analysis Tools:**

- Survey questionnaires (Google Forms, paper-based surveys at the site).
- SPSS software for statistical analysis of satisfaction levels and comparison between groups.

**Key Research Questions:**

- Does VR help visitors better understand the architecture and history of Hue Imperial City?
- Do visitors find VR more engaging than real-life visits?

**B. Expert Interviews**

This method gathers expert opinions on the feasibility, benefits, and challenges of applying VR in Hue heritage preservation. It also analyzes technical, historical, and economic aspects of VR implementation. The study includes 12 experts from the following fields: 5 heritage conservation experts from the Hue Monuments Conservation Center, 3 VR technology experts from software development companies and university VR training programs, 2 historians and architects from universities specializing in heritage research, 2 tourism and heritage management experts from the cultural tourism sector.

**Interview Methodology:**

- Semi-structured interviews to facilitate open discussions and gain in-depth insights.
- Recording, note-taking, and content analysis for data synthesis.

**Key Interview Questions:**

**Feasibility of VR in heritage preservation**

- How can VR reconstruct lost structures such as Dien Kien Trung and Cung An Dinh?
- How accurate is VR in restoring colors, materials, and decorative patterns compared to real artifacts?

**Impact of VR on visitor experiences**

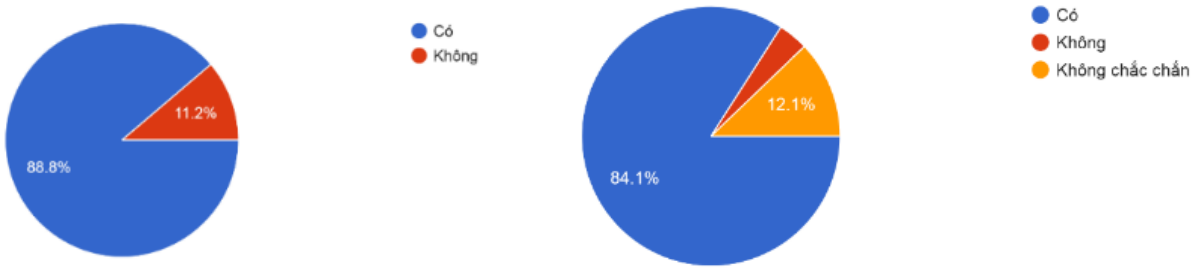
- Can VR completely replace real-life visits, or does it serve as a complementary tool?
- Does VR enhance visitors' understanding of Hue’s imperial culture?

**Challenges of implementing VR in Vietnam**

- What technological, financial, and social barriers hinder VR adoption?

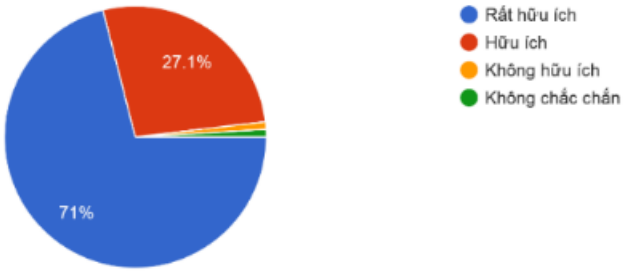
– How can VR be integrated into a long-term conservation strategy?

**Data Collection and Analysis Tools:**



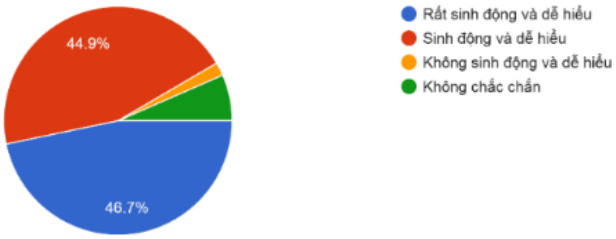
– Interview recordings, transcribed into text.

– Content analysis to extract key themes and insights.



## II. RESULTS AND DISCUSSION

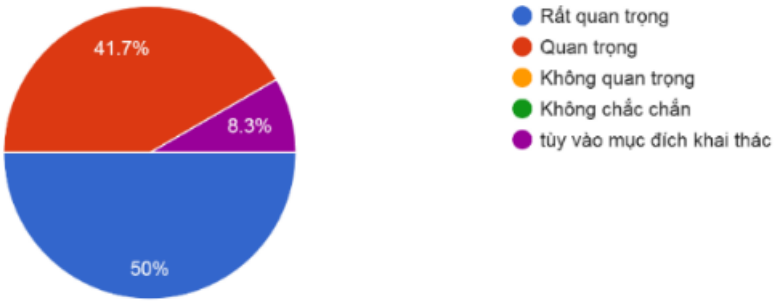
### 3.1. Research Findings:



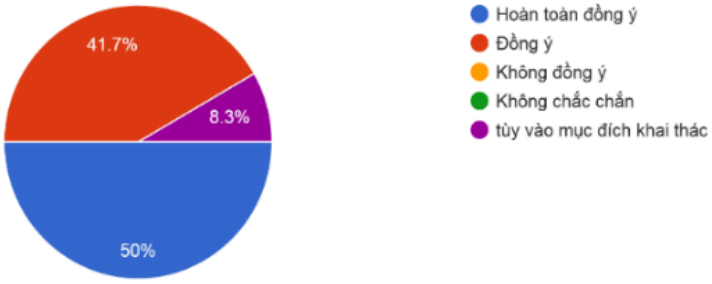
**Survey Data:** Results from the survey indicate that nearly **89%** of participants were already familiar with virtual reality, and **84%** expressed willingness to participate in VR-based tourism experiences.

*Survey chart of the number of people familiar with VR technology and the number of people willing to participate in the experience.*

*Survey chart evaluating the effectiveness of VR technology in visiting areas under restoration.*



*Survey chart evaluating whether VR can effectively recreate historical spaces and events, making them easier to understand and more engaging for visitors.*



Virtual reality (VR) technology is highly regarded for its ability to recreate heritage, especially in inaccessible or restoration sites. 98% of visitors agreed that VR enriches tourism experiences by providing an immersive way to visualize historical spaces and events. Additionally, 84% of visitors expressed willingness to participate in VR tours instead of directly interacting with artifacts, reducing stress on heritage sites and minimizing damage. VR has proven effective in heritage education, helping users gain deeper insights into history, architecture, and culture. It is particularly beneficial for international tourists and younger generations, who may have limited access to information about Hue. However, VR cannot completely replace real-life experiences, as 18% of visitors still prefer to engage with heritage using multiple senses, such as smell and touch. Studies by He et al. (2024) and Zhang et al. (2023) confirm that while VR enhances interaction and memory retention, it cannot fully replicate the emotional connection of on-site visits. This research supports that perspective, highlighting VR as an effective complementary tool rather than a complete substitute

for real-world experiences.

**Expert Interviews:** Interviews with heritage site managers, VR technology experts, and researchers in history, art, and architecture indicate that VR technology can be a **powerful tool** for heritage preservation and promotion.

*Survey chart on the role of VR technology in heritage preservation and promotion.*

*Survey chart on the necessity of a robust technological infrastructure for implementing VR programs.*

However, experts also highlighted challenges in implementation, including technological infrastructure, high initial investment costs, and workforce training requirements. Some specialists emphasized that VR should be integrated harmoniously with traditional conservation methods to preserve the authenticity of physical heritage. Additionally, community acceptance and government support policies play a crucial role in the successful adoption of VR. The study indicates that VR in Vietnam is still in its experimental phase and requires adjustments to align with local conditions.

### 3.2. Discussion

**Comparison with Previous Studies:**

The findings of this study align with previous research on the application of VR in heritage preservation. For instance, Rigby & Smith (2013) found that VR enhances public engagement in understanding cultural heritage. Other studies have also indicated that VR can provide a more immersive experience compared to traditional methods like guidebooks or documentaries. This research contributes to the field of VR applications in heritage preservation by specifically analyzing the case of Hue Imperial City, whereas many previous studies focused on museums or globally recognized heritage sites.

Rigby & Smith (2013) suggested that Augmented Reality (AR) is a more suitable solution for heritage conservation since it integrates digital content with the real world, allowing visitors to experience sites firsthand. However, this study highlights VR's advantage in reconstructing lost structures, a challenge for AR, which relies on existing physical objects as reference points. VR enables the recreation of destroyed interiors, such as Dien Kien Trung and Cung An Dinh, providing a more immersive and comprehensive experience than AR.

Zhang et al. (2023) emphasized that VR plays a crucial role in digitizing heritage for long-term preservation, though it cannot fully replace the authenticity of physical visits. Our study supports this argument, as 18% of surveyed visitors still prefer real-world experiences over VR. However, we expand on this perspective by proposing a hybrid model combining VR and physical visits to optimize the experience.

He et al. (2024) argued that VR's immersive quality should be combined with interactive storytelling to enhance engagement. Our survey results reinforce this idea, as many younger visitors expressed a preference for more dynamic

VR experiences rather than static 3D models. This suggests the need to improve VR by incorporating gamification and interactive storytelling elements to better attract and retain visitors.

**Key Differences of This Study**

This study focuses on Indochinese heritage in Vietnam, specifically in interior spaces, an area that has been underexplored in VR applications, whereas most previous research has focused on European and Chinese heritage. By integrating visitor and expert analysis, the study evaluates VR not only from a user experience perspective but also from the conservation and technological standpoint. Furthermore, it proposes a practical implementation model for Hue Imperial City, covering technological solutions, financial considerations, and the integration of VR in heritage management.

**New Directions from This Study**

Based on the above comparisons, VR shows great potential but cannot completely replace real-life experiences. Therefore, this study proposes a new approach: using VR to recreate lost spaces while still allowing for physical visits to protected areas, besides Developing more interactive VR experiences (immersive storytelling, video games) to attract visitors, especially the younger generation, and exploring the emotional impact of VR on visitors to optimize experience design. Therefore, this study not only consolidates previous findings but also expands the scope of VR applications in Vietnam heritage conservation, proposing a model that integrates VR with physical tours to enhance sustainable tourism.

### 3.3. Benefits of VR in Heritage Preservation

**The research highlights several key benefits of VR:**

**1. Enhancing Visitor Experience** : VR allows visitors to interact with heritage instead of just passively observing. It also reduces direct physical impact on fragile heritage sites. "The findings indicate that VR can reconstruct Hue Imperial City's architectural spaces with high detail. However, static VR models do not provide an engaging experience, especially for younger visitors. This aligns with He et al. (2024), who emphasized that incorporating immersive elements into VR enhances emotional engagement and historical perception, allowing users to not only see but also feel the cultural context as part of history."

**2**. **Expanding Accessibility**: VR allows people unable to visit heritage sites physically to explore and experience them in virtual spaces. "Research has shown that VR can help recreate heritage sites damaged by war or natural disasters. According to Staff Researcher (2022), VR has been used to restore heritage sites in conflict zones such as Ukraine, Iraq, and Syria, enabling digital preservation and vivid reconstructions of historical landmarks. This suggests that VR could also be applied to Hue Imperial City, where many interior structures were lost due to war and time. Our findings indicate that VR not only digitizes architecture but also accurately recreates cultural spaces, enhancing experiences for visitors and historians alike."

**3. Quality and Effectiveness of the VR Experience**: Survey results show that VR enhances cultural understanding, but some younger visitors fear it might diminish the authenticity of real-world experiences. Therefore, a balance between technology and historical integrity is needed to ensure interactivity while respecting physical heritage. Visitors suggested improving VR quality by increasing realism, interactivity, and gamification elements. Infrastructure upgrades are also necessary, including better guidance, device maintenance, and battery life improvements. While VR is valuable for those unable to visit heritage sites, accurate simulation is crucial to prevent over-reliance on technology, ensuring an objective and balanced tourism experience.

**4**. **Sustainable Tourism Development Through VR**: Experts believe that VR reduces the impact of visitors on heritage sites while preserving fragile spaces and providing engaging experiences. However, for VR to be effective, it is necessary to: firstly, adjust conservation policies, secondly, improve image quality to meet user expectations, and finally: Stronger public awareness campaigns to increase accessibility

**3.4. Challenges in implementing VR in Hue Imperial CityDespite its advantages, VR technology faces several challenges:** Although VR technology offers many benefits, it still faces several challenges. First, the high investment cost includes the development of 3D models, software, equipment, and system maintenance. Vietnam also

lacks experts in VR for heritage conservation, requiring international collaboration and significant funding. Second, visitor accessibility remains limited, especially for the elderly or those unfamiliar with technology. Lastly, VR cannot completely replace real-life experiences; it should only be considered a supplementary tool to enhance awareness and interaction with heritage**.**

### 4.4. Proposed Solutions

VR technology contributes to heritage preservation and sustainable tourism development by reducing the negative impact of tourists, allowing virtual visits without affecting fragile sites. However, for VR to be truly effective, supportive policies, enhanced image quality, and strengthened communication efforts are necessary to increase accessibility. The implementation of VR requires interdisciplinary collaboration among historians, architects, and technology experts to ensure accuracy and effectiveness. At the same time, developing user-friendly VR platforms that are compatible with various devices—including PCs, VR headsets, and mobile phones—will help expand the visitor experience. Government investment and support from cultural organizations will be crucial in driving research and development efforts for VR applications in heritage conservation.

## IV. CONCLUSION

The study demonstrates that virtual reality (VR) technology plays a crucial role in preserving and promoting the cultural heritage of the Hue Imperial Citadel, particularly for structures featuring Indochinese architectural styles. VR not only enables an authentic and vivid reconstruction of heritage spaces but also minimizes the physical impact of visitors on valuable artifacts, contributing to the protection of historical sites from overexposure. The VR experience allows visitors to engage with and gain a deeper understanding of the history and culture of the Hue Imperial Citadel. According to surveys, 88% of visitors believe that VR enhances their awareness compared to traditional tours. Moreover, VR technology supports sustainable tourism development by dispersing visitor traffic, reducing pressure on heritage sites, and expanding remote access for individuals with geographical or time constraints. Despite its proven effectiveness, the VR model in Hue still requires improvements in image quality, sound, and interactivity to meet the increasing demands of visitors. Expanding the application of VR to different target groups, such as students, researchers, and scholars, as well as implementing it in other heritage sites, will further enhance the preservation of national cultural heritage. In summary, VR is not only a tool for heritage conservation but also a means to enrich tourism experiences and foster sustainable tourism models. With continued investment and interdisciplinary collaboration, VR is expected to remain an effective solution for safeguarding and promoting Vietnam's cultural heritage.

**ABTRACT**

Research discussing the impact of implementing Green Human Resource Management and tourists' environmentally friendly behavior at tourist destinations, especially in sustainable tourism, is limited. It is important to understand how to implement good Green Human Resource Management practices in tourism sector organizations. The findings show the importance of environmentally friendly behavior as implementing Green Human Resource Management can improve tourism management. The unique point of this research is that it develops a human resource readiness model to implement environmentally friendly behavior towards sustainable tourism. This resource readiness will be reflected in the GHRM model in supporting sustainable tourism. The results of this study present a Sustainable Green Tourism model that includes premises, implementation, and outcomes. These premises come from internal and external managers (environmental ethics and management commitment) which will lead to good GHRM implementation. This model will be the basis for implementing sustainable tourism and highlighting the destination image in human resource management practice based on literature review and also tourism management practice.

*Keywords*: “Green human resources”; “behavior”; “sustainable image”

## I. BACKDROP AND RESEARCH OBJECTIVES

Tourism is an important industry that can play a significant role in improving human well-being. Sustainable tourism, if well managed, can bring positive benefits. However, there is still a lack of understanding of sustainable tourism behavior. Research on the influence of policies and leadership on employees’ pro-environmental behavior can help shed light on this issue, especially in examining the relationship between pro-environmental human resource management (GHRM) and pro-environmental innovation activities (Ababneh, 2021; Darvishmotevali and Altinay, 2022a, 2022b; Gholamiet et al., 2016; Ribeiro et al., 2022).

In the context of increasing ecological damage caused by production processes, GHRM is necessary to mitigate these conditions. HRM aims to utilize, develop and study existing human and natural resources to manage them effectively, and green training and development emphasizes the practices implemented while managing this destination (Murni et al., 2023). Therefore, it is necessary to work and plan for training and development of employees towards green knowledge and competence.

This study aims to explore the role of green human resource management (GHRM) in promoting environmentally friendly behavior of employees in the tourism industry. The goal is to build a suitable GHRM model to contribute to the sustainable development of the tourism industry, while enhancing the image of the destination, minimizing negative impacts on the environment and preserving natural resources for the future.

## 2. OVERVIEW

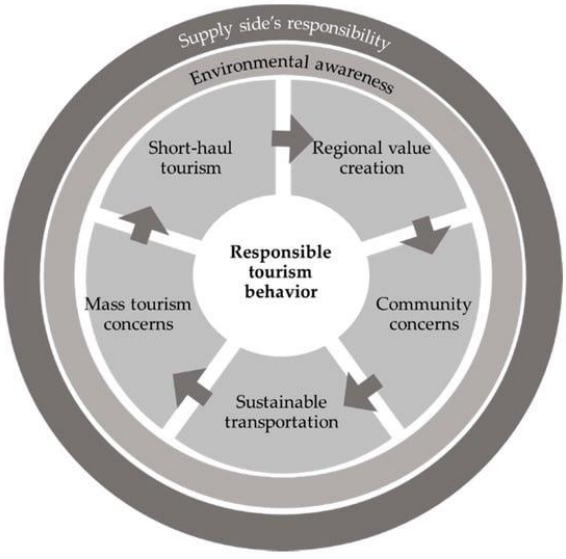
### 2.1. Green human resource management

Green human resource management (GHRM) is the application of human resource management practices to promote environmental protection and sustainability activities. GHRM focuses on how HR decisions affect the environment and society, including policies such as recruitment, training and development of employees with the aim of

raising environmental awareness, encouraging green behavior and creating a sustainable culture.

Research by Kumar and Jain (2013) shows that GHRM can improve business performance through raising environmental awareness. Research by Ren and Zhang (2018) shows that GHRM is not only related to policies but also affects organizational culture.

GHRM is not only a trend but also an important part of a business's sustainability management strategy. In the future, GHRM is expected to become an essential part of many businesses' strategies, and technological developments can also support GHRM initiatives.



**2.2. Customer behavior**

Customer behavior in tourism studies consumer actions and decisions regarding travel, from initial need recognition to post-trip evaluation. It encompasses the psychological, social, cultural, and personal factors influencing travel choices. Moutinho (2000) explored the travel decision process, outlining steps like destination information seeking and option evaluation. Cano and Lera-Lospez (2010) focused on travel consumption behavior, including how customers choose and use services, influenced by budget, time, and preferences. Kozak (2001) researched post-trip evaluation, noting its impact on future travel and recommendations. Understanding these behaviors is crucial for tourism businesses to develop effective marketing strategies, enhance customer experience, and achieve sustainable success.

**2.3. Friendly behavior**

Customer-friendly behavior in sustainable tourism involves tourists minimizing negative environmental, cultural, and social impacts. Han and Hwang (2015) define eco-friendly consumption as tourists actively choosing environmentally positive products and services, like green accommodations and transportation, and reducing waste. Gossling and Peeters (2007) add that this includes minimizing resource waste and using economical methods, like saving energy and water. Bramwell and Lane (2011) highlight the importance of stakeholder cooperation for effective green management policies.

Ultimately, this friendly customer behavior is crucial for sustainable tourism, limiting negative impacts, boosting the local economy, and encouraging environmentally and culturally friendly measures from businesses and destinations.

**Responsible tourist behavior triggered by the COVID-19 pandemic**

*Source: Exploring the Role of Tourists: Responsible Behavior Triggered by the COVID-19 Pandemic*

**2.4. Sustainable destination image**

Sustainable destination imagery is crucial for sustainable tourism. It encompasses not just natural beauty but also environmental protection, cultural respect, and community support. Gossling and Peeters (2007) highlight the importance of environmental commitment (resource conservation, pollution reduction, renewable energy) in attracting

eco-conscious travelers. Bramwell and Lane (2011) emphasize respecting and preserving local culture and heritage, attracting tourists seeking authentic experiences. Dwyer and Kim (2003) connect sustainable destinations with social responsibility, supporting the local economy and community development. A strong sustainable destination image, built authentically, attracts tourists and promotes sustainable development.

## III. RESEARCH METHODS

This qualitative study explores green HRM and environmentally friendly behavior in sustainable tourism. Informants include tourism actors in coastal areas, tourists, government agencies, community leaders, and destination management representatives, selected via snowball sampling. Data collection methods include focus group discussions, in-depth interviews, questionnaires, document analysis, and observation, supplemented by a literature review. Data trustworthiness was assessed through reliability (researcher involvement), validation (theory and prior research), consistency (monitoring, evaluation, and triangulation), and transferability.

The research comprised three stages: literature review on tourism behavior and green HRM to identify tourism management strategies; TLN with stakeholders to assess current management practices; and identification of internal/external factors and strategic alternatives for green HRM to promote environmentally friendly behavior. Results from documentary and field studies highlight the importance of organizational support and internal/external triggers in fostering eco-friendly behavior for sustainable tourism and destination image.

## IV. DISCUSSION

Based on several documentary studies and field studies conducted, it shows many factors that determine the creation of sustainable tourism and highlight the destination image. Eco-friendly behavior focuses not only on practice but also on how the organization supports it and also the triggers that come from outside and within the organization.

### 4.1. Premise of green human resource management

Environmental problems are moral problems stemming from human behavior, not just technical issues (Keraf, 2010). Human ethics and environmental ethics are crucial for environmentally friendly behavior, which aims to mitigate global warming and ensure survival. This behavior is linked to human resource management, especially in tourism where environmental sustainability is critical. Renwick et al. (2013) highlight challenges in green human resource management (GHRM) implementation, including management practices. Lack of environmental awareness in tourism management requires capacity building and green management understanding. Effective leadership is also essential for strategic decision-making in management policies (Susanto et al., 2021).

### 4.2. GHRM implementation process in HR practice

In the process, the implementation of the GHRM requires a commitment to management, in this case, to the tourism managers. Policies implemented by tourism managers or managers can be implemented in various forms that are integrated with environmental performance (Arulrajah et al., 2015). The study explains that there are a number of management practices such as training and development, and safety management. Some of these activities will support sustainable environmental activities.

Environmentally friendly practices and also an understanding of human capital practices. GHRM tends to maximize the use of all available resources to raise employee awareness in order to support an environmentally conscious sustainability attitude. The role of management in organizations plays an important role in environmental responsibility. GHRM also focuses employees on environmentally conscious behavior and also motivates employees and develops their sense of pride as part of the organization and green program.

### 4.3. Green training

Environmental HRM, including training on waste disposal, cleanliness, and digitalization, is crucial for implementing environmental management programs (Curkovic, 2003). A GHRM Implementation Model for Sustainable Tourism comprises premise, implementation, and outcomes. The premise includes internal and external factors like environmental ethics (Keraf, 2010; Renwick et al., 2013) and organizational commitment (Susanto, Kurniaty, et al., 2021; Susanto et al., 2021). In this study, tourism managers demonstrate environmental awareness through policies, technology use, and green infrastructure. Implementation involves increasing GHRM understanding

via training (Ahmad, 2015; Arulrajah et al., 2015; Farooq et al., 2022; Siyambalapitiya et al., 2018; Veerasamy et al., 2023; Zhang et al., 2019), focusing on IT skills for finance, marketing, and operations. The desired outcome is sustainable tourism (Budeanu et al., 2016; Farooq et al., 2022; Hardy et al., 2002; Higgins-Desbiolles, 2018; Lu and Nepal, 2009), leading to resource and image efficiency, and competitive advantage.

Hilton Hotels has implemented eco-friendly measures, such as hiring employees with sustainable experiences, eliminating plastic straws, switching to digital room key cards, and eliminating plastic water bottles from events. These efforts have significantly reduced plastic waste.

Six Senses Resorts & Spa regularly rewards employees for environmental initiatives, such as limiting plastic consumption or saving water.

Radisson Group has integrated environmental criteria into its performance evaluation, incentivizing employees through reward programs for those who actively contribute to green activities.

In short, GHRM is not just a disruptive movement but a long-term strategy to build a more sustainable tourism industry. Incorporating eco-friendly human resources policies from recruitment, training to incentives and evaluation will create positive changes not only for the business but also for the community and the environment.

Intrepid Travel: Intrepid Travel is a leading sustainable travel company in the world. The company has a number of green policies, such as a no-single-use plastic policy, a policy to support local communities, and a policy to protect wildlife. The company also hires and trains employees in sustainable travel.

### 4.4. The relationship between green management and green behavior in tourist destinations

The interplay between green management and green behavior is crucial for sustainable tourism. Green management (policies and measures to minimize tourism's environmental impact) provides the foundation for green behavior (environmentally beneficial actions by tourists and stakeholders). Gössling and Peeters (2007) highlight how green management (e.g., waste management, renewable energy) encourages tourist green behavior (e.g., recycling). Tourists' green behavior (e.g., water conservation, waste reduction) strengthens the destination's sustainable image, attracting environmentally conscious tourists (Brown and Morrison, 2003). This creates a reciprocal relationship: green management fosters green behavior, which in turn motivates better green management (Bramwell and Lane, 2011).

Challenges remain, including resource limitations and lack of awareness. Education, incentives, and government support are needed. Ultimately, a strong link between green management and green behavior is key to sustainable tourism, balancing economic development, environmental protection, and cultural respect.

### 4.5. Green behavior towards a sustainable image

Green tourist behavior is crucial for a sustainable destination image, contributing to sustainable tourism development. It encompasses actions like energy saving, waste reduction, using eco-friendly products, and respecting local culture, minimizing tourism's negative impact and supporting resource conservation. Han and Hwang (2015) show that environmentally friendly tourist behavior protects ecosystems and reduces waste, creating a sustainable image that attracts green-conscious travelers. A sustainable image builds trust, encouraging repeat visits and recommendations (Bramwell and Lane, 2011), and promoting a wider green tourism movement. Destination commitment, including supportive policies and amenities (recycling, renewable energy, resource guidelines), plus education and promotion of the sustainable image, are key to fostering green behavior (Gössling and Peeters, 2007).

## V. RESULTS

Green HRM positively impacts sustainable tourism management by fostering environmentally conscious behavior. A sustainable Green Tourism model involves premises (environmental ethics and management commitment from internal and external managers), implementation (environment-based policies and green training), and results (resource efficiency and improved image, leading to competitive advantage). Challenges to maintaining green behavior include lack of tourist awareness and inadequate infrastructure. Brown and Morrison (2003) highlight the need for collaboration between tourists, authorities, and businesses.

Green behavior is crucial for sustainable tourism development, minimizing negative impacts and encouraging green management. While promoting green behavior is challenging, stakeholder cooperation and effective management

can strengthen a destination's sustainable image.

## VI. VALUES

The significance of this study is to create a model of green tourism implementation in human resource management practice based on document evaluation and tourism management practice. With this model, it is hoped that sustainable tourism management can be achieved and a positive impact on the destination image.

Future research requires a more in-depth study to be able to find other determinants related to sustainable green tourism in human resource practice.

Research on customer green behaviour and sustainable tourism images is important, helping to promote sustainable tourism development and create long-term benefits for both local communities and visitors. In the context of climate change, environmental pollution, and the increase in the tourist population, it is essential to understand the green behavior of customers and build a sustainable image. Here are some theses on the significance and value of studying these aspects.

This study aims to model green tourism implementation in human resource management for sustainable tourism and positive destination image. Future research should explore other determinants of sustainable green tourism in HRM. Research on customer green behavior and sustainable tourism image is crucial for sustainable tourism development. Understanding traveler motivations and perceptions (Han & Hwang, 2015) allows destinations to tailor green programs. Encouraging green behavior (Gössling & Peeters, 2007) builds a broader movement for environmental protection. A sustainable image attracts eco-conscious customers (Dwyer & Kim, 2003) and fosters loyalty. Research informs sustainable tourism policies (Bramwell & Lane, 2011). It also supports local economies and preserves culture (Brown & Morrison, 2003). Ultimately, studying green behavior and sustainable image is essential for building sustainable destinations and a harmonious tourism future.

Research on green behavior of customers and sustainable images in tourism is of great significance in building sustainable destinations, developing green tourism strategies, and protecting the environment. These studies not only help create economic and cultural value, but also contribute to spreading awareness about the protection of local resources and culture. With the increase in tourist awareness and the importance of sustainable development, the research and application of green behavior factors and sustainable images will be the foundation for the tourism industry to move towards a more harmonious and sustainable future.

# POST-NET ZERO TOURISM AND HOSPITALITY: A BIBLIOMETRIC REVIEW OF EMPLOYEE ENGAGEMENT AND SUSTAINABILITY

**Ngo Thanh Phuong Quynh [1*], Nguyen Thi Kim Thoai [2]**

[1] Institute of International, Ho Chi Minh City University of Economics and Finance.
[2] Faculty of Tourism and Hospitality Management, Ho Chi Minh City University of Economics and Finance.
*Corresponding: quynhntp@uef.edu.vn

**ABSTRACT**

This bibliometric analysis explores the crucial role of employee engagement in driving sustainability within the tourism and hospitality industry (THI) in the context of emerging post-Net Zero trends. Addressing a significant research gap – the lack of bibliometric analysis exploring the understanding of specific contributions of employee engagement to sustainability within this evolving post-Net Zero THI landscape, this bibliometric analysis analyzed 11 high-quality (Q1, Q2) peer-reviewed articles, selected from 50 Scopus records using pre-defined criteria related to employee engagement and sustainability in the THI. Rigorous selection criteria focused on the intersection of employee engagement and sustainability in THI by adopting the PRISMA framework. Using bibliometric methods and Flourish visualization tools, the analysis explores key publication characteristics, including publication timeline, geographical distribution, major subject area, influential journals, dominant research type, and cited trends. Furthermore, the reviews identify prevalent terminology and research themes after analyzing author keywords, revealing key areas of focus within the field. This analysis highlights three prominent themes: Proactive Involvement, Behavioral Change, and a Culture of Sustainability. Notably, this study contributes by explicitly focusing on the post-Net Zero THI, providing a novel roadmap for future scholarly inquiry.

*Keywords*: “a bibliometric review”, “employee engagement”, “hospitality and tourism industry”, “post-Net Zero”, “sustainability”

## I. INTRODUCTION

### 1.1 Background of the study

Employee engagement has become a critical area of focus for both academics and practitioners in today's competitive business environment (Rai & Maheshwari, 2021). Employee engagement, characterized by dedication, vigor, and absorption (Schaufeli & Bakker, 2004), is vital in today's competitive business landscape. Engaged employees display energy, enthusiasm, and focus, driving superior performance and enhancing organizational productivity and profitability (Karatepe & Demir, 2014; Paek et al., 2015; Demerouti & Cropanzano, 2010). This connection is especially crucial in the tourism and hospitality industry (THI), where positive customer interactions are essential. Engaged employees are the critical link between organizations and customers, delivering quality service, fostering loyalty, and contributing to business success (Babakus et al., 2017). They are more likely to go the extra mile, anticipate customer needs, and create memorable experiences, vital for customer satisfaction and repeat business in this service-oriented sector. However, sustaining high engagement levels in the THI is challenging. Studies show that the leisure and hospitality sector often faces lower engagement compared to other industries due to cost-cutting measures, understaffing, demanding schedules, and long hours that affect well-being (Deery and Jago, 2015). These challenges have been further exacerbated by the COVID-19 pandemic, which introduced unprecedented levels of uncertainty, isolation, and job security (Liu et al., 2022; Jung et al., 2021), leading to widespread job losses and a decline in employee morale.

Beyond these existing pressure, the THI faces increasing scrutiny regarding its environmental impact and is under growing pressure to adopt sustainable practices in line with post-Net Zero commitments the tourism and hospitality sector alone is responsible for a significant portion of global greenhouse gas emissions (UNWTO&IFT, 2019), making the transition to Net-Zero crucial for mitigating climate change. The increasing global commitment to achieving net–zero emissions has placed unprecedented pressure on industries, including THI, to drastically reduce their carbon footprint. This commitment necessitates a fundamental shift in operational practices and the widespread adoption of

sustainable initiatives across all aspects of the industry. This context highlights the urgent need to find effective solutions to meet these ambitious targets. One such solution, and the central focus of this research, is understanding how employee engagement can foster sustainability initiatives within the THI. Recent research has begun to explore this intersection, recognizing that engaged employees are more likely to contribute to organizational sustainability efforts (Kim & Kim, 2020). Furthermore, engaged employees can act as powerful advocates for sustainability, influencing customer behavior and promoting eco-friendly choices (Lai et al., 2020). Therefore, enhancing employee engagement emerges as a potentially crucial strategy for THI to effectively implement and archive its Net-Zero commitments.

### 1.2 Research questions and objectives

While the literature on employee engagement in the HTI spans over two decades (Kusluvan et al., 2010), its intersection with sustainability, particularly within the specific context of the post–Net Zero transition, remains a relatively under-developing area. Most existing research focuses on general sustainability practices, or employee engagement before the Net Zero era, with limited attention to the unique challenges and opportunities presented by the post–net zero agenda, and in the THI context. This study addresses this critical gap by conducting the first bibliometric analysis to explore how employee engagement drives sustainability within the THI in the post–Net Zero era. This research aims to achieve the following objectives: (1) To identify key publication characteristics, including publication timeline, geographical distribution, major subject area, influential journals, dominant research type, and cited trends; (2) To analyze keywords and identify prevalent terminology and research themes within the literature; (3) To suggest avenues for future research based on the identified trends and gaps. To accomplish these objectives, the following are important questions that will be answered in this research: RQ1: What are publication characteristics (publication timeline, geographical distribution, major subject area, influential journals, dominant research type, cited trends)? RQ2: Which research theme is more popular by analyzing keywords? RQ3: What are suggested avenues for future research?

This bibliometric review, titled “Post Net Zero Tourism and Hospitality: A Bibliometric Review of employee engagement and Sustainability”, is structured into four parts: firstly, the research introduces the objectives and research questions; secondly, in the material and method part, the research background defines the employee engagement and its importance in driving sustainability initiatives in post-Net Zero THI context, and the research method; next, providing result and discussion to address the research questions; finally, it concludes the research. This structure provides a clear and organized framework for presenting the research process, findings, and implications. This study contributes by mapping the current state of research. Identifying key research themes, and providing a novel roadmap for future scholarly inquiry in this increasingly important area within the context of the post–Net Zero transition. It specifically addressed the need for research that explicitly links employee engagement to the achievement of Net – Zero targets in the THI.

## II. MATERIAL AND METHOD

### 2.1. Employee engagement definition

Employee engagement, encompassing emotional, cognitive, and behavioral commitment, reflects the level of enthusiasm, dedication, and connection employees have toward their work and organization (Macey, W. H., & Schneider, B., 2008). In the tourism and hospitality industry (THI), this translates to employees not only performing their core duties but also actively contributing to creating positive guest experiences and promoting organizational values, including sustainability (Karatepe & Demir, 2014). This multifaceted concept, often interlinked with job-specific engagement, integrates loyalty and proactive workplace behavior, making it a multifaceted concept central to productivity, innovation, and organizational success (Babakus et al., 2017). Factors, including job satisfaction, leadership, workplace environment, and recognition significantly influence employee engagement, creating a foundation for positive outcomes like higher performance, retention, and well-being (Kurnia & Hendriani, 2023; Chandani et al., 2016). Theoretical models such as the Job Demands-Resources framework and Social Exchange Theory further highlight how engagement develops and how it can be cultivated through balanced job demands, adequate resources, and reciprocal relationships (Sun & Bunchapattanasakda, 2019).

In the context of the post-Net Zero transition, employee engagement takes on an even greater significance in the

THI. As the industry strives to meet ambitious emissions reduction targets, engaging employees in sustainability initiatives becomes crucial. Employees are not just implementers of green policies; they are also key communicators and advocates for sustainable practices, both within the organization and with guests (Albrecht et al., 2020). Recent research suggests that employees who are engaged with sustainability initiatives demonstrate a higher level of environmental awareness and are more likely to adopt pro-environmental behaviors at work (Bissing – olson et al., 2013). This is particularly important in the post-net zero context, where innovation and adaptation are essential for implementing new technologies and practices aimed at reducing carbon emissions. Therefore, fostering employee engagement in sustainability becomes a key driver for THI to achieve its Net – Zero commitments.

**2.2 The importance of employee engagement in the tourism and hospitality field to develop sustainable initiatives effectively**

In the tourism and hospitality industry (THI), where success relies on employee performance, customer satisfaction, and adaptability, employee engagement plays a pivotal role in effectively developing and implementing sustainable initiatives. Engaged employees, characterized by enthusiasm, dedication, and a sense of ownership, are crucial for enhancing service quality, fostering positive guest experiences, and creating lasting impressions that contribute to customer loyalty and positive word-of-mouth (Rastogi & Karatepe, 2022). This positive impact on customer experience is a key driver of business success in THI. However, the benefits of employee engagement extend far beyond customer interactions. Engaged employees also drive critical organizational outcomes such as increased productivity, reduced employee turnover rate, and enhanced organizational resilience, creating a stable foundation upon which sustainability efforts can thrive (Rabiul et al., 2022). These employees are more likely to collaborate effectively with colleagues, generate innovative solutions, and readily adapt to the evolving demands of sustainable tourism practices, including the adoption of new technologies and procedures (Jyoti & Dimple, 2022).

The impact of engaged employees on sustainability is multifaceted. They actively advance eco-friendly practices within the organization, enthusiastically support social responsibility initiatives, and play a vital role in aligning daily operational activities with broader sustainability goals (Darban et al., 2022). This alignment not only reinforces long-term environmental and social responsibility but also fosters workforce well-being by creating a sense of purpose and shared value. Furthermore, it stimulates green creativity, encourages employees to develop innovative solutions to sustainability challenges, and promotes adaptive behavior, enabling the organization to respond effectively to changing environmental regulations and consumer preferences. Various organizational factors can further enhance employee engagement and align it with sustainability objectives. Effective leadership styles that prioritize sustainability, the implementation of green human resource management (HRM) practices that incentivize and reward sustainable behaviors, and the creation of inclusive and supportive workplace environments all contribute to fostering a culture of engagement and sustainability (Rabiul et al., 2022; Jyoti & Dimple, 2022).

Given the increasing reliance on proactive and committed employees for achieving sustainability in the THI, integrating robust engagement strategies is not merely beneficial but essential for success. Engaged employees are the driving force behind the adoption and consistent implementation of green practices, the innovative resolution of sustainability challenges, and the consistent demonstration of behaviors aligned with these crucial goals. Therefore, fostering a culture of employee engagement is a strategic imperative for THI organizations seeking to effectively develop and implement sustainable initiatives. Future research should continue to explore this critical relationship, focusing on developing practical strategies to maximize the positive influence of employee engagement on tangible sustainability outcomes within the THI.

**2.2. The Bibliometric Review Approach**

This study employs bibliometric analysis to evaluate the literature on employee engagement and its role in fostering sustainability within the tourism and hospitality industry, specifically in the post-net zero context. Bibliometric analysis, a quantitative method analyzing scholarly publications, provides a broad overview of a research field by examining patterns in publication data (Guiling et al., 2022; Martin-Del-rıo et al., 2021; Palacios et al., 2021). This approach identifies key research trends, influential authors, prominent themes, and collaborations. Scopus was chosen as the primary data source due to its extensive coverage of peer-reviewed literature, including a wider journal

range than Web of Science (WoS) while encompassing most WoS- indexed journals (Mongeon and Paul-Hus, 2016; Vieira & Gomes, 2009).

This bibliometric analysis provides insights into global research trends related to employee engagement and sustainability in the post–net Zero THI using key indicators: publication timeline, geographical distribution, influential journals, dominant research type, and cited trends. Additionally, the authors will analyze keywords and identify prevalent terminology and research themes within the literature. While SCOPUS analytical tools were used for initial data visualization (Choudhri et al., 2015), this study utilizes Flourish Studios for enhanced data visualization. Flourish provides interactive and dynamic visualizations, effectively communicating complex bibliometric data like publication trends, geographical distributions, and keyword co-occurrence networks. This enhances the accessibility and interpretability of findings, offering a clearer understanding of the research landscape. While tools like VOSviewer (van Eck & Waltman, 2010) and R's biblioshiny function (Aria and Cuccurullo, 2017) are valuable for science mapping, Flourish offers a more user-friendly and visually engaging way to present the descriptive bibliometric data relevant to this study's research questions. The final Scopus database search was conducted on December 25, 2024, as the primary data source. The query string focused on the main topic about employee engagement, so the string was: TITLE-ABS-KEY ("employee engagement" OR "work engagement" OR "staff engagement" OR "job engagement" OR "employee involvement" OR "staff participation" OR "employ* engagement" OR "team* engagement" OR "organization* engagement" OR "manager* engagement"). Focusing on publications from 2021 to the present to capture the influence of post-COP26 and Net Zero commitments, the string added AND ( "carbon emission" OR "carbon neutrality" OR "sustainable transition" OR "net-zero" ) AND PUBYEAR > 2021 AND PUBYEAR < 2025, and under the pressure of sustainability initiatives, which was AND ( "sustainab*" OR "sustainable practices" OR "environmental responsibility" OR "green practices" OR "CSR" OR "corporate social responsibility" OR "environmental sustainability" OR "environmental management" OR "sustainable development" ). Additionally, depending on the scenario in tourism and hospitality context, the query string added AND ( "tourism" OR "hospitality" OR "travel industry" OR "hotel" OR "hospitality industry" ). Ensuring that the analysis was more accurate, the paper only use English articles in published stage (e.g. DOCTYPE , "ar"; PUBSTAGE , "final"; LANGUAGE , "English"). The field search was "Economics, Econometrics and Finance", "Social Sciences", "Business, Management, and Accounting"; "Environmental Sciences", so the query string added LIMIT-TO ( SUBJAREA , "BUSI" ) OR LIMIT-TO ( SUBJAREA , "ECON" ) OR LIMIT-TO ( SUBJAREA , "SOCI" ) OR LIMIT-TO ( SUBJAREA , "ENVI"). Finally, 50 eligible records used for this bibliometric analysis. Table 1 provides detailed information about the search strategies and query strings.

**Table 1. Search strings for selected literature sources**

| Database | Article part searched | Field Search | Search string |
|---|---|---|---|
| SCOPUS | TITLE-ABS-KEY (Title – Abstract – Keywords) | Business, Management and Accounting; Social Sciences; Environmental Science; Economics, Econometrics and Finance | TITLE-ABS-KEY ("employee engagement" OR "work engagement" OR "staff engagement" OR "job engagement" OR "employee involvement" OR "staff participation" OR "employ* engagement" OR "team* engagement" OR "organization* engagement" OR "manager* engagement") AND ( "carbon emission" OR "carbon neutrality" OR "sustainable transition" OR "net-zero" ) AND ( "tourism" OR "hospitality" OR "travel industry" OR "hotel" OR "hospitality industry" ) AND ( "sustainab*" OR "sustainable practices" OR "environmental responsibility" OR "green practices" OR "CSR" OR "corporate social responsibility" OR "environmental sustainability" OR "environmental management" OR "sustainable development" ) AND PUBYEAR > 2021 AND PUBYEAR < 2025 AND ( LIMIT-TO ( PUBSTAGE , "final" ) ) AND ( LIMIT-TO ( DOCTYPE , "ar" ) ) AND ( LIMIT-TO ( SUBJAREA , "BUSI" ) OR LIMIT-TO ( SUBJAREA , "ECON" ) OR LIMIT-TO ( SUBJAREA , "SOCI" ) OR LIMIT-TO ( SUBJAREA , "ENVI" ) ) AND ( LIMIT-TO ( LANGUAGE , "English" ) ) |

*Source: Authors, 2024*

### 2.3. PRISMA framework

The PRISMA technique is a structured process for careful screening and inclusion of relevant studies from multiple databases and helps to achieve objectivity and reliability in the research (Hahn & Kuhnen, 2013). Adhering to PRISMA guidelines for article selection (Moher et al., 2009) to finalize the number of articles in the papers (Figure 1). The details of each stage of study selection are as follows:

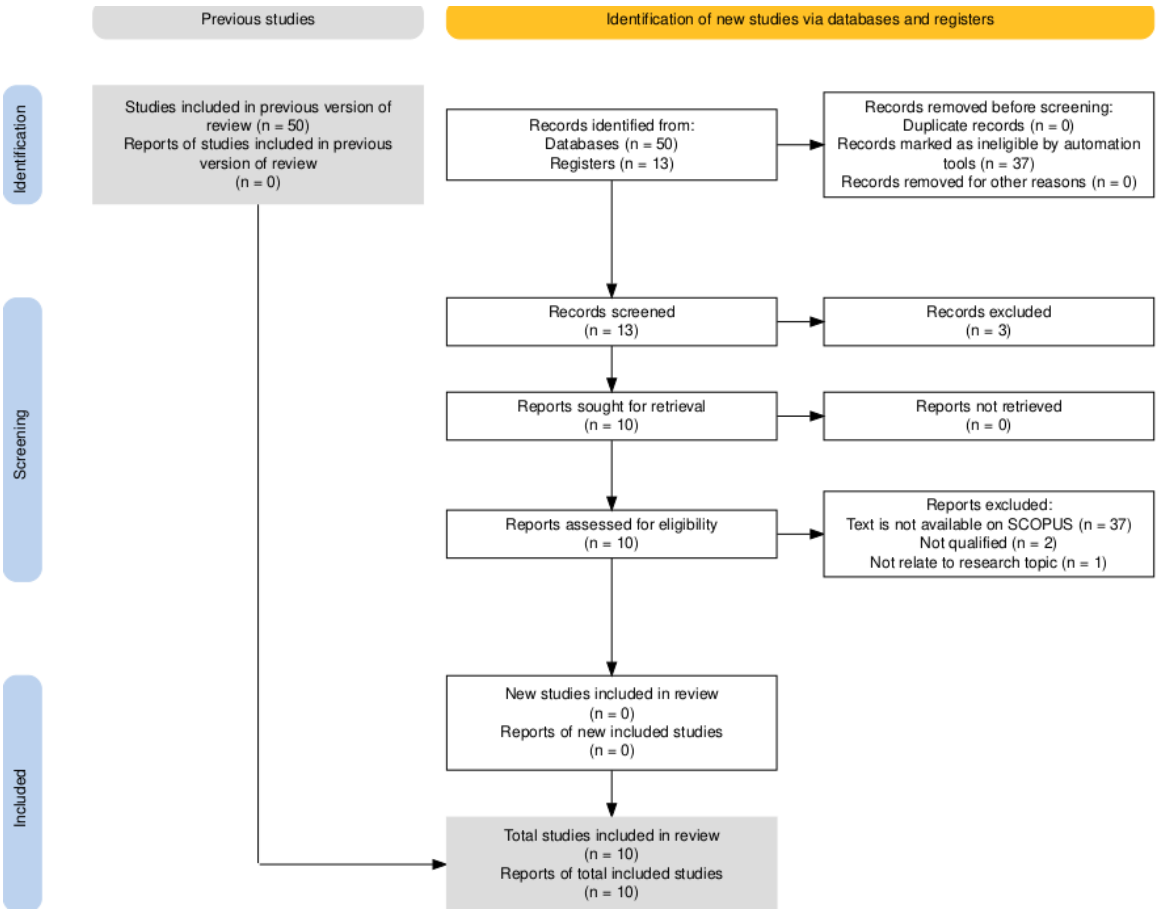

**Figure 1. PRISMA flow diagram steps**

*Source: Haddaway et al., 2022*

In Figure 1, at the identification phase, 50 articles were retrieved from Scopus, but only 13 papers can be downloaded from the database. The screening stage focused on relevance to the employee engagement impact on sustainability in the THI field, excluding articles not directly connected to the topic, only publish article were included, resulting in 12 articles. Eligibility assessment then focused on article quality, retaining only those published in Scopus-indexed journals and ranked as Q1 and Q2 to have the best quality, reducing the selection to 10 articles. Finally, a quality and content assessment of these remaining articles resulted in the final inclusion of 10 research articles for the review.

## III. RESULT AND DISCUSSION

### 3.1 (RQ1) What are publication characteristics (publication timeline, geographical distribution, major subject area, influential journals, dominant research type, cited trends)?

Figure 2 illustrates the years of publications from 2022 to 2024 in post- Net Zero era. The publication timeline experiences a clear upward trend over the three years provided (2022 – 2024). By 2022, there were 3 articles published. Then, the number of publication increased to 4 articles in 2023 and continuously developed to 6 documents in 2024. In general, this indicates a growing interest and increasing research activity in the topic area over this period. The substantial jump in publications from 2023 to 2024 suggest a recent surge in scholarly attention. However, the total number illustrated that this topic still under explored in THI context, this suggests a focus on research activity in the topic area.

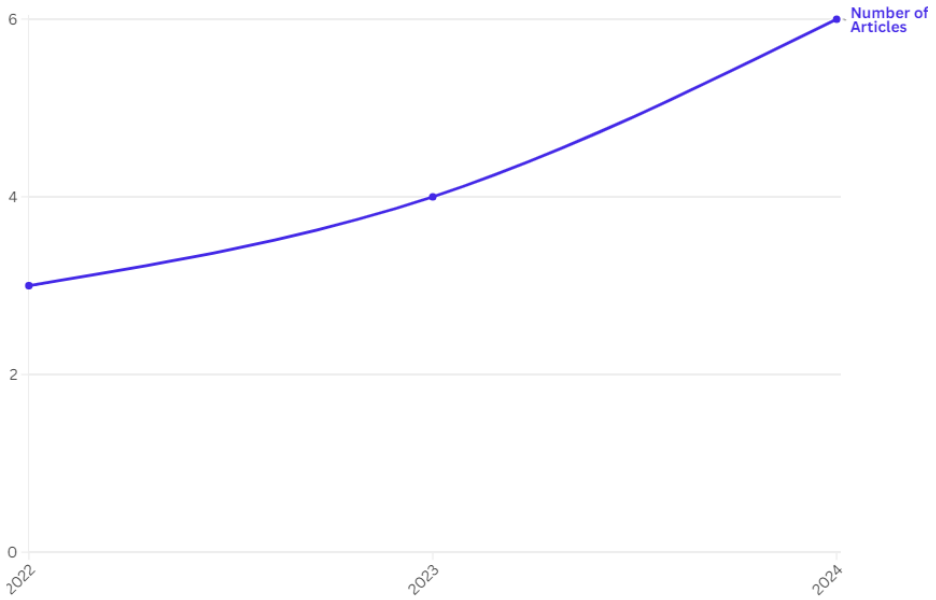

**Figure 2. Articles by year**

*Source:* SCOPUS database and Authors, 2024

In terms of geographical area of studies, the result shows (Figure 3) that most of the studies are conducted in Asia countries, including China (3), India (3), Malaysian (2), Pakistan (2), Saudi Arabia (2), United Arab Emirates (2), Indonesia (1), (arranging in orders); except United States (2) is from America, Ghana (1) is from Africa, and France (1) is from Europe.

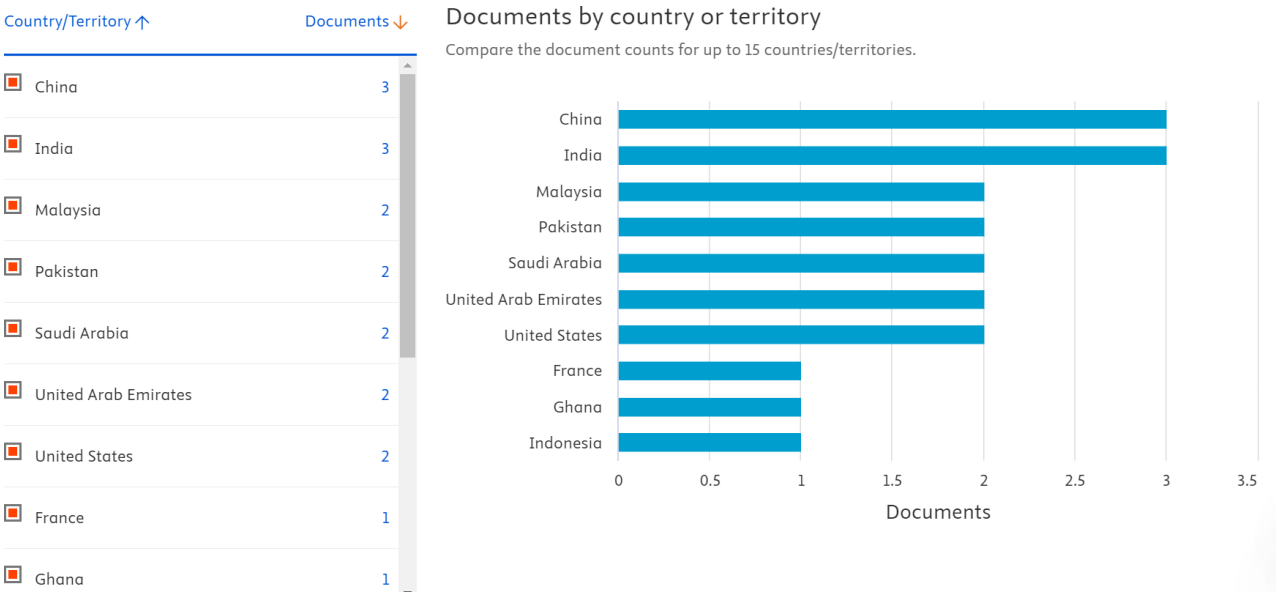

**Figure 3. Articles by country and territory**

*Source: SCOPUS database, 2024*

Figure 4 shows a breakdown of articles by subject area, presented in both a list view and a pie chart graph. Business, Management and Accounting, Environmental Science, and Social Sciences appear to be dominant fields related to research topic of this paper, each representing approximately 20.7% of the total articles. The remaining portions are distributed among various disciplines including Computer Science, Economics/ Econometrics/ Finance, Energy, Psychology (Each at 6.9%), Art and Humanities, Decision Science, and Medicine (each at 3.4%). The left side of the graph provided illustrates a numerical list indicating the number of articles in each category, with Business, Management and Accounting, Environmental Science, and Social Sciences each having 6 documents, while Computer Science, Economics/ Econometrics/ Finance, Energy, and Psychology have 2 articles each, and Art and Humanities has 1 article. This visualization effectively demonstrates the distribution of academic or research documents across different

disciplines.

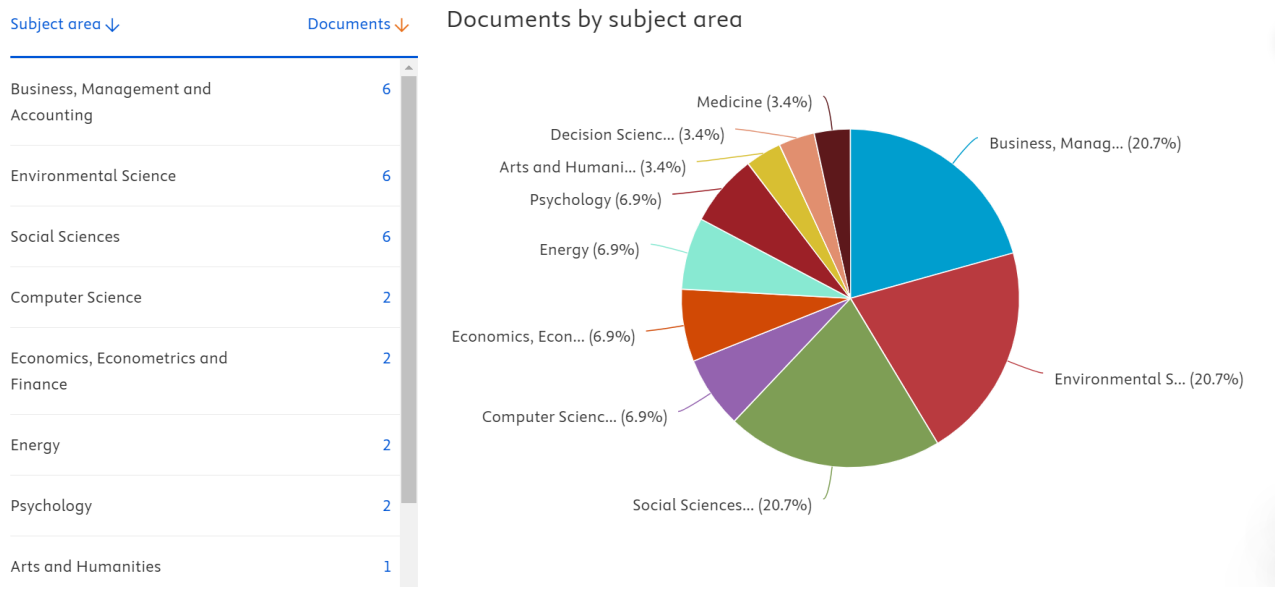

**Figure 4. Documents by subject area related to research topic**

*Source: SCOPUS database, 2024*

In term of the type of research articles. Each article has different journal published, including Qubahan Academic Journal, Current Research in Ecological and Social Psychology, Personnel Review, ABAC Journal, Frontiers in Environmental Science, Business Strategy and the Environment, International Journal of Environmental Research and Public Health, Journal of Knowledge Management, Sustainable Futures, International Journal of Renewable Energy Development. All of the papers are empirical studies.

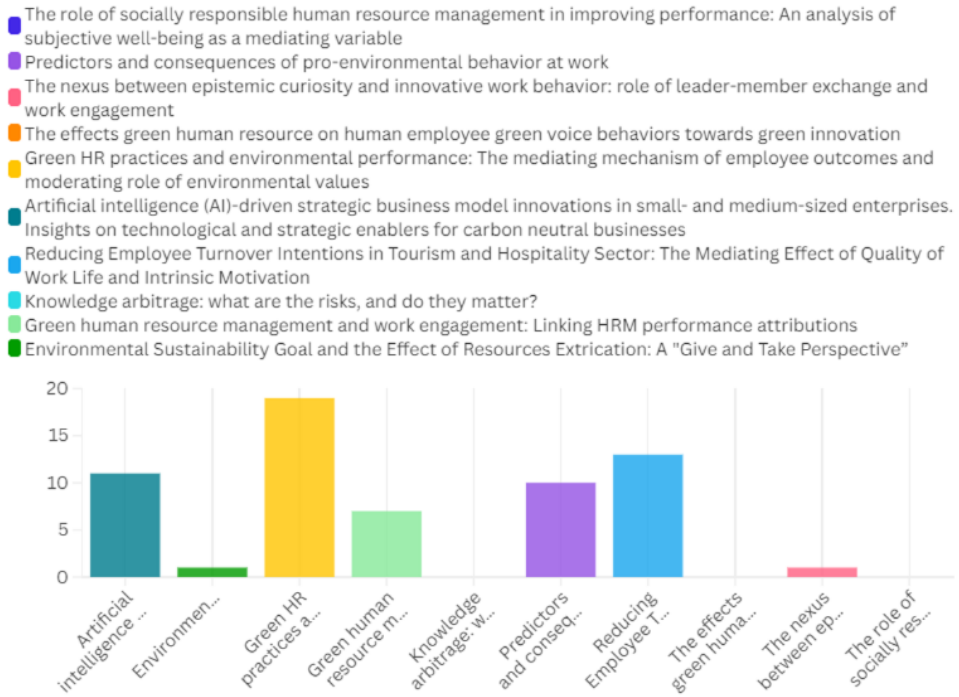

**Figure 5. The most cited paper *(Source:* Authors, 2024)**

The bar graph (Figure 5) illustrates the citation impact of various research themes related to employee engagement and sustainability. "Green HR practices and environmental performance: The mediating mechanism of employee outcomes and moderating role of environmental values" (Adeelet al., 2022) – stands out as the most highly cited paper, with approximately 19 citations. This suggests that research exploring the link between green HR practices, employee outcomes, and environmental performance, particularly considering the moderating influence of environmental values,

has garnered significant attention and influence within the field. The second popular article is "Reducing Employee Turnover Intentions in Tourism and Hospitality Sector: The Mediating Effect of Quality of Work Life and Intrinsic Motivation" (Xu et al., 2022), with around 13 citations, highlighting the importance of research on employee retention and the role of quality of work life in this context. Both of them meets the Q2 quality and is indexed in SCOPUS database. "Predictors and consequences of pro-environmental behavior at work" (Composto et al., 2023) also shows a considerable citation count of approximately 10, indicating a strong interest in understanding the factors that drive and result from pro-environmental actions in the workplace. The remaining themes, including other papers have received fewer citations, suggesting that these areas have either been less impactful or are relatively newer areas of research within the broader domain. "Knowledge arbitrage" appears to have the lowest set citation count in this dataset. Overall, the graph emphasizes the high impact of research focusing on green HR practices and their connection to environmental performance, as well as the important role of employee retention in the THI.

**3.2 (RQ2) Which research theme is more popular by analyzing keywords?**

Keyword analysis forms the foundation of robust literature reviews (Kabil et al., 2021). Several visualization methods exist for analyzing keywords, including frequency counts, word clouds, and thematic maps based on centrality and density. This study employs two of these techniques: thematic graph and word clouds.

Figure 6 as a world cloud highlighting key themes in employee engagement and sustainability within tourism and hospitality in the post-Net Zero era. Central terms like "Green", "innovation", "engagement", and "management" emphasize *Sustainability and Organizational Strategies* focusing. Other significant keywords include "knowledge", "performance", and "human resource", reflecting the importance of *HRM* in fostering the green practices. Words such as "environmental", "responsibility" and "citizenship" highlight *pro-environmental behaviors* and *corporate social responsibility*. Additionally, concepts like "curiosity", "exchange", and "strategic" suggest a focus on *innovation, leadership, and organizational learning*. Overall the word cloud underscores the integration of net zero strategy and innovation, employee engagement, and strategic sustainability.

**Figure 6. Keywords word cloud**

*Source: Authors, 2024*

Analyzing deeply into the research themes related to the topic to set a light into research trend, the results are shown in figure 7. This graph categorizes key themes related to employee engagement and sustainability in tourism and hospitality, emphasizing their role in the post Net Zero era. A central focus is on *"Employee engagement in Pro-environmental behaviors (PEB)"*, highlighting elements such as workplace engagement, organizational citizenship behavior of the environment, and perception of behavioral control, which collectively encourage employees to adopt environmentally responsible practices. Another significant theme involves *"Net zero strategies and de-carbonization"*, where concepts like carbon neutrality, strategic intent, green technology innovation, and AI-driven business model innovation underscore the importance of leveraging technology and strategic frameworks to reduce emissions. *"Green human resource management (GHRM) for sustainability"* plays a pivotal role in embedding sustainability within organizational culture, with practices such as green HR initiatives, training, and managerial support driving employee participation in green activities. The *"Sustainable operations and Performance"* theme contrasts green and non-green performance, emphasizing environmental management and corporate social responsibility (CSR) as vital elements for

archiving sustainability goals. *"Leadership for Sustainable engagement",* including leader-member exchange and fostering environmental values, are critical in shaping pro-sustainability attitudes and behaviors among employees. Furthermore, the *"Organizational Culture for sustainability"* is also another supportive theme to archive Net-Zero goals including organizations, environmental values. Overall, the graph underscores the integration of employee behaviors, organizational strategies, HR practices, and leadership as key drivers for achieving sustainability and de-carbonization in the post Net-Zero era.

The identified themes in the paper highlighting the unique interplay between sustainability and employee engagement in the THI. *"Employee engagement in Pro- environmental behaviors (PEB)"* theme is similar to findings in environmental psychology, where individual attitudes significantly influence PEB, the THI shows that engages employees are keys drivers of sustainable behaviors. *"Net zero strategies and de-carbonization"* theme focus on Net Zero strategies aligns with other industrial efforts in energy, transportation and construction sectors, which have been prioritizing carbon reduction through technological innovation and policy implementation. In the THI, *"Green human resource management (GHRM) for sustainability"* theme focuses on training, rewards, and recruitment to foster a culture of sustainability. It contrast with manufacturing or IT industries, where GRHM may prioritize more technical or process-driven sustainability improvements. The *"Sustainable operations and Performance"* theme resonates with lean management practices in other sectors, but in THI, sustainable operations also emphasize experiential aspects, such as eco-friendly guest experiences, which differ from the more product-centric focus in manufacturing. In THI, *"Leadership for Sustainable engagement"* theme shows that leaders with green transformational leadership play a crucial role in setting sustainability agendas and motivating staff to align with these goals to systemic change. This aligns with findings in healthcare and education sectors, but more challenging since in THI, leaders need to balance profitability with sustainability in a highly competitive market. *"Organizational Culture for sustainability"* in THI also uniquely integrates sustainability into daily operations and guest experiences, reflecting its service – oriented nature and urgent adaptation to post-Net Zero goals.

In general, keyword and thematic analyses reveal a strong focus on sustainability, organizational strategies, and HRM's role in driving green practices within the post- Net Zero THI. While the word cloud shows about word frequency, the graph illustrates the dominance research theme. Key themes highlights the importance of employee engagement in pro – environmental behaviors, net-zero strategies, GHRM, sustainable operations, organizational culture for sustainability, and leadership for sustainable engagement.

**Figure 7. Keywords arranged in research themes**

*Source: Authors, 2024*

### 3.3 (RQ3) What are suggest avenues for future research?

The thematic analysis of employee engagement and sustainability within THI in the post Net Zero context highlights several critical research areas. Longitudinal studies are essential to capture the dynamic interplay between

engagement levels and sustainability outcomes over time, particularly under the pressures of net-zero transitions (Pekaar & Demerouti, 2023). Broadening the research scope through diverse sampling across THI segments – hotels, restaurants, and tour operators – can enhance the generalizability of findings, while sector-specific studies address unique challenges such as energy efficiency in hotels or waste reduction in restaurants (Ababneh, 2021). Investigating the influence of digital tools and emerging technologies on employee engagement is also crucial, as these innovations can enhance operational efficiency and sustainability transparency (Albrecht et al., 2021). Cross-cultural research is needed to understand how cultural differences impact engagement in global sustainability initiatives, as frameworks like Hofstede's cultural dimensions and leadership strategies underscores the importance of cultural adaptation (Pansini et al., 2024). Additionally, the findings highlight that integrating sustainability into the THI requires a comprehensive approach involving employee engagement, leadership, and organizational culture. Practical implications include implementing policies that promote pro- environmental behaviors, Net Zero strategies, and GHRM. Future practices could involve sustainability – focused training, leadership roles dedicated to environmental goals, and embedding sustainability, aligning operational practices with long-term environmental objectives. This multifaceted approach is crucial for THI to effectively navigate and meet post – Net Zero sustainability targets. Finally, developing robust metrics to measure the tangible impacts of engagement of sustainability outcomes, potentially through composite indices or established environmental performance indicators, will enable more rigorous analysis. Together, these directions offer a roadmap to advance employee engagement's role in fostering THI sustainability in the post-Net Zero era.

## IV. CONCLUSION

This study highlights the critical role of achieving sustainability goals in THI, particularly in the post- Net Zero era. Employee engagement emerges as a key driver of pro-environmental behaviors and sustainable practices, suggesting that organizations can strategically leverage engagement to advance their sustainability agendas. By aligning workforce motivations with organizational environmental objectives, business can foster a culture of responsibility that supports long-temr ecological and operational goals.

*Theoretical and practical implications*

This study enriches the theoretical discourse by illustrating how employee engagement can shape sustainability outcomes, bridging the gap between organizational behavior and environmental management literature. Furthermore, it provides a foundation for developing initiatives, offering structured guidance for future scholarly exploration. In the tourism and hospitality context, the findings emphasize the importance of adopting strategic green human resource management (GHRM) practices that nurture employee engagement, thereby amplifying sustainability efforts. Additionally, policy-markers and industry leaders can draw on these insights to craft policies and initiatives that prioritize employee engagement as a core strategy for achieving sustainability objectives.

*Potential biases*

Bibliometric analysis can introduce biases such as publication bias, favoring well-known journals over emerging ones, and language bias, which limits the inclusion of non-english research. Database bias may result from relying on a single database, potentially omitting relevant studies from other sources. Citation bias also skews results toward highly cited works, potentially neglecting newer or less-cited but significant studies. These biases can lead to a narrowed view or the research landscape, overemphasizing dominant perspectives and possible overlooking innovative or diverse contributions.

*Challenges, Limitations and Future Research Directions*

However, the study acknowledges challenges, including limited access to comprehensive data. The reliance on existing literature may not fully capture the breadth of the topic, and the rapidly evolving nature of sustainability and employee engagement research poses difficulties in maintaining relevance.

The scope of this bibliometric review is constrained by its reliance on specific keywords and publication types, potentially excluding valuable contributions from grey literature or adjacent fields. It provides only a snapshot of current research, potentially missing evolving trends. Additionally, geographical biases in research distribution may overlook insights from underrepresented regions, limiting the global applicability of the findings.

To address the gaps, future research should prioritize longitudinal studies that explore the evolving dynamics of employee engagement and sustainability over time or the systematically qualitative approaches. Expanding the scope to sector- specific studies across diverse segments of the THI will also enhance the generalizability of findings. Further, exploring the role of digital tools and emerging technologies in fostering engagement can provide actionable insights for modern organizations. Cross – cultural studies are needed to understand the impact of cultural nuances on employee involvement in sustainability efforts Finally, the development of robust, quantifiable metrics to measure the outcomes of employee engagement I sustainability pratices will facilitate more rigorous and impactful research.

# VISUAL ARTS IN SUSTAINABLE TOURISM: INNOVATING AWARENESS OF GREEN LIVING AND ENVIRONMENTAL RESPONSIBILITY

**Nguyen Hong Duong**[1]

[1]Department of Informatics, Foreign Languages & Library,
Ho Chi Minh City University of of Fine Arts, Vietnam.
Corresponding: duongsculptor@hcmufa.edu.vn

**ABSTRACT**

In the context of globalization and digital transformation, visual arts—through their potent expressive power and profound emotional impact—are increasingly recognized as essential, innovative tools in promoting sustainable tourism and cultivating public awareness of green living. This paper examines the perspectives of multiple stakeholders, including local communities, tourism managers, environmental organizations, and artists, to illustrate how visual arts (e.g., public art, recycled sculptures, and interactive installations) effectively communicate sustainability messages and shape environmentally responsible behaviors. Drawing on mixed-methods research that includes in-depth interviews, surveys, and case analyses at sustainable destinations, the study underscores the synergy of visual arts with digital technologies such as Virtual Reality (VR) and Augmented Reality (AR). This synergy offers immersive, emotionally engaging experiences that significantly enhance tourist involvement and amplify creative outreach.

The findings demonstrate that visual arts transcend mere cultural expression, functioning as a robust strategy for establishing green artistic spaces, *galvanizing public awareness*, and nurturing a more harmonious, responsible relationship between humans and nature. Practical implications include recommendations for further investment in art-based attractions, guidance on effective management strategies to support these initiatives, and an outline of how policymakers and local tourism authorities can capitalize on the long-term impacts of visual art integration in Vietnam's tourism industry. The article concludes with suggestions for future research that bridges art, technology, environmental stewardship, and sustainable destination development.

*Key words:* "green living", "social responsibility", "sustainable tourism", "visual arts"

## I. INTRODUCTION

In the era of globalization and digital transformation, environmental issues and sustainable development have become central to global socio-economic policies. The tourism industry, with its rapid growth, significantly contributes to global GDP but also poses considerable negative impacts on the environment, including resource overexploitation, pollution, and increased waste generation. This has led to the emergence of the concept of "sustainable tourism," emphasizing the balance between economic development, natural resource conservation, and social responsibility.

According to the United Nations World Tourism Organization (UNWTO), "sustainable tourism is the development of tourism activities that meet the current needs of tourists and local communities while preserving natural, cultural, and ecological resources to meet future demands" (Nguyen Dinh Hoa, 2016). In Vietnam, the 2017 Tourism Law also defines sustainable tourism development as the harmonious integration of economic, social, and environmental factors, ensuring long-term benefits for both present and future generations. In 2023, the theme "Tourism and Green Investment" chosen for World Tourism Day highlighted the urgent need to increase investment in green tourism for sustainable development (Than Trong Ngoc Tram, 2024).

In this domain, visual arts play an essential role in raising environmental awareness and promoting sustainability. Artistic interventions—such as public sculptures made from recycled materials, interactive installations, and immersive exhibitions—provide a compelling medium to engage audiences emotionally and intellectually, fostering a deeper connection with nature (Guttentag, 2010). Research suggests that art is a powerful tool for shaping human perceptions and behaviors, as visual storytelling enables individuals to grasp complex ecological issues more intuitively than conventional environmental campaigns (Tran Thanh Nam, 2024).

Numerous studies have demonstrated the effectiveness of visual arts in sustainable tourism by influencing visitor

attitudes and encouraging eco-friendly actions. For example, large-scale environmental art installations—such as the "Washed Ashore" project in the United States—have successfully educated millions of tourists on ocean pollution through sculptures crafted from marine debris (Sovhyra, 2022). Similarly, public art initiatives in European eco-tourism destinations, like Denmark's ARKEN Museum's green art projects, have promoted responsible tourism by integrating artistic expressions with local environmental narratives (Omran et al., 2024).

Moreover, in the digital era, the fusion of visual arts with emerging technologies—such as Virtual Reality (VR) and Augmented Reality (AR)—has revolutionized how environmental messages are conveyed. Digital art experiences provide tourists with interactive and immersive encounters, significantly enhancing their engagement and retention of sustainability principles (Zulkifli et al., 2021). VR-based simulations, for instance, allow visitors to explore endangered ecosystems virtually, fostering empathy and inspiring conservation efforts. A study by Omran et al. (2024) confirmed that digital storytelling through AR applications strengthens tourists' emotional bonds with nature and positively influences their willingness to adopt green behaviors.

In light of these developments, an increasing body of literature emphasizes how the visual arts and associated digital technologies can create transformative experiences that deepen visitors' ecological awareness. In particular, large-scale exhibitions and installations have been shown to reshape local communities' perceptions of fragile environments, reduce ecological footprints through interactive education, and serve as a catalyst for sustainable lifestyle choices (**Sovhyra, 2022; Omran et al., 2024; Trần, 2024**). Moreover, the use of Virtual Reality and Augmented Reality can enhance these installations by offering immersive, emotionally resonant experiences that further encourage pro-environmental behavior (**Guttentag, 2010; Zulkifli et al., 2021**). These positive impacts underscore the need to examine how art- and technology-driven interventions can be systematically integrated into tourism strategies to foster long-term environmental stewardship.

In Vietnam, the application of visual arts combined with digital technology in sustainable tourism is gaining traction. Initiatives such as eco-art parks, immersive VR experiences in conservation areas, and recycled-material art festivals contribute not only to visitor engagement but also to long-term environmental awareness (Ngo Thanh Loan, 2023). Notably, projects at Flamingo Dai Lai Nature Reserve showcase how artistic and technological integration can create compelling narratives that educate the public on sustainability issues.

This article aims to explore the role of visual arts in fostering sustainable tourism, emphasizing how artistic interventions—both traditional and technology-enhanced—can be leveraged to communicate environmental messages, promote eco-conscious behaviors, and enhance visitor experiences. Additionally, it proposes strategic solutions to optimize the potential of visual arts in sustainable tourism planning and policy-making, contributing to the broader discourse on art, technology, and environmental stewardship in the digital age.

## II. MATERIAL AND METHODOLOGY

### 2.1. Theoretical Framework

Visual arts, encompassing sculpture, installations, murals, and public art, operate as potent instruments for social education and cultural expression. Their effectiveness lies in the ability to visually communicate multifaceted environmental messages (e.g., pollution, climate change, natural resource conservation) in a manner that is simultaneously accessible and impactful. Within the sustainable tourism model, visual arts thus serve a dual purpose:

– **Enriching Tourist Experiences**: By integrating cultural and aesthetic elements, visual artworks offer novel ways for tourists to engage with local environments.

– **Promoting Green Living**: Through the careful design of spaces and messages, visual art installations can elicit long-term behavioral shifts toward eco-friendly habits (Nguyen Dinh Hoa, 2016).

Such engagements are increasingly augmented by digital technologies, including VR and AR, which break geographical barriers and foster deeper interactions with artworks (Guttentag, 2010). This convergence of art and technology aligns with the overarching goal of sustainable tourism: balancing economic, social, and environmental priorities. Furthermore, recent meta-analyses indicate that art-focused interventions in tourism settings can boost visitors' willingness to participate in pro-environmental actions by up to 30% (Omran et al., 2024). Such findings underscore the critical role of visual arts not only in amplifying the appeal of tourist destinations but also in reinforcing

community-based sustainability initiatives.

### 2.2. Research Methodology

To gain a comprehensive understanding of the roles, impacts, and implications of visual arts in sustainable tourism, the study employed a mixed-methods design comprising both qualitative and quantitative approaches. Unlike single-method designs, mixed methods provide a more robust and nuanced examination by triangulating data from multiple sources.

#### 2.2.1. Qualitative Approach

– **Expert Interviews:** Ten in-depth, semi-structured interviews were conducted with artists, tourism managers, environmental officers, and local community representatives. The sample was purposive, focusing on individuals with direct experience or expertise in implementing visual art projects at tourist destinations.

– **Interview Guide:**

+ Perceptions of visual arts' contribution to raising environmental awareness

+ The integration of VR and AR technologies in art displays

+ Challenges in planning and managing art-based tourism products

+ Opportunities for further investment and policy support in Vietnam's tourism industry

– **Focus Groups with Local Stakeholders:** In addition to expert interviews, focus groups (6–8 participants each) were organized with local community members and small business owners operating in the vicinity of Flamingo Đại Lải Natural Resort and Hoàn Kiếm Lake. Discussions revolved around economic benefits, environmental concerns, and social acceptance of art-based tourism initiatives.

#### 2.2.2. Quantitative Approach

– **Survey Design and Data Collection**: A structured questionnaire was administered to 100 visitors at Flamingo Đại Lải and 100 visitors at Hoàn Kiếm Lake Walking Street. A convenience sampling method was adopted at each site, intercepting tourists who had just experienced art installations. The survey featured a 5-point Likert scale (1 = strongly disagree, 5 = strongly agree) to measure:

+ Visitor engagement and satisfaction (e.g., "The art installations enhanced my overall experience.")

+ Environmental awareness (e.g., "I have learned new information about the impacts of waste on the environment.")

+ Behavioral intentions (e.g., "I am more likely to reduce my use of single-use plastic after this visit.")

– **Sampling Rationale:** While convenience sampling can limit generalizability, the primary intent was to gather immediate perceptions of art experiences. The demographic profile varied from domestic visitors to international tourists, ensuring representation of multiple viewpoints.

– **Research Model and Statistical Analysis**: Following standard procedures, data were coded and analyzed using SPSS (version 26). The research model hypothesized:

+ Visual arts interventions → ↑Visitor engagement → ↑Environmental awareness → ↑Behavioral change

+ Integration of VR and AR → ↑Emotional resonance → ↑Long-term sustainable tourism practices Multiple regression analyses tested these pathways, while correlation analysis assessed the strength of relationships between key variables.

Multiple regression analyses tested these pathways, while correlation analysis assessed the strength of relationships between key variables. In addition, reliability of the survey instrument was confirmed with a Cronbach's Alpha of 0.87, indicating high internal consistency. ANOVA tests were also conducted to compare mean differences in environmental awareness between the two survey locations ($F = 6.45$, $p < .05$), and independent t-tests were used to determine whether visitors' engagement levels differed significantly by demographic groups ($t = 2.12$, $p < .05$). These statistical results reinforce the quantitative validity of the findings and highlight the importance of robust software-based (SPSS) analyses in drawing meaningful conclusions about the impact of visual arts on sustainable tourism.

**2.2.3. Study Process**

– **Pre-Field Research:**

+ Designing the semi-structured interview guide in consultation with tourism and environmental experts

+ Crafting the survey questionnaire, pilot-testing it with 10 participants

– **Data Collection:**

+ Conducting expert interviews and focus groups over two weeks

+ Distributing surveys at Flamingo Đại Lải (eco-resort environment) and Hoàn Kiếm Lake (urban public space)

– **Data Analysis**:

+ Thematic analysis for qualitative insights

+ Statistical tests (e.g., regression, correlation) for quantitative findings

– **Synthesis & Reporting:**

+ Integrating findings from both qualitative and quantitative strands

+ Highlighting implications for investment, management, and further research

**2.3. Case Study Selection**

Two destinations in Vietnam were chosen for their distinctive characteristics:

– **Flamingo Đại Lải Natural Resort (Vinh Phuc)**: An eco-resort recognized for innovative art installations crafted from recycled materials and the integration of VR.

– **Hoàn Kiếm Lake Walking Street (Hanoi)**: An urban public space frequently hosting street art projects and outdoor exhibitions to raise community awareness of environmental protection.

These cases were analyzed to illustrate various stakeholder perspectives, from local authorities and artists to visitors and environmental NGOs involved in planning or participating in the events.

**III. RESULT AND DISCUSSION**

**3.1. Key Findings from Mixed Methods**

**Qualitative Outcomes**

– **Multiple Stakeholder Perspectives:**

+ Artists: Highlighted the importance of creative autonomy and financial backing to produce large-scale installations that effectively communicate sustainability.

+ Tourism Managers: Emphasized the need for strategic planning and logistical support to integrate art installations seamlessly into existing tourism products.

+ Community Representatives: Expressed strong support when art-based initiatives lead to tangible economic benefits (e.g., local handicraft sales, increased foot traffic) while also voicing concerns about environmental preservation.

– **Challenges and Opportunities:** Stakeholders acknowledged significant logistical challenges (e.g., high production costs and maintenance), but also recognized opportunities to diversify tourism offerings, enhance destination branding, and bolster environmental education.

**Quantitative Outcomes**

– **Survey Findings:**

+ 72% of respondents reported adopting at least one new eco-friendly habit (reducing plastic use, saving energy) after visiting the art installations.

+ 80% stated they experienced a heightened sense of emotional involvement when VR or AR elements were integrated.

+ Regression analysis revealed that visitor engagement ($\beta = 0.45$, $p < .01$) and integration of VR/AR ($\beta = 0.38$, $p <$

.01) significantly predicted environmental awareness and behavioral change.

– **Additional Statistical Evidence:** The ANOVA results ($F = 6.45$, $p < .05$) showed a statistically significant difference in environmental awareness scores between visitors at Flamingo Đại Lải and Hoàn Kiếm Lake, suggesting that the context and style of art installations can influence the degree of eco-consciousness. Moreover, independent t-tests revealed that younger tourists (under 35) reported significantly higher interest in VR/AR-enhanced artworks ($t = 2.12$, $p < .05$), underlining the importance of demographic factors in shaping engagement levels.

– **Long-Term Sustainability Intentions:** A majority of survey participants expressed willingness to share their experiences on social media and revisit the sites, indicating a potential ripple effect for destination marketing and ongoing eco-conscious behaviors.

### 3.2. Case Study Analysis

Flamingo Đại Lải Natural Resort (Vinh Phuc, Vietnam)

Situated in a vast ecological space, Flamingo Đại Lải leverages visual art as a key tool for raising awareness about environmental protection. Iconic works like "The Sun Gate" and "Fragments from the Sky," along with hundreds of other sculptures crafted from recycled stone and steel, attract over 200,000 visitors annually. Surveys show that nearly all visitors deeply resonate with the message of nature conservation conveyed through these artworks.Interactive activities such as outdoor exhibitions and artistic experiences in nature foster a closer connection between visitors and the ecological space. Visitors at Flamingo Đại Lải Nature Reserve find that artworks made from recycled materials such as plastic, metal, and wood help them gain a deeper understanding of environmental pollution and the urgent need to mitigate its negative impacts.

**Fig 1 - Artistic installation in a natural setting: Flamingo Đại Lải Natural Resort.**

One of the most iconic pieces is **"The Sun Gate"** by Artist Nguyễn Hồng Dương, located near the lakeside.

**Fig 2 - Artwork: The Sun Gate. Artist: Nguyễn Hồng Dương. (Flamingo Contemporary Art Museum)**

In addition to their aesthetic appeal, green art spaces strongly convey messages of sustainability and environmental responsibility. Many visitors acknowledge gaining a deeper understanding of environmental pollution issues after participating in these immersive experiences. According to a report by Flamingo Group, more than 75% of visitors who attended the "Art in the Forest" program stated they were deeply inspired to take action to protect the environment.

The sculptures placed amidst the pine forests are not merely aesthetic symbols but also clear conveyors of messages about nature conservation and sustainable development. By integrating these artistic creations into natural settings, these spaces create a profound connection between visitors and the environment, emphasizing the importance of harmony with nature.

In addition, Flamingo Đại Lải employs VR technology to offer virtual tours of its art exhibits, expanding visitors' immersive experiences:

**Fig 3 - Visitors experiencing VR technology at Đại Lải Natural Resort.**

This digital integration not only elevates visitor engagement but also overcomes the spatial limitations of physically large sculptures, enabling tourists to explore intricate artistic details and underlying environmental messages more deeply.

**Hoàn Kiếm Lake Walking Street (Hanoi)**: Hoàn Kiếm Lake is a prime example of an urban public space regularly hosting cultural and artistic events. This public space has hosted numerous street art projects and outdoor exhibitions aimed at raising community awareness about environmental protection. The continuous cultural, artistic, and recreational activities along the walking street have transformed it into a vibrant cultural hub.

Notably, frequent art events draw significant participation from both residents and tourists. One standout event was the **Hanoi Creative Design Festival 2023**, held in the Hoàn Kiếm Lake walking area. The festival focused on promoting sustainable design ideas, showcasing many outdoor installations and sculptures made from recycled materials.

These aesthetically striking artworks delivered powerful messages about environmental protection and sustainable development, engaging the audience with their innovative design and inspiring a deeper sense of environmental responsibility.

**Fig 4 – "The Windows." Sculptors: Mai Thu Vân, Nguyễn Ngọc Lâm; Architect: Đỗ Anh Tuấn.**

Frequent cultural programs—like the Hanoi Creative Design Festival—showcase how sustainable design and visual arts can synergize to promote green living behaviors. According to official statistics, pedestrian flows can reach 15,000–20,000 visitors on weekends, illustrating the significant reach of such events. Observations and interviews indicate a positive shift in environmental awareness among both residents and international tourists.

**Fig 5 – "The Creative Gate." Hanoi Creative Design Festival 2022.**

Overall, Hoàn Kiếm Lake's vibrant art scene underscores the collective impact of combining cultural entertainment with environmental education in highly accessible public domains. The integration of art with public spaces at Hoàn Kiếm Lake Walking Street has contributed to a diverse cultural environment, promoting green living and fostering a sense of nature conservation among the public. Organizing cultural and artistic activities in this area provides entertainment for locals and visitors and serves as an effective medium for conveying environmental protection messages, helping to build community awareness about sustainable development. Visitors highly appreciate the artworks in this space for their clear communication of environmental conservation messages, creating a strong emotional connection between people and nature. Outdoor exhibitions and interactive art experiences in natural settings also foster a deeper bond with nature, inspiring responsibility and encouraging actions to protect ecosystems. This exemplifies the effective combination of visual arts and environmental education.

### 3.3. Impact of Visual Arts on Green Living Awareness

In Vietnam, visual arts have emerged as a powerful medium to raise community awareness about green living and environmental protection. Through their visual expressiveness and emotional impact, public art, sculptures, and installations have become effective channels for conveying environmental messages. These works draw attention and foster deeper understanding of the importance of preserving natural resources and minimizing negative environmental impacts.

**Raising Environmental Awareness:** Public art, particularly sculptures made from recycled materials, has significantly contributed to changing public perceptions. For instance, street art projects in Hanoi and Ho Chi Minh City have garnered substantial community interest, spreading awareness of environmental protection. A survey conducted at Flamingo Dai Lai Nature Reserve revealed that the majority of visitors found sculptures made from recycled plastics, metals, and wood helped them better understand issues like environmental pollution and the necessity of conserving natural resources. This underscores the vital role of art in communicating complex environmental messages in an accessible and visually engaging manner.

**Strong Emotional Impact and Perceptual Change:** These findings align with the research of Tran Thanh Nam (2024), which affirms that visual arts in public spaces create powerful interactions with audiences due to their large

scale and striking visual appeal. Far from being mere aesthetic expressions, these artworks act as potent educational tools, delivering sustainable development messages clearly and effectively. The integration of artistic forms with public spaces evokes emotions that change perceptions and inspire positive actions among viewers.

**Promoting Green Living Behavior:** Beyond raising awareness, visual arts stimulate behavioral changes. Visitors exposed to sculptures with environmental messages have reported modifying daily habits, such as reducing single-use plastics, increasing recycling efforts, and sorting waste. These actions demonstrate the practical effectiveness of visual arts in encouraging environmentally friendly lifestyles.

**Fig 5 & 6 - The structure designed by STUDIOKCA is made from 53,780 recycled plastic bottles—the number of bottles discarded in New York City in a single day. Visitors can step inside and admire the light and colors shining through these discarded plastic bottles.**

**Connection to the Sustainable Development Goals (SDGs):** Immediate changes in awareness and behavior resulting from visual arts have a contributing impact on achieving the Sustainable Development Goals (SDGs) in the long term. In particular, goals such as SDG 12 (Responsible Consumption and Production) and SDG 13 (Climate Action) are promoted through public awareness education and the dissemination of green living messages.

**The Importance of Emotional Connection:** One remarkable aspect of visual art is its ability to establish a strong emotional bond between humans and nature. Through highly symbolic works, visitors perceive nature as a resource and a part of the ecosystem that must be respected and protected. This connection lays the groundwork for sustainable actions, from changing personal habits to participating in community environmental protection efforts.

These impacts demonstrate the role of visual art as a versatile medium that combines aesthetic value with practical contributions to raising awareness, promoting green behavior, and creating sustainable community values. This underscores art as a cultural field and a strategic tool for education and social change in the context of global sustainable development.

### 3.4. Integrating Digital Technology for Enhanced Effectiveness

Both AR and VR are deployed to enrich the interpretive layers of art installations:

– **Augmented Reality (AR)**: Provides real-time information overlays about materials, creative processes, and sustainability tips, making the viewing experience highly interactive. AR helps visitors understand the origin of recycled materials, for instance, and fosters a sense of personal connection with environmental narratives (Sovhyra, 2022).

– **Virtual Reality (VR)**: Offers immersive simulations of pre- and post-pollution environments, amplifying the emotional urgency to adopt eco-friendly behaviors (Phạm Quốc Toàn, 2024). A robust correlation exists between the quality of VR experiences and long-term visitor satisfaction (Zulkifli et al., 2021), underscoring the need for high-quality, smoothly functioning VR interfaces.

### 3.5. Long-Term Impacts and Practical Implications

The integration of visual arts into sustainable tourism does more than enhance visitor experiences; it can also trigger profound and enduring transformations in the way individuals and communities perceive and interact with the environment. These long-term impacts manifest at both the individual and collective levels, directly shaping ecological awareness, social engagement, and local policymaking. Consequently, practical measures for investment and

management emerge as indispensable for maintaining and amplifying these positive effects in Vietnam and beyond.

### 3.5.1. Behavioral Change and Community Influence

#### Driving Individual Lifestyle Shifts

As evidenced by survey data, over 70% of visitors report renewed commitment to resource conservation after experiencing art installations. This behavioral change often translates into tangible actions, such as reduced use of single-use plastics, increased recycling, and a heightened sense of stewardship for local habitats. Research in environmental psychology indicates that *emotional resonance*—spurred by powerful visual cues and immersive experiences—forms a cornerstone for prompting these long-lasting lifestyle changes. Tourists who form strong emotional bonds with an artwork's message are more likely to carry that awareness back home, integrate eco-friendly habits into daily routines, and potentially influence friends and family to do the same.

#### Catalyzing Community-Level Outcomes

While initial change starts with the individual, repeated exposure to art-based sustainability messages fosters broader shifts in community culture. Projects featuring large-scale sculptures made from reclaimed materials, for example, can galvanize local residents into forming conservation groups, organizing grassroots recycling initiatives, or volunteering for ecosystem restoration activities. These collaborative efforts often extend the life cycle of an artwork beyond a tourist attraction, transforming it into a civic landmark that anchors community identity around sustainability. Communities with limited resources can also adapt and replicate art-based approaches—like small-scale recycled-art workshops or traveling pop-up installations—to enhance environmental awareness and rally support for local conservation efforts.

#### Reinforcing Sustainable Social Norms

Over time, the repeated visibility of public art and community-based events helps normalize eco-friendly behavior. In sociological terms, sustainability transitions require not only structural policies and financial incentives but also a redefinition of what is socially acceptable or desirable. Art projects, especially when endorsed by local institutions and integrated into popular public spaces, contribute to this redefinition. As more residents and visitors participate in eco-art festivals or interact with sculptures that illustrate pressing environmental issues, sustainability becomes embedded in everyday discourse. This peer-driven form of reinforcement makes green habits more likely to endure, even as economic and demographic changes occur.

### 3.5.2. Implications for Investment and Management in Vietnam

To ensure that visual arts can catalyze and sustain these transformative outcomes, strategic investments and sound management practices are essential. In the context of Vietnam—a nation that balances rapid tourism growth with the need for environmental preservation—the following considerations are paramount.

– **Infrastructure Investment**

+ **Artistic Infrastructure:** Governments and private investors should actively collaborate to establish dedicated art zones - such as sculpture parks, cultural corridors, or designated urban squares for art installations—that blend harmoniously with local landscapes. These zones not only draw tourists but also serve as loci for environmental education programs. Choosing locations with proximity to natural features (e.g., lakes, forests) can further reinforce ecological messages.

+ **Digital Upgrades:** Adequate funding and planning are required to integrate and maintain VR/AR systems, especially if installations are designed to be interactive or if curated exhibits rely on augmented digital content. Reliable internet coverage, user-friendly interfaces, and ongoing technical support are crucial. This is particularly true in rural or semi-urban areas of Vietnam, where digital infrastructure may still be developing.

– **Policy and Collaborative Management**

+ **Regulatory Frameworks**: Clear guidelines on waste management, public space usage, and environmental impact assessments ensure art installations contribute to, rather than detract from, sustainability. For instance, imposing requirements for recycled or locally sourced materials can reinforce the ecological messages communicated by the artworks themselves.

+ **Inter-agency Coordination**: Sustainable tourism initiatives often span different government bodies, including cultural affairs, tourism boards, and environmental agencies. Formalized coordination mechanisms—such as joint task forces or interdepartmental committees—help optimize resource allocation, avoid overlapping efforts, and maintain consistent messaging across public outreach campaigns.

+ **Stakeholder Engagement**: Meaningful engagement of local communities, youth groups, and artists from the earliest planning stages is pivotal. By encouraging shared ownership of these art projects, communities are more likely to invest in their long-term upkeep and champion sustainability beyond the initial launch. Early involvement also mitigates conflicts, ensures respect for local customs, and boosts acceptance among residents who might otherwise feel excluded.

– **Capacity Building and Community Education**

+ **Workshops and Training:** Tailored training programs enable local communities to see the economic potential in sustainable art tourism—such as micro-entrepreneurship linked to craft production or eco-friendly souvenirs—while also clarifying their environmental responsibilities. These sessions can be delivered through public-private partnerships or local NGOs already engaged in community development work.

+ **Educational Programs:** Strengthening collaboration with schools, colleges, and non-governmental organizations ensures art installations serve as real-world learning platforms, where students can experience hands-on demonstrations of environmental challenges and creative solutions. Such integration with formal curricula can institutionalize sustainability values in the next generation of citizens and local leaders.

– **Long-Term Research and Monitoring**

+ **Continuous Evaluation:** Implementing structured monitoring programs that track how visitor behaviors and attitudes evolve over time is invaluable for policymakers. Surveys, observation checklists, and digital analytics (e.g., VR interaction logs) can reveal patterns of engagement and identify areas for improvement.

+ **Academic-Industry Collaborations:** Encouraging partnerships between universities, research institutes, and the tourism sector can yield new insights into emerging digital art forms, measure visitor satisfaction, and quantify the return on investment for large-scale installations. The findings can then be fed back into policy design, guiding future investments and ensuring that resources are allocated to initiatives with the greatest sustainable impact.

**3.6. Sample of Secondary Data: Vietnam's International Tourist Arrivals (2018–2022)**

| Year | International Arrivals (Millions) | Annual Growth Rate (%) | Tourism Revenue (USD Billion) |
|---|---|---|---|
| 2018 | 15.5 | 19.9 | 26.8 |
| 2019 | 18.0 | 16.1 | 32.8 |
| 2020 | 3.8 | –78.8 | 8.4 |
| 2021 | 0.157 | –95.9 | 0.4 |
| 2022 | 3.66 (est.) | +2236 (vs. 2021) | 8.7 (est.) |

*Source: General Statistics Office of Vietnam, VNAT Reports, 2023*

Although international arrivals dropped sharply due to global events (COVID-19), domestic tourism recovery has been robust. These data highlight the opportunity to reinvigorate tourism through sustainable and art-centered strategies that meet evolving demands for both environmental responsibility and innovative visitor experiences.

## IV. CONCLUSION

This study underscores how visual arts, enriched by emerging technologies like VR/AR, function as a catalyst for fostering green living habits and elevating environmental consciousness within the tourism sector. Integrating stakeholder perspectives reveals that art-based interventions contribute not only to visitor satisfaction and destination competitiveness but also to long-term sustainability goals—changing daily habits, mobilizing local communities, and offering a robust platform for environmental education.

Key findings from the mixed-methods analysis validate the proposed research model, in which strong visitor engagement and emotional resonance drive heightened environmental awareness and meaningful behavior change. Moreover, ANOVA and t-test results confirm significant differences in eco-consciousness and engagement among

different demographic segments and tourism settings, further illustrating the model's relevance across diverse contexts.

From a practical standpoint, the research highlights a pressing need for further investment in art infrastructure, managerial expertise in art-based tourism, and cross-sectoral collaborations that align cultural expression with eco-conscious principles. Local and international policymakers can harness these insights to design comprehensive guidelines that streamline funding, regulatory frameworks, and management strategies supportive of art-centered sustainable tourism. In Vietnam, incorporating visual arts into local planning documents, providing incentives for creative projects, and systematically monitoring environmental impacts can significantly amplify the transformative potential of these initiatives.

The managerial implications extend to developing "smart tourism" platforms that integrate real-time visitor data, AR/VR enhancements, and collaborative engagement with local stakeholders. By leveraging these tools, tourism planners and community leaders can optimize resource allocation, personalize visitor experiences, and strengthen environmental stewardship. This approach not only enhances the short-term appeal of tourist sites but also contributes to sustainable destination management in the long run.

Future Research Directions

– **Longitudinal Studies**: More in-depth, long-term studies are necessary to examine whether the behavioral changes prompted by art installations persist.

– **Technology Innovations**: Investigations into AI-driven art could reveal novel ways to broaden accessibility and enhance visitor engagement.

– **Comparative Analyses**: Cross-cultural studies contrasting Vietnam's experience with that of other Southeast Asian nations could enrich the global dialogue on art's role in promoting environmental responsibility.

In sum, visual arts are not mere decorative tools; they form powerful and versatile instruments in the mission toward sustainable tourism. By combining artistry, technological innovation, and strategic policy, Vietnam and other emerging markets can create visually compelling, eco-conscious travel experiences that leave enduring impacts on both local communities and international visitors.

**ABSTRACT**

This study investigates the impact of green finance (GF), green technology (GT), and innovation (IV) on the performance (TES) and competitiveness (CTI) of small- and medium-sized enterprises (SMEs) in Vietnam's tourism industry. Data were collected from 448 respondents through a survey questionnaire and analyzed using structural equation modelling. The analysis process involved testing the reliability, convergence, and divergence of the scales as well as evaluating the structural model to test the hypotheses. These results indicate that GF has a direct and positive effect on GT, IV, operational efficiency, and competitiveness. Furthermore, GT and i IV serve as significant intermediaries, reinforcing the relationship between GF and competitiveness. This study contributes a novel perspective by constructing an integrated model of GF, GT, IV, operational efficiency, and competitiveness, particularly in the context of tourism SMEs in Vietnam, a sector with substantial potential that faces numerous challenges related to sustainability and international competition. The research findings not only contribute to the theoretical foundation but also provide practical governance recommendations, such as promoting access to GF and investing in GT and IV to enhance competitiveness and sustainable development.

*Keywords*: "Small and medium-sized SMEs", "Sustainable development", "Green Finance – GF", Green Technology – GT", Innovation – IV", "Tourism Enterprise Efficiency – TES", "Vietnam's tourism industry

## I. INTRODUCTION

In the context of globalization and increasing environmental pressures, small- and medium-sized enterprises (SMEs) encounter challenges not only in maintaining operational efficiency, but also in their capacity to compete in the international market. The tourism industry, a significant sector of Vietnam's economy, must not only meet the escalating requirements of consumers, but also ensure adherence to sustainable criteria to adapt to current development trends. Thus, businesses seek innovative and environmentally sustainable solutions to maintain and enhance their competitive positions.

Green Finance is conceptualized as the mobilization of financial resources for sustainable projects, particularly environmentally sustainable economic activities. According to UNEP (2016), green finance encompasses financial products such as green bonds, green credits, and sustainable investment funds, which aim to support businesses in transforming their business models towards sustainability and minimizing negative environmental impacts. In the tourism industry, access to green finance plays a crucial role in investing in environmentally sustainable technology, developing green infrastructure, and improving resource-use efficiency (Zhang et al., 2021). Furthermore, Wang et al. (2022) demonstrate that tourism businesses with access to green finance often reduce operating costs, improve energy efficiency, and enhance competitiveness. However, the primary challenge for SMEs in the tourism industry is access to capital, owing to limitations in financial capacity, information, and stringent green finance standards (Nguyen & Pham, 2023).

Green Technology (GT) plays a significant role in minimizing the negative environmental impacts. According to the OECD (2017), green technology encompasses technical and technological solutions to optimize the use of natural resources, reduce greenhouse gas emissions, and improve operational efficiency. Hall et al. (2019) indicate that the application of green technology not only helps businesses comply with environmental policies but also enhances the experience of visitors and reduces operating costs. In the context of the increasing trend of sustainable tourism, the

application of green technology will confer a competitive advantage to businesses and create more favorable conditions for accessing green finance (Gössling & Scott, 2021).

Innovation (IV) is considered to be the primary driving force behind the development of SMEs in the tourism industry. According to Schumpeter (1934), innovation enables businesses to create new products, enhance operational processes, and improve service value, thus increasing their competitive advantage. In the tourism industry, innovation can be demonstrated through the application of digital technology, development of novel business models, and implementation of sustainable strategies to attract customers and optimize costs (Hjalager, 2010). Camison and Monfort-Mir (2012) indicated that tourism businesses that innovate in technology, business models, and marketing strategies tend to exhibit higher financial performance than traditional businesses. Notably, by combining innovation with green finance and technology, SMEs can utilize resources more effectively, enhance operational efficiency, and create sustainable value for customers (Bocken et al., 2014).

Consequently, green finance, technology, and innovation play crucial roles in the development of SMEs in the tourism industry. Green finance facilitates businesses' access to sustainable capital; green technology aids in reducing environmental impacts; and innovation serves as the key to enhancing competitiveness. Therefore, this study focuses on analyzing the relationship between green finance, green technology, innovation, and the performance of SMEs in the tourism industry. This study also aims to elucidate the intermediary role of green technology and innovation, contribute to the construction of a comprehensive theoretical model, and provide practical recommendations for businesses and policymakers.

## II. MATERIAL AND METHOD

### 2.1. Related concepts

**Green finance** is an innovative concept aligned with the financial industry's responsibility to address contemporary major challenges in a manner that ensures the creation of business and social value without environmental detriment (Thomson 2021). Green finance serves as a mechanism to increase the level of financial flows (banking, microcredit, insurance, and investment) from the public, private, and non-profit sectors to promote sustainable development priorities (Desalegn & Tangl, 2022). Consequently, green finance functions as an instrument for achieving development goals that consider green growth. Green finance also contributes to mitigating and building resilience to the adverse impacts of climate change. According to UNEP (2021), if the world aims to achieve its goals of climate change, biodiversity, and land degradation, it will require financing of $4.1 trillion by 2050.

**Green technology** refers to technologies developed with the objective of environmental protection and minimizing the negative impact of human activities on the ecosystem throughout production and use processes. Green technological solutions emphasize sustainability and address current needs without compromising the responsiveness of future generations. According to Zaid (2021), green technology has been extensively applied in fields such as energy, transportation, waste management, water and air purification.

**Green finance and technology are interrelated**; green finance provides the resources necessary for the development and deployment of green technologies. Conversely, the advancement of green technology can generate new investment opportunities, thereby promoting green finance. This synergy not only addresses environmental challenges, but also creates economic value for society (Thomson, 2021). Green finance and technology are critical factors for constructing a sustainable future (UNEP, 2021). Investing in green projects not only yields environmental benefits but also creates new economic opportunities, contributing to the sustainable development of society.

### 2.2. The context of GF affecting SMEs tourism enterprises in Vietnam

GF has emerged as a significant factor in promoting sustainable development of SMEs in Vietnam, particularly in the tourism industry, which is susceptible to environmental concerns. In the context of increasing demand to mitigate negative environmental impacts, GF not only provides capital for sustainable projects, but also assists businesses in enhancing their competitiveness through technological and innovative initiatives.

According to Chien et al. (2021), GF plays a crucial role in mitigating the financial barriers SMEs frequently encounter when implementing environmental projects. Specifically, for tourism businesses in Vietnam, access to GF facilitates the implementation of solutions to reduce emissions, utilize renewable energy, and improve resource

efficiency. Pu et al. (2021) emphasized that, in the context of the COVID-19 pandemic, GF has supported SMEs in improving their adaptability through investment in GT and innovative projects. Kumar et al. (2022) noted that the utilization of GF assists tourism businesses in optimizing operating costs and enhancing operational efficiency, which is particularly significant in the context of intense competition. GF promotes these businesses to establish a sustainable image, thereby attracting more customers and partners. Hu and Zhu (2023) further posited that, in the tourism industry in Vietnam, GF not only improves environmental performance but also enhances the competitiveness of businesses in the face of global market fluctuations.

Furthermore, as a key economic sector, the tourism industry in Vietnam is subject to considerable pressure from the international requirements for sustainable development. Sun et al. (2021) asserted that GF, in conjunction with GT, enables tourism businesses to not only meet international standards but also increase their competitive advantage in the global market. In conclusion, GF has established a robust financial foundation for SMEs in Vietnam's tourism industry, fostering sustainability and IV initiatives, thereby improving operational efficiency and competitiveness in an increasingly challenging business environment.

### 2.3. Research hypotheses

#### 2.3.1. Green finance

GF are defined as financial services that support sustainable economic practices, including investments, credit, insurance, and other financial instruments, to mitigate negative environmental impacts and promote climate protection initiatives. This encompasses efficient use of clean resources and technologies (Kumar et al. 2022). Zhang et al. (2021) further defined GF as a financial system that focuses on promoting sustainable investment, reducing environmental risks, and supporting projects for climate protection, energy conservation, and effective resource management. Additionally, the OECD (2017) emphasizes that GF is the integration of a traditional financial system with environmental objectives. It encompasses loans, equity investments, green bonds, and other financial products that are intended to finance projects or activities that benefit the environment. Pu et al. (2021) emphasized that innovative finance and technology adaptation play a crucial role in supporting the sustainability of SMEs through support from GF, particularly in challenging situations such as the COVID-19 pandemic. GF facilitates investment in clean technologies to minimize negative environmental impacts. Similarly, Kumar et al. (2022) assert that GF plays an essential role in promoting the development and application of green technologies, especially in textile and leather SMEs in Pakistan. According to Chien et al. (2021), GF not only helps reduce environmental barriers but also encourages IV through the provision of long-term capital and specialized financial solutions. Sun et al. (2021) demonstrated that GF supports the dissemination of advanced technology, thereby promoting IV in the tourism and hospitality industry in China. Kumar et al. (2024) also emphasized that GF contributes to improving the operational efficiency of tourism businesses through financing sustainable projects and energy optimization. Moreover, Hu and Zhu (2023) argued that GF not only improves environmental efficiency but also enhances the productivity and competitiveness of businesses in the tourism industry during the pandemic. Chien et al. (2021) and Kumar et al. (2024) both concur that GF helps SMEs reduce energy costs, improve operational efficiency, and build a sustainable image. Based on these studies, we propose the following hypotheses:

*H1: GF has a positive effect on GT.*

*H2: GF demonstrates a positive impact on IV*

*H3: GF exerts a positive effect on the performance of SMEs (TES)*

*H4: GF influences the competitiveness of SMEs (CTI)*

#### 2.3.2. Green Technology (GT)

Sun et al. (2021) define green technologies as technologies designed to mitigate environmental impact through the utilization of clean energy sources, resource recycling, and enhancement of energy efficiency. These technologies play a crucial role in the sustainable development of tourism and hospitality industries. According to a study by Kumar et al. (2024), GT encompasses technologies and methodologies that contribute to reducing the negative environmental impact of business operations, particularly in environmentally sensitive industries such as tourism. Hu and Zhu (2023) emphasized that GT is not solely an environmental protection solution, but also a factor that promotes innovation and

competitiveness of enterprises in the context of globalization and increasing environmental challenges. Sun et al. (2021) assert that the adoption and dissemination of GT not only improves environmental efficiency but also promotes innovation, especially in technology-dependent industries such as tourism and hospitality. GT is considered a catalyst for businesses to develop innovative solutions to achieve their sustainability goals. Similarly, Pu et al. (2021) argue that adaptation to modern technology, particularly GT, can enhance innovation capacity through the establishment of financial and supporting technology platforms. Kumar et al. (2022) further posit that the adoption of GT enables businesses to improve operational efficiency by optimizing resources and reducing environment-related costs, as evidenced by a study of textile and leather SMEs in Pakistan. Moreover, Hu and Zhu (2023) affirmed that GT improves the operational efficiency of tourism businesses by addressing the growing demand for minimizing environmental impact. Chien et al. (2021) emphasize the role of GT in enhancing the competitiveness of SMEs through reducing energy costs and building a sustainable corporate image, thereby attracting customers and business partners. Finally, Kumar et al. (2024) argue that GT not only provides a competitive advantage but also becomes an essential factor in enabling tourism SMEs to maintain and strengthen their position in the international market. Therefore, hypotheses H5, H6, and H7 were proposed.

*H5: GT has a positive impact on IV of tourism SMEs*

*H6: GT has a positive impact on the efficiency of tourism SMEs (TES)*

*H7: GT has a positive impact on the competitiveness of tourism SMEs (CTI)*

**2.3.3. Innovation (IV)**

According to a study by Sun et al. (2021), IV plays a crucial role in promoting sustainable development, particularly when organizations implement novel technologies and concepts to mitigate environmental impacts and enhance operational efficiency. Chien et al. (2021) define IV as the capacity of enterprises to transform ideas into practical solutions that benefit businesses, consumers, and society. This is especially significant in SMEs, where IV facilitates overcoming business and environmental obstacles. Pu et al. (2021) emphasized that IV is the outcome of applying modern technology and finance, enabling businesses to develop distinctive products and services, thereby enhancing their efficiency and competitive position. Pu et al. (2021) assert that IV plays a pivotal role in improving the sustainability and operational efficiency of SMEs. Research indicates that organizations adopting innovative ideas and processes can optimize resources and enhance performance, particularly in challenging contexts such as the COVID-19 pandemic. Concurring with this perspective, Chien et al. (2021) emphasize that IV assists SMEs in overcoming business barriers by applying novel solutions, thereby improving operational efficiency and minimizing costs. In the tourism and hospitality industry, Sun et al. (2021) posited that IV supports businesses in enhancing operational efficiency by upgrading products and services to better meet market demand. Kumar et al. (2024) stated that IV is a strategic factor that enables SMEs to improve their competitiveness. Innovative enterprises frequently offer products and services that are unique and differentiated and attract consumers. Furthermore, Chien et al. (2021) emphasized that IV not only optimizes processes but also cultivates a professional and sustainable corporate image, thereby enhancing competitiveness. Hu and Zhu (2023) also noted that in sensitive industries such as tourism, IV not only enhances adaptability to challenges but also creates a long-term competitive advantage. Therefore, we propose the following hypotheses:

*H8: IV has a positive impact on the efficiency of tourism SMEs (TES)*

*H9: IV has a positive impact on the competitiveness of tourism SMEs (CTI)*

**2.3.4. Small- and medium-sized business efficiencies**

Enterprises' operational efficiency is a core factor in improving competitiveness. Pu et al. (2021) asserted that when SMEs achieve high operational performance, they can optimize resources, increase productivity, and create additional value, thereby enhancing their competitiveness in the market. Concurring with this perspective, Chien et al. (2021) emphasized that the superior performance of SMEs in the tourism industry contributes to improved product and service quality, fostering customer trust and enhancing their competitive position. Hu and Zhu (2023) further affirmed that, in the tourism industry, operational efficiency not only minimizes costs but also facilitates flexibility in responding to market fluctuations, directly contributing to improved competitiveness. Sun et al. (2021) emphasize that business

efficiency supports process and service improvements, enabling businesses to create a distinctive advantage in the highly competitive environment of the tourism and hospitality industry. Therefore, we propose the following hypotheses:

*H10: The efficiency of tourism SMEs (TES) has a positive impact on the competitiveness of tourism SMEs (CTI)*

**2.3.5. The intermediary role of Green finance (GF) and Innovation (IV)**

GF enables businesses to invest in GT through loans, financial support, and environment-friendly financial products (Kumar et al. 2022). In turn, GT assists businesses in reducing energy costs, improving operational efficiency, and enhancing corporate image, thereby augmenting competitiveness (Sun et al., 2021). Hu and Zhu (2023) affirmed that GF support encourages the adoption of advanced technologies, contributing to improved enterprise competitiveness in the context of a volatile business environment. Chien et al. (2021) emphasized that GT not only aids businesses in achieving sustainability goals but also enhances their ability to meet market requirements, contributing to competitiveness.

GF plays a significant role in providing financial resources while simultaneously encouraging businesses to develop innovative solutions to enhance operational efficiency and minimize negative environmental impacts (Pu et al., 2021). IV not only enables businesses to create unique products and services but also optimizes operational processes, providing a competitive advantage in the market (Kumar et al., 2024). Sun et al. (2021) and Hu and Zhu (2023) emphasized that, in the tourism industry, IV is a key factor in helping businesses improve their adaptability and flexibility to market fluctuations, thereby enhancing competitiveness. Chien et al. (2021) also noted that IV driven by financial support not only improve operational performance but also help businesses strengthen their position in a highly competitive environment. Therefore, we propose the following hypotheses:

*H11. GT plays an intermediary role between GF and the CTI*

*H12: IV plays an intermediary role between GF and CTI*

**2.4. Proposed research model**

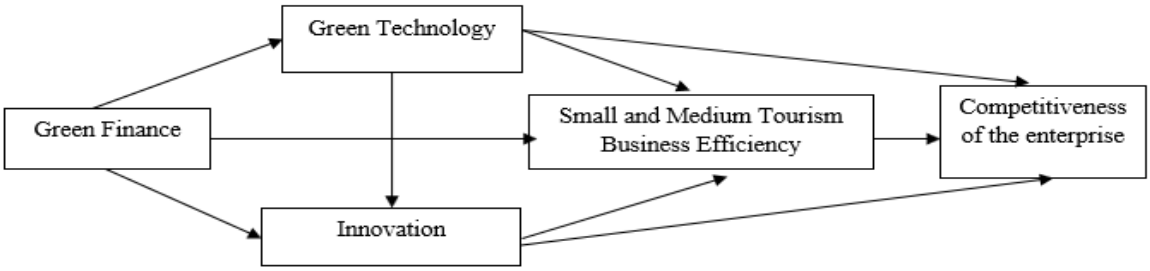

**Fig.1. Proposed research model**

## III. RESEARCH METHODS

This study employs a quantitative methodology utilizing a linear structure model (SEM) to investigate the relationship between green finance (GF), green technology (GT), innovation (IV), operational efficiency (TES), and competitiveness (CTI) of small and medium-sized enterprises in the tourism industry in Vietnam. The research process was conducted in specific stages: (1) Constructing a research model and hypothesis: The study identified the primary variables and their interrelationships based on previous studies; (2) survey design: the questionnaire was developed based on scales that have been validated in previous studies (Chien et al., 2021; Kumar et al., 2024; Sun et al., 2021) and adapted to the Vietnamese context. The scale utilizes a 5-point Likert scale, with 1 representing "completely disagree" and 5 for "completely agree"; (3) Sample selection: The convenience sampling method is applied to collect data from small and medium-sized enterprises operating in the tourism industry, including the travel industry, hotels, and related tourism services. The minimum sample size was determined according to Hair et al. (2017), which required at least 200 observations.

Data were collected through in-person and online surveys, from October to November 2024. Following data collection, the data were cleaned to eliminate invalid responses and were analyzed using SmartPLS 3.0. The SEM method was selected because of its capacity to simultaneously assess multiple relationships between potential variables

(Bagozzi & Yi, 2012) and to facilitate testing the mediating impact of green technology (GT) and innovation (IV) on the relationship between green finance (GF) and competitiveness (CTI). This method is consistent with studies in the field of management and finance that measure abstract concepts (Hair et al., 2019).

The reliability and validity evaluation process of the scale comprised the following steps: reliability assessment using Cronbach's alpha coefficient (>0.7) and composite reliability (CR > 0.7) to ensure internal consistency (Hair et al., 2019). Convergent validity was examined using average variance extracted (AVE > 0.5), and discriminant validity was examined using Fornell-Larcker and Heterotrait-Monotrait criteria (HTMT < 0.85) to confirm the discriminant scales (Fornell & Larcker, 1981). To ensure the validity and reliability of the collected data, we conducted tests such as Common Method Bias (CMB) testing using Variance Inflation Factor (VIF) testing, with a VIF value of < 5, to ensure that there was no excessive correlation between the observed variables (Kock, 2015). Data conformity testing using SEM was conducted by testing data distribution, multicollinearity, and outlier values to confirm that the data met the conditions of the SEM model. These validations play a crucial role in ensuring the reliability of the data and accuracy of the research results, establishing a robust foundation for subsequent analyses

## IV. RESULT AND DISCUSSION

### 4.1. Study sample and descriptive statistical results

Over a two-month period, from the beginning of July to the end of August 2024, 450 questionnaires were distributed to SMEs in Vietnam's tourism industry. The survey participants were companies operating in the fields of travel, accommodation, and related tourism services, with employees or managers directly involved in innovative activities, GF, and GT. The survey questions focused on aspects such as GF utilization, GT implementation, IV, operational efficiency, and business competitiveness.

To ensure the quality of the collected data, the questionnaire was designed using a 5-point Likert scale (1 = strongly disagree, 5 = strongly agree) and pilot-tested on a small group of businesses to assess its comprehensibility and practical applicability. Consequently, 448 valid responses were collected with a response rate of 99.5%. Responses that were incomplete or did not meet the specified criteria were excluded from analysis. With a minimum sample size exceeding 200, the collected data ensured reliability and suitability for SEM analyses (Hair et al., 2021). The research sample was obtained from businesses in major urban centers such as Hanoi, Da Nang, and Ho Chi Minh City, where the tourism industry is prominent. The participants were evenly distributed among the following industry groups: travel (30%), accommodation (40%), and related tourism services (30%).

The results of the demographic analysis revealed the following: gender distribution: 60% male and 40% female; educational attainment: 85% had a university degree or higher; age distribution: 78% fell within the 25-45 year age group; and work experience: 70% had five years or more of experience in the tourism industry. These data indicate that the research sample adequately and accurately reflects the characteristics of SMEs in Vietnam's tourism industry, ensuring representativeness and relevance to the research objectives.

### 4.2. Common Method Variance Bias Test (CMB)

The researcher examined variance inflation factor (VIF) values, as recommended by Kock (2015). The VIF values reported for the structures ranged from 1 to 1,661 (Table 1), which is substantially below the recommended threshold of 5, thus confirming the absence of common method bias (CMB).

**Table 1. Inner VIF Value**

| | CTI | GF | GT | IV | TESTS |
|---|---|---|---|---|---|
| **GT** | 0.323 | | | 0.356 | 0.383 |
| **GF** | | | 0.527 | 0.329 | 0.220 |
| **CTI** | | | | | |
| **IV** | 0.245 | | | | 0.374 |
| **TESTS** | 0.188 | | | | |

**Notes:** *Green technology – GT; Green finance – GF; Innovation – IV; Tourism efficiency of SMEs – TES; Competitiveness of the tourism industry - CTI*

*Source: Extracted from PLS*

### 4.3. Completion of scale evaluation

A partial least squares structure equation model (PLSSEM) was used to analyze the data. The factor load values (Table 2) were examined to assess the convergence reliability. All factor load values exceeded the recommended threshold of 0.7 (Hair et al. 2019). Furthermore, the Cronbach Alpha values were all above the minimum threshold of 0.7 and · 0.95 (Hair et al., 2019), confirming the internal consistency reliability of the structures (Table 3). These findings indicate that the model demonstrates high reliability and can be applied to subsequent analyses.

**Table 2. Factor Load Factor**

| Element | Factor | Factor loading | VIF |
|---|---|---|---|
| **Green finance – GF** | GF1 | 0.789 | 1,920 |
| | GF2 | 0.748 | 1.781 |
| | GF3 | 0.801 | 2.467 |
| | GF4 | 0.774 | 2.437 |
| | GF5 | 0.746 | 1.602 |
| **Green technology – GT** | GT1 | 0.817 | 1.556 |
| | GT2 | 0.850 | 1.796 |
| | GT3 | 0.857 | 1.753 |
| **Innovation – IV** | IV1 | 0.812 | 1.695 |
| | IV2 | 0.830 | 1.837 |
| | IV3 | 0.785 | 1.675 |
| | IV4 | 0.805 | 1.792 |
| **Tourism efficiency of SMEs – TES** | TES1 | 0.786 | 1.803 |
| | TES2 | 0.830 | 1.969 |
| | TES3 | 0.850 | 2.034 |
| | TES4 | 0.838 | 1.896 |
| **Competitiveness of the tourism industry – CTI** | CTI1 | 0.839 | 1.475 |
| | CTI2 | 0.756 | 1.346 |
| | CTI3 | 0.791 | 1.379 |

*Source: Extracted from PLS*

The scale test table shows that all the loading factors are greater than 0.7, proving that the observed variables have a strong correlation with the latent variable. Cronbach's Alpha and the Composite Reliability (CR) of the scales were both above 0.7, confirming the reliability of the scale. The median extract variance (AVE) all exceeded the threshold of 0.5, indicating that the scales had good convergence, reflecting the good interpretation of potential variables. Overall, the results of the confirmatory factor analysis showed that the scales have high reliability and good convergence, meet the requirements of quantitative research, and can be used for further research.

**Table 3. Reliability and value**

| | CA | CR | AVE | CTI | GF | GT | IV | TES |
|---|---|---|---|---|---|---|---|---|
| **GT** | 0.711 | 0.838 | 0.634 | 0.796 | | | | |
| **GF** | 0.831 | 0.880 | 0.596 | 0.645 | 0.772 | | | |
| **CTI** | 0.794 | 0.879 | 0.708 | 0.584 | 0.527 | 0.841 | | |
| **IV** | 0.823 | 0.883 | 0.653 | 0.546 | 0.517 | 0.530 | 0.808 | |
| **TES** | 0.846 | 0.896 | 0.683 | 0.582 | 0.615 | 0.697 | 0.690 | 0.826 |

**Note**: *CA = Cronbach's alpha; CR = Composite reliability; AVE = Average variance extracted*

### 4.4. Structural model

**Table 4. Impact Relationship Assessment**

| H | Relationship | Original Sample (O) | STDEV | t Statistics | P- Values |
|---|---|---|---|---|---|

| | | | | | |
|---|---|---|---|---|---|
| H1 | GF → GT | 0.527 | 0.074 | 11.126 | 0,000 |
| H2 | GF → IV | 0.517 | 0.051 | 10.143 | 0,000 |
| H3 | GF → TES | 0.615 | 0.035 | 17.685 | 0,000 |
| H4 | GF → CTI | 0.412 | 0.040 | 10.390 | 0,000 |
| H5 | GT → IV | 0.356 | 0.053 | 6.678 | 0,000 |
| H6 | GT → TES | 0.517 | 0.040 | 12.889 | 0,000 |
| H7 | GT → CTI | 0.508 | 0.049 | 10.380 | 0,000 |
| H8 | IV → TEST | 0.374 | 0.044 | 8.528 | 0,000 |
| H9 | IV → CTI | 0.315 | 0.066 | 4.769 | 0,000 |
| H10 | CTI → TES | 0.188 | 0.067 | 2.810 | 0,005 |
| H11 | GF → GT → CTI | 0.374 | 0.044 | 8.528 | 0.000 |
| H12 | GF → GF → CTI | 0.188 | 0.067 | 2.810 | 0.005 |

**Notes:** *Green technology – GT; Green finance – GF; Innovation – IV; Tourism efficiency of SMEs – TES; Competitiveness of the tourism industry - CTI*

*Source: Extracted from PLS*

The results of linear structure model (SEM) analysis demonstrated that all hypotheses from H1 to H10 exhibited high statistical significance ($p < 0.001$ or $p < 0.005$), confirming the positive relationship between the variables in the study model. Specifically, green finance (GF) exhibited a significant impact on green technology (GT) ($\beta = 0.527$, $t = 11.126$, $p = 0.000$) and innovation (IV) ($\beta = 0.517$, $t = 10.143$, $p = 0.000$), indicating that access to green finance facilitates SMEs' promotion of green technology adoption and innovation initiatives in business operations. Furthermore, green finance (GF) demonstrated a strong influence on enterprise performance (TES) ($\beta = 0.615$, $t = 17,685$, $p = 0.000$) and competitiveness (CTI) ($\beta = 0.412$, $t = 10,390$, $p = 0.000$), indicating that the mobilization and utilization of green capital not only optimizes operations but also enhances the competitiveness of enterprises in the market. Green technology (GT) also exhibited a significant impact on innovation (IV) ($\beta = 0.356$, $t = 6.678$, $p = 0.000$), enterprise performance (TES) ($\beta = 0.517$, $t = 12.889$, $p = 0.000$), and competitiveness (CTI) ($\beta = 0.508$, $t = 10.380$, $p = 0.000$). This indicates that the application of green technology not only improves operational efficiency but also enhances the competitive advantage of businesses. Moreover, innovation (IV) demonstrated a positive effect on enterprise performance (TES) ($\beta = 0.374$, $t = 8.528$, $p = 0.000$) and competitiveness (CTI) ($\beta = 0.315$, $t = 4.769$, $p = 0.000$), emphasizing the critical role of innovation in improving enterprises' operational efficiency and market position. Finally, enterprise performance (TES) exhibited a significant impact on competitiveness (CTI) ($\beta = 0.188$, $t = 2.810$, $p = 0.005$), indicating that enterprises with superior operational performance demonstrate higher competitiveness. The two indirect relationships (H11 and H12) also revealed a close connection between green finance, green technology, and competitiveness, with impact coefficient ($\beta$) values of 0.374 and 0.188, respectively.In summary, the analysis results affirm that green finance plays a central role in promoting green technology and innovation, thereby improving operational performance and enhancing the competitiveness of small and medium-sized enterprises in the tourism industry. The intermediate impacts of green technology and innovation were also confirmed, underscoring the importance of these factors in sustainable development strategies.

## V. CONCLUSION

### 5.1. Conclusion

This study elucidates the roles of GF, GT, and IV in enhancing the operational efficiency (TES) and competitiveness (CTI) of SMEs in the Vietnamese tourism industry. The findings indicate that GF not only exerts a direct and positive influence on GT, IV, operational efficiency, and competitiveness but also operates through the mediating roles of GT and IV. These mediators strengthen the relationship between green financing and business competitiveness. These findings are consistent with those of previous studies. Pu et al. (2021) demonstrate that GF promotes IV and improves the performance of SMEs in the context of crises such as the COVID-19 pandemic. Similarly, Chien et al. (2021) and Kumar et al. (2024) emphasized that GF not only enhances operational efficiency, but also augments competitiveness by supporting GT and IV initiatives. Sun et al. (2021) have also elucidated the role of

GT in optimizing processes and enhancing competitiveness in the tourism and hospitality industry. However, this study contributes novel insights by highlighting the significant mediating role of GT and IV, an aspect that has not been elucidated in previous studies, such as those by Kumar et al. (2022) and Hu and Zhu (2023). The results demonstrate that these mediating factors not only enhance the efficacy of GF, but also directly improve enterprises' competitiveness. This study developed a comprehensive model that integrates GF, GT, IV, operational efficiency, and competitiveness. This model provides a more holistic and in-depth perspective, focusing on SMEs in the tourism industry in Vietnam, a sector with substantial growth potential that faces numerous challenges related to sustainable development and international competition.

### 5.2. Administrative implications

***First, to strengthen access to GF,*** SMEs should proactively seek and utilize GF sources from financial institutions and support funds to invest in environmentally friendly projects, implement green technologies, and foster IV. To achieve this, businesses should develop a comprehensive business plan aligned with their development goals to persuade investors and GF partners. Furthermore, the government and financial institutions need to implement specific support policies, such as reducing interest rates and providing credit incentives for projects utilizing renewable energy, clean technology, and environmental protection. Concurrently, it is necessary to enhance communication to increase SMEs' awareness of the benefits and conditions of accessing GF, thus enabling businesses to comprehend the value and potential of applying GF for sustainable development.

***Second, Substantial investment in green technology (GT):*** businesses should prioritize investment in GT to optimize production processes, reduce energy costs, and enhance operational efficiency. This approach not only yields economic benefits but also contributes to improving the organization's image, thereby increasing trust from customers and partners. In addition, businesses should actively participate in programs and seminars on GT to acquire knowledge, understand new trends, and improve their technological capabilities. The government should provide financial support for GT research and application activities through investment funds and Technology IV incentive programs specifically tailored to SMEs. Moreover, it is essential to strengthen environmental protection policies and establish clear requirements for businesses to apply GT to minimize negative environmental impacts and promote sustainable development.

***Third, Promoting Innovation (IV):*** Organizations should prioritize the development of novel products and services to address customer needs more effectively, particularly in the context of intense competition in the tourism industry. It is essential to cultivate a culture of creativity within an organization by encouraging employees to propose innovative ideas and implement modern technology in operational processes. Furthermore, governmental bodies and supporting organizations should provide comprehensive training programs and in-depth support for IV in SMEs. The establishment of centers that support IV in the tourism industry, with a focus on product improvement and the enhancement of customer experience, is recommended.

***Fourth, Improve operational efficiency (TES):*** Organizations should leverage GF and GT to optimize processes, thereby minimizing costs and improving labor productivity. The utilization of Key Performance Indicators (KPIs) to measure and align business strategies is crucial to ensure the achievement of performance goals. It is necessary to develop policies that encourage businesses to apply advanced operational efficiency management tools such as digitalization and automation in the tourism industry.

***Fifth, Enhancing Competitiveness (CTI):*** GF, GT, and IV should be integrated to develop unique products and services that facilitate market differentiation. The promotion of a sustainable marketing strategy, emphasizing the organization's efforts in environmental protection and IV, is essential to attract customers and partners. Concurrently, increased investment in green infrastructure and support for businesses in the tourism industry to access resources and sustainable development networks are recommended. Establishing standards and regulations to support businesses in achieving sustainability certifications is crucial for enhancing competitiveness in international markets.

***Sixth, collaboration and experience sharing are encouraged.*** It is imperative to strengthen cooperation among businesses in the industry to share experiences in the application of GF, GT, and IV. It is advisable to form industry alliances in order to implement large-scale projects on green and sustainable technologies. Establishing connecting

platforms to promote cooperation among businesses, financial institutions, and GT providers is recommended. The organization of national and international forums is necessary to provide SMEs with opportunities to learn from successful businesses in sustainable development.

These implications not only contribute to the improvement of operational efficiency and competitiveness for businesses but also foster the sustainable development of the tourism industry in Vietnam.

# UNDERSTANDING INTERNATIONAL GUESTS' DECISION TO STAY AT GREEN HOTELS IN VIETNAM

**Huynh Thi Minh Chau[1]***

[1] School of Industrial Management, Ho Chi Minh City University of Technology.
*Corresponding: htmchau@hcmut.edu.vn

**ABSTRACT**

Global tourism has increasingly embraced sustainability, driven by the need to reduce environmental and community impacts, heightened awareness, and the growing demand for responsible travel options. This study aims to deepen the understanding of hotel guests' environmentally conscious behaviors by integrating the theory of planned behavior with the value-belief-norm theory of environmentalism into a unified framework. It offers insights into how guests make decisions regarding their intentions to stay at green hotels. The research comprises two phases: a qualitative study involving in-depth discussions with 10 experts to refine the scales, and a quantitative study surveying 550 international tourists staying at green hotels in Vietnam in 2024 to evaluate the theoretical model. The findings suggest that: (1) green attitudes, moral obligation, environmental concerns, egoistic values, biospheric values, and altruistic values are key factors influencing guests' intentions to stay; (2) guests' intentions significantly impact their final decision; and (3) green attitudes mediate the relationship between value components and guests' intentions to stay at green hotels. This study contributes to the growing body of literature on sustainable tourism by providing valuable insights into the factors that influence guests' decision in staying at green hotels, particularly within the context of Vietnam.

*Keywords:* "Environmentalism", "green hotel", "sustainable tourism".

## I. INTRODUCTION

In the Sustainable Travel Report (2023) which surveyed over 33,000 travelers worldwide, Booking.com found that a significant majority of travelers are seeking more sustainable ways to travel, with approximately 76% of respondents expressing a desire to travel sustainably in the next 12 months. Sustainability has thus become a central focus across various industries, including hospitality (Shen et al., 2020). The growing emphasis on sustainable development principles, combined with increasing pressure from media, governments, and consumers, is motivating many hotels to adopt environmentally friendly practices (Kapera, 2018).

Research has shown that the rapid expansion of the hotel sector significantly contributes to global environmental degradation, primarily due to high energy and water consumption for heating, cooling, and lighting, which adversely affects the environment. It is clear that failing to integrate sustainability and resource conservation into business strategies will threaten the industry's long-term viability, as environmental pollution undermines the foundation for future growth (Sarkar, 2013). Consequently, some hotels have proactively implemented environmental policies aimed at promoting conservation and enhancing human well-being (Abdel-Maksoud et al., 2016). The hotel industry has introduced a variety of sustainability initiatives, such as acquiring eco-label certifications, adopting sustainable business practices, and implementing environmental management systems (Leroux & Pupion, 2018). Hotels that implement sustainable initiatives gain two main benefits: improved resource efficiency and cost savings in energy and water usage, and positioning themselves as attractive options for eco-conscious travelers (Fukey & Issac, 2014).

Green hotels are environmentally friendly establishments where managers actively implement programs to conserve water and energy, reduce waste, and save costs, while also contributing to environmental protection (Verma & Chandra, 2016). One notable approach in this direction is green hotel practices, which aim to minimize environmental impact by conserving energy (e.g., installing energy-efficient appliances and utilizing renewable energy solutions), reducing water consumption (e.g., adopting water-efficient fixtures and linen/towel reuse programs), and managing waste effectively (e.g., implementing recycling initiatives and replacing single-use items with durable alternatives) (Singh et al., 2024; Taghipour et al., 2024). Eco-certifications are official labels awarded to businesses or products that meet environmental and sustainability standards, emphasizing efforts in energy conservation, waste management, and

resource conservation. In the hospitality industry, these certifications are given to hotels and resorts that adopt eco-friendly practices, and these hotels can be referred to as green hotels. Several accommodations in Vietnam have earned notable eco-certifications, including The Anam and Six Senses Con Dao (Green Globe), Hotel Nikko Saigon, InterContinental Danang Sun Peninsula Resort, and Mia Resort Nha Trang (Green Key), La Veranda Resort Phu Quoc (EarthCheck), and Rex Hotel and Vinpearl Resort & Spa Nha Trang (ISO 14001). The concept of green hotels has recently gained significant attention in research (e.g., Nguyen et al., 2017; Trang et al., 2019; Thai & Nguyen, 2022; Hien et al., 2023; Van Huy et al., 2024). However, many aspects remain unexplored, such as the key factors that influence tourists, especially international guests, in choosing a green hotel as their place of stay while traveling to Vietnam.

This study integrates the theory of planned behavior (TPB) with the value-belief-norm (VBN) theory of environmentalism to provide comprehensive insights into guests' decision-making regarding their intentions to stay at green hotels. The research was conducted in two phases: a qualitative study involving in-depth discussions with 10 tourism experts to refine the scales, followed by a quantitative phase evaluating the theoretical model with data from 550 international tourists who stayed at green hotels in Vietnam in 2024. This study contributes to the growing literature on sustainable tourism by offering valuable insights into the factors influencing guests' behavior when staying at green hotels, particularly in the context of Vietnam. The research findings also serve as a reference for green marketing managers in building a hotel brand that meets sustainable tourism standards.

## II. MATERIAL AND METHOD

### 2.1. Literature review

Environmentalism is defined as the tendency to engage in actions that reflect pro-environmental intent (Stern, 2000), including environmentally relevant actions, environmentally friendly actions, environmentally significant actions, and green actions (Canlas et al., 2022). In the hospitality industry, environmentalism involves adopting sustainable practices to reduce environmental impact. As major contributors to energy use, water consumption, and waste, hotels and resorts face growing pressure from consumers and regulators to become more eco-friendly. Several sustainability measurement frameworks for hotels have been developed, offering structured approaches, models, or systems tailored to the unique characteristics and practices of green hotels (e.g., Hussain et al., 2019; Bagheri et al., 2020; Abdalla Eltoum et al., 2024). These frameworks guide the implementation of sustainable practices in hotel management, focusing on areas like energy efficiency, water conservation, waste management, and sustainable sourcing. By incorporating standards, certifications, and strategies, they help hotels achieve eco-friendly operations, meet environmental goals, and enhance guest experiences while reducing their ecological impact. Examples include green building certifications (Wei et al., 2020), sustainability ratings (Bianco et al., 2023), and eco-labeling programs (Yılmaz et al., 2019) designed specifically for the hospitality industry.

In research, the TPB (Ajzen & Fishbein, 1980) not only predicts behaviors based on attitudes but also explains the process linking them. This theory suggests that behavioral intentions are the most direct predictors of behavior, and these intentions are influenced by three key factors: (a) individuals' attitudes toward the behavior, (b) their perceptions of social norms and conventions (subjective norms), and (c) the degree to which they perceive the behavior to be under their personal control (perceived behavioral control). The TPB has been widely used to study pro-environmental behaviors, with several recent studies confirming its effectiveness in predicting green behaviors (e.g., De Leeuw et al., 2015; Yuriev et al., 2020; Correia et al., 2022). Meanwhile, Stern et al. (1999) proposed a behavioral theory that effectively identifies the antecedents and dimensions of pro-environmental behavior. According to Stern et al. (1999), individuals who align with a movement's core values, perceive that valued objects are under threat, and believe their actions can restore those values develop a sense of obligation for pro-environmental action. This sense of obligation drives them to provide support, with the specific type of support depending on their capabilities and constraints. Stern later refined this theory by categorizing environmentally significant behaviors into four types: environmental activism, non-activist public sphere behaviors, private sphere environmentalism, and other environmentally significant actions (e.g., influencing organizational practices). The VBN theory of environmentalism (Stern, 2000) has since been commonly used as a foundational framework for scholars examining pro-environmental behavior. It has been instrumental in modeling, explaining, predicting, and describing the antecedents of pro-environmental behavior, as well

as determining the continuum of such behaviors.

**2.2 Research model**

Integrating the TPB with the VBN theory of environmentalism, this study proposes a theoretical model outlining key factors that positively influence guests' intentions to stay at green hotels, ultimately affecting their final decision. These factors include green attitudes, moral obligation, environmental concerns, egoistic values, biospheric values, and altruistic values. Green attitudes (attitudes toward the behavior), moral obligation (subjective norms), and environmental concerns (perceived behavioral control) align with the TPB. Egoistic values, biospheric values, and altruistic values, as components of value orientations or value systems, align with the VBN theory of environmentalism. These values reflect individuals' motivations and priorities in decision-making, particularly regarding environmental behavior and sustainability. They are frequently explored in studies on pro-environmental behavior, social responsibility, and ethical decision-making.

First, attitudes toward green hotels play a significant role in predicting guests' intentions to stay at such establishments. Numerous studies have confirmed a strong positive correlation between attitude, intention, and behavior (Wang, 2022). Accordingly, hotel guests' attitudes, habits and perceived behavioural control influence their purchase intentions towards an eco-friendly hotel (Tavitiyaman et al., 2024). Wang et al. (2024) found that implicit and explicit attitudes, personal norms, and perceived behavioral control positively influence intention. Van Huy et al. (2024) highlight the importance of providing tourists with environmental information through social media platforms, which enhances green attitudes and intentions to stay at green hotels. Attitude has also been recognized as a critical determinant of green purchase intentions and behaviors in numerous contexts (e.g., Lim et al., 2019; Costa et al., 2021; Shehawy & Khan, 2024). This aligns with the theory of planned behavior, which identifies attitude as a key determinant of behavior. Therefore, the following hypothesis is proposed: ***(H1) Green attitudes positively influence guests' intentions to stay at green hotels.***

Second, Sia & Jose (2019) highlight the significance of personal moral obligation in the choice of eco-friendly houses, noting that moral obligation mediates the relationship between both attitude and subjective norm with the intentions to build such houses. Similarly, moral obligation, green self-identity, environmental concern, and social pressure are positively associated with green purchase intentions (Sun et al., 2022). Annamdevula et al. (2022) emphasize the role of moral obligation in promoting youth's higher intentions for waste recycling and actual recycling behavior. Moreover, moral obligation influences the relationship between green consumption values and behavioral intentions (Chae et al., 2024). Addressing why environmental concern does not always translate into green purchase intention, Kumar (2024) demonstrates that the effect of environmental concern is mediated through attitude and ethical obligation. Therefore, the following hypothesis is proposed: ***(H2) Moral obligation positively influences guests' intentions to stay at green hotels.***

Third, the empirical results by Wang et al. (2018) show that environmental concern has positive effects on the attitude and the intention of consumers to visit green hotels in China. Suhartanto et al. (2023) indicated that environmental concern is the most influential factor affecting consumers' attitudes and behavioral intentions, both directly and indirectly. As young Muslims' concern for the environment increases, their attitudes toward environmental issues improve, motivating them to purchase and promote green plastic products. Environmental concern indirectly influences the intentions to purchase organic food (Xu et al., 2024). Investigating carriers' intentions to switch to green vehicles for last-mile delivery in an emerging market, (Le, 2024) found that environmental concerns and attitudes significantly influenced their intentions to adopt green vehicles. Waste reduction behavior is significantly influenced by waste reduction intentions, which, in turn, is strongly impacted by environmental concern, climate change concern, and healthy environmental norms among young coastal tourists in Bangladesh (Hasan & Aziz, 2024). Therefore, the following hypothesis is proposed: ***(H3) Environmental concerns positively influence guests' intentions to stay at green hotels.***

Fourth, according to Sony & Ferguson (2017), Thai consumers' green lifestyle behavior is primarily driven by their egoistic and social-altruistic values. Dong & Gao (2024) found that egoistic values significantly predict behavioral intentions in the context of organic wine purchases. Waris et al. (2024) discovered that egoistic values have the greatest

impact on pro-environmental beliefs and environmentally responsible behavior, ultimately influencing the intentions to visit green hotels. In particular, Jebarajakirthy et al. (2024) indicated that psychological factors based on the VBN theory of environmentalism and the theory of planned behavior mediate the effects of altruistic, biospheric, and egoistic values on green purchase intention. Therefore, the following hypothesis is proposed: ***(H4) Egoistic values positively influence guests' intentions to stay at green hotels.***

Fifth, biospheric values are positively associated with eco-socially conscious consumer behaviors (Saleem et al., 2018). In the study by Mukherjee & Chandra (2022), biospheric values are identified as a direct and important antecedent of environmental concern, which in turn are influential predictors of environmental intentions. Chen & Lee (2022) highlighted that biospheric values have a positive indirect influence on the psychological benefits of supporting green activities and utilitarian environmental benefits. According to Stadlthanner et al. (2022), biospheric values moderate the relationship between gain-framed messages and cause involvement. Cause involvement, in turn, enhances consumer attitudes, which positively influence consumers' behavioral intentions. Therefore, the following hypothesis is proposed: ***(H5) Biospheric values positively influence guests' intentions to stay at green hotels.***

Sixth, consumers' altruistic values tend to positively influence their personal norms, environmental attitudes, and subjective norms, while also mitigating perceived barriers related to the purchase of energy-efficient appliances (Nguyen et al., 2017). Biospheric and altruistic values have been found to positively influence attitudes, which in turn shape intentions toward selecting green hotels (Wang et al., 2020). Altruistic values are one of the key factors that positively influence tourists' intention to stay in green hotels (Patwary et al., 2022). Javed et al. (2024) identified a direct and positive relationship between green brand image and consumer purchase intentions, emphasizing the need for marketers in the clothing and textile industry to strategically promote altruistic values in their sustainability efforts within the Chinese context. Additionally, the meta-analysis by Jebarajakirthy et al. (2024) which integrates findings from 173 studies, demonstrates the effects of altruistic, biospheric, and egoistic values on green purchase intention. Therefore, the following hypothesis is proposed: ***(H6) Altruistic values positively influence guests' intentions to stay at green hotels.***

Seventh, the effect of intentions on final behavior has been demonstrated in numerous studies based on the theory of planned behavior. In the context of selecting green accommodation in tourism, guests' intentions have been confirmed as a key antecedent of their final decision. Hasan (2023) study on green hotel visitors in Bangladesh found that intentions to revisit green hotels significantly influenced the actual decision to revisit. Jana et al. (2024) indicated that green attitudes significantly affect green purchase intentions among affluent consumers, with a strong positive correlation between green purchase intentions and actual green purchase behaviors. Additionally, the study highlighted that the unavailability of green hotels weakens the intention-behavior link. Therefore, the following hypothesis is proposed: ***(H7) Guests' intentions to stay at green hotels positively influence their final decision.***

Finally, value components such as altruistic, biospheric, and collectivistic values positively influence pro-environmental attitudes in green marketing (Özekici, 2022; Wang, Wang, et al., 2022) or implicit attitudes (Wang et al., 2020; Wang, Zhang, et al., 2022) in green marketing. Verma et al. (2019) found that biospheric values significantly affect attitudes, with attitudes towards green hotels predicting the intention to visit them. Wang et al. (2023) showed that biospheric and collectivistic values positively influenced explicit attitudes, while altruistic value had a negative impact. This suggests that China, as a highly collectivistic society, is characterized by nature-oriented cultures, making individuals from collectivist countries more likely to adopt environmentally friendly behaviors. Dong & Gao (2024) noted that biospheric-altruistic and egoistic values positively correlate with attitudes towards organic wine, with attitude mediating the relationship. Therefore, the following hypothesis is proposed: ***(H8) Green attitudes mediate the relationship between values and guests' intentions to stay at green hotels.***

### 2.3. Research methodology

The scale was adapted from previous related studies, including Wang's (2022) scale on green attitudes and intentions to stay, Annamdevula et al.'s (2022) scale on moral obligation and final decision, Xu et al.'s (2024) scales on environmental concerns and egoistic values, and Mukherjee & Chandra's (2022) scales on biospheric values and altruistic values. The research process consists of two phases: (1) a qualitative study and (2) a quantitative study. The

qualitative phase focuses on refining the proposed scale through in-depth interviews with 10 experts from Vietnam's tourism industry. These experts include two members of the management boards of Green Globe-certified hotels in Ho Chi Minh City, four directors of eco-friendly hotels in Hanoi and Da Nang, two lecturers specializing in tourism and travel services management, and two professionals from the Vietnam National Authority of Tourism. A semi-structured questionnaire is used during face-to-face interviews to validate the relevance of the measurement variables and refine the wording to align with the context of green hotels in Vietnam (see Table 1).

**Table 1: Definitions and measurements of research concepts**

| Concept | Code | Definition | Source of measurement | Items | Examples |
|---|---|---|---|---|---|
| Green attitudes | GRE | The predisposition or tendency to evaluate the environment positively and support environmental-friendly practices. | (Wang, 2022) | 5 | "I believe environmental protection is important" |
| Moral obligation | MOR | The sense of duty or moral responsibility towards environmental protection and sustainable practices. | (Annamdevula et al., 2022) | 4 | "I feel it is my responsibility to make environmentally conscious decisions" |
| Environmental concerns | CON | The level of concern and awareness about environmental issues and their impact on the planet. | (Xu et al., 2024) | 6 | "I am worried about the effects of climate change on future generations" |
| Egoistic values | EGO | Values focusing on personal benefits, including how environmental behavior impacts individual well-being. | (Xu et al., 2024) | 4 | "I make green decisions because they benefit me personally" |
| Biospheric values | BIO | Values that emphasize the preservation of the environment for the well-being of ecosystems and future generations. | (Mukherjee & Chandra, 2022) | 5 | "I am motivated by the desire to protect the planet" |
| Altruistic values | ALT | The likelihood that guests will choose eco-friendly accommodations based on their attitudes and values. | (Mukherjee & Chandra, 2022) | 5 | "I make environmentally friendly choices because they help others" |
| Intentions to stay | INT | The likelihood that guests will choose eco-friendly accommodations based on their attitudes and values. | (Wang, 2022) | 6 | "I would prefer to stay at a green hotel during my travels" |
| Final decision | DEC | The actual decision made by guests regarding their stay at green hotels, based on their intentions and other factors. | (Annamdevula et al., 2022) | 4 | "I stayed at a green hotel during my last trip" |

In the subsequent quantitative phase, a structured questionnaire is distributed to assess the theoretical model. The questionnaire consists of two sections: (1) personal information (age, gender, country of residence, and the hotel where the respondent is staying in Vietnam) and (2) measurement items. Survey respondents are international tourists staying at green hotels in Vietnam in 2024, including guests at renowned green accommodations such as The Anam Hotel, Six Senses Resort Con Dao, Hotel Nikko Saigon, InterContinental Danang Sun Peninsula Resort, Mia Resort Nha Trang, La Veranda Resort Phu Quoc, Rex Hotel, Vinpearl Resort & Spa Nha Trang, among others. The survey link is shared with hotel management, who are responsible for forwarding it to their international guests. The data collection process spans six months, and quantitative data is analyzed using SPSS and AMOS (Hair et al., 2013).

## III. RESULT AND DISCUSSION

### 3.1. Sample description

A total of 568 questionnaires were collected, and after data cleaning, 550 valid responses were retained, meeting the minimum sample size requirement. Regarding the demographics of the respondents, the majority belong to Generation Y (247, or 44.9%), followed by Generation X (202, or 36.7%) and Generation Z (101, or 18.4%). A larger proportion of male respondents (284, or 51.6%) compared to female respondents (217, or 39.5%) participated in the survey, with 49, or 8.9% of respondents not specifying their gender. Geographically, most respondents came from Europe (39.5%), followed by the USA (33.5%), and other regions (27.1%). The majority of international guests choose to stay at green hotels in the Central region (215, or 39.1%), followed by the North (206, or 37.5%), and lastly, Ho Chi Minh City and the Southern region (129, or 23.5%).

### 3.2. Scale verification

Testing the normal distribution of observed variables revealed that the absolute value of the largest deviation was 2.006 (<3), and the largest kurtosis value was 4.461 (<8). This indicates that the variables follow a normal distribution, and the dataset is suitable for statistical testing. Out of 39 variables, preliminary reliability testing using Cronbach's Alpha identified 3 variables (GRE2, CON3 and INT3) for elimination due to |variable-total correlation| < 0.3 and an increase in Cronbach's Alpha when removed. With the remaining 36 variables, exploratory factor analysis (EFA) with Promax rotation led to the elimination of 5 variables (CON2, BIO4, ALT1, MOR1, BIO2) due to a loading difference of |load difference| < 0.3 across two factors. The final scale includes 31 items, all with loading coefficients > 0.7. The Kaiser-Meyer-Olkin (KMO) coefficient was 0.825 ($p < 0.05$), forming 9 factors with Cronbach's Alpha coefficients all > 0.7. The total variance extracted was 80.012%, effectively explaining the data variation (Table 2).

**Table 2: Testing the reliability and convergent validity of the scales**

| No | Scale | EFA | | CFA | | |
|---|---|---|---|---|---|---|
| | | Factor loadings | Items | Standardized factor loadings | CR | AVE |
| 1 | GRE | 0.820 –> 0.831 | 4 | 0.800 –> 0.872 | 0.872 | 0.698 |
| 2 | MOR | 0.838 –> 0.865 | 3 | 0.794 –> 0.850 | 0.866 | 0.724 |
| 3 | CON | 0.853 –> 0.892 | 4 | 0.793 –> 0.835 | 0.882 | 0.603 |
| 4 | EGO | 0.887 –> 0.896 | 4 | 0.744 –> 0.788 | 0.806 | 0.783 |
| 5 | BIO | 0.831 –> 0.925 | 3 | 0.759 –> 0.821 | 0.841 | 0.620 |
| 6 | ALT | 0.827 –> 0.889 | 4 | 0.729 –> 0.801 | 0.802 | 0.610 |
| 7 | INT | 0.802 –> 0.869 | 5 | 0.800 –> 0.882 | 0.886 | 0.723 |
| 9 | DEC | 0.814 –> 0.860 | 4 | 0.836 –> 0.882 | 0.834 | 0.799 |

The measurement model was evaluated using CFA for the first-order scale, showing good fit: Chi-square ($\chi^2$)/dF = 1.868 (<3) ($p = 0.000 < 0.05$), GFI = 0.902 (>0.9), TLI = 0.903 (>0.9), CFI = 0.905 (>0.9), IFI = 0.903 (>0.9), and RMSEA = 0.028 (<0.06). All standardized loading factors for the 33 variables were > 0.5 ($p = 0.000 < 0.05$). The average variance extracted (AVE) for all factors was > 0.5, confirming convergent validity (Hair et al., 2013).

### 3.3 Testing structural model

SEM analysis using ML estimation indicated a good fit for the structural model, with indices showing: Chi-square ($\chi^2$)/dF = 2.048 (<3) ($p = 0.000 < 0.05$), GFI = 0.906 (>0.9), TLI = 0.904 (>0.9), CFI = 0.904 (>0.9), IFI = 0.905 (>0.9), and RMSEA = 0.022 (<0.06). The model explained 39.9% of the variance in final decision of staying at green hotel, supporting all seven hypotheses (from H1 to H7). Green attitudes, moral obligation, environmental concerns, egoistic values, biospheric values, and altruistic values are key factors influencing guests' intentions to stay at green hotels, and guests' intentions to stay at green hotels significantly impact their final decision (Table 3). These findings align with previous research and contributes significantly by addressing the limited quantitative research on the decision to stay at green hotels in Vietnam.

**Table 3: Testing the hypotheses of the structural model**

| Relationships | Hypotheses | Standardized regression | Estimate | S.E. | CR | p-value | Result |
|---|---|---|---|---|---|---|---|

| | | coefficient | | | | | |
|---|---|---|---|---|---|---|---|
| GRE -> INT | H1 | 0.488 | 0.286 | 0.045 | 6.411 | *** | Supported |
| MOR -> INT | H2 | 0.343 | 0.345 | 0.043 | 8.080 | *** | Supported |
| CON -> INT | H3 | 0.356 | 0.383 | 0.046 | 8.391 | *** | Supported |

Using Zhao et al. (2010) procedure for testing mediation effects, the analysis follows a two-step process: first, verifying the significance of the indirect effects, and second, determining the type of mediation, if any. In the case of the relationship between egoistic values and guests' intentions to stay, the indirect effect is significant (e.g., 0.112) as shown in Table 4, indicating that green attitudes play a mediating role as expected. With a significant direct effect (e.g., 0.328), a partial mediation role of green attitudes is observed. Moreover, since both the direct and indirect effects have the same positive sign, green attitudes serve as a complementary partial mediator in the relationship between egoistic values and guests' intentions to stay. The ratio of the indirect-to-total effect, or the VAF (variance accounted for) value, is 17.73% (e.g., 0.634), suggesting that the mediation process with green attitudes accounts for a small portion of the variance in customer readiness as the dependent variable <20%, a cut-off value recommended by Hair et al. (2021). In other words, green attitudes absorb a limited portion of the impact of egoistic values on guests' intentions to stay. Similarly, green attitudes mediate the relationship between biospheric values, altruistic values, and guests' intentions to stay at green hotels, providing full support for H8.

**Table 4. Result of mediation analysis**

## IV. CONCLUSION

### 4.1. Theoretical contributions

While tourism is widely regarded as a positive driver of economic development, conventional mass tourism is linked to negative impacts, such as ecosystem degradation and the loss of cultural heritage. In response to these challenges, sustainable tourism has gained considerable attention, with green hotels emerging as key players in this shift. Green hotels represent a sustainable approach to tourism, attracting guests who hold green attitudes, an intense sense of moral obligation, environmental concerns, and deep-rooted environmental values. This study contributes to the development of the green hotel theory by integrating the TPB with the VBN theory of environmentalism, thus providing a comprehensive framework for understanding the factors that influence guests' decisions to stay at green

hotels.

The proposed theoretical model identifies key factors—green attitudes, moral obligation, environmental concerns, egoistic values, biospheric values, and altruistic values—that significantly impact guests' intentions to choose green hotels, which, in turn, affect their final accommodation decisions. These findings highlight the importance of green attitudes as a pivotal determinant in the decision-making process. By linking TPB with the VBN theory, the study underscores the role of green attitudes as a mediator, amplifying the effect of guests' environmental values on their pro-environmental behavior. This integration of both theories advances our understanding of how environmental value systems shape guests' intentions and actions in the context of green hotel selection.

These results align with previous research, confirming that TPB's core antecedents continue to influence environmental intentions and behaviors. However, the study emphasizes the need for further exploration of the role of green attitudes and the other two TPB antecedents in the context of green hotels. This approach not only enriches the theoretical framework for green hotel research but also provides practical insights for hotel managers aiming to attract more eco-conscious guests and promote sustainable practices within the hospitality industry. Therefore, the study offers significant contributions to the growing body of literature on green hotels and the application of environmental behavior theories in tourism decision-making.

**4.2 Managerial implications**

From a management perspective, it can be observed that the decision to choose a green hotel for accommodation, particularly in this study focusing on international tourists visiting Vietnam, is strongly influenced by pre-existing intentions. These intentions are shaped by attitudes, perceptions, and the underlying norms and values within each guest. Therefore, to increase the likelihood of being chosen as the accommodation during a trip, extend guests' stay, and set higher service prices, green hotels need to develop strategies to promote these important antecedents.

Given that ethics and personal value systems are difficult to change, managers of green hotels should carefully design and implement tailored communication strategies. Guests who have a strong moral obligation towards the environment and hold sustainability-oriented values are more likely to be positive about eco-friendly products and services, such as green hotels. Additionally, addressing guests' concerns regarding the environmental impact of tourism by providing information and explaining the eco-friendly practices of green hotels can effectively encourage them to choose these hotels for their stay. Finally, because green attitudes play a crucial role, hotel managers should focus on promoting positive attitudes toward green hotels. This can be achieved through effective communication about the hotel's commitment to environmental protection, efforts to earn green certifications and awards, offering guests environmentally friendly experiences, and encouraging participation in environmental protection activities within the hotel.

More specifically, to attract international tourists, green hotels should develop targeted communication strategies emphasizing their eco-friendly practices. This can include promoting sustainability efforts through the hotel's website, in-room materials, and social media, as well as offering guests opportunities to engage in sustainability programs like eco-friendly activities and workshops. Hotels can also encourage positive green attitudes by offering experiences that highlight their commitment to environmental protection, such as "Green Stay" packages or exclusive discounts for eco-conscious choices. Clear communication about eco-certifications builds trust with environmentally minded guests. Additionally, pricing tiers for eco-friendly accommodations, partnerships with local eco-tourism operators, and leveraging positive reviews can further strengthen the hotel's reputation as a sustainable choice, attracting more eco-conscious travelers.

**4.3 Future research directions**

From this study, conducting multi-group analyses based on factors such as respondent age, gender, country of residence, and hotel location could provide valuable insights into how these demographic and contextual factors moderate the relationships within the proposed model. Understanding these moderating effects would not only enhance the application of both the TPB and the VBN theory but also help refine how these theories are applied in the context of green hotel decision-making. By examining how various groups, such as different age ranges or cultural backgrounds, perceive and respond to environmental cues, managers could tailor their strategies more effectively to target specific

market segments.

In addition, expanding the data collection to cover a broader range of locations across Vietnam, including both urban and rural settings, would improve the representativeness of the sample. This geographical diversification would help ensure that the findings are more generalizable, providing insights that are not only relevant to tourists staying at well-known green hotels but also applicable to a wider variety of green accommodations across the country. A more inclusive data set could reveal regional variations in environmental attitudes and behaviors, which would be crucial for both researchers and hotel managers aiming to attract international tourists with diverse preferences and values.

Looking forward, while the current model offers a strong explanation for the factors influencing guests' decisions to stay at green hotels, exploring additional theoretical perspectives could further enrich our understanding. For instance, incorporating elements from consumer behavior theory, decision-making processes in the hospitality industry, or even theories on sustainable consumption could provide a more holistic view of how guests' choices are shaped. Furthermore, integrating psychological, sociocultural, and behavioral dimensions could illuminate additional antecedents that play a role in guests' intentions, such as social norms, peer influence, or even emotional engagement with eco-friendly practices. By broadening the theoretical framework and continuing to explore new perspectives, future studies could more clearly highlight the complex and multi-faceted nature of the decision to stay at a green hotel, offering deeper insights for both academia and industry practice.

# THE ALLURE OF RURAL LIVING: TOURISM WITH A LOCAL EMPHASIS FOR ECONOMIC SUSTAINABILITY - A CASE STUDY IN KEMIREN VILLAGE, INDONESIA

**Wiwin Hartanto[1]*, Markus Porsche-Ludwig[2]**

[1] PhD Student, Department of Asia-Pacific Regional Studies, College of Humanities and Social Sciences, National Dong Hwa University, Hualien 974301, Taiwan.

[2] Department of Public Administration, College of Humanities and Social Sciences, National Dong Hwa University, Hualien 974301, Taiwan.

*Corresponding: 81120b008@gms.ndhu.edu.tw

**ABSTRACT**

This study explores the charm of rural life through a case study of Kemiren Village, Indonesia, focusing on the integration of local culture into tourism to promote sustainable economic growth. Kemiren, known for its "Osing" solid cultural heritage, has successfully blended traditions with tourism activities, offering visitors authentic experiences such as traditional dances, culinary delights, and local crafts. This research highlights how community-based tourism empowers residents by fostering economic resilience, preserving cultural identity, and enhancing social cohesion. Key findings reveal that active community participation, the promotion of cultural heritage, and sustainable practices are crucial to the success of rural tourism. Challenges such as balancing modernization with cultural preservation and ensuring equitable benefits are also discussed. The study concludes by emphasizing the potential of rural tourism to become a model for sustainable economic development while preserving the unique cultural fabric of Kemiren Village.

*Keywords*: Rural tourism, community-based tourism, economic sustainability, cultural preservation, Kemiren Village.

## I. INTRODUCTION

### 1.1. Background of the study

Indonesia is home to a rich diversity of traditions and cultures. This diversity presents significant potential for tourism activities. Tradition and culture are invaluable heritages that reflect the identity of a nation. While modernity often dominates various aspects of life, tradition and culture serve as unique attractions in the realm of tourism. Culturally-based tourism offers visitors a distinctive and authentic experience, while simultaneously serving as a medium to preserve local values (Cheteni & Umejesi, 2024; Lussetyowati, 2015; Putra et al., 2021). With their uniqueness and richness, traditions and culture possess the capacity to attract tourists from around the globe, creating economic opportunities and strengthening national identity. However, realizing traditions and culture as sustainable tourism assets requires prudent management, community awareness, and support from multiple stakeholders. Therefore, traditions and culture not only function as tourist attractions but also as enduring legacies for future generations (Lussetyowati, 2015; Putra et al., 2021).

Law Number 10 of 2009 on Tourism (Government Regulation of Indonesia, 2009) outlines three primary objectives for tourism development: fostering economic growth, improving public welfare, and advancing cultural heritage. Beyond contributing to national revenue, the tourism sector also serves as an industry that provides employment opportunities, promotes equitable income distribution, and supports cultural preservation (Dangi & Petrick, 2021; Dłużewska & Giampiccoli, 2020; Mtapuri et al., 2021). The tourism sector's capacity to generate employment ultimately strengthens the economy, making it a critical driver for sustainable development (Mtapuri et al., 2021; Nugroho & Numata, 2020). This rationale underpins the establishment of Kemiren Village as a tourist destination in 2012, known today as the Osing Kemiren Cultural Tourism Village.

The Osing Cultural Tourism Village of Kemiren is located in Glagah Subdistrict, Banyuwangi Regency, East Java Province, approximately 5 kilometers from the center of Banyuwangi city. Initially, Kemiren was an expanse of rice fields and community-owned forests. Over the past 167 years, it has gradually transitioned into a village and is now home to approximately 2,569 residents. Kemiren is unique as the only village predominantly inhabited by the

indigenous Osing people of Banyuwangi (Lubis, 2020; Oktawirani, 2023).

Kemiren Village is inhabited by the Osing community, who uphold their traditions and customs with great care. Most residents work as farmers, livestock breeders, or artisans, with tourism serving as an additional economic support. Recognized as a cultural village, Kemiren boasts a rich heritage. Many homes in the village retain the traditional Osing architecture, featuring distinctive roofs known as tikel balung. The design, resembling fish bones, symbolizes simplicity and harmony in the lives of the Osing people. Kemiren is renowned for its unique traditions, passed down as part of the Osing people's ancestral legacy (Lubis, 2020; Oktawirani, 2023). The community maintains its distinctive cultural practices in daily life, emphasizing hospitality, familial values, and mutual cooperation (gotong-royong). These attributes reflect the Osing people's commitment to preserving their cultural identity while adapting to contemporary opportunities such as tourism (Nuh et al., 2023).

Kemiren Village plays a vital role in preserving local traditions amidst the pressures of globalization (Lussetyowati, 2015; Nuh et al., 2023; Satiadji, 2017; Wu et al., 2022). The customs and culture of the Osing community exemplify the ethnic diversity in Indonesia that endures despite the tides of modernity. Through community-based tourism, Kemiren offers authentic experiences to visitors, including homestays, traditional cuisine, and participation in cultural activities. This model not only enhances the community's income but also strengthens their sense of ownership over their traditions (Dangi & Petrick, 2021; Dłużewska & Giampiccoli, 2020). Community-based tourism serves as an effective strategy to ensure equitable economic benefits while preserving cultural heritage. However, the greatest challenge lies in maintaining a balance between cultural preservation and commodification (Satiadji, 2017). Commodification risks diminishing the authenticity of cultural practices. In Kemiren, the active involvement of the local community in tourism management has been key to preventing excessive cultural exploitation, ensuring that traditions remain meaningful and sustainable.

Kemiren Village was selected for this study due to its distinctive cultural heritage and status as a well-established cultural tourism village. As the cultural center of the Osing community, the village has successfully integrated tourism with local traditions, offering valuable insights into the dynamics of community-based tourism. Moreover, the active participation of local residents in various tourism activities, including homestay management, traditional performances, and culinary experiences, provides an exemplary model for sustainable tourism development that prioritizes local empowerment and cultural preservation.

This study is expected to make significant contributions both academically and practically. By examining Kemiren Village as a case study, this research expands the literature on community-based tourism and its role in economic sustainability and cultural preservation in rural areas. The findings will provide a theoretical framework for future studies on sustainable tourism in developing regions. The study offers recommendations for policymakers, tourism practitioners, and local communities on implementing tourism strategies that balance economic growth with cultural sustainability. These insights can be applied to similar rural tourism destinations seeking to develop cultural tourism without undermining their heritage. The findings can serve as a reference for sustainable rural tourism development, ensuring that tourism remains a tool for cultural and economic resilience rather than a force of cultural erosion.

### 1.2. Research Problem

Despite the potential of community-based tourism to support local economies and cultural heritage, its implementation faces several challenges. One of the main concerns is ensuring that economic benefits from tourism are equitably distributed among community members without compromising the cultural values that define the destination's appeal. Additionally, excessive commercialization risks reducing cultural practices to staged performances, undermining their authenticity and significance (Satiadji, 2017). In the context of Kemiren Village, it is essential to explore how active community involvement in tourism management can help maintain a balance between economic sustainability and cultural integrity.

### 1.3. Research Objectives

The objective of this study is to analyze how community-based tourism empowers residents by fostering economic resilience, preserving cultural identity, and enhancing social cohesion. This study also identifies the role of tourism in preserving the Osing culture and the challenges faced in maintaining its authenticity amidst globalization. Kemiren

Village is recognized as the cultural hub of the indigenous Osing community in Banyuwangi, featuring traditional culture, customs, and cuisine. It is crucial to understand how Kemiren balances tourism appeal with cultural preservation, which helps mitigate the potential loss of authentic local traditions. Kemiren serves as a model for other rural areas seeking to develop culturally-based tourism without compromising traditional values.

## II. MATERIAL AND METHOD

### 2.1. Literature Review

Rural Tourism and Economic Sustainability

Amid the dynamics of global development, the establishment of rural tourism has emerged as a strategic solution to enhance the welfare of local communities, particularly in rural areas. Rural tourism not only serves as a platform to showcase local traditions and culture to the world but also acts as an economic driver that upholds sustainability principles (Cheteni & Umejesi, 2024; Garwi, 2024; Krasnokutska et al., 2024). By integrating cultural preservation, environmental management, and economic growth, village tourism holds significant potential to promote equitable and sustainable development. As a rural development strategy, village tourism aims to boost the local economy while preserving cultural traditions (Cheteni & Umejesi, 2024; Ivona, 2021). This concept places the local community at the heart of tourism activities, where the primary objectives include economic, social, and environmental sustainability. Literature on rural tourism underscores a strong link between its development and the achievement of sustainable economic growth, while also highlighting various challenges that need to be addressed.

A tourist village is characterized by its natural environment, reflecting the authenticity of rural life and offering a unique experience of the community's daily social and cultural practices (Dai et al., 2023). The potential of a tourist village can be observed through its architectural heritage and environmental setting (Putra et al., 2021; Zuo et al., 2022). The central focus of rural tourism development is the local community, whose way of life becomes the focal point for visitors seeking an authentic rural experience. Through direct interaction with local residents, tourists gain a deeper understanding of the community's way of life, actively participating in their daily activities (Priatmoko et al., 2021; Stylidis, 2020; Wu et al., 2022). This engagement provides added value through the appreciation of the region's cultural and traditional richness, making rural tourism a dynamic tool for promoting sustainable rural development while preserving the unique identity of local communities. In In Indonesia, villages such as Pentingsari (Yogyakarta), Nglanggeran (Gunung Kidul), and Kemiren (Banyuwangi) have emerged as successful examples of how rural communities can harness tourism for sustainable development (Lubis, 2020).

Community-Based Tourism

Community-based tourism (CBT) is a tourism approach that places local communities as the primary stakeholders in the planning, management, and benefits of the tourism sector (Dłużewska & Giampiccoli, 2020; Mtapuri et al., 2021). This model extends beyond economic profit, aiming to preserve environmental sustainability and local cultural heritage. Its core objective is to empower communities, provide equitable economic opportunities, and ensure that the positive impacts of tourism are experienced directly by local residents.

The development of CBT adheres to several key principles (Dangi & Petrick, 2021; Dłużewska & Giampiccoli, 2020; Nugroho & Numata, 2020), including Community Involvement, Equitable Benefit Distribution, and Tourism Education. The ultimate goal of CBT is to enhance community independence and empowerment, enabling local populations to take an active role in their own development while fostering sustainable tourism practices.

In Indonesia, CBT has been recognized as a tool for promoting rural economic resilience while safeguarding cultural heritage (Nugroho & Numata, 2020). Studies on CBT in Indonesia emphasize the importance of community involvement, governance, and economic impact. Nugroho & Numata (2020) found that in Gunung Ciremai National Park, residents' support for CBT initiatives was significantly influenced by their perceptions of economic benefits and cultural preservation. Similarly, Priatmoko et al. (2021) explored how local participation in Pampang Village, Indonesia, has led to more sustainable tourism practices by fostering a strong sense of ownership among villagers.

Governance plays a critical role in the success of CBT. Dangi & Petrick (2021) emphasize the need for collaborative participation, representation, and inclusion in tourism governance to ensure long-term sustainability. In the context of Kemiren Village, the presence of the Tourism Awareness Group (Pokdarwis) has facilitated structured

community involvement in managing tourism activities.

Cultural Preservation through Tourism

Cultural preservation through tourism involves efforts to safeguard and sustain cultural heritage (Lussetyowati, 2015), encompassing both tangible elements (such as historic buildings and archaeological sites) and intangible aspects (including traditional dances, languages, and customs). Cultural tourism attracts visitors eager to learn about and experience local cultures, providing financial and moral support for preservation efforts (Cheteni & Umejesi, 2024; Putra et al., 2021). By engaging tourists with cultural heritage, this approach not only raises awareness about the importance of safeguarding traditions but also generates resources for ongoing preservation initiatives. Lussetyowati (2015) examined cultural heritage tourism in Palembang, Indonesia, demonstrating how traditional performances and rituals can be integrated into tourism while maintaining authenticity. Cultural tourism serves as a bridge between development and conservation, ensuring that cultural heritage remains vibrant and accessible for future generations while supporting the socio-economic well-being of local communities (Dłużewska & Giampiccoli, 2020; Lussetyowati, 2015; Satiadji, 2017).

Preserving and safeguarding cultural heritage is essential for cultural heritage tourism, as the sustainability of the offered commodities must be ensured (Lussetyowati, 2015; Satiadji, 2017). A primary challenge in tourism programs is to ensure that the growth of tourism does not degrade the qualities that initially attract visitors. Issues such as increased visitor numbers and added pressure on infrastructure and heritage sites pose significant concerns for the tourism industry (Dłużewska & Giampiccoli, 2020). As a service-oriented industry, tourism programs rely heavily on the competence of individuals across various roles and locations. By adopting Quality Tourism, efforts are made to encourage tourists to better appreciate and understand local cultures (Wardana et al., 2020). Tourists who visit with the intent to learn about and value the local culture are more likely to respect local traditions and customs. This approach not only aids in cultural preservation but also reduces the risk of commercialization, which can undermine the authenticity of the culture (Lussetyowati, 2015; Satiadji, 2017).

### 2.2. Research Method

This study employs a qualitative research approach, utilizing field research as its primary methodology. Field research involves direct observation and interaction within the study's setting (Burgess, 2002). Field research included direct observation of Osing tourism activities, capturing non-verbal interactions, ritual performances, and community-tourist dynamics. Observation sites included Traditional ceremonies (Barong Ider Bumi, Tumpeng Sewu), Tourist interactions in homestays and Kampoeng Osing Market, and Cultural workshops (Gandrung dance performances, Osing language classes).

Interviews were conducted with local stakeholders directly involved in tourism activities, focusing on their experiences, challenges, and perspectives on CBT's impact. The semi-structured format allowed flexibility in exploring emerging themes while maintaining a core set of guiding questions. A purposive sampling technique was used to select informants who could provide relevant insights to achieve the research objectives. Key informants included the Head of Kemiren Village, the Chairman of the Kemiren Tourism Awareness Group (Pokdarwis), and 5 community members directly involved in the development of tourism in Kemiren Village. Fieldwork and interviews were conducted from July 2024 to September 2024.

In this study, qualitative data analysis was conducted following the framework proposed by Miles & Huberman (1994), which consists of three interconnected stages: data reduction, data presentation, and conclusion drawing. These steps ensure that the large volume of field data collected through interviews and observations is systematically processed, leading to valid and meaningful conclusions. As a complementary source of information, this study also utilized literature reviews to establish a theoretical foundation, drawing on a variety of credible references. This combination of field research and theoretical insights ensures a comprehensive understanding of community-based tourism in Kemiren Village.

## III. RESULT AND DISCUSSION

### 3.1. Tourism Development in Kemiren

Kemiren Tourism Village, located in Banyuwangi Regency, East Java, is a successful example of culturally-based

rural tourism development. The village is renowned for the rich culture of the Osing people, the indigenous population of Banyuwangi. The establishment of Kemiren Tourism Village was not only aimed at boosting the local economy but also at preserving its unique cultural heritage. Kemiren has a long history dating back to the Dutch colonial period. The village's early inhabitants originated from Cungking Village, approximately 4 kilometers east of Kemiren. Over time, Kemiren evolved into the cultural hub of the Osing people, celebrated for their traditions and customs.

The development of Kemiren as a tourism village began in the 1990s when researchers and academics showed increasing interest in studying the Osing culture. This heightened focus on local heritage motivated the community and local government to capitalize on the village's tourism potential, turning it into a destination that celebrates and preserves the cultural identity of the Osing people. The development of tourism in Kemiren has gained significant momentum since 2012, aligning with the Banyuwangi Regency Master Plan for Development implemented by the local government. The establishment of the Osing Traditional Tourism Village was driven by the village's unique potential, deeply rooted in long-standing traditions and culture integral to the community's daily life.

In Kemiren, the local population continues to use the Osing language in their everyday interactions, and many customs and traditions have been preserved and maintained over time. The Osing Traditional Tourism Village upholds local wisdom and environmental sustainability while providing educational opportunities for visitors to learn about the culture and interact directly with the local population.

The development and management of the Osing Traditional Tourism Village are handled by a youth organization called the Tourism Awareness Group (Pokdarwis), comprising 26 members. The Pokdarwis was established in 2017 in response to a regulation requiring all tourism destinations in Banyuwangi Regency to have an organized management group. This initiative reflects a collaborative effort to promote sustainable tourism while safeguarding cultural heritage and enhancing community involvement.

### 3.2. Community Involvement and Empowerment

The development of Kemiren Tourism Village actively involves local residents as key actors in tourism activities. This engagement aims to enhance the welfare of the village community by creating new job and business opportunities and improving pre-existing enterprises and services. Involving local communities in tourism activities is a strategic effort to achieve the objectives of the village tourism development program. This includes their participation in managing natural resources, cultural heritage, and traditions, which are the main attractions of Kemiren Village. By integrating community involvement in resource management and tourism initiatives, the development efforts not only support economic growth but also ensure the sustainability and preservation of the village's unique identity.

The communities of Kemiren Village actively participate in tourism activities as providers of accommodation and attractions. The tourism concept adopted in Kemiren aligns with the principles of Quality Tourism, which emphasizes offering high-quality experiences for tourists while ensuring positive impacts on the destination. Quality tourism prioritizes visitors who respect local culture, nature, and the environment. Tourists typically engage with the local community, appreciate traditions, and seek deeper, more meaningful travel experiences. This approach has indirectly benefited the local community by providing additional income and employment opportunities. The available jobs generated by tourism activities have been well-utilized by the locals to supplement their earnings and meet daily needs. For instance, the village youth now have opportunities to work as local guides or perform as traditional musicians. The community is also actively involved in various tourism-related activities, such as serving as local guides, performing arts practitioners, and establishing art studios to teach traditional dance and music to visitors. Additionally, they have opened restaurants offering Kemiren's traditional food and beverages, managed homestays, and provided unique cultural experiences for tourists. This collaborative effort highlights the integration of community development with sustainable tourism in Kemiren Village.

### 3.3. Cultural Preservation and Benefits

The cultural heritage of Kemiren Village is protected under Indonesian law, which formalizes the legal framework for cultural management across the nation, including in Kemiren. Key actions for advancing cultural objects include inventorying, safeguarding, maintaining, and preserving them. Every citizen has the right to actively participate in cultural promotion efforts, which encompass ten categories: oral traditions, manuscripts, customs, folk games,

traditional sports, traditional knowledge, traditional technology, arts, languages, and rituals.

For the community of Kemiren Village, culture serves as the foundation of development. Cultural values drive progress by shaping the mindset and awareness necessary for economic growth. Moreover, culture empowers development by fostering attitudes and perspectives that prioritize harmony between humanity and the environment.

Cultural preservation in Kemiren aims to raise local awareness of the value of cultural heritage while fostering openness to existing cultural expressions. Community-based tourism development must incorporate efforts to safeguard cultural heritage. This responsibility lies with the local community to ensure that their traditions and wisdom endure despite the passage of time. Cultural attractions, including daily customs, traditions, norms, and beliefs, serve as focal points for tourists, drawing them to visit the village. Culture-based tourism provides a unique and enriching experience for visitors, allowing them to learn about and participate in the lives of rural communities through direct interaction and engagement. The blend of tourism and cultural heritage creates a compelling appeal, offering distinctiveness, beauty, and values imbued with cultural dimensions. The successful preservation of culture is evident in the authenticity of local traditions, which serve as key tourism attractions such as arts and customary practices. The development of Kemiren Tourism Village in its cultural dimension is sustained through the commitment of the local community to maintain and preserve their culture and traditions as integral aspects of tourism activities. This ensures that cultural heritage remains the defining characteristic of their village.

Interactions between tourists and the local community foster the exchange of cultural elements, including ideas, norms, and daily practices. This cultural exchange enriches both parties, enhancing the value of tourism and strengthening the identity of Kemiren as a culturally significant tourism destination. Tourist attractions with a cultural background serve as a magnet for both domestic and international visitors.

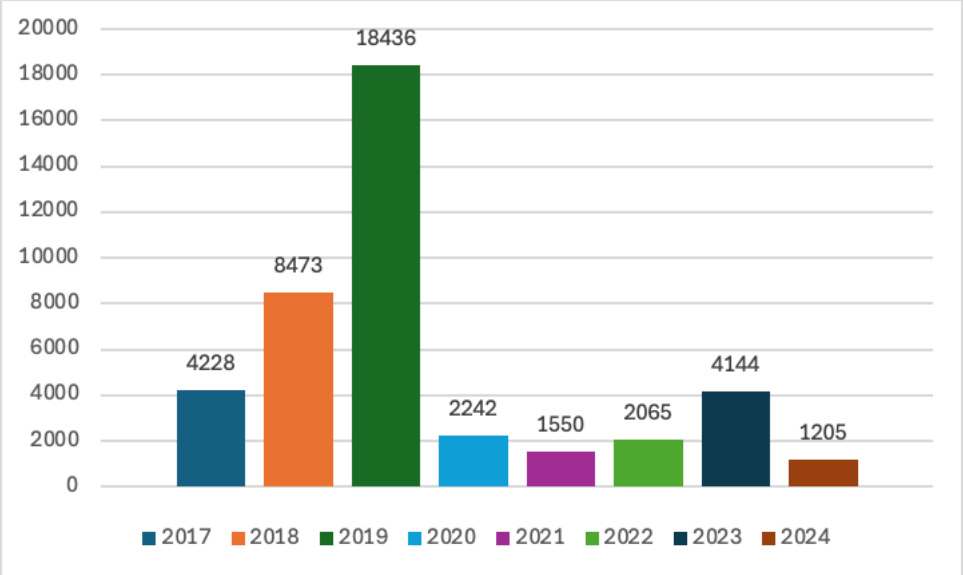

**Fig 1. Visitor Statistics of Kemiren Village (2017-2024)**

The growing number of festivals in Kemiren Village, such as Tumpeng Sewu, Barong Ider Bumi, and Ngopi Sepuluh Ewu drove the increase in visitor numbers from 2017 to 2019. The rise in tourism visits in 2019 was also influenced by improved visitor data collection by Pokdarwis. In previous years, Kemiren Village faced challenges in recording visitor numbers, as it did not charge entrance fees but operated through tour packages. In 2019, efforts to enhance visitor data collection were intensified to ensure all tourists were recorded, providing valuable insights for evaluation. However, a decline occurred in 2020 due to the impact of COVID-19. The chairman of Pokdarwis said that In 2021, Pokdarwis intensified its promotional efforts through social media and organized limited events to boost the number of tourists.

In 2024, tourist visits to Kemiren Village experienced a significant decline compared to the previous year. One of the primary contributing factors to this decrease is the weakening purchasing power of the public, influenced by a

nationwide rise in layoffs (PHK). According to an interview with the Head of Kemiren Village, the layoff rate in 2024 increased by 20.21%, directly impacting household budgets for leisure and travel. As household incomes declined, tourism—especially to cultural destinations like Kemiren—became a lower priority for many domestic travelers.

Additionally, according to the Chairman of Pokdarwis, this decline was also influenced by changing consumer behavior in tourism, where people increasingly prefer destinations that offer lower-cost experiences or recreational alternatives closer to their place of residence. The economic downturn's impact is evident in the reduced number of homestay reservations and declining tourist participation in cultural activities such as Gandrung performances and the Barong Ider Bumi ritual.

The culture of Kemiren Village represents a harmonious blend of traditions, arts, language, and cuisine, reflecting the unique identity of the Osing Tribe. With its diverse cultural attractions, Kemiren not only serves as a captivating tourism destination but also plays a vital role in preserving local cultural heritage. The community of Kemiren remains committed to safeguarding and perpetuating their cultural legacy, ensuring it remains an integral part of their daily lives. This dedication strengthens the village's identity as a cultural hub and contributes to the broader effort of maintaining Indonesia's rich and diverse heritage.

### 3.4. Local Economic Impacts

The development of tourism in Kemiren Village has indirectly provided economic benefits to the surrounding community. Prior to the emergence of tourism activities, the majority of Kemiren residents relied solely on farming and construction work as their primary sources of income. While a small number of residents traded coffee beans in nearby cities, this activity was limited and did not significantly contribute to the local economy.

The establishment of Kemiren as a tourist village has created new employment opportunities for the local population. Many residents are now involved in tourism activities, such as managing homestays, which utilize local homes and are directly operated by the homeowners. Others have opened food stalls or restaurants that offer traditional Kemiren dishes and beverages, providing both culinary experiences for visitors and additional income for the community. The impact of economic activities in Kemiren Village is reflected in the increase in the Village Revenue and Expenditure Budget (APBDes). APBDes is an integral part of village development policy and governance. It includes projections of village revenue and expenditures to support development programs. These programs fundamentally have clear objectives and positively impact the welfare of the village community. As a result of Kemiren Village's economic activities, the APBDes increased from USD $66,067.80 in 2016 to $114,029.66 in 2020.

Furthermore, the development of tourism has provided a platform for local artists to express and preserve the cultural heritage of Kemiren Village. Artists specializing in traditional performances such as gandrung dance, gedogan music, and dance workshops (sanggar tari) have found greater opportunities to showcase their talents and contribute to the village's cultural tourism. This economic transformation highlights the significant role of tourism in enhancing the livelihoods of Kemiren residents while preserving and promoting their cultural identity.

The development of Kemiren as a tourism village has created numerous new job opportunities for the local community. Beyond the tourism sector, many residents have also become involved in creative economic activities, such as crafting and performing arts. The influx of tourists to Kemiren has positively impacted the circulation of the local economy. Visitors spend money on various needs, including accommodation, food, and souvenirs, ultimately increasing the income of the local population. Alongside the growth of the tourism village, Kemiren has also experienced significant infrastructure improvements. Better road access, enhanced public facilities, and government support for tourism development have all contributed to fostering local economic growth. These advancements not only benefit tourism but also improve the overall quality of life for the residents, strengthening the village's position as a sustainable and vibrant destination. CBT in Kemiren promotes inclusive economic opportunities by providing stable employment and encouraging entrepreneurial activities, thereby reducing rural unemployment and poverty. This contributes to Indonesia's Sustainable Development Goal (SDG) 8: Decent Work and Economic Growth.

**Table 3.1 Core community members involved in tourism activities in Kemiren village**

| No | Group Name | Role | Number of People |
|---|---|---|---|
| 1 | Homestay Owner | Accommodation Providers | 43 |

| No | Group Name | Role | Number of People |
|---|---|---|---|
| 2 | Kampoeng Osing Market | Osing Culinary Specialties Provider | 40 |
| 3 | Cinde Sutro | Art Performances and Costume Rental | 25 |
| 4 | Tourism Awareness Group (Pokdarwis) | Event Organizers and Tour Guides | 23 |
| 5 | Barong Sapu Jagad | Art Performances | 20 |

| 15 | Angklung Paglak | Art Performances | 4 |
| **Total** | | | 223 |

*Source: Document on advancement of village culture of Kemiren Village 2023*

The development of tourism villages in Kemiren has had a significant economic impact by creating new job opportunities for the local community. Residents are actively involved in various tourism activities, such as providing homestays that utilize local houses and are managed directly by homeowners. Additionally, food stalls and restaurants serve traditional Kemiren cuisine, with eight food stalls frequently visited by tourists. Events and festivals such as Ngopi Sepuluh Ewu, Barong Ider Bumi, and Tumpeng Sewu engage around 80% of the local community as participants, hosts, and food providers for invited guests and pre-registered tourists through Pokdarwis (Tourism Awareness Group).

The development of the tourism village has also created job opportunities for local residents as tour guides. Kemiren Village has 10 local guides from the Karang Taruna youth organization. However, one challenge in developing tourism in Kemiren is the selection process for local tour guides. To qualify, individuals must meet certain criteria, including knowledge of Kemiren Village's history and strong proficiency in both English and Indonesian. Some tourism activities, such as the Pasar Kampoeng Osing, held every Sunday, actively involve women as vendors of traditional food and beverages. Approximately 50 stalls are directly managed by women from Kemiren Village. Additionally, women play a significant role in performing arts as dancers and gedogan musicians. Their involvement in tourism-related activities contributes to their family income, with earnings from playing lesung music every week reaching up to USD $10, as stated by the community member who was the interviewee.

## IV. CONCLUSION

Kemiren Village serves as a model for sustainable rural tourism, demonstrating how community-based tourism (CBT) can foster economic growth while preserving cultural heritage. By integrating tourism with Osing traditions, the village has created inclusive economic opportunities, ensuring that local residents remain the primary beneficiaries of tourism-related activities. Unlike mass tourism models, CBT in Kemiren promotes equitable income distribution, allowing small-scale entrepreneurs, artisans, and cultural performers to actively participate in and profit from the tourism sector.

One of the key strengths of CBT in Kemiren is its direct impact on local livelihoods. The development of homestays, traditional culinary businesses, and cultural performances has diversified the village's economy, reducing dependency on agriculture while increasing household incomes. Additionally, the role of Pokdarwis (Tourism Awareness Group) in managing tourism initiatives ensures that revenues from tourism are reinvested into community

development, supporting infrastructure improvements and local capacity-building. Beyond economic benefits, CBT reinforces cultural sustainability by preserving Osing customs, rituals, and traditional arts. Cultural events such as Gandrung Dance performances and Barong Ider Bumi rituals serve not only as tourism attractions but also as mechanisms for cultural transmission, engaging younger generations in heritage conservation. This ensures that tourism does not erode local identity but rather strengthens it as a source of economic resilience.

However, challenges remain, particularly in balancing tourism growth with cultural authenticity and ensuring long-term visitor interest. The recent decline in domestic tourist visits, linked to reduced consumer spending due to rising unemployment, highlights the vulnerability of CBT-dependent economies to external economic shifts. Addressing these challenges requires adaptive strategies, such as developing affordable tourism packages, enhancing digital marketing efforts, and promoting sustainable tourism policies that safeguard Kemiren's cultural and environmental integrity.

Ultimately, CBT in Kemiren exemplifies how tourism can serve as a catalyst for economic empowerment, cultural preservation, and social inclusion. Its success underscores the importance of community ownership in tourism management, positioning Kemiren as a replicable model for other rural villages seeking sustainable tourism development. By maintaining a balanced approach between economic progress and cultural sustainability, Kemiren can continue to thrive as a culturally rich and economically resilient rural destination. The study offers actionable insights into community-based tourism management, emphasizing the importance of local participation and equitable benefit-sharing in achieving sustainable rural development. By documenting Kemiren's traditions, such as the Gandrung Dance and Barong Ider Bumi ritual, the study helps preserve and promote intangible cultural heritage, serving as a resource for cultural conservation efforts.

**ABSTRACT**

This study examines the factors that impact tourists' emotional involvement with ChatGPT, a virtual travel agent. Utilizing the Artificially Intelligent (AI) Device Use Acceptance (AIDUA) framework, the research model investigates the antecedents (Social Influence, Hedonic Motivation, Perceived Informativeness, and Perceived Humanness) and outcomes (ChatGPT acceptance and Willingness to Use) of emotional engagement. Data was gathered from 405 participants who have utilized ChatGPT in a travel context, and the results of hypothesis testing strongly support the proposed relationships. The findings indicate that the antecedents significantly influence emotional engagement, which subsequently predicts ChatGPT acceptance and the willingness to use ChatGPT as a virtual travel agent. The study provides valuable insights for tourism businesses seeking to enhance customer engagement and encourage the adoption of AI-powered chatbot services.

*Keywords*: ChatGPT, Virtual Travel Agent, tourism digital transformation, Chatbots, digital marketing

## I. INTRODUCTION

Artificial intelligence (AI) has emerged as a transformative force across diverse industries, driving innovation and operational efficiency (Ed-Douibi et al., 2021). This cutting-edge technology has significantly influenced consumer behavior and reshaped corporate strategies (Cheng & Jiang, 2020). AI-driven platforms like ChatGPT have been integrated into various applications, profoundly impacting customer decision-making processes (Flavián et al., 2021). By enabling businesses to analyze vast datasets and generate actionable insights, AI empowers organizations to make swift and informed decisions. In the rapidly evolving marketplace, adopting tools like ChatGPT enhances business performance and ensures competitiveness and sustainability (Mydyti & Kadriu, 2021). ChatGPT's capabilities allow businesses to adapt to market dynamics, address evolving consumer needs, and deliver innovative solutions effectively. In the tourism sector, ChatGPT represents a paradigm shift in digital transformation, offering unprecedented opportunities for enhancing customer interactions and service efficiency (Garcia et al., 2022). However, comprehensive studies exploring its impact on travelers' willingness to adopt this technology remain limited (Hu et al., 2023; Svenningsson & Faraon, 2019; Ukpabi et al., 2019). Addressing this gap, the present research examines international tourists' engagement with ChatGPT and their attitudes toward its adoption within the tourism industry. Specifically, the study aims to evaluate how ChatGPT can influence customer service strategies and the factors shaping tourists' adoption intentions.

Unlike other travel chatbots such as Google Assistant, Siri, and Expedia Assistant, ChatGPT stands out due to its advanced natural language processing capabilities, enabling more conversational, context-aware, and personalized interactions. While Google Assistant and Siri are general-purpose virtual assistants designed for broad functionality—ranging from setting reminders to providing basic travel information—ChatGPT excels in generating human-like responses and handling complex, open-ended queries specific to travel planning. For instance, Google Assistant relies heavily on structured data and web search integration, while Siri prioritizes quick, voice-activated responses tied to Apple ecosystems. In contrast, Expedia Assistant, tailored for travel-related tasks like booking flights or hotels, operates within a narrower scope and lacks the depth of conversational flexibility that ChatGPT offers. This distinction positions ChatGPT as a more adaptable tool for addressing nuanced traveler needs, such as crafting detailed itineraries or responding to subjective preferences, setting it apart in the tourism context.

This research contributes to the field by investigating tourists' willingness to use ChatGPT, emphasizing the

importance of personalized interactions, human-like chatbot qualities, and the capability to address complex inquiries. These insights provide actionable recommendations for travel agencies and industry stakeholders, enabling them to effectively integrate AI chatbots into their operations. Such strategies are expected to enhance customer satisfaction, foster loyalty, and strengthen the competitive positioning of businesses in the dynamic travel industry. To achieve these objectives, the study is guided by the following research questions:

***RQ1:*** *How does ChatGPT, as a Virtual Intelligent Agent, influence tourists' emotions in the travel industry?*

***RQ2:*** *What factors contribute to enhancing tourists' intention to use ChatGPT in a tourism context?*

This paper provides a comprehensive literature review on ChatGPT's role in the tourism industry and formulates hypotheses based on existing studies. The methodology outlines the research design, sampling techniques, and data collection methods. The findings and discussion section presents key insights and implications, followed by a conclusion offering practical recommendations for AI chatbot implementation and directions for future research.

## II. MATERIALS AND METHODOLOGY

### 2.1. Theoretical background

With the swift integration of ChatGPT in the travel sector, customer engagement has been significantly enhanced (Gursoy et al., 2023). Hence, the traditional technology acceptance models like the Technology Acceptance Model (TAM) by Davis (1989) and the Unified Theory of Acceptance and Use of Technology (UTAUT) by Venkatesh, Thong, and Xu (2012) often fail to capture customer attitudes toward AI technology fully (Tan et al., 2015). To bridge this gap, Lu et al. (2019) introduced the AIDUA (AI Device Use Acceptance) framework, grounded in Cognitive Appraisal and Dissonance theories, to delve into customer willingness to adopt AI in service settings. This study employs the AIDUA model to assess frequent travellers' inclination to utilize AI-powered chatbots, particularly ChatGPT, as virtual travel agents in Vietnam. Customer engagement with AI devices is influenced by factors like hedonic motivation, social influence, and anthropomorphism, as delineated in the AIDUA model (Lu et al., 2019). The perceived informativeness and humanness of ChatGPT significantly impact user satisfaction and confidence in the technology (Ma & Huo, 2023; Rapp et al., 2021).

**Table 14. Comparison of AIDUA, TAM, and UTAUT**

| Feature | AIDUA | TAM | UTAUT |
|---|---|---|---|
| **Year Developed** | 2019 | 1989 | 2003 |
| **Primary Focus** | AI device acceptance in service contexts | General technology acceptance | Unified technology acceptance and use |
| **Process Structure** | Three-stage acceptance process (primary appraisal, secondary appraisal, outcome stage) | Direct relationships between perceptions and attitudes | Direct and indirect relationships with moderating variables |
| **Core Constructs** | Six antecedents: social influence, hedonic motivation, anthropomorphism, performance expectancy, effort expectancy, emotion | Two main constructs: perceived usefulness, perceived ease of use | Four main constructs: performance expectancy, effort expectancy, social influence, facilitating conditions |
| **Unique Elements** | Incorporates anthropomorphism and emotional factors specific to AI interaction | Parsimony and simplicity | Integration of eight previous theories; includes moderating variables (age, gender, experience, voluntariness) |
| **Theoretical Foundation** | Builds on UTAUT while adding AI-specific elements | Theory of Reasoned Action | Eight theories including TAM, IDT, TRA, TPB, and others |
| **Key** | Acceptance of AI device use | Behavioral intention and | Behavioral intention and use |

| Feature | AIDUA | TAM | UTAUT |
|---|---|---|---|
| **Outcome Variable** | | actual use | behavior |
| **Application Context** | Service encounters with AI devices | Various technology contexts | Broad range of information technology |

### 2.2. Hypothesis development

#### 2.2.1. Social Influence

Social influence, a significant concept in the UTAUT model, refers to how individuals perceive the beliefs of essential others regarding new technology adoption (Cioc, 2023; Andwika & Witjaksono, 2020). Prior research has highlighted that positive opinions within a customer's social network can enhance attitudes towards AI tools like ChatGPT (Gursoy et al., 2019; Tan, 2023; Astuti et al., 2023; Dwivedi et al., 2023). If a customer's social circle views ChatGPT positively and recommends its use, it fosters positive emotional associations with utilizing ChatGPT for travel. Thus, the following relationship is proposed:

H1: Social influence positively impacts the generation of positive emotions toward the acceptance of ChatGPT as a virtual travel agent.

#### 2.2.2. Hedonic Motivation

Hedonic motivation, derived from enjoying interactions with AI devices, significantly influences technology acceptance (Gursoy et al., 2019). It plays a crucial role in user behavior towards AI service robots and autonomous vehicles, enhancing pleasure and happiness in travel planning (Roy et al., 2020; Ribeiro et al., 2021). In this research, if travelers perceive ChatGPT as a virtual travel agent that enriches their journey by offering a joyful and pleasant experience, their evaluation and emotional response to the technology will likely be positive. Based on these insights, the following hypothesis is proposed:

*H2: Hedonic motivation positively impacts on positive emotions of ChatGPT as a virtual travel agent.*

#### 2.2.3. Perceived Informativeness

Informativeness refers to a chatbot's capacity to deliver timely, accurate, and relevant information, a critical factor in ensuring users feel supported and well-informed during travel planning (Ma & Huo, 2023). According to Cappelli et al. (2024), AI systems such as ChatGPT represent a viable alternative to traditional travel agency services, offering rapid response times, continuous availability, multilingual support, and reliable accuracy. These attributes enhance the acceptability of ChatGPT among users seeking travel advice by demonstrating its ability to meet and exceed informational requirements during the travel planning process. Based on these insights, the following hypothesis is proposed:

*Hypothesis 3 (H3): Perceived Informativeness positively impacts on positive emotions of ChatGPT as a virtual travel agent.*

#### 2.2.4. Perceived Humanness

Perceived Humanness, reflecting ChatGPT's human-like communication style, influences user acceptance of AI technologies, fostering personalized and satisfying user experiences (Han et al., 2018). Perceived Humanness is a critical factor in human-chatbot interaction, encompassing humanlike conversational features such as syntax and language, which foster a more personalized, comfortable, and satisfying user experience (Ma & Huo, 2023; Rapp et al., 2021). The considerate and kind nature of ChatGPT's humanlike interactions facilitates simple and pleasant communication, further enhancing user satisfaction. Based on this discussion, the following hypothesis is proposed:

*H4: Perceived Humanness positively impacts on positive emotions of ChatGPT as a virtual travel agent.*

#### 2.2.5. Customer’s emotions and outcomes

Customers' emotions during interactions with AI devices shape their intentions towards using ChatGPT as a virtual travel agent. Positive emotions are associated with higher acceptance rates of advanced technologies. Fan et al. (2022) emphasize that customers are increasingly predisposed to incorporating AI solutions into their daily lives when these technologies demonstrate personalization, accuracy, and responsiveness that meets or exceeds human advisors. Their

willingness to utilize such solutions correlates strongly with higher acceptance rates of advanced technologies. Based on these insights, the following hypothesis is proposed:

*H5: Emotions are positively related to customer's acceptance of using ChatGPT as virtual travel agent.*

*H6: Emotions are positively related to customer's willingness of using ChatGPT as virtual travel agent.*

*H7: Customer's acceptance is positively related to customer's willingness of using ChatGPT as virtual travel agent.*

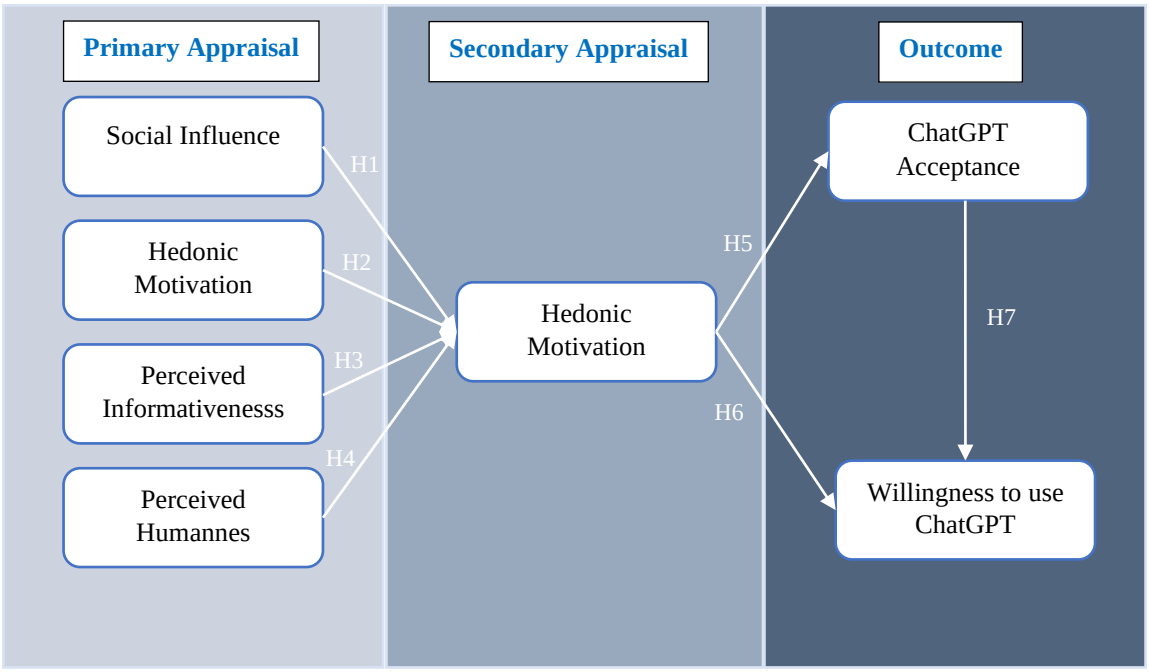

**Figure 10. Research Model**

## III. RESULT AND DISCUSSION

### 3.1. Measures

The survey questionnaire items were adapted from established studies and tailored for tourism services using AI to ensure credibility and reliability. A panel of five experts, including tourism managers and professors from Ho Chi Minh University, validated the content. Social Influence (SOI) was based on Grover et al. (2022), Hedonic Motivation (HEM) from Blümel et al. (2024), Perceived Informativeness (POI) from Vanjani et al. (2019), Perceived Humanness (POH) from Sophia et al. (2024), Emotion (EMO) from Ribeiro et al. (2021), ChatGPT Acceptance (CGA) from Goli et al. (2023), and Willingness to Use ChatGPT (WTU) from Fan et al. (2023). The questionnaire used a 5-point Likert scale from 1 ("Strongly Disagree") to 5 ("Strongly Agree"), and was translated into Vietnamese by bilingual lecturers for accuracy.

### 3.2. Data collection

Purposive sampling gathered data through an online questionnaire with two sections. The first section screened for experience with generative AI tools like ChatGPT and collected demographic information. Data collection occurred through survey links shared in public travel-focused Facebook groups and emails to customers of a travel company using AI services. Participation was voluntary, targeting tourists aged 18 and above familiar with AI applications. Purposive sampling was selected over random sampling methods due to the specific research objectives requiring participants with particular characteristics and experiences. This non-probability sampling technique allowed for intentional selection of participants based on their experience with generative AI tools in travel contexts, which was essential for addressing the research questions. Unlike random sampling, purposive sampling enabled targeting individuals who could provide valuable insights specific to AI adoption in tourism settings, creating a more relevant dataset for analysis. While this approach limits statistical generalizability to the broader population, it enhances the qualitative depth of insights from participants with the desired characteristics. 405 valid questionnaires were collected

after excluding incomplete responses, ensuring anonymity and privacy throughout the process. The sample comprises 45.19% male and 54.81% female respondents, indicating a slight overrepresentation of females. Most respondents are young adults, with 26% aged 18-20 years and 23% in the 21-30 and 31-40 age groups. Older age groups (41-50 and above 51 years) constitute 18% and 10%, respectively. The educational background is diverse, with 30% holding an undergraduate degree, 19% having completed high school, and 20% with postgraduate degrees. An additional 18% reported other qualifications. Regarding monthly earnings, 35% earn between 6 million and under 10 million, while 30% earn between 11 million and under 20 million. Only 15% report earnings above 21 million. Additionally, the sample includes 32% employed individuals, 31% entrepreneurs, 22% students, and 15% unemployed, reflecting a range of professional statuses. Regarding annual travel, 33% travel 3-4 times, 28% travel 1-2 times, and 17% prefer to stay at home. The duration of ChatGPT usage shows high engagement, with 35% using it for over a year, 33% for 6 months to 1 year, and 31.85% for less than six months. The detailed demographic profile is provided in Table 2.

**Table 2. Demographic characteristics (N = 405)**

| Variables | Frequencies | Percentage (%) |
|---|---|---|
| **Gender** | | |
| Male | 183 | 45.19 |
| Female | 222 | 54.81 |
| **Age Group** | | |
| Between 18 and 20 years | 105 | 26.00 |
| Between 21 and 30 years | 93 | 23.00 |
| Between 31 and 40 years | 93 | 23.00 |
| Between 41 and 50 years | 73 | 18.00 |
| Above 51 years | 41 | 10.00 |
| **Level of Education** | | |
| Less than High School | 53 | 13.00 |
| High School Graduate | 77 | 19.00 |
| Undergraduate Degree | 122 | 30.00 |
| Postgraduate Degree | 81 | 20.00 |
| Other | 73 | 18.00 |
| **Monthly Earnings** | | |
| Less than 5 million | 81 | 20.00 |
| Between 6 and under 10 million | 142 | 35.00 |
| Between 11 and under 20 million | 122 | 30.00 |
| Above 21 million | 61 | 15.00 |
| **Professional Status** | | |
| Student | 89 | 22.00 |
| Entrepreneur | 126 | 31.00 |
| Employed | 130 | 32.00 |
| Unemployed | 61 | 15.00 |
| **Number of Travels Annually** | | |
| 1-2 times | 113 | 28.00 |
| 3-4 times | 134 | 33.00 |
| More than 4 times | 89 | 22.00 |
| Prefer staying at home | 69 | 17.00 |
| **Duration of ChatGPT Usage** | | |
| Less than 6 months | 129 | 31.85 |
| Between 6 months and 1 year | 134 | 33.00 |
| More than 1 year | 142 | 35.00 |

**3.3. Measurement assessment**

The measurement model underwent evaluation using Smart-PLS to analyze outer loadings, reliability, and construct validity (see Table 1). Most item loadings exceeded the recommended threshold of 0.70 (Hair et al., 2014), ensuring strong indicator reliability. Two items, HEM4 (0.651) and SOI2 (0.693), below the standard, were excluded. Constructs exhibited high internal consistency, exceeding the minimum recommended values for Cronbach's Alpha and Composite Reliability (Nunnally, 1978). This affirms construct reliability and consistency within the study. Average Variance Extracted (AVE) values surpassed the 0.50 benchmark, confirming convergent validity. Discriminant validity was validated using the Heterotrait-Monotrait Ratio (HTMT), supporting the distinctiveness of constructs within the model.

**Table 3. Measurement and construct realiability**

| **Variables** | **Items** | **Outer Loadings** | **α** | **CR** | **AVE** |
|---|---|---|---|---|---|
| HEM | HEM1 | 0.802 | 0.761 | 0.764 | 0.676 |
| | HEM2 | 0.751 | | | |
| | HEM3 | 0.829 | | | |
| | HEM4 | 0.651 | | | |
| POH | POH1 | 0.835 | 0.848 | 0.854 | 0.685 |
| | POH2 | 0.845 | | | |
| | POH3 | 0.808 | | | |
| | POH4 | 0.824 | | | |
| POI | POI1 | 0.813 | 0.824 | 0.826 | 0.654 |
| | POI2 | 0.811 | | | |
| | POI3 | 0.795 | | | |
| | POI4 | 0.816 | | | |
| SOI | SOI1 | 0.754 | 0.738 | 0.739 | 0.657 |
| | SOI2 | 0.693 | | | |
| | SOI3 | 0.806 | | | |
| | SOI4 | 0.781 | | | |
| EMO | EMO1 | 0.763 | 0.788 | 0.789 | 0.611 |
| | EMO2 | 0.808 | | | |
| | EMO3 | 0.770 | | | |
| | EMO4 | 0.785 | | | |
| WTU | WTU1 | 0.856 | 0.829 | 0.846 | 0.745 |
| | WTU2 | 0.905 | | | |
| | WTU3 | 0.826 | | | |
| CGA | CGA1 | 0.874 | 0.850 | 0.851 | 0.769 |
| | CGA2 | 0.887 | | | |
| | CGA3 | 0.870 | | | |

*Note: α: Cronbach Alpha; CR: Composite Reliability; AVE: Average Variance Extract*

**Table 4. Constructs validity**

| Heterotrait - Monotrait Ratio (HTMT) | | | | | | | |
|---|---|---|---|---|---|---|---|
| | **CGA** | **EMO** | **HEM** | **POH** | **POI** | **SOI** | **WTU** |
| **CGA** | | | | | | | |
| **EMO** | 0.699 | | | | | | |
| **HEM** | 0.577 | 0.718 | | | | | |
| **POH** | 0.548 | 0.497 | 0.512 | | | | |
| **POI** | 0.492 | 0.786 | 0.643 | 0.383 | | | |
| **SOI** | 0.618 | 0.83 | 0.697 | 0.512 | 0.677 | | |
| **WTU** | 0.814 | 0.67 | 0.592 | 0.594 | 0.488 | 0.619 | |

### 3.4. Common Method Bias

To address common method bias, rigorous techniques were applied. Harman's single-factor analysis assessed standard method variance, revealing no significant issue as no single factor explained over 50% of the variance (Podsakoff et al., 2003). Exploratory Factor Analysis (EFA) demonstrated adequacy for factor analysis with a high Kaiser-Meyer-Olkin (KMO) Index of 0.923 and significant Bartlett's test results (Chi-Square = 5234.060, df = 325, $p < 0.001$). Collinearity assessment, evaluating variance inflation factors (VIF), indicated no significant concerns, with VIF values below the recommended threshold of 3.30 (Kock, 2015). These measures confirm that common method bias did not impact the study's findings.

### 3.5. Results

#### 3.5.1. Hypothesis testing

Results strongly support the research model's proposed relationships (refer to Table 4). All seven hypotheses were statistically significant at the $p < 0.05$ level. Social Influence (SOI), Hedonic Motivation (HEM), Perceived Informativeness (POI), Perceived Humanness (POH), significantly and positively influenced Emotion (EMO), and Emotion (EMO) significantly and positively influenced ChatGPT Acceptance (CGA) and Willingness to Use ChatGPT (WTU). These findings align with prior studies and emphasize the importance of emotional engagement, perceived value, and trust in technology acceptance and continued usage behavior.

**Table 15. Hypotheses Testing**

| Hypotheses | Path | Original sample (O) | Standard deviation (STDEV) | T statistics (\|O/STDEV\|) | P values | Results |
|---|---|---|---|---|---|---|
| **H1** | SOI -> EMO | 0.322 | 0.067 | 4.788 | 0.000 | **Accepted** |
| **H2** | HEM -> EMO | 0.176 | 0.056 | 3.150 | 0.002 | **Accepted** |
| **H3** | POI -> EMO | 0.341 | 0.057 | 5.950 | 0.000 | **Accepted** |
| **H4** | POH -> EMO | 0.100 | 0.038 | 2.674 | 0.008 | **Accepted** |
| **H5** | EMO -> CGA | 0.574 | 0.045 | 12.723 | 0.000 | **Accepted** |
| **H6** | EMO -> WTU | 0.231 | 0.045 | 5.077 | 0.000 | **Accepted** |
| **H7** | CGA -> WTU | 0.557 | 0.050 | 11.210 | 0.000 | **Accepted** |

### 3.6. Discussion

This study investigated the factors influencing emotional engagement (EMO) with ChatGPT as a virtual travel agent and explores how this engagement influences user attitudes and behavioral intentions. The results shed light on user engagement dynamics with AI-driven technologies in virtual settings. The significant and positive relationship between social influence (SOI) and emotional engagement (EMO) supports H1, indicating that greater social pressure or endorsement enhances emotional involvement with ChatGPT. Hedonic motivation (HEM) positively influences emotional engagement (H2), emphasizing the role of pleasure in fostering attachment to technology. Perceived informativeness (POI) strongly impacts emotional engagement (H3), highlighting the importance of relevant information. While perceived humanness (POH) contributes to emotional engagement, its impact is less significant compared to social influence, hedonic motivation, and perceived informativeness. Emotional engagement is crucial in ChatGPT Acceptance (CGA), driving users' willingness to use the virtual agent (WTU). These findings align with existing research and reinforce the significance of emotional connections, perceived value, and trust in technology acceptance. The study underscores the pivotal role of emotional engagement in encouraging continued use of ChatGPT, emphasizing its utility, value, and relevance in travel-related tasks. Additionally, the study supports the notion that emotional engagement and trust are essential for AI acceptance, influencing users' willingness to adopt ChatGPT. Positive interactions with ChatGPT enhance acceptance and reliance in travel decision-making processes, reinforcing the link between ChatGPT Acceptance (CGA) and Willingness to Use ChatGPT (WTU). Users' favorable perceptions of ChatGPT's utility, ease of use, and personalized service contribute to increased confidence and satisfaction, driving

their willingness to integrate the technology into their travel-related decisions.

### 3.7 Implications and Future Research

The study's findings carry implications for AI-driven virtual agent design, especially in service sectors like travel. Social influence, hedonic motivation, perceived informativeness, and perceived humanness underscore the need for a holistic approach in virtual agent design to enhance user engagement. Features aligning with these factors, such as providing valuable information and creating enjoyable experiences, can deepen users' emotional connections with the technology. Emotional engagement's impact on attitudes (like gratitude) and behavioral intentions (like willingness to use) stresses the importance of cultivating positive user experiences for sustained engagement. Despite ChatGPT's potential benefits, several significant barriers impede its widespread implementation in tourism contexts. Research indicates that algorithmic errors pose a substantial challenge, with inaccurate information provided by ChatGPT significantly reducing users' reliance on its recommendations and diminishing their likelihood of visiting recommended destinations (Kim et al., 2023). The perceived accuracy and trustworthiness of information directly mediates user acceptance of AI recommendations, with the prominence of incorrect information serving as a critical moderating factor (Kim et al., 2023). Recent studies demonstrate that misleading responses stem from ChatGPT's lack of transparency regarding information sources, raising concerns about the authenticity and reliability of its outputs (Vu et al., 2024). Additionally, ChatGPT faces challenges in understanding complex or specialized domain questions relevant to tourism, limiting its utility for sophisticated travel planning. The system also struggles with maintaining updated knowledge in an industry where information changes frequently, requiring continuous knowledge base maintenance (Vu et al., 2024). Regarding personalization, ChatGPT must overcome the diversification of user needs, as travelers have highly individualized preferences requiring tailored recommendations. While ChatGPT can analyze dialogue data to provide personalized suggestions, its effectiveness varies across different user segments and cultural contexts. These implementation barriers necessitate strategic approaches, including rigorous data verification processes, specialized tourism knowledge integration, and advanced personalization algorithms to enhance user trust and engagement with AI-driven travel services. Future research avenues could explore variables like trust and personalization in emotional engagement, delve into cross-cultural differences in virtual agent engagement, and examine emotional engagement's link to satisfaction, loyalty, and advocacy for a more nuanced understanding of user behavior in tech-driven settings.

## IV. CONCLUSION

This study underscores the significant role of emotional engagement in shaping users' interactions with ChatGPT as a virtual travel agent. The findings provide valuable insights into how various factors—such as social influence, hedonic motivation, perceived informativeness, and perceived humanness—affect emotional engagement, which in turn influences users' attitudes and behavioral intentions. By enhancing emotional engagement, developers and organizations can foster greater user loyalty, satisfaction, and continued usage of AI-driven technologies.

# THE POTENTIAL FOR DEVELOPING AGRICULTURAL TOURISM LINKED TO GEOGRAPHICAL INDICATION AGRICULTURAL PRODUCTS IN TIEN GIANG PROVINCE

**Pham Thi Thu Yen[1]**

[1]Department of Geography, Ho Chi Minh City University of Education, Ho Chi Minh City, Viet Nam
Corresponding author: yenptt.dlho033@pg.hcmue.edu.vn

**ABSTRACT**

Tien Giang province, with its rich and diverse tropical fruit orchards, holds great potential in attracting tourists. Notably, two types of fruit have been granted Geographical Indication (GI) certification, not only well-known domestically but also recognized internationally, contributing to the influx of visitors. Agricultural products with GI not only enhance the diversity of goods and increase economic value but also open up new opportunities for local tourism development, with products closely tied to the unique characteristics of the region. Tourists visiting here can enjoy not only the natural beauty and cultural experiences along rural waterways but also local specialty products, prepared with the distinctive flavors of the area, making them an ideal choice for both consumption and souvenirs. This not only contributes to the sustainable economic development of the local area but also helps promote local tourism products and Vietnamese tourism to domestic and international visitors. Therefore, the article analyzes the potential for community-based tourism development linked to GI agricultural products and evaluates the strengths, weaknesses, opportunities, and challenges of this development. Based on this analysis, the article proposes several solutions to support the development of agricultural tourism linked with GI agricultural products, contributing to the growth and sustainable economic development of the local area through agricultural tourism activities.

*Key words:* “Agricultural Tourism”, “Geographical Indication”, “Tien Giang province”, “Agricultural Products”

## I. INTRODUCTION

Tien Giang is a province in the Mekong Delta region, known for its distinctive characteristics of the waterway region. It has an area of 2,510.5 square kilometers (as of 2023) and consists of 11 administrative units, including 2 cities (My Tho and Go Cong), 1 town (Cai Lay), and 8 districts (Cai Be, Tan Phuoc, Cai Lay, Chau Thanh, Cho Gao, Go Cong Tay, Go Cong Dong, and Tan Phu Dong). The province is renowned for its rich natural environment, with fruit orchards bearing fruit all year round, offering over 20 types of seasonal fruit. Additionally, Tien Giang attracts many tourists annually, especially international visitors, who come to experience community-based eco-tourism, agricultural tourism, visiting fruit orchards, and rowing traditional boats. This helps Tien Giang's tourism sector to grow steadily and is recognized as a key economic sector that brings in significant revenue.

Thanks to its natural resources, Tien Giang attracts many tourists, with international visitors making up the largest portion. This is a competitive advantage for the province's tourism development. With its unique features of the Mekong Delta and favorable conditions for tourism growth, combined with its advantageous geographical location about 70 km from Ho Chi Minh City, Tien Giang offers a convenient destination for tourists. One of the most popular types of tourism is community-based eco-tourism, particularly eco-tourism experiences in fruit orchards, which are highly preferred, especially in orchards with fruits typical of the province.

Tien Giang is home to two internationally recognized GI agricultural products: the Vinh Kim Lo Ren star apple and Hoa Loc mango. These products have high economic value, with a variety of offerings such as fresh fruits and processed products. GI agricultural products not only serve as the province's unique trademark but also offer high quality and significant economic value. These two tropical fruit species are grown throughout the Mekong Delta and neighboring areas. However, Tien Giang stands out as both the "birthplace" of these agricultural products and the region with a unique quality that cannot be found elsewhere. It is also designated as a specialized production zone with GI.

A typical example of combining agricultural tourism with GI agricultural products that has been successful in

several countries around the world is New Zealand, which is famous for its GI agricultural product: the kiwi fruit. In New Zealand, tourism has been developed around this GI agricultural product by creating tours that include visits to kiwi orchards, where visitors can learn about the cultivation and harvesting of Kiwi. In addition, tourists can also experience and purchase kiwi-based products such as juice, jam, and ice cream as souvenirs. Similarly, in Greece, the thyme honey from Crete Island is a GI product that has been successfully developed for tourism. Tourists visiting Crete can join tours to visit beekeeping farms on the island, where they can learn about bee farming, honey production, and the health benefits of thyme honey. Moreover, visitors can also enjoy tasting various types of honey and honey-based products.

With the rapid development of agricultural tourism, especially community-based agricultural tourism tied to fruit orchards with GI, Tien Giang's tourism sector is seeing considerable growth. The development of GI agricultural products brings high economic efficiency, and the integration of tourism with these products in the designated GI areas is a promising direction for further growth.

## II. MATERIAL AND METHOD

### 2.1. Material

#### Conceptual Foundation

The article has used secondary data from statistics in localities that are producing and have been certified for GI, sourced from the Department of Agriculture and Rural Development of Tien Giang Province, as well as relevant departments such as the Agriculture and Rural Development Divisions of Cai Be, Cai Lay, and Chau Thanh districts, and the Economic Division of My Tho City, Tien Giang Province.

In addition, the author has also used data collected from surveys and interviews with local farmers who produce GI agricultural products, as well as feedback from both domestic and international tourists, to compile the statistical data.

#### Research focus

The article focuses on researching agricultural tourism in Tien Giang province, with an emphasis on the potential for developing agricultural tourism in combination with the province's GI agricultural products. From this, the article provides orientations and solutions to help develop GI agricultural products alongside tourism, aiming to generate additional income for residents in the regions where these GI agricultural products are produced.

### 2.2. Method

*Field survey method:* Throughout the research process, the author spent time visiting localities in the GI areas to conduct field surveys in 16 specialized communes growing Vinh Kim Lo Ren star apples in the districts of Chau Thanh, Cai Lay, and My Tho City, and 13 communes growing Hoa Loc mangoes in Cai Be district, Tien Giang province. The survey focused on locations where local people actively participate in agricultural tourism. Through these field visits, the author gained a more practical understanding, allowing for objective observations about agricultural products from theoretical concepts to real production processes.

*Data Collection and Processing Methods:* During the research process, the author visited various government departments to collect relevant information and statistical data related to the study, such as data on the area and yield of GI agricultural products, tourist numbers, and agricultural tourism sites within the study area. This data was then compiled and processed for use as illustrative figures, ensuring the research was more scientifically grounded. By utilizing official data sources, the author was able to propose solutions based on solid evidence to further develop the subject.

*Sociological Survey Method:* This method was chosen by the author for statistical purposes, using questionnaires to collect primary data that reflects the reality in the study area. The survey targets were tourists, owners of agricultural tourism sites growing GI crops, and establishments involved in processing GI agricultural products. The survey focused on the production status of GI agricultural products, tourist arrival figures, accommodation facilities, and agricultural tourism activities. The geographical area for the interviews was concentrated on the agricultural regions in four districts: Chau Thanh, Cai Lay, My Tho City, and Cai Be. The sample selection formula was based on Cochran's formula (Cochran, W.G, 1977), considering the number of households growing GI agricultural products and those

participating in tourism services. A total of 84 questionnaires were distributed in the area producing Vinh Kim Lo Ren star apple, 95 in the area producing Hoa Loc Mango, and 35 surveys were conducted with tourists. This primary data provided the author with a realistic foundation for the study, ensuring its relevance and practical application.

*Mapping method:* The author created maps to visually represent the distribution areas and factors affecting the production of GI agricultural products in the geographical areas for both types of agricultural products, helping to illustrate spatial distribution more clearly.

*SWOT analysis method:* The author analyzed the strengths, weaknesses, opportunities, and challenges of factors influencing the production of GI agricultural products in Tien Giang province. Based on this analysis, the author offered objective recommendations and solutions to help develop GI agricultural products in the province.

## III. RESULT AND DISCUSSION

### 3.1. Result

**– Factors Affecting the Development of Agricultural Tourism Linked with GI-certified Agricultural Products in Tien Giang Province:**

*Geographical Location:*

The Vinh Kim Lo Ren star apple is grown in the geographical area corresponding to the GI certification in Chau Thanh district, including 12 communes: Nhi Binh, Duong Diem, Dong Hoa, Huu Dao, Long Hung, Binh Trung, Thanh Phu, Ban Long, Vinh Kim, Song Thuan, Kim Son, Phu Phong (Department of Agriculture and Rural Development of Chau Thanh District, 2023); Phuoc Thach commune in My Tho City (Economic Department of My Tho City, Tien Giang Province, 2023); and Cai Lay district with three communes: My Long, Long Tien, Tam Binh (Department of Agriculture and Rural Development of Cai Lay District, 2023).

The Hoa Loc mango is grown and certified in 13 communes in Cai Be district, including Hoa Hung, An Huu, An Thai Trung, Tan Hung, Tan Thanh, My Luong, An Thai Dong, My Duc Tay, My Duc Dong, Thien Tri, Hoa Khanh, Hau Thanh, My Loi A.

*Natural Tourism Resources:*

Topography: The area has easy drainage and high, flat land that is ideal for growing a variety of tropical fruits, including the Vinh Kim Lo Ren star apple and Hoa Loc mango, which are well-known for their unique quality in the market. These fruits are grown in areas with elevated soil ridges and annually receive rich alluvial deposits.

Climate: The Vinh Kim Lo Ren star apple and Hoa Loc mango thrive in temperatures around 27,9°C, with humidity at 79,2% and annual rainfall between 1200 - 1450mm. From June to November, these plants require large amounts of water as this is a critical period for accumulating nutrients such as acids, sugar, and vitamin C. From December to May of the following year, the trees need less water to preserve the fruit quality as they approach harvest, which coincides with the dry season. Additionally, the southwest monsoon winds from May to October align with the flowering and pollination periods, facilitating fruit development.

Water Resources: Consistent irrigation is vital for the growth of Vinh Kim Lo Ren star apple, which require abundant water while also needing good drainage to prevent root rot.

*Tourism Resources:*

Tien Giang is known for its diverse fruit orchards, offering different fruits each season. The Vinh Kim Lo Ren star apple is harvested around November to January, and the Hoa Loc mango is harvested around February to March. However, thanks to advancements in science and technology, farmers have learned to manage off-season flowering and fruiting, providing additional opportunities for economic growth, including tourism. The province also boasts over 20 different types of fruits, ensuring that tourists can visit frequently to experience new products.

With the development of the "One Commune, One Product" (OCOP) program, many local products, including GI agricultural products, have been further promoted. By 2022, the program had expanded to 174 products in the province, with 94 products achieving a 4-star OCOP certification.

*Cultural Tourism Resources:*

Tien Giang has a long history of cultivating Vinh Kim Lo Ren star apple and Hoa Loc mango. The area has extensive cultivation and a wealth of local expertise in producing high-quality fruits.

In addition to natural tourism attractions, there are several cultural landmarks in the GI regions. For the Vinh Kim Lo Ren star apple, the key cultural tourism sites include Vinh Trang Pagoda, the Rach Gam – Xoai Mut historical site, Ap Bac historical site, the Four Heroes Memorial, and the memorial of writer Son Nam. These sites are also well-connected to famous tourist routes, such as the Tu Linh islets on the Tien River (MeKong River), enhancing tourism development in the area through agricultural activities.

The area growing Hoa Loc mango in Cai Be is also home to fertile fruit orchards with opportunities for eco-tourism. Additionally, Cai Be boasts cultural landmarks like the Cai Be Floating Market and the Dong Hoa Hiep ancient village. These locations can be integrated into a diverse tourism offering, attracting visitors and encouraging them to stay overnight.

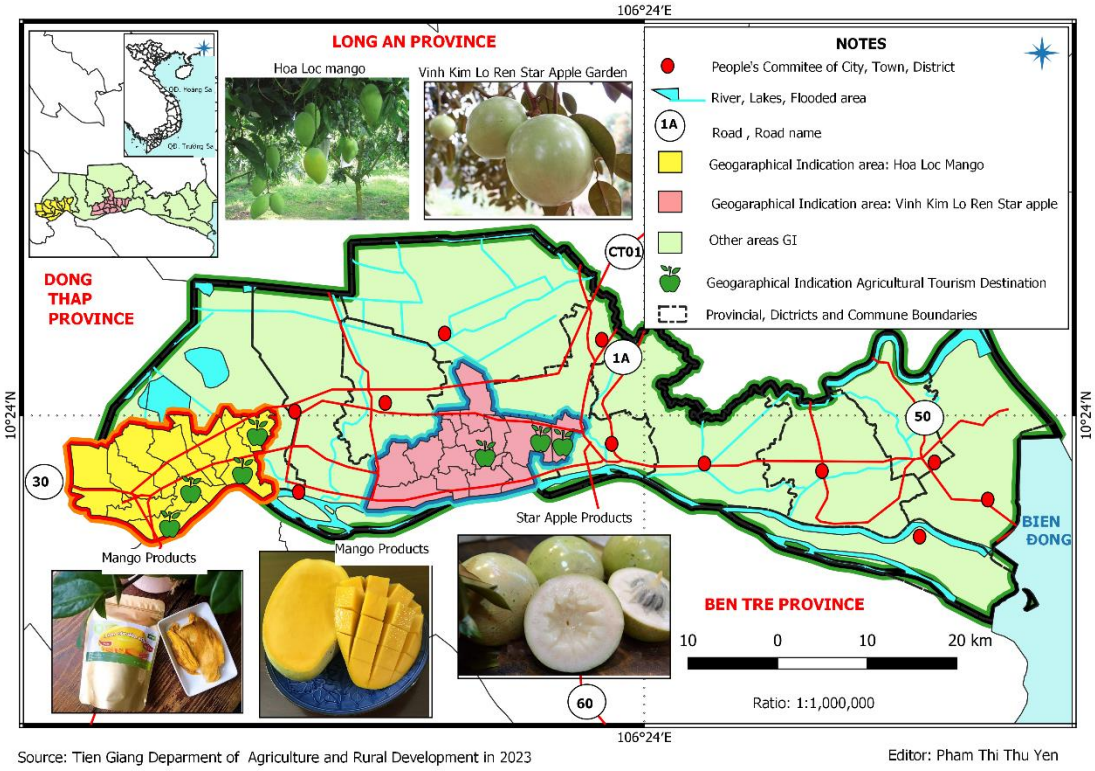

**Figure 2.1: Map of Potential for Developing Agricultural Tourism Linked with GI-certified Agricultural Products in Tien Giang Province in 2023**

The geographical areas where GI agricultural products are distributed in Tien Giang province are strategically located along the main stretch of National Highway 1A, providing convenient access for tourism development. Additionally, the GI products offer a unique advantage in terms of branding and product quality, which draws visitors seeking to experience local "specialties." Beyond the orchards of these two GI agricultural products, the area also offers a variety of crops, adding diversity to the range of products for tourists. Furthermore, local farmers and cooperatives have developed strongly in processing fresh GI agricultural products, allowing visitors to sample and purchase these items as souvenirs, thus enhancing the promotion of the product's brand.

– **Current Status of Agricultural Tourism Linked with GI Agricultural Products in Tien Giang Province**

Evaluation of the potential of agricultural tourism activities associated with GI agricultural products in Tien Giang province shows that localities in the GI area have a lot of development potential. It shows that the 5 criteria that the author gave for the survey all received positive feedback, in which the factor of local community achieved a perfect score, followed by the criteria of location and accessibility. Ranked 3rd is attractive tourism products, 4th is tourism safety and the final factor is infrastructure.

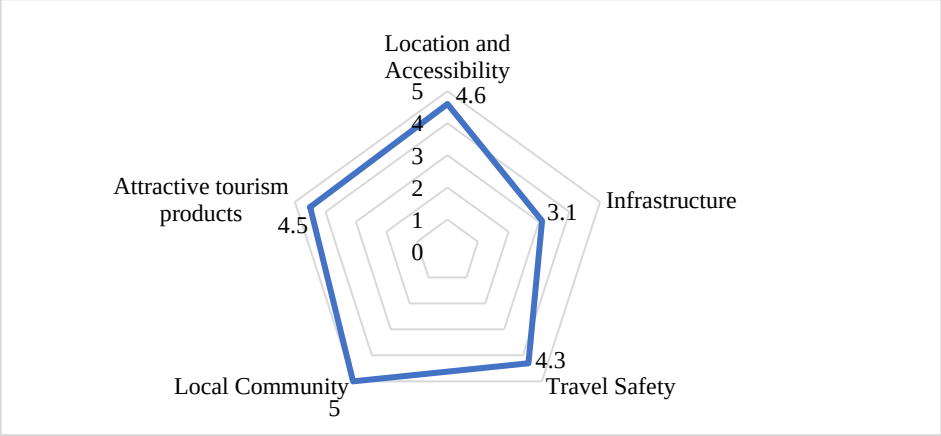

**Chart 2.1: Tourist Evaluation of the Appeal of Tourism Resources in the GI Areas of Two Agricultural Products**

*Source: Analysis from the author's survey*

The distinctive tourism products exclusive to the GI regions have made it a popular destination for tourists who come mainly to enjoy the local specialties. Many visitors also choose this area for relaxation, seeking harmony with nature after a period of work or study. Additionally, numerous tourists are drawn to the opportunity to explore the pristine landscapes while engaging in hands-on experiences with local farmers, participating in agricultural activities. This form of experiential tourism is particularly favored by international visitors.

This highlights the strong appeal of the area, driven by its unique tourism offerings, the ability to connect with nature, and opportunities for interactive learning experiences that attract both local and international tourists.

| Tourist Activity | Frequency | Percentage (%) |
|---|---|---|
| Exploring natural landscapes | 4 | 11.4 |
| Tasting local specialties | 13 | 37.1 |
| Experiencing activities with farmers | 5 | 14.3 |
| Relaxation activities | 7 | 20.0 |
| Other activities | 6 | 17.1 |

**Table 2.1: Tourist Activities When Visiting the GI Agricultural Product Areas**

**– SWOT Analysis on the Potential for Developing Agricultural Tourism Linked with GI Agricultural Products in Tien Giang Province**

| | Strengths (S) | Weaknesses (W) |
|---|---|---|
| **SWOT** | -Natural conditions and socio-economic conditions are favorable for the development of many types of tourism<br>- Hoa Loc mango and Vinh Kim Lo Ren star apple are of high quality, certified for international GI in the GI area<br>- Long-standing growing area, specialized farming area, with unique local characteristics<br>- Meets Global Gap standards, famous product brands, diverse processed products, 4-star OCOP<br>- Close to other tourist destinations<br>- Flowers and fruits have been processed out of season, so they will be available to | -Weather and climate affect quality and productivity, especially during the flowering and pollination stages<br>- There are not many standard accommodation facilities to serve tourists<br>- The route has not yet exploited its full tourism potential in the geographical indication area<br>- People mainly work in agriculture and have no experience in the tourism field<br>- Depends on the geographical indication agricultural product |

| | | |
|---|---|---|
| | serve customers all year round<br>- Diverse agricultural products in designated areas | harvest time |
| | **Opportunities (O)** | **Threats (T)** |
| | -Agricultural policy on developing Hoa Loc mango and Vinh Kim Lo Ren star apple varieties<br>-OCOP program aims to diversify products made from Hoa Loc mango and Vinh Kim Lo Ren star apple to serve the product shopping needs of tourists.<br>- Large international visitors, demand for eco-tourism and experiences<br>- There are other seasonal agricultural products year-round to help diversify products<br>- Highly competitive, with unique characteristics only in geographical areas | - Customer demand for accommodation is still limited<br>- There are not many standard storage facilities to serve customers<br>- Not enough conditions to meet the requirements regularly, still depends a lot on the service season |
| **SO** | **ST** | **SW** |
| -Promoting the strengths of growing Hoa Loc mango and Vinh Kim Lo Ren star apple in specialized farming areas in geographical areas<br>- Maintain brand value, expand markets, especially international markets<br>- Brand promotion, Distinctive characteristics of local agricultural products<br>-Create opportunities to develop more products processed from Hoa Loc mango and Vinh Kim Lo Ren star apple achieving OCOP standards. | -Prevent pests and diseases, handle out-of-season flowering and fruiting with the application of science and technology"<br>- Maintain quality and brand<br>-Diversity of processed products Processed from agricultural products GI<br>-Combining other local agricultural products<br>- Invest in accommodation facilities, build more combined tourist routes in the province and region | -Promoting the brand of Hoa Loc mango, Vinh Kim Lo Ren star apple and products achieving OCOP<br>-Increase planting area in geographical areas<br>-Construction of equipment and accommodation facilities<br>- Training for farmers in implementing agricultural tourism<br>- Combine with localities to develop tourism inside and outside the province, and travel companies |
| **WO** | **WT** | **OT** |
| -Regularly use measures to improve the garden, cover fruit, treat flowers, and create off-season fruit for visitors to experience.<br>-Establish a large model garden, combining with surrounding households that have other types of agricultural products<br>-Build accommodation facilities in the garden for guests to experience | -Apply techniques, food safety and hygiene, Gap standards<br>-Invest in equipment to serve tourists<br>-Diverse agricultural tourism models | - Maintain the quality of Hoa Loc mango and Vinh Kim Lo Ren star apple products<br>- Identify customers to build models that suit customer needs<br>-Application of science and technology to increase product preservation time |

*Source: Analysis by Author*

**Table 2.2: SWOT Analysis on the Potential for Developing Agricultural Tourism Linked with GI Agricultural Products in Tien Giang Province**

– **Evaluate factors affecting the development of agricultural tourism associated with geographically indicated agricultural products**

*Favorable:*

Agricultural tourism associated with the geographical indications of agricultural products in Tien Giang province has great development potential. With its favorable geographic location, it offers advantages for development, being situated at the gateway to the Mekong Delta, which attracts tourists and facilitates tourism links with other provinces in the region, as well as with the Southeast region.

The transportation system is convenient, with both GI products located along National Highway 1A. Additionally, there are new expressways running north-south, such as the Ho Chi Minh City – Trung Luong expressway, Trung Luong – My Thuan expressway, and the My Tho port, which welcomes a large number of international visitors.

Tien Giang boasts a rich and diverse range of tourist resources. The region's flat terrain offers distinctive local features, with a relatively pristine and clean natural environment that is ideal for tourists seeking relaxation and experiencing the simple life of the local people.

Tien Giang is the birthplace of many historical and cultural sites, traditional craft villages, and various unique festivals, which create distinctive tourism products to attract visitors, especially international tourists. The province's cuisine is diverse, with specialties such as My Tho noodle soup, Vietnamese pancakes, fish hotpot, and a variety of tropical fruits, drawing tourists eager to explore. The local community is friendly, hospitable, and generous, with a high sense of community, solidarity, and a willingness to assist visitors.

*Hard:*

The human resources for the development of agricultural tourism in the GI areas are lacking in both quantity and quality. Most people involved in tourism have not received formal training or professional development in skills, expertise, or foreign languages, and lack experience.

The promotion and advertising of tourism spots related to GI agricultural products in the local area have not been adequately focused on. There have been no programs introducing the development of tourism linked to the province's GI agricultural products through media channels, leading to limited awareness among tourists, especially international visitors.

Tourism products in the GI areas lack diversity and are still largely spontaneous. The tourism offerings are too monotonous and lack a long-term strategic development plan. The integration of tourism development in these areas with more developed tourist routes has not been effective. The potential to combine these routes with GI agricultural tourist spots has not been fully exploited.

In terms of infrastructure, the technical facilities serving tourism in GI agricultural areas do not meet the required standards to accommodate the increasing demands of tourists.

The planning for tourism development in GI areas is slow, leading to spontaneous development. There is a lack of connection between the managing authorities, businesses, and the community, preventing effective collaboration in tourism development.

**3.2. Discussion**

Through the research process, the author has recognized that Tien Giang possesses many conditions for developing tourism based on GI agricultural products. However, the development has not yet been effective. Therefore, the author offers several recommendations regarding the potential for developing agricultural tourism linked to GI products in Tien Giang to highlight the importance of GI products in tourism development, aiming for more effective strategies. Specifically, the following points are made:

***Distinctive Features of Tourism Resources in GI Areas:*** Tien Giang is home to two agricultural products - Vinh Kim Lo Ren star apple, which was granted international GI certification in 2014, and Hoa Loc mango, which was certified in 2009. These certifications create a unique identity for Vietnamese agricultural brands on the global market. To earn GI certification, these products undergo a thorough evaluation process and must meet international criteria, particularly being certified within a specific geographical area where quality assessments are conducted. This

distinctive feature provides advantages for the products' development in both domestic and international markets. Additionally, Tien Giang has various opportunities to further enhance local tourism development.

***Natural Tourism Resources:*** The region is well-equipped to develop agricultural tourism, especially in combination with GI agricultural products. Its geographic location is extremely advantageous for developing tourism routes, particularly linking with other provinces in the Mekong Delta. The area embodies the unique characteristics of the Mekong Delta, with its flat terrain, dense river systems, and numerous winding canals, offering visitors a rich, immersive experience. The equatorial monsoon climate makes it suitable for year-round tourism, with a diverse array of tropical and equatorial agricultural products, in which the two GI products stand out.

***Cultural Tourism Resources:*** In addition to GI resources based on natural conditions, Tien Giang has maintained the reputation of its agricultural products through the traditional farming techniques of local people, with long-standing knowledge and experience. Moreover, the region features several cultural tourism sites that contribute to diversifying the range of attractions and experiences for visitors.

*Development Strategy:* The local area possesses the conditions necessary for tourism development, with a distinctive feature being GI agricultural products that are unique to specific regions within Tien Giang province. Therefore, government departments need to capitalize on these advantages to fully unleash the local potential. This can be done by building infrastructure to support tourism, designing specialized tourism programs such as visiting GI agricultural product orchards, experiencing farming practices for GI agricultural products, organizing agricultural festivals, and holding agricultural product fairs with OCOP products. Furthermore, community-based tourism in the GI regions should be developed, and additional GI certifications for other local agricultural products should be pursued. However, it is also crucial to identify potential risks to address them promptly and find solutions to maximize effectiveness. These risks may include the seasonality of agricultural products, pest and disease outbreaks during production, and the preservation of agricultural products, among others.

### 3.3. Solution

Based on the recommendations, the author proposes several solutions to contribute to the development of tourism from GI agricultural products in Tien Giang Province, specifically as follows:

*Policies*

This is the most important solution for developing tourism, including agricultural tourism. When local authorities implement timely and appropriate policies, the execution and development of tourism can be more effective. Issuing mechanisms and policies that encourage socialized investment in building tourism sites within GI regions, linked to sustainable livelihoods, is crucial. The continuation of the development project for key fruit trees initiated by the Tien Giang provincial government, in collaboration with the Department of Tourism, is essential for local tourism development. It is also necessary to organize workshops on agricultural promotion and tourism linked to local products, to guide and support farmers in applying modern scientific and technological techniques in cultivating GI agricultural products, ensuring a sufficient supply of tourism products. Furthermore, there should be close coordination between various departments, especially the Department of Culture, Sports, and Tourism, the Department of Agriculture and Rural Development, and local agricultural offices that manage GI agricultural products, to integrate tourism development with GI agricultural products. Moreover, it is essential to have supportive policies regarding capital, seedlings, local enterprises, and promoting local tourism products. Specific policies and regulations are needed to protect farmers in their production activities, ensure stability in the area cultivated, create conditions for enterprises to diversify processed products, and allow farmers to confidently expand production and business activities. These policies will also help in marketing and promoting local tourism products to attract both domestic and international tourists.

*Capital*

Financial support is an urgent solution for local people to invest in accommodation facilities and entertainment spots to attract tourists and encourage overnight stays, contributing to increasing local tourism revenue. Encouraging and supporting local people to participate in tourism development from agricultural activities. It is necessary to encourage people to invest in tourism development, such as establishing homestays, fruit orchards combined with tourism, product processing, and souvenirs, through specific regulations on financial support and preferential loans for

agricultural development investment.

*Human resources*

Training human resources to serve local tourism, especially in mountainous communes and districts of the province. Open tourism training classes for local people to participate and learn how to do tourism, especially in geographically designated areas. Strengthen propaganda work to raise awareness about tourism for leaders, managers and people at all levels to help officials and people be properly aware of the potential and advantages of local tourism and its role. its responsibility for tourism development.

*Infrastructure, cooperation and linkages*

Increase investment in developing infrastructure and technical facilities to serve tourism: take advantage of central and provincial resources to focus on investing in perfecting infrastructure, especially infrastructure. Accommodation, restaurants, entertainment facilities, resorts... in accordance with local needs and development orientation.

*Promotion and development of tourism markets and products*

Create and enhance the province's tourism image through professional and diversified promotion and advertising programs. Information is promoted in locations with a large number of tourists such as Cu Lao Thoi Son tourist destination, My Tho city, Dong Hoa Hiep ancient village,...

## IV.CONCLUSION

The research results show that agricultural tourism associated with GI agricultural products has significant development potential. However, the development of tourism linked to these two agricultural products has not been adequately prioritized for effective growth. Among the factors influencing tourism development, both natural elements and socio-economic factors, combined with the distinct quality of the GI products, provide advantages for development. In addition to promoting the main agricultural products of the two GI, integrating tourism development is also an opportunity for the local area to further grow and contribute to diversifying the province's tourism offerings, while meeting the demand of tourists interested in exploring the concept of "geographical indications" in agricultural products.

The two agricultural products, Vinh Kim Lo Ren star apple and Hoa Loc mango, have great potential for development because they are the "birthplaces" of these products, with large cultivation areas, supplying seeds to other regions, producing the highest quality products, and being key agricultural products in the provincial reorganization plan. These areas possess all the elements needed to develop tourism. However, tourism development in the GI areas of these two agricultural products has not yet been sufficiently addressed. Therefore, the author has chosen to research these areas to identify their development potential and propose solutions for advancing tourism in the GI regions, contributing to sustainable local economic growth.

# THE IMPACT OF ARTIFICIAL INTELLIGENCE ON PERSONALIZED SUSTAINABLE TOURISM EXPERIENCE: THE MEDIATING ROLE OF REALIZING THE SUSTAINABILITY OF TRAVELERS

**Doan Thi Bich Thu[1]*, Le Quoc Hong Thi[2], Duong Thi Xuan Dieu[3]**

[1]Faculty of Economics - Management, Dong Nai Technology University
[2]Faculty of Business Administration, Sai Gon University
[3]Duy Tan University, Da Nang City
*Corresponding: doanthibichthu@dntu.edu.vn

**ABSTRACT**

This study analyses the impact of artificial intelligence (AI) on personalized and realizing the sustainability of travelers (PDE), as well as the mediating role of realizing the sustainability of travelers (RST). Using the least squares structure equation model (PLS-SEM), this study analyzed data from 436 travelers who employed AI technology in tourism. The findings indicate that AI not only directly positively influences PDE, STB, and STE but also indirectly through RST. RST plays a significant role in promoting the personalization of sustainable experiences and environmentally responsible behaviors. The research findings provide valuable implications for managers and businesses in leveraging AI to enhance sustainable travel experiences while promoting responsible behavior among travelers.

*Key words:*Artificial Intelligence (AI), Realizing the Sustainability of Travelers (RST), Sustainable Travel Experience Personalization (PDE), Sustainable Travel Behavior (STB), Travel Experience Satisfaction (STE)

## I. INTRODUCTION

The tourism industry is undergoing a significant transformation owing to advancements in AI technology. AI applications, such as chatbots, intelligent recommendation systems, and big data analytics, not only enhance service efficiency, but also provide personalized experiences for visitors (Yang, Zhang, & Feng, 2024). Concurrently, within the context of increasing emphasis on sustainable development, AI plays a crucial role in promoting sustainable awareness and behavior among travelers, thereby contributing to environmental conservation and supporting local communities (Zheng & Wu, 2023; Koo et al., 2024).

Although AI has demonstrated its efficacy as an advanced tool for optimizing services and encouraging sustainable behavior (Koo et al., 2024; Zheng & Wu, 2023), the tourism industry continues to face numerous challenges related to minimizing the negative environmental impacts and developing local communities. In this context, AI can play a significant role in personalizing travel experiences, enhancing travellers' awareness of sustainable values, and encouraging engagement in eco-friendly activities (Majid et al. 2024; Yang et al. 2024).

Previous research has indicated that personalizing the travel experience through AI recommendations not only enhances engagement but also creates a more relevant connection for travelers with sustainable journeys (Yang, Zhang, & Feng, 2024). RST is considered a critical factor influencing satisfaction (STE) and sustainable tourism behavior (STB) (Xu et al., 2024; Pai et al., 2020). Furthermore, smart travel technologies not only enhance the convenience and quality of the experience but also create long-term value for both visitors and destinations (Srivastava & Shandilya, 2024). Although numerous studies have demonstrated AI's capacity to raise awareness and promote sustainable behavior (Majid, Tussyadiah, & Kim, 2024), there remains a gap in understanding how cognitive factors such as RST function as intermediaries in the relationship between AI and sustainable tourism outcomes. Zheng and Wu (2023) also emphasized that, while AI technologies have driven the perception of sustainable value, the specific impact of this perception on the personalization of the experience and sustainable behavior of travelers has not yet been elucidated.

This study aims to address these gaps by examining the mediating role of RST in the relationship between AI and sustainable tourism-related outcomes, including PDE, STB, and STE. Additionally, this study expands the understanding of the synergy between AI technology and personal awareness in achieving sustainability goals, thereby

providing important implications for the tourism industry. With a novel approach and rigorous theoretical framework, this research not only contributes to filling academic gaps, but also provides significant practical recommendations for sustainable tourism development based on the integration of technology and visitor awareness.

## II. MATERIAL AND METHODOLOGY

### 2.1. Related concepts

**Artificial Intelligence (AI):** Artificial Intelligence (AI) is a field of computer science dedicated to developing systems capable of simulating human intelligence, including learning, reasoning, pattern recognition, natural language processing, and decision-making (Russell & Norvig, 2021). AI can be classified into two main categories: narrow and general AI. Narrow AI consists of systems designed to perform specific tasks, such as travel chatbots, personalized recommendation systems, or voice recognition technologies (Zheng & Wu, 2023). In contrast, General AI has the potential to learn and perform multiple complex tasks like humans but has not yet been fully developed (Ku & Chen, 2024). In the tourism sector, AI plays a crucial role in optimizing services, personalizing customer experiences, and fostering awareness and sustainable travel behavior through tools such as chatbots, big data analytics, and intelligent recommendation systems (Majid, Tussyadiah, & Kim, 2024). One of AI's most significant contributions to tourism is its ability to personalize the traveler's experience. By analyzing user data, AI can provide recommendations tailored to individual preferences, thereby enhancing overall travel experience. For instance, AI-powered systems can suggest eco-friendly destinations based on travelers' search histories and preferences (Yang, Zhang, & Feng, 2024). Additionally, AI provides detailed insights into sustainable tourism activities, contributing to the enhancement of travelers' awareness of environmental protection and local cultural preservation (Suanpang and Pothipassa, 2024). Beyond personalization, AI also enhances traveler satisfaction by creating seamless experiences, optimizing services, and improving the operational efficiency of destinations (Srivastava and Shandilya 2024). Furthermore, AI contributes to smart tourism management by forecasting travel trends, optimizing visitor flows, and supporting sustainable destination management strategies (Koo et al., 2024).

**Personal travel experience:** Personal travel experiences encompass the activities and perceptions an individual experiences when engaging in trips for leisure, exploration, or relaxation. According to the Vietnam Tourism Law of 2005, a tourist is defined as 'a person who travels or combines travel, except in cases of study, work, or practicing a profession for income at the destination' (Vietnam Tourism Law, 2005). This definition emphasizes that personal travel experience not only involves geographical relocation, but also encompasses the interactions, emotions, and perceptions that an individual acquires throughout the journey. Furthermore, the Vietnamese Encyclopedia (1995) defines tourism as "a form of human recreation and active sightseeing outside the place of residence with the purpose of resting, entertaining, and visiting scenic spots, historical sites, and cultural and artistic works." This definition indicates that personal travel experiences involve participation in activities aimed at relaxation, entertainment, and the expansion of cultural knowledge. Consequently, personal travel experiences can be conceptualized as a combination of activities, emotions, and perceptions that an individual experiences when departing from their usual place of residence to engage in tourism activities for purposes unrelated to work or study.

### 2.2. The impact of artificial intelligence on personalized sustainable tourism experience

Artificial Intelligence (AI) has transformed the tourism industry by enhancing personalization and promoting sustainable travel experiences. Through AI-driven technologies, such as chatbots, big data analytics, and recommendation systems, tourism enterprises can provide tailored experiences that align with both traveler preferences and sustainability objectives. This section analyzes the impact of AI on personalized sustainable tourism experiences by examining its role in enhancing personalization, influencing sustainable tourism behavior, and improving traveler satisfaction.

AI and Personalization in Sustainable Tourism: AI significantly enhances the personalization of sustainable tourism experiences by leveraging data analytics and machine learning to understand traveler preferences. AI-driven recommendation systems analyze user behavior, past travel history, and environmental preferences to suggest eco-friendly accommodations, sustainable travel routes, and cultural activities that align with responsible tourism practices (Yang, Zhang, & Feng, 2024). The capacity to provide personalized recommendations enhances traveler engagement

and increases the likelihood of adopting sustainable tourism behaviors (Majid, Tussyadiah, & Kim, 2024). Furthermore, AI-powered chatbots and virtual assistants offer real-time support, assisting travelers in making informed decisions regarding sustainable tourism options (Srivastava & Shandilya, 2024). These systems improve the efficiency of service delivery, while promoting sustainability awareness. AI also optimizes travel itineraries by suggesting routes with lower carbon footprints, reducing inefficient travel, and encouraging the use of public transportation or eco-friendly travel options (Koo et al., 2024).

AI's influence on sustainable tourism behavior: Artificial Intelligence (AI) promotes sustainable tourism behavior by increasing awareness and guiding travelers towards responsible choices. Through AI-powered platforms, travelers receive personalized recommendations that encourage eco-friendly accommodations, ethical tourism activities, and low-emission transportation alternatives (Zheng & Wu, 2023). AI systems also educate tourists on the environmental impact of their travel decisions, encourage behaviors that minimize carbon footprints, and support local communities (Xu et al., 2024). A significant contribution of AI in sustainable tourism is its role in predictive analytics. By analyzing patterns in tourism demand, AI assists businesses in optimizing resources, reducing overtourism, and implementing sustainable strategies (Ku & Chen, 2024). For instance, smart tourism technologies can distribute visitors across multiple locations to prevent congestion at popular sites, ensuring a more sustainable travel experience (Ghesh, Alexander, & Davis, 2024). Additionally, AI contributes to sustainable tourism marketing by targeting eco-conscious travelers and promoting sustainable tourism products. AI-powered platforms can tailor advertisements to travelers interested in sustainability, increasing their engagement with green tourism initiatives (Bedu et al., 2024).

AI and Traveler Satisfaction in Sustainable Tourism: AI enhances traveler satisfaction by improving the efficiency and quality of sustainable tourism experience. Smart AI-driven systems provide seamless booking experiences, instant travel assistance, and tailored recommendations, leading to higher satisfaction levels among eco-conscious tourists (Torabi et al. 2024). AI also improves the accessibility of sustainable tourism by offering multilanguage support, real-time updates, and customized itineraries that cater to diverse traveler needs (Suanpang & Pothipassa, 2024). Furthermore, AI-powered customer feedback systems can assist tourism providers in enhancing service quality. By analyzing traveler reviews and sentiment analysis, AI identifies areas for improvement, ensuring that sustainable tourism services meet travelers' expectations (Xu et al., 2024). This real-time adaptability strengthens the relationship between travelers and sustainable tourism businesses, fostering long-term engagement and repeat visits. Studies indicate that AI contributes to a more memorable tourism experience by providing interactive and immersive travel services such as augmented reality (AR) and virtual reality (VR) experiences that highlight cultural and environmental conservation efforts (Khan, 2024). This technology-driven approach increases travelers' engagement with sustainability initiatives while enriching their overall travel experience.

Challenges and Future Prospects of AI in Sustainable Tourism: Despite its advantages, AI in sustainable tourism faces challenges including ethical concerns, data privacy issues, and the digital divide between technologically advanced and developing tourism markets (Al-Romeedy & Alharethi, 2024). There is a need for responsible AI governance to ensure transparency in AI recommendations and to prevent biases that may favor commercial interests over genuine sustainability efforts (Tavitiyaman et al., 2021). The integration of AI with emerging technologies such as the Internet of Things (IoT) and blockchain can further enhance the personalization of sustainable tourism experiences. IoT-enabled smart destinations can provide real-time sustainability insights, whereas blockchain can enhance transparency in eco-tourism practices (Suanpang & Pothipassa, 2024). Continued research is essential to optimize AI's role of AI in promoting responsible tourism while addressing ethical and technological challenges.

### 2.3. Research hypothesis

#### 2.3.1. Artificial Intelligence - AI

AI has emerged as a crucial tool in the travel industry, offering the capability to personalize experiences, optimize services, and promote sustainable travel behavior through systems such as chatbots, data analytics, and other intelligent solutions (Zheng & Wu, 2023; Yang et al., 2024). AI can be categorized into various forms, including narrow AI designed to perform specific tasks, and strong AI (general AI), which is capable of learning and multitasking in a manner analogous to human cognition (Russell & Norvig, 2021). AI is defined as the field of research and application

of technologies that simulate human cognitive abilities, including learning, thinking, and decision making through computer systems.

In economic sectors, particularly the tourism industry, AI plays a significant role in disseminating information related to sustainable practices, thereby enhancing tourist awareness of the importance of sustainable tourism behavior. According to Koo et al. (2024), transparency in how AI technologies deliver sustainable value is a critical factor in shaping customer perception. Similarly, Zheng and Wu (2023) assert that AI-based smart travel technologies not only provide convenience, but also promote awareness of sustainable values through effective solutions. AI facilitates the personalization of travel experiences by analyzing individual preferences and optimizing suggestions based on user behavior (Yang et al., 2024). This enhances the interaction and sense of relevance of visitors for sustainable journeys. Concurrently, the integration of AI with IoT has created a more sustainable travel experience environment, particularly for smart destinations (Suanpang and Pothipassa, 2024). AI promotes sustainable behavior among tourists through applications that suggest eco-friendly activities. Majid et al. (2024) emphasize that AI chatbots have the potential to motivate customers to adopt sustainable travel habits by providing clear information and encouraging specific actions. Khan (2024) notes that AI increases travelers' engagement and sense of responsibility in sustainable religious practices. AI contributes to improving traveler satisfaction through service optimization and timely information provision. Srivastava and Shandilya (2024) posit that intelligent AI technologies enhance the convenience and overall quality of the traveler experience. Similarly, Torabi et al. (2024) demonstrated that AI could enhance memorable experiences and customer satisfaction, particularly in the context of rural tourism. AI is a powerful tool that not only raises awareness and promotes sustainable behavior but also significantly improves the quality of experience and satisfaction of travelers, contributing to the development of sustainable tourism. Based on relevant studies, the following hypotheses are proposed:

*H1: AI has a positive impact on Realizing the Sustainability of Travelers (RST)*

*H2: AI has a positive impact on Personalized and durable travel experience (PDE)*

*H3: AI has a positive impact on Sustainable Tourism Behaviour (STB)*

*H4: AI has a positive impact on Satisfaction with the travel experience (STE)*

**2.3.2. Realizing the Sustainability of Travelers (RST)**

The RST is a crucial factor in promoting the personalization of travel experiences. According to a study by Koo et al. (2024), RST enables travelers to comprehend their role in minimizing environmental impact and utilizing resources efficiently, thereby enhancing the personalization of experiences in accordance with sustainability principles. Travelers with high awareness of sustainability also tend to exhibit behaviors that are more aligned with these goals, such as selecting eco-friendly services, prioritizing local products, and engaging in community support activities (Majid et al., 2024). Furthermore, this perception enhances travellers' perceptions of the value of the experience, thereby improving their overall satisfaction. RST not only achieves personal goals, but also contributes to enhancing destination image, leading to higher levels of satisfaction (Xu et al., 2024). Research by Yang, Zhang, and Feng (2024) has demonstrated that personalizing the travel experience through intelligent suggestions from AI not only enhances engagement but also creates a more relevant experience for travelers with sustainable journeys. These findings indicate that when travelers possess a clear awareness of sustainability, they tend to prioritize personalized experiences in this direction. Similarly, Majid et al. (2024) demonstrated that AI chatbots have the potential to motivate travelers to adopt sustainable travel habits, suggesting that high awareness of the importance of sustainability encourages more responsible travel behavior. Additionally, Srivastava and Shandilya (2024) emphasized that smart tourism technology plays a significant role in enhancing traveler satisfaction by providing reliable and seamless services. As travelers become cognizant of the importance of sustainability and experience sustainability-oriented services, their satisfaction with trips increases significantly. Based on related theories, this study hypothesizes H4, H5, and H6:

*H4: RST has a positive impact on Visitor Sustainable Travel Experience Personalization (PDE)*

*H5: RST has a positive impact on Sustainable Tourism Behaviour (STB)*

*H6: RST has a positive impact on Travel Experience Satisfaction (STE)*

### 2.3.3. Personalized and durable travel experience (PDE)

The personalization of sustainable travel experiences (PDE) plays a significant role in promoting sustainable tourism behavior. Yang, Zhang and Feng (2024) assert that personalized suggestions from smart travel technologies are not only tailored to individual preferences but also guide users towards environmentally and socially responsible behaviors. Personalizing recommendations, such as selecting eco-friendly services or community-oriented tourism activities, enhances visitors' awareness of their personal responsibility towards sustainability goals. This creates a substantial incentive for them to engage in behaviors that closely align with sustainability principles. Majid et al. (2024) further emphasize that smart platforms, including AI chatbots, can guide and motivate travelers to adopt sustainable practices through personalized suggestions. Moreover, personalizing the experience not only addresses the needs of travelers, but also enhances their satisfaction with the trip. Srivastava and Shandilya (2024) posit that smart travel technology facilitates the provision of seamless, accurate, and reliable services, thereby enhancing overall visitor satisfaction. When personalized suggestions and experiences align with sustainable values, visitors experience increased satisfaction upon realizing that they not only achieve their personal goals but also contribute to environmental protection and social development. Research findings by Xu et al. (2024) demonstrated that integrating sustainable elements into personalized experiences promotes heightened feelings of satisfaction, attributed to the strong correlation between expectations and actual outcomes. Therefore, we propose the following hypotheses:

*H7: PDE has a positive impact on Sustainable Tourism Behaviour (STB)*

*H8: PDE has a positive impact on Travel Experience Satisfaction (STE)*

### 2.3.4. Sustainable Tourism Behavior (STB)

Sustainable tourism behavior (STB) positively influences visitor satisfaction (STE) by creating highly meaningful travel experiences and a sense of contribution to social and environmental benefits. Research conducted by Zheng and Wu (2023) indicate that travelers tend to report higher satisfaction with their trip when they engage in sustainable tourism practices, such as utilizing eco-friendly services or participating in community support programs. These behaviors not only engender a sense of personal value but also reinforce visitors' sense of social responsibility. Furthermore, Pai et al. (2020) assert that sustainable experiences can enhance traveler satisfaction by providing meaningful activities and creating a balance between personal and community benefits. This is particularly salient when visitors perceive that their behavior contributes to the sustainable development of the destination, thereby increasing their satisfaction with their trip. Xu et al. (2024) also emphasized the role of sustainability factors in the travel experience, arguing that traveler satisfaction is driven by an emotional connection to the destination's sustainability goals, thus increasing feelings of pride and contentment post-journey. Therefore, we propose the following hypotheses:

*H9: STB has a positive impact on Travel Experience Satisfaction (STE)*

### 2.3.5. The Mediating Role of Realizing the Sustainability of Travelers (RST)

RST was a significant mediating factor in the relationship between AI and PDE. Research conducted by Yang, Zhang and Feng (2024) indicates that AI technologies, such as recommendation systems and chatbots, not only facilitate the personalization of experiences but also contribute to enhancing travelers' awareness of sustainable values. As this awareness increases, travelers tend to seek experiences designed to support sustainability objectives. Koo et al. (2024) demonstrated that AI can influence travelers' perceptions by providing information about sustainable options, including green hotels or eco-friendly tourism activities. These perceptions motivate visitors to pursue personalized experiences that align with their individual needs and sustainability goals. This study emphasizes that this perception functions as a mediating factor in effectively linking AI technology and personalized travel behavior. Furthermore, Srivastava and Shandilya (2024) asserted that AI technology can facilitate reliable and seamless interactions, thereby contributing to an increased awareness of sustainable value among travelers. This heightened awareness leads to the personalization of experiences in accordance with sustainability principles, enabling visitors to engage in experiences that are not only satisfying but also engender a positive sense of contribution to the environment and community. Consequently, this study proposes the following hypotheses:

*H10. RST Plays an intermediary Role Between AI and PDE*

## 2.4. Proposed research model

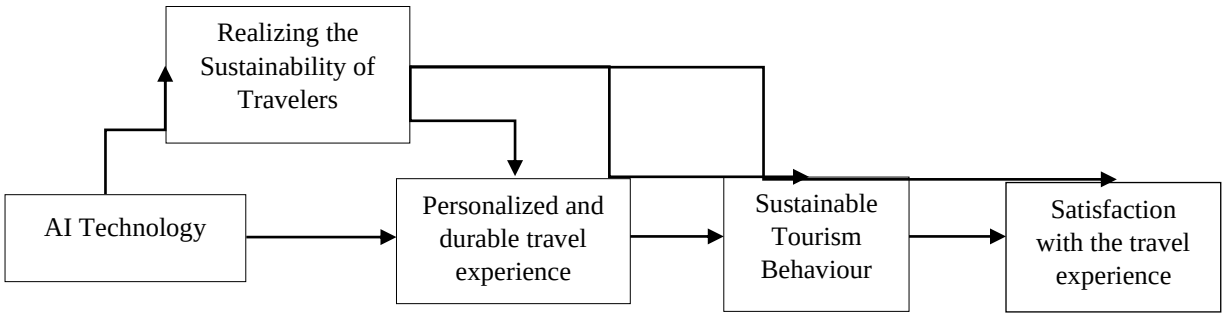

**Fig.1. Proposed research model**

*Source: Recommended author*

## III. RESEARCH METHODS

### 3.1. Approach

This study employs quantitative research methods that focus on measuring and testing the relationships between the variables in the research model. The research model is grounded in previous theories and research and encompasses the concepts of AI, RST, PDE, STB, and STE.

### 3.2. Survey subjects

The research sample was drawn from a population of travelers who had utilized services related to AI technology in the tourism sector and possessed an awareness or experience of sustainability in their travel journey in Vietnam. The survey subjects were both domestic and international students. Data collection occurred from August to October 2024 at prominent tourist destinations in Da Nang, Ho Chi Minh City, Hanoi, Phu Quoc, Nha Trang, and Can Tho. The study gathered data from 436 randomly selected participants using convenience sampling from online platforms and smart travel destinations. The sample size was determined in accordance with the recommendations of Hair et al. (2019), ensuring its suitability for PLS-SEM analysis (PLS-SEM).

### 3.3. Data collection tools

Data were collected through questionnaires, using scales developed in previous studies. The scales utilized a 5-point Likert scale, which measures participants' agreement with assertions related to the study variables. The questionnaire consisted of the following main sections: demographic information (age, gender, occupation, nationality) and scale of study variables (AI, RST, PDE, STB, and STE).

### 3.4. Data analysis

The data were analyzed using PLS-SEM software to validate the relationships in the study model. The analysis included an evaluation of the reliability and validity of the scale. Cronbach's Alpha, Composite Reliability (CR), and Average Extract Variance (AVE) were used to ensure that the scale was reliable and demonstrated good convergence. Structural model analysis: Relationships between variables were examined using factor load values, t-statistics, and p-values. Intermediary role validation: The intermediary role of the RST between the AI and PDE was tested using bootstrapping with 2000 samples, as recommended by Kumar et al. (2022).

## IV. RESEARCH RESULTS

### 4.1. Common Method Variance Bias Test (CMB)

The author examines the variance inflation coefficient (VIF) values, as recommended by Kock (2015). The VIF values reported for the structures ranged from 1 to 1,661 (Table 4.1), which is well below the recommended limit of 5, confirming the absence of CMB.

**Table 4.1 - Inner VIF Value**

| | AI | PDE | RST | STB | STE |
|---|---|---|---|---|---|
| **AI** | | 1.316 | 1.000 | | |
| **PDE** | | | | 1.395 | |
| **RST** | | 1.316 | | 1.395 | |

| | |
|---|---|
| **STB** | 1.000 |
| **STE** | |

**Notes:** *Artificial intelligence = AI; Realizing the Sustainability of Travelers = RST; Personalized and durable travel experience = PDE; Sustainable tourism behavior = STB; Satisfaction with the travel experience =STE*

*Source: Extracted from PLS*

### 4.2. Completion of scale evaluation

A partial least squares structure equation model (PLSSEM) was used to analyze the data. The factor load values (Table 2) were examined to evaluate the convergence reliability. All factor load values exceeded the recommended threshold of 0.7 (Hair et al. 2019). Furthermore, the Cronbach Alpha values were all above the minimum threshold of 0.7 and · 0.95 (Hair et al., 2019), confirming the internal consistency reliability of the structures (Table 3). These findings indicate that the model demonstrates high reliability and can be applied to subsequent analyses.

**Table 4.2 - Factor Load Factor**

| Element | Question | Source | Factor loading | VIF |
|---|---|---|---|---|

The scale test table indicates that all loading factors exceeded 0.7, demonstrating a strong correlation between the observed and latent variables. Cronbach's Alpha and the Composite Reliability (CR) of the scales both surpassed 0.7, confirming high scale reliability. The median extracted variance (AVE) exceeded the threshold of 0.5, suggesting good convergence of the scales and effective interpretation of potential variables. The results of the confirmatory factor analysis demonstrated that the scales possessed high reliability and good convergence, meeting the requirements for quantitative research and enabling further research.

**Table 4.3 - Reliability and value**

| | CA | CR | AVE | AI | PDE | RST | STB | STE |
|---|---|---|---|---|---|---|---|---|
| **AI** | 0.812 | 0.876 | 0.638 | 0.799 | | | | |

Based on the content of Table 4.5 on intermediary role analysis, the authors examined the mediating role of tourist sustainability perception (RST) in the relationship between AI and PDE. The bootstrapping method with 2000 resamples and a 95% confidence interval, as recommended by Kumar et al. (2022), was employed to test the intermediate effect. The results indicate that RST plays a significant role in mediating the impact of AI on outcomes related to sustainable travel experiences.The t-values and p-values both demonstrate clear statistical significance, supporting the hypothesis that sustainability perceptions not only directly influence traveler behavior and satisfaction but also mediate the relationship between AI and these factors. This finding underscores that travelers' sustainability awareness serves as a conduit for AI to promote eco-friendly travel behaviors and enhance personalized experiences in a sustainable manner. Furthermore, the study demonstrates that RST enhances the personalization of the travel experience by increasing travelers' awareness of the value of sustainable actions, thereby encouraging them to engage in environmentally and socially responsible behaviors and experience increased satisfaction with their experience.

## IV. CONCLUSION

### 4.1. Conclusion

This study examines the role of tourist RST in mediating the relationship between AI and PDE. Additionally, this study elucidated the impact of PDE on STB and STE. The results indicate: AI positively influences sustainability perception (RST): This finding aligns with previous studies by Zheng and Wu (2023) as well as Koo et al. (2024), which assert that AI technology not only optimizes services but also enhances travelers' awareness of sustainability values; The mediating role of RST: RST plays a crucial role in connecting AI to personalizing sustainable travel experiences. This result complements and extends the conclusions of Yang, Zhang, and Feng (2024), who focused on the direct impact of AI on the travel experience. The current research further demonstrates that RST is essential to maximizing the effectiveness of AI in personalizing travel experiences; PDE promotes sustainable travel behavior (STB) and satisfaction with travel experiences (STE): Consistent with the findings of Majid, Tussyadiah and Kim (2024), this study confirms that personalizing experiences not only facilitates travelers' sustainable behavior choices but also increases their satisfaction with the journey. A notable distinction is that the current study focuses on the sustainability aspect of personalization, which has not been fully explored in previous studies. Sustainable Tourism Behavior (STB) Enhances Satisfaction with Travel Experience (STE), which is consistent with the research by Pai et al. (2020), which emphasizes that sustainable behavior not only contributes positively to the environment but also brings higher emotional value and satisfaction to travelers. Compared to previous studies, this research not only corroborates the role of AI in the travel industry, but also expands our understanding of how RST mediates the impacts of AI. Furthermore, the integration of PDE, STB, and STE into a comprehensive model introduced a novel perspective, facilitating a better understanding of the connection between technology, perception, and travel experience.

### 4.2. Administrative implications

First, integrating AI technology to raise awareness of sustainability: Tourism managers should implement AI technologies such as chatbots, intelligent suggestion systems, and data analytics platforms to provide comprehensive and detailed information about sustainable travel options, including eco-friendly accommodations, community outreach activities, and environmental impact reduction services. This implementation will enhance visitors' awareness of the importance of sustainable behaviors, thereby promoting their active participation in environmental protection and community support activities.

Second, Personalize the experience to meet the sustainable needs of travelers: Travel businesses need to utilize AI to personalize travelers' experiences, from making service recommendations tailored to individual preferences to integrating sustainability elements into their experiences, such as low-emission sightseeing route recommendations or tourism programs that engage with local communities.

Third, to encourage sustainable tourism behavior through AI: Businesses need to employ AI applications to promote sustainable tourism behavior, such as providing information about the environmental impact of each activity and offering alternative suggestions, such as less polluting transportation or eco-friendly products. This approach not only assists businesses in achieving sustainable development goals but also builds a positive brand image, fostering trust among tourists.

Fourth, enhancing visitor satisfaction through sustainable services: Managers should focus on improving services by incorporating sustainability factors such as ensuring transparency in the provision of information, supporting visitors to participate in environmental protection activities, and providing high-quality services with sustainable value. This approach will create more meaningful experiences for travelers, enhance their satisfaction, and promote their likelihood of returning to service in the future.

Fifth, investment in sustainability training and education programs: Destination managers and businesses should implement educational programs or communication campaigns to raise awareness of sustainable tourism among both employees and visitors. Staff will develop a clear understanding of how to integrate sustainability elements into the service, while visitors will have the opportunity to become more aware of the responsibilities and benefits of choosing sustainable tourism behaviors.

Sixth, strengthening cooperation between stakeholders: Tourism businesses, governments, and local communities must collaborate to create a sustainable tourism ecosystem, in which AI technology plays a central role in connecting stakeholders. Effective collaboration ensures that sustainable solutions are implemented synchronously, thereby creating a consistent and positive experience for travelers.

# TOURISM IN SINGAPORE'S CULTURAL DIPLOMACY AND LESSONS FOR VIETNAM

**Nguyen Ngoc Thuy Trang**[1]
[1]Saigon University
*Corresponding: nnttrang@sgu.edu.vn

**ABSTRACT**

In the context of globalization and the rapid development of technology, cultural diplomacy has become an important tool for countries to enhance their soft power and expand their international influence. Since 2014, Singapore, with its Smart Nation strategy, has pioneered the integration of smart technology into socio-economic fields, in which tourism has emerged as a key sector. Singapore not only develops tourism as an important economic sector but also integrates cultural and technological values to strengthen the country's position on the world map. Over the past decade, Singapore has built iconic structures such as Marina Bay Sands, Gardens by the Bay, and organized international events. These are not only tourist attractions but also a foundation for implementing cultural diplomacy through promoting the image of a modern, diverse and dynamic country. This article not only analyzes Singapore's strategy but also suggests important lessons for other countries in developing tourism and conduct effective cultural diplomacy.

*Keywords:* "*Cultural diplomacy", "Tourism", "Singapore".*

## I. INTRODUCTION

Tourism and cultural diplomacy are two fields that have a mutual relationship, together promoting economic and social development and enhancing the national position in the international arena. Cultural diplomacy is a set of activities, carried out directly by or in cooperation with the diplomatic agencies of a country, to promote the foreign interests of that country in the field of cultural policy, mainly through promoting cultural exchanges with other countries (Pajtinka. E, 2014). Meanwhile, "Tourism is a soft power tool, contributing to strengthening the reputation and image of a country by winning hearts and minds. Since soft power is conveyed through a country's culture, values, political ideals, and foreign policies, it can promote a more effective and capable national position, thereby contributing to attracting tourism to destinations" (Claro et al, 2023)

Singapore is a multicultural country with a blend of many identities, and has developed and implemented many policies to promote tourism and cultural diplomacy. These policies not only focus on promoting the country's image but also focus on sustainable development, preserving cultural heritage, and promoting people-to-people exchanges. These policies have been implemented synchronously and effectively, contributing to enhancing Singapore's image in the international arena, promoting tourism, and creating a foundation for sustainable development in the future.

Singapore's proactive approach to tourism-based cultural diplomacy from 2019 to 2024 demonstrates how a systematically coordinated strategy integrating domestic policy frameworks and international cooperation can establish a competitive edge in regional and global diplomacy. This study evaluates these policies through a qualitative analysis, comparative policy analysis of Singapore's major tourism events and international collaboration mechanisms, providing lessons applicable to Vietnam's evolving foreign policy agenda. The paper also applies a systems approach, because Singapore is a part of the Southeast Asian regional system in particular and the Asia-Pacific region in general.

## II. RESEARCH OVERVIEW

Research on the role of tourism in Singapore's cultural diplomacy is a topic that has attracted the attention of many scholars in the field of international relations and tourism development.

The theoretical foundation of this study lies in Joseph Nye's soft power theory (2004), which emphasizes influence through culture, values, and policies. The concept of "soft power" mentioned by Joseph Nye in the book "Soft Power: The Means to Success in World Politics" in 2004 has become an important theoretical foundation for studying the role of cultural diplomacy in the context of globalization. Soft power refers to a country's ability to create influence through the attraction of culture, values and policies, instead of relying on military or economic power. According to the study

"Nation Branding: Concepts, Issues, Practice. Butterworth-Heinemann" by Dinnie (2008), building a national brand through cultural and tourism promotion is an important factor in creating soft power. Singapore has been very aware of this and quickly applied it to its cultural diplomacy strategy.

This issue began to be studied in depth in the early 2000s, especially when Singapore emerged as an international hub for trade, finance, and tourism under the leadership of Prime Minister Lee Hsien Loong (Ministry of Trade and Industry Singapore, 2021). Singapore has long focused on tourism—the smokeless industry—as part of its national development strategy. Throughout its economic development since the 1960s, tourism has been used by Singapore as an important factor in promoting the image of a modern and progressive nation (Teo, 2002). However, under Prime Minister Lee Hsien Loong, tourism has been promoted to a new level as a key tool in building national branding and cultural diplomacy (Hall & Page, 2017). In the article "Tourism in Singapore: A review of tourism policies 1960-2005" (published in Tourism and Hospitality Research, 2007), Joan C. Henderson discussed in detail the development of Singapore's tourism industry from an economic tool to a strategy for building soft power and promoting international cultural exchanges. Henderson analyzed that the Singapore government not only focused on economic growth through tourism, but also utilized this industry as a way to promote the national image and enhance Singapore's position in the international arena. The development of large projects such as Marina Bay Sands and Gardens by the Bay was not only aimed at attracting tourists, but also acted as cultural icons, contributing to building the image of Singapore as an innovative and advanced destination. In her study "The Rise of Singapore: From British Colony to Global City" (2014), Lay Hwee Yeo - an expert on international relations and has done many research works related to cultural diplomacy and soft power of Southeast Asian countries, especially Singapore - analyzed how Singapore has skillfully combined modernity and tradition in tourism development and national image building. She argued that major tourism projects such as Marina Bay Sands and Gardens by the Bay have helped Singapore become a bridge between the East and the West, both maintaining its East Asian cultural identity and demonstrating modernity and advanced creativity.

Another important element in Singapore's cultural diplomacy is the organization of large-scale international events such as the Formula 1 Singapore Grand Prix and the Singapore Arts Festival. These events not only attract international visitors but also provide an opportunity for Singapore to showcase its diverse culture. Tan (2018) argues that by hosting these events, Singapore has created a global cultural exchange platform, helping the country to further consolidate its position as an international cultural hub.

The Singapore Tourism Board (2020) reports that international events have contributed greatly to the increase in tourist arrivals and promote mutual understanding between countries. Attracting international events also helps Singapore expand its diplomatic influence and strengthen relations with important partners in the ASEAN region and Western countries.

Singapore not only uses tourism and cultural diplomacy to build its national image, but also to promote regional diplomatic relations. Wang (2021) points out that Singapore has leveraged tourism events and cooperation within the ASEAN region to consolidate its leadership role in the region. Cultural relations through tourism not only help promote the economy but also strengthen diplomatic relations with neighboring countries, creating a sustainable cooperation network.

Recently, Singapore has also pioneered the development of smart tourism, combining technology and cultural preservation. Nguyen Ngoc Anh (2015) commented that Singapore has actively invested in smart tourism projects, with the goal of not only attracting tourists but also enhancing cultural interaction and learning through digital platforms. This not only contributes to the sustainable development of tourism but also enhances the ability to promote Singaporean culture to the world in a more effective and modern way.

Singapore has successfully used tourism development policies to promote cultural diplomacy, through the development of tourism infrastructure and the organization of international events. Henderson (2011) stated that the combination of tourism development policies with cultural diplomacy has created a breakthrough in the way Singapore builds its national image. Projects such as Gardens by the Bay and Marina Bay Sands have become symbols not only of tourism, but also highlights of the cultural diplomacy strategy, helping Singapore continue to affirm its position in the international arena.

## III. ANALYSIS OF TOURISM POLICIES IN SINGAPORE'S CULTURAL DIPLOMACY FROM 2019 TO 2024

The analysis uses a multi-level framework, examining policy implications at the individual, national, and international systemic levels. These are also the three levels of policy analysis commonly used in the study of international relations today. Data sources include official government reports, event records, and secondary academic analysis. A particular focus is placed on Prime Minister Lee Hsien Loong's leadership in shaping tourism as a diplomatic tool, as well as Singapore's participation in ASEAN-led initiatives.

### 3.1. Analysis at the Individual Level

Prime Minister Lee Hsien Loong has strategically positioned Singapore as a "regional hub of communication and innovation" (Ministry of Foreign Affairs Singapore, 2022), leveraging its cultural and tourism diplomacy to enhance its global influence. His vision of building Singapore into a "regional globalist" reflects a deliberate integration of ASEAN cooperation with a focus on maintaining a distinct national identity (Tan, 2021). By embedding soft power strategies into Singapore's foreign policy, Lee recognizes that culture and tourism are not merely economic tools but powerful mediums to project national prestige and influence regional narratives. (Nye, 2004; Heng, 2020).

Critically, Lee's approach transcends traditional notions of tourism as a commercial sector, reframing it as a core component of Singapore's soft power arsenal. His leadership highlights the application of Nye's soft power theory by prioritizing cultural engagement and sustainability as vehicles for influence. For instance, through the Singapore Green Plan 2030, Lee has not only emphasized eco-tourism (Chong, 2022) but also redefined Singapore as a model of sustainable innovation, appealing to environmentally conscious travelers and reinforcing Singapore's leadership in the region (UNWTO, 2023; Tan, 2022). This demonstrates how tourism strategies can simultaneously serve economic, environmental, and diplomatic objectives.

Moreover, Lee's focus on initiatives like the "Southeast Asia Travel Collective" and "ImaginASEAN" exemplifies Singapore's efforts to position itself as a cultural bridge within ASEAN, fostering deeper regional cooperation. These campaigns are not merely promotional activities but deliberate soft power maneuvers to showcase Singapore as a curator of Southeast Asian heritage and identity. His support for ASEAN heritage preservation, alongside active involvement in international forums such as the COP26 Climate Change Conference, underscores a nuanced strategy: combining environmental diplomacy with cultural tourism to shape global perceptions of Singapore as a progressive and responsible nation.

Lee's speeches, often highlighting that "Singapore may be small, but we have a big responsibility for sustainable development and cultural diplomacy" (Lee, 2021), reflect a personal commitment to aligning Singapore's tourism diplomacy with broader international norms (ASEAN Secretariat, 2022). This not only builds trust with ASEAN and European partners but also positions Singapore as a thought leader in sustainable cultural tourism. By moving beyond generic promotional campaigns and adopting a values-driven approach, Lee has effectively linked Singapore's tourism initiatives to a broader narrative of regional leadership and innovation (Tan, 2023).

Through coordinated efforts, Lee has transformed Singapore into a cultural hub that balances modernity with tradition, enabling it to act as a bridge between East and West. Initiatives like hosting ASEAN conferences and collaborating with regional artists and cultural organizations exemplify Singapore's commitment to creating a unified Southeast Asian identity. These efforts, underpinned by soft power strategies, elevate Singapore's position not just as a tourist destination but as a strategic cultural influencer within ASEAN and beyond.

### 3.2. Analysis at the National Level

At the national level, Singapore has strategically crafted its tourism policies as a deliberate instrument of soft power, rather than merely an economic or cultural initiative. The government's approach from 2019 to 2024 underscores a calculated effort to enhance Singapore's global influence through a sophisticated blend of sustainable tourism, high-profile cultural events, and heritage preservation. This is not simply about increasing visitor numbers; rather, it is an intentional exercise in nation branding and geopolitical positioning within ASEAN and beyond.

A critical example of this approach is the Singapore Green Plan 2030, which goes beyond a standard sustainability policy to function as a diplomatic statement on Singapore's leadership in climate-conscious tourism (Tan, 2022). By

integrating tourism with environmental diplomacy, Singapore not only appeals to eco-conscious travelers from Europe and North America but also positions itself as a regional norm-setter in sustainable urban development (ASEAN Centre for Sustainable Development, 2022). Unlike traditional tourism-dependent economies, which often struggle with balancing development and conservation, Singapore has weaponized sustainability as a form of competitive advantage in soft power projection. This aligns with Joseph Nye's theory of "soft power through values", demonstrating that a nation's ability to influence is not merely rooted in cultural assets but also in the ethical and policy-driven narratives it successfully exports.

Furthermore, the deliberate hosting of international cultural mega-events, such as the Formula One Singapore Grand Prix, Singapore Art Week, and Singapore Design Week, is not just a cultural engagement strategy but a means of embedding Singapore into global networks of influence. These events attract elite stakeholders—including investors, policymakers, and global influencers—who in turn reinforce Singapore's brand as a cosmopolitan, innovative, and strategically indispensable nation ((UNWTO, 2022). This reflects Nye's notion of soft power as "the ability to shape preferences through attraction rather than coercion," where Singapore creates an aspirational image that other nations and regional actors seek to emulate.

Heritage preservation efforts, particularly in districts like Chinatown, Kampong Glam, and Little India, also serve a dual function. On the surface, these efforts maintain Singapore's multicultural authenticity for tourism purposes. However, at a deeper level, they recontextualize Singapore's identity within the broader Southeast Asian cultural sphere, subtly reinforcing its position as the region's de facto cultural and diplomatic bridge (ASEAN Cultural Heritage Report, 2022*)*. Unlike other ASEAN nations that emphasize their indigenous or nationalistic historical narratives, Singapore has adopted a curatorial approach to cultural heritage, incorporating regional influences to position itself as both a preserver and a modern interpreter of Southeast Asian identity. This further strengthens Singapore's diplomatic role as a crossroads of Eastern and Western cultural currents, amplifying its appeal as a regional thought leader in cultural diplomacy.

The cumulative effect of these policies is a highly intentional soft power strategy that extends beyond tourism promotion to geopolitical influence. By embedding sustainability, cultural diplomacy, and heritage preservation within its tourism framework, Singapore moves beyond being a mere destination to becoming a soft power hub that dictates regional cultural and sustainability norms. This demonstrates a sophisticated application of Nye's soft power framework, where Singapore leverages tourism not only to attract visitors but also to shape global discourses on sustainable urban living and regional cultural leadership.

### 3.3. Analysis at the International System Level

At the international system level, Singapore's cultural diplomacy through tourism is not merely a response to globalization but a strategic maneuver within the intensifying competition for cultural and economic influence in Southeast Asia. The post-pandemic global tourism recovery has prompted a power recalibration in the region, with Thailand, Malaysia, and Indonesia aggressively expanding their soft power through tourism-driven diplomacy. However, Singapore distinguishes itself by not merely competing in tourism volume but by asserting control over regional cultural narratives.

Unlike its regional counterparts, which primarily emphasize heritage-driven tourism to attract visitors, Singapore has adopted a meta-strategic approach—shaping not just its own brand, but ASEAN's collective identity on the world stage. The "ImaginASEAN" campaign, developed in collaboration with global industry players like Agoda and AirAsia, is more than a promotional effort—it reflects Singapore's orchestration of ASEAN's cultural diplomacy, consolidating its role of Southeast Asian tourism narratives. This approach aligns with Nye's soft power mechanisms, wherein influence is exerted not by dominance but by setting the frameworks through which others operate. By leading regional branding efforts, Singapore ensures that ASEAN's cultural tourism is understood through a Singapore-centric lens, reinforcing its authority over the region's soft power agenda.

In addition to branding leadership, Singapore has systematically deployed bilateral and multilateral tourism agreements as diplomatic leverage. For example, the Tourism and People-to-People Exchange Cooperation Agreement with Vietnam is not just a tourism initiative but a deliberate effort to integrate Vietnam into a Singapore-led cultural

ecosystem within ASEAN (Singapore Ministry of Trade and Industry, 2021). Such agreements do not merely foster mutual trust but also align the soft power strategies of ASEAN nations with Singapore's overarching diplomatic framework, ensuring that Singapore remains central to intra-regional cultural diplomacy.

Beyond ASEAN, Singapore's deep integration into global cultural governance further amplifies its influence. Unlike other regional tourism hubs that focus primarily on attracting visitors, Singapore actively participates in agenda-setting within organizations such as UNESCO and the ASEAN Tourism Forum (ATF). Its role in these multilateral institutions allows it to shape sustainability and tourism policies at a structural level, positioning Singapore as not just a practitioner but a policymaker in global cultural diplomacy (UNWTO, 2023*)*. This strategic engagement is a direct application of Nye's concept of soft power through institutional influence, wherein Singapore's presence in decision-making bodies enables it to steer global tourism norms in ways that align with its long-term diplomatic interests.

Perhaps the most sophisticated dimension of Singapore's international tourism diplomacy is its synthesis of environmental responsibility with cultural diplomacy. By embedding sustainability principles into its tourism initiatives—particularly through the Singapore Green Plan 2030—the nation has transcended the traditional role of a tourism hub and repositioned itself as a global thought leader in sustainable cultural tourism. This shift is significant because it allows Singapore to engage with Western nations and international institutions not just as a participant, but as a model and influencer in sustainability discourse. It also serves as a strategic counterweight to regional competitors like Thailand, which, despite its strong tourism sector, lacks a comparable global leadership position in sustainable tourism governance.

In sum, Singapore's cultural diplomacy through tourism is not merely an economic endeavor but a calculated soft power initiative that intertwines regional leadership, global influence, and sustainability-driven diplomatic positioning. Rather than competing in sheer tourist numbers, Singapore has strategically ensured that it dictates the cultural and policy frameworks within which Southeast Asian tourism is understood and promoted internationally. This approach transforms Singapore from a participant in ASEAN tourism into the architect of ASEAN's cultural soft power, reinforcing its geopolitical influence far beyond its geographic size.

## IV. LESSONS FOR VIETNAM

Vietnam can learn valuable lessons from Singapore's success in using tourism as an effective cultural diplomacy tool. To apply this model, Vietnam needs to focus on building a long-term cultural diplomacy strategy, investing in green and sustainable tourism initiatives, developing international cultural events, and building a people-centered cultural diplomacy policy.

First, the Vietnamese government needs to institutionalize a long-term cultural diplomacy strategy that explicitly integrates tourism as a key instrument of soft power. This strategy must be aligned with Vietnam's Master Plan for Tourism Development until 2030, ensuring that cultural diplomacy is not an isolated effort but a systematic component of national foreign policy. Cultural diplomacy should be considered a core part of the overall foreign policy, in parallel with economic and security goals. A well-defined strategy should include clear vision, mission, and specific quantifiable objectives. For instance, Vietnam has actively promoted bilateral cultural exchanges within ASEAN, evident in initiatives such as the Vietnam-Laos Cultural Exchange Program (2023) and the Vietnam-Singapore Tourism Cooperation Agreement (2022-2025) (Vietnam Ministry of Culture, Sports and Tourism, 2023; ASEAN Secretariat, 2023). However, these programs must be expanded beyond diplomatic circles to grassroots participation, ensuring that cultural interactions go beyond official delegations to include artists, local communities, and young entrepreneurs engaged in tourism innovation. Vietnam possesses a wealth of cultural assets that remain underutilized in its international branding efforts. While traditional values like Dong Son culture, Tuong, Cheo, and Quan Ho folk music have been promoted in academic and artistic circles, they have yet to be systematically embedded into Vietnam's tourism and cultural diplomacy framework. The country should develop cultural tourism clusters—such as the "Ancient Capital Heritage Corridor" linking Ha Noi, Hue, and Ninh Binh—to create immersive experiences for international visitors (Vietnam National Administration of Tourism, 2023). Similarly, modern cultural soft power assets, such as Vietnamese cuisine, contemporary visual arts, and indie music, have gained organic international recognition (e.g., Pho and Banh Mi being ranked among the world's best street foods by CNN in 2023). These elements should be formally

incorporated into diplomatic initiatives, such as the "Vietnam Culinary Diplomacy Program" launched in 2021, to ensure their strategic leverage in national branding efforts. Beyond cultural content, the success of cultural diplomacy lies in its execution and measurement. Vietnam should establish concrete performance indicators such as: the number of annual international cultural exchange events, the level of participation of the international community in activities promoting Vietnamese culture. To ensure effective execution, cross-ministerial coordination must be reinforced. The Ministry of Culture, Sports and Tourism (MCST) should lead strategic planning, while the Ministry of Foreign Affairs (MOFA) incorporates cultural diplomacy within broader foreign policy dialogues. The Vietnam National Administration of Tourism (VNAT) should integrate cultural diplomacy into destination marketing strategies, and the Ministry of Industry and Trade (MOIT) should facilitate cultural exports (e.g., leveraging Vietnamese handicrafts in UNESCO Creative Cities Network partnerships).

The Singaporean Prime Minister has successfully leveraged international platforms to shape public perception of Singapore as a pioneer in sustainable and green tourism diplomacy. Singapore is a leader in eco-friendly urban tourism and responsible environmental stewardship. Vietnam must adopt a similarly proactive approach, ensuring that cultural and sustainable tourism are fully embedded within its national foreign policy agenda rather than being treated as isolated industry initiatives. Vietnam already has a strong foundation for sustainable tourism but needs to institutionalize it as a diplomatic strategy. In 2022, Vietnam ranked sixth in Asia on the Global Sustainable Tourism Index, driven by its successful eco-tourism models in Phong Nha - Ke Bang and Trang An Scenic Landscape Complex. However, these successes remain fragmented and lack a coordinated national strategy to integrate green tourism into Vietnam's international branding efforts (ASEAN Centre for Sustainable Development, 2023). A structured framework should be built around three key pillars: green infrastructure, community-based conservation tourism, and policy-driven incentives for sustainable tourism investments. This can be done through developing Green Infrastructure as a Core Soft Power Tool. Vietnam must prioritize large-scale green investments in its most visited cultural and ecological heritage sites. This includes: Expanding electric transportation networks; Implementing zero-waste tourism zones; Encouraging the adoption of "carbon-neutral" hotel certifications. Vietnam can further leverage its rural and ethnic tourism potential, ensuring that cultural tourism is driven by local communities rather than corporate enterprises. Cat Ba Biosphere Reserve, a UNESCO-listed site, has seen a rise in visitor interest due to its sustainable fishing and tourism integration model. Expanding such initiatives strengthens Vietnam's global reputation as a protector of indigenous ecosystems and heritage. To ensure long-term success, Vietnam must embed sustainable tourism policies within its broader cultural diplomacy agenda. Vietnam must actively advocate for ASEAN-wide sustainable tourism frameworks at the ASEAN Tourism Forum (ATF) and UNWTO summits, positioning itself as a regional thought leader on balancing tourism growth with environmental protection. By executing a structured and measurable green tourism diplomacy strategy, Vietnam can move beyond merely attracting tourists to actively shaping global tourism policies.

Vietnam must prioritize the strategic development of international cultural events as a pivotal instrument of cultural diplomacy. Singapore has successfully leveraged tourism to enhance regional and global influence through high-profile forums such as the ASEAN Tourism Forum and UNESCO partnerships, effectively positioning itself as a cultural and diplomatic hub. Vietnam can adopt a similar approach by institutionalizing large-scale cultural events that not only showcase national identity but also foster deeper diplomatic engagement. A prime example would be the establishment of signature events like the "ASEAN Arts Festival" or "Indochina Cultural Week" in Hanoi, where artists from Vietnam, Laos, and Cambodia present both traditional and contemporary performances, reinforcing regional solidarity and cultural integration. These events do not merely serve as artistic showcases but function as diplomatic platforms that cultivate people-to-people connections, strengthening regional ties and enhancing Vietnam's image as a cultural leader in ASEAN. Furthermore, Vietnam can integrate cultural events with economic and commercial diplomacy. Singapore has demonstrated the effectiveness of combining cultural promotion with trade and sports diplomacy, a model that Vietnam can replicate through initiatives like the "Vietnam Culture and Cuisine Week" in key partner nations such as France, Japan, and Singapore. By merging cultural exhibitions with culinary showcases and trade fairs, Vietnam can elevate its agricultural exports and artisan industries while simultaneously reinforcing its soft power through the global appeal of Vietnamese culture. The success of such initiatives, however, necessitating strategic collaboration with international event organizers, partnerships with renowned cultural institutions, and the engagement

of globally recognized artists to amplify media reach and international impact. To further institutionalize cultural diplomacy, Vietnam must embed cultural narratives into its participation in major international forums such as APEC, ASEAN, and the United Nations. Singapore has effectively woven its cultural identity into global discourse by consistently highlighting its multicultural heritage and sustainable development initiatives. Vietnam should take a proactive stance by strategically incorporating references to "Dong Son culture, Cham heritage, and Vietnam's ethnic diversity" into its diplomatic engagements, reinforcing its distinct cultural legacy while shaping regional narratives. This should be complemented by the expansion of "bilateral and multilateral cultural agreements" that facilitate the preservation of both tangible and intangible cultural heritage, drive sustainable tourism development, and institutionalize Vietnam's leadership role in ASEAN's cultural exchange frameworks.

Vietnam must prioritize a people-centered approach to cultural diplomacy, ensuring that its initiatives foster long-term. Effective cultural diplomacy should emphasize sustained people-to-people exchanges, educational collaborations, and heritage conservation partnerships, creating deeper international bonds that extend beyond formal diplomatic interactions. One of the most impactful ways to achieve this is through academic and artistic exchange programs between Vietnam and leading cultural institutions in Japan and South Korea. These initiatives not only facilitate knowledge transfer but also cultivate a new generation of cultural ambassadors who strengthen diplomatic ties through shared artistic and scholarly endeavors. Vietnam must expand its cross-border heritage conservation efforts, using cultural preservation as a foundation for long-term diplomatic relationships. The "My Son Sanctuary and Champa heritage conservation project with India" exemplifies how cultural diplomacy can transcend traditional state interactions and build deeper historical and strategic partnerships (Vietnam Ministry of Culture, Sports and Tourism, 2023). Such collaborations ensure that heritage sites are not merely national treasures but also shared cultural legacies that bind nations together. A truly inclusive cultural diplomacy policy must also engage NGOs, youth organizations, and local communities, recognizing that grassroots cultural initiatives have the potential to generate the most authentic and sustainable diplomatic outcomes. The "Cultural Village – Community Tourism" model in Sa Pa and Ha Giang has proven that when local communities are empowered to preserve and showcase their own cultural traditions, it leads to mutual respect, economic sustainability, and increased international cultural engagement (Vietnam National Administration of Tourism, 2023). Expanding such community-driven cultural tourism initiatives will not only enhance Vietnam's global image but also demonstrate how cultural diplomacy can be an instrument of both national development and international influence.

## V. CONCLUSION

Singapore's tourism policies in cultural diplomacy from 2019-2024 have brought great success in both economic and international status. From the individual level with the role of Prime Minister Lee Hsien Loong, to national level policies and participation in the international system, Singapore has demonstrated a synchronous and effective strategy. Singapore's strategy is a typical model of using tourism as an effective cultural diplomacy tool, contributing to enhancing the national position in the international arena.

From Singapore's success in combining tourism with cultural diplomacy, Vietnam can learn to develop sustainable tourism, enhance the national position, contributing to building a national image rich in identity and responsibility in the international system. To successfully apply lessons from Singapore, Vietnam needs a comprehensive and sustainable approach in building a cultural diplomacy policy through tourism. Focusing on a long-term strategy, investing in green tourism, developing international cultural events and building people-centered policies will help Vietnam not only strengthen its national position in the international arena but also contribute to sustainable development, preserve cultural identity and enhance regional peace and cooperation. This strategy requires synchronous coordination between state agencies, the business community and the people to achieve the highest efficiency.

# ROLE OF TEACHER'S ETHICAL LEADERSHIP IN SHAPING HOSPITALITY STUDENTS' GREEN VOICE BEHAVIOR: THE MEDIATING EFFECT OF UNIVERSITY SOCIAL RESPONSIBILITY AND GREEN WORK CLIMATE

**Pham Thi Ngoc Thu**[1]

[1]Faculty of Economics, Nong Lam University Ho Chi Minh City, HCM City, Vietnam

**ABSTRACT**

This study used a quantitative research design to explore how Ethical Leadership (EL) demonstrated by teachers influences the Green Voice Behavior (GVB) of students within the hospitality management faculty in Ho Chi Minh City. Perceived Universities' Social Responsibility (USR) and the University's Green Work Climate (GWC) were considered mediators. Data were collected from 253 students using a systematic, self-administered questionnaire over two weeks with a one-day time lag, ensuring response clarity through direct assistance. Structural Equation Modeling was employed for analysis. The results provide useful insights into promoting sustainable behaviors among students while contributing to the theoretical advancement of green behavior in ACADEMIC contexts. Additionally, the findings reveal that students' Green Voice Behavior is positively influenced by their perception of universities' social responsibility and the presence of a green work climate at their institution. Teacher's Ethical Leadership influences Green Voice Behavior indirectly by shaping students' perceptions of the university's social responsibility and fostering a Green Work Climate. Enhancing Teachers' Ethical Leadership can promote students' Green Voice Behavior through these mechanisms. The study suggests measures for universities to encourage responsible practices and a green climate among students.

## I. INTRODUCTION

With the growing focus on sustainability, higher education institutions are increasingly responsible for developing future leaders who can address societal needs, advance sustainability, and foster sustainable behaviors (Ali et al., 2021). Green behaviors remain a key topic, with growing research on Green Voice Behavior (GVB). While work-related EGB, pro-environmental citizenship behaviors, and counterproductive sustainability behaviors have been widely studied, other dimensions remain underexplored. One such dimension is GVB, which involves advocating for sustainability and challenging traditional norms (Zacher et al., 2023). Aboramadan et al. (2024) emphasize the importance of engaging university stakeholders in the "green voice," noting that students, as the majority, deserve greater attention. Similarly, Piramanayagam, Mallya, and Payini (2023) highlight the growing focus on sustainability education in hospitality, stressing its role in addressing social needs in human resources and preparing future generations for challenges. Research on green voice behavior among hotel and restaurant students underscores the need for green practices to protect the environment and sustain resources. However, a gap remains in sustainability education research within this industry in developing countries. Thus, studying green voice behavior among Vietnamese students is both timely and essential.

Leadership fosters environmentally sustainable behaviors, influencing employees (Tuan, 2022) and positioning teachers as role models for students. Further research is needed on how teachers shape students' sustainable behaviors, particularly green voice behavior, which raises awareness and promotes eco-friendly practices. Cultivating this behavior early is crucial for workforce readiness. Le et al. (2018) highlight that overemphasizing theory in hotel education can hinder students' practical and sustainable development skills. Ethical leadership, rooted in social learning theory (Bandura, 1977, 1986), promotes appropriate conduct (Brown et al., 2005) and positively shapes subordinates' ethical perceptions (Khan et al., 2019). Social responsibility, essential for organizational sustainability, is now a formalized subject in universities. Organizations integrate economic, social, and environmental well-being into their operations (Du et al., 2015). Universities must align programs with labor market demands while engaging in social and environmental

initiatives, known as university social responsibility (Shek et al., 2017). While USR holds political and strategic value, students' perceptions remain underexplored (Coelho & Menezes, 2022). This study argues that, as per social learning theory, USR positively influences students' green voice behavior and mediates the impact of teachers' ethical leadership in promoting sustainability. The green work climate mediates the impact of sustainability-focused organizational elements on green behavior. Murillo-Ramos et al. (2024) highlighted its role in hospitality, emphasizing organizational green mindfulness. It shapes perceptions of pro-environmental opportunities, moderates pro-environmental attitudes and motivation (Tian et al., 2020), and partially mediates the link between green HRM and behavior in sustainable fashion (Rubel et al., 2021). Norton et al. (2014) also linked it to sustainability policies and employee green behavior.

Advancing towards a sustainable educational environment in Vietnam, particularly within the hospitality industry, necessitates focused attention from educators, active promotion by institutions through social responsibility initiatives, and the establishment of a supportive climate that fosters and encourages green voice behavior. This study examines how students' perceptions of the green work climate, social responsibility, and teachers' ethical leadership influence their green voice behavior. It also explores the mediating roles of social responsibility and the green work climate. Research was conducted at five hospitality institutions in Ho Chi Minh City, with data collected in March 2024.

## II. MATERIAL AND METHODOLOGY

### 2.1. Conceptual Foundation

#### 2.1.1. Social Learning Theory and Stakeholder Theory

The Social Learning Theory, first proposed by Bandura in 1977, has been extensively applied in research within the hospitality sector to examine employee behaviors. According to Bandura, followers adopt appropriate behaviors by observing the attitudes, values, and actions of their models (Aftab et al., 2023). Furthermore, this study highlights research by Bakker et al. (2011) and Sarwar et al. (2020), demonstrating how leaders can foster a positive work environment to enhance employee engagement and achieve improved outcomes through their attitudes and behaviors.

Stakeholder Theory provides a framework for understanding an organization's role and responsibilities towards various groups in society. Since its initial introduction in Freeman's *Strategic Management* book in 1984, the term "stakeholder" has become strongly associated with business research (Mitchell et al., 1997). Stakeholder Theory systematically clarifies which parties with an interest in the organization's activities qualify as stakeholders. Identifying roles, evaluating interests, categorizing types, and assessing power are some of the approaches discussed in this field. According to research on branding, quality, and customization of educational offerings (Foroudi et al., 2020), universities regard students as their end users. This indicates that students are stakeholders akin to relatively unique customers for educational institutions.

#### 2.1.2. Teachers' Ethical Leadership

Leaders who demonstrate integrity, honesty, and reliability toward their followers are considered ethical. Ethical leadership, as defined by Brown et al. (2005, p. 120), refers to "the demonstration of normatively suitable behavior through personal acts and interpersonal interactions, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making." Hsieh et al. (2023) reviewed this topic, which has garnered significant attention from scholars since the early 2000s, and concluded that, in addition to the fact that an ethical leader is also an ethical person, the demonstration of normative appropriateness depends on the context. Furthermore, although studies on ethical leadership in education have been conducted, they continue to be predominantly approached from an organizational standpoint (Hsieh et al., 2023). Teachers' decision-making, communication, and reinforcement shape students' behaviors when perceived as moral leaders. Research shows that teachers and students share knowledge and communication skills in higher education (Franke & Arvidsson, 2011, cited by Nejati & Shafaei, 2017). Ethical teaching, including fair discipline, ethics discussions, and role modeling, also influences students' thoughts and behaviors (Arain et al., 2016; Nejati & Shafaei, 2017).

#### 2.1.3. Universities' Social Responsibility

Colleges and universities have always had a social responsibility to advance society as part of their mission (Derrida, 1992). However, a study by Menezes et al. (2018) found that it was not until the 2000s that this responsibility began to receive greater emphasis from their leaders and researchers. If we consider the origins of University Social

Responsibility (USR), corporate strategies were the source of USR's creation, according to the theoretical review of USR by Larran Jorge et al. (2011), and research on strategic management and the conceptualization of universities as corporate entities by Ramos-Monge et al. (2017) (Coelho & Menezes, 2022). Recently, as higher education has become more commercialized and internationalized, USR offers a way to help institutions fulfill their objectives, maintain financial stability, engage students, and—most importantly—adapt to a changing society (Shek and Hollister, 2017).

#### 2.1.4. Green Work climate

How socially acceptable behavior is perceived is a key factor in how employees evaluate the work climate. There are two categories of norms: injunctive norms, which are expectations about what people should do and are generally agreed upon by the majority, and descriptive norms, which represent what people commonly observe or consider typical in society. Individual behavior in society is shaped and reinforced by social punishments that people may face for violating norms (Tian et al., 2019).

Employees internalize organizational policies into tacit understandings of expectations, rewards, and support, which they share with others (Schneider et al., 2013). Their value-based schema shapes perceptions of workplace norms, influencing how they interpret the green working climate (Norton et al., 2014).

#### 2.1.5. Green Voice Behavior

Voice behavior, first defined by Van Dyne and Lepine in 1998, has been a prominent subject of research since the 1990s. To investigate green voice behavior—the behavior of employees providing feedback on environmental issues and proposing ideas for organizational improvements within the framework of green human resource management—this definition was later adapted to an environmental context (Murillo-Ramos et al., 2024). It is also significant to note that employees generate novel ideas for green initiatives even when others disagree with them (Ari et al., 2020). Both required and voluntary green behaviors are possible for employees; however, green voice behavior is distinct from voluntary green behavior, as it involves speaking up independently without external pressure (Robertson and Barling, 2013).

### 2.2. Conceptual Framework and Hypotheses Development

Bandura's Social Learning Theory (1977, 1986) explains how teachers' ethical leadership, university social responsibility, and a green work environment influence students' green voice behavior by shaping a green workplace through ethical leadership. As stated by Shore et al. (2011), leaders play a crucial role in establishing and fostering the work unit climate because they are key stakeholders in organizations and are responsible for translating policies into actionable practices. Teachers can do this by acting as behavioral role models, enabling learners to observe what is considered proper and valued and to learn how to behave appropriately. As leaders, they must also communicate policy guidelines, set clear behavioral expectations, reward, and discipline actions, and consistently serve as role models (Brown et al., 2005).

Studies on organizational context have shown that climate is a highly significant and influential factor (Kuenzi and Schminke, 2009), and as such, it also impacts green behaviors (Norton et al., 2014). The effects of green work climate on pro-environmental behavior have been the subject of relatively few studies. However, some authors, including Norton et al. (2014), Dahiya (2020), and Hicklenton et al. (2019), have examined its relationship with the predictor variable and green work climate (GWC) perception (Rubel et al., 2021). The university's green policies and initiatives help create a green working climate in the classroom. When students witness others around them engaging with green issues and receiving attention and recognition for their contributions, they are motivated to take similar actions. This aligns with Norton et al. (2015)'s reasoning that a green workplace can encourage environmentally friendly behavior among employees.

As a result, the author proposes the following hypotheses (H1, H2, H3):

H1: Teachers' Ethical Leadership (EL) positively influences student's Green Work Climate (GWC).

H2: Student's Green Work Climate (GWC) positively influences their green voice behaviors (GVB).

H3: Student's Green Work Climate (GWC) mediates the relationship between Teachers' Ethical Leadership (EL) and students' green voice behavior (GVB).

Research has demonstrated that ethical leadership has a favorable impact on voice behavior as well as on extra-role behaviors among workers (Zeng & Xu, 2020). Furthermore, encouragement from both sides motivates employees to participate in the leader's decision-making process. When working with ethical leaders, managers encourage employees to do so, creating an environment where employees feel comfortable expressing their thoughts (Ahmad & Gao, 2018). It can be argued that when teachers exhibit an ethical leadership style, they are more likely to engage in green behaviors, set an example for their students, and encourage them to act similarly. Teachers can inspire students to engage in "green voice" behavior, which involves continuously discussing ideas and suggestions for improvement with others around them. As a result, the author proposes the following hypothesis (H4):

H4: Teachers' Ethical Leadership (EL) positively influences students' Green Voice Behavior (GVB).

Stakeholder Theory explains teachers' awareness of stakeholder demands, including schools, communities, and students. Classroom leaders must serve stakeholder interests to enhance organizational performance (Zhu et al., 2014). Ethical leaders promote cooperation and responsible commitment for sustainability (Maak & Pless, 2006) while improving environmental, social, and ethical performance in response to stakeholder perceptions of CSR (Morsing & Schultz, 2006).

Ethical leaders shape followers' perceptions of CSR, extending beyond employees (Groves & LaRocca, 2011). Institutional sustainability relies on ethical educators who engage in social responsibility initiatives and communicate this commitment to students. Social responsibility includes legal, ethical, and environmental stewardship (Zhu et al., 2014). Organizations prioritizing CSR recognize and encourage environmentally responsible behaviors like the "green voice." Thus, USR can positively influence students' green behaviors. Ethical leaders implementing CSR initiatives and communicating CSR values influence subordinates' actions, with CSR mediating the impact of EL on-employee's behavior (Wood et al., 2021). Since teachers influence all students in the classroom, when they demonstrate ethical leadership and encourage social responsibility, students are more likely to adopt environmentally responsible behaviors. Consequently, the author proposes hypotheses H5, H6, and H7:

H5: Teachers' Ethical Leadership (EL) positively influences their perception of the university's social responsibility.

H6: Students' perception of the university's social responsibility positively influences their Green Voice Behaviors (GVB).

H7: Students' perception of university social responsibility mediates the relationship between Teachers' Ethical Leadership (EL) and student's Green Voice Behaviors (GVB).

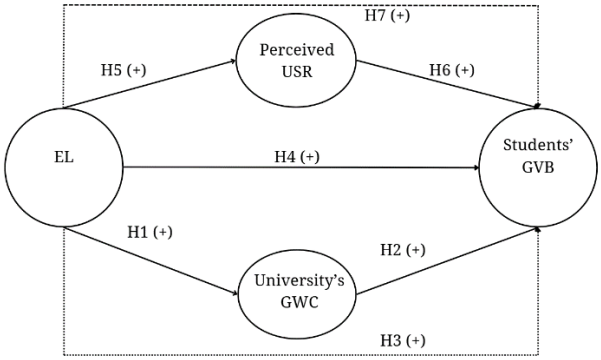

**Figure 2.2 - Proposed Conceptual Model**

## 2.3. Research Methodology

### 2.3.1. Measurement instruments

Ethical leadership emerges from the combination of traits and behaviors that demonstrate integrity and high ethical standards, treat others fairly, and hold subordinates accountable for unethical behavior. The scale developed by Brown et al. (2005) is used because it shows significant agreement among group members regarding their supervisor's ethical leadership. Considering that teachers are closely involved with students the study has adopted this scale with adjustments in terminology and context to ensure its relevance. One item in this scale is "Listens to what employees

have to say". The 6-item green voice behavior (GVB) scale, originally developed by Van Dyne and LePine (1998), served as the basis for Murillo-Ramos et al.'s (2024) use in measuring green voice among hospitality workers. “This particular co-worker develops and makes recommendations concerning issues that affect this work group” was one of the six items on the scale. Since students frequently work in study groups, the author adopted this scale to assess students' contributions to group discussions. Using various platforms, including websites, social media fan pages, extracurricular activities, seminars, and competitions, students can observe how they are responsible towards both social and non-social stakeholders. These platforms also help create a positive image of universities among stakeholders. There are several advantages to using the scale from Duygu Turker's (2009) research in a higher education setting to examine how students perceive university social responsibility (USR). One of the items on the scale is as follows: "Our company participates in the activities which aim to protect and improve the quality of the natural environment". An eight-item scale is used to assess students'GWC. Norton's (2014) green work climate perception scale forms the basis of this scale. “Our company is worried about its environmental impact” is one of the items. Four items gauge how students perceive the school, while the other four measure how they perceive their peers.

The study adopted hospitality sector scales for specialized education, with thorough translations and reviews by lecturers and students in Ho Chi Minh City confirming no significant cultural or linguistic differences. This confirmed the widespread applicability and generalizability of the selected scales. Through the previous steps, the author appropriately replaced certain terms, including “teacher” for “manager”, “student” for “employee”, “teaching approach”' for “working approach”, “my institution” for “my company”, and “the students in my group” for “my colleagues”. The scales were then finalized and sent students for verification and identification of spelling issues. Afterwards, the author proceeded to develop the questionnaire and conduct the official survey.

### 2.3.2. Questionnaire design and sample

To test the study hypotheses, a survey was reviewed by instructors, students, and industry professionals. A pilot survey with 50 students ensured clarity. Participation was voluntary, with questionnaires distributed directly and via messaging platforms. EL, GWC, and USR were surveyed first, followed by the GVB section, sent via email 24 hours later with a follow-up reminder. Initially, 500 students were invited, but only 253 completed part two. Using convenience sampling across five major hospitality colleges in Ho Chi Minh City, the sample size ensures research validity and generalizability.

The questionnaire has four sections. The first introduces the study to encourage participation. The second collects demographic data (gender, age, year, university) to manage variables affecting green voice behavior. The third includes scales for EL, USR, and GWC, while the final GVB scale is sent later. Each scale has 6–10 items, rated on a 5-point Likert scale (1 = Strongly Disagree to 5 = Strongly Agree).

## III. RESULT AND DISCUSSION

### 3.1 Research subjects

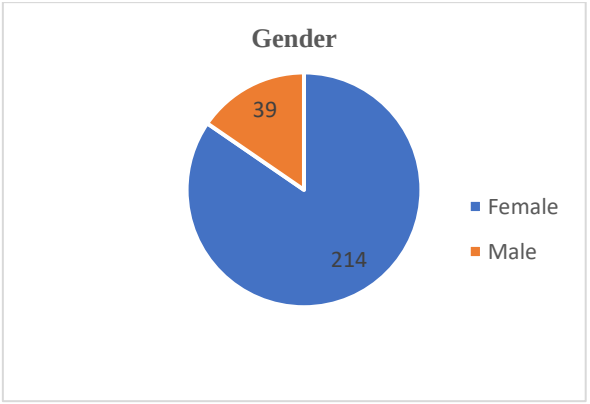

**Figure 3.1a - Survey results by gender**

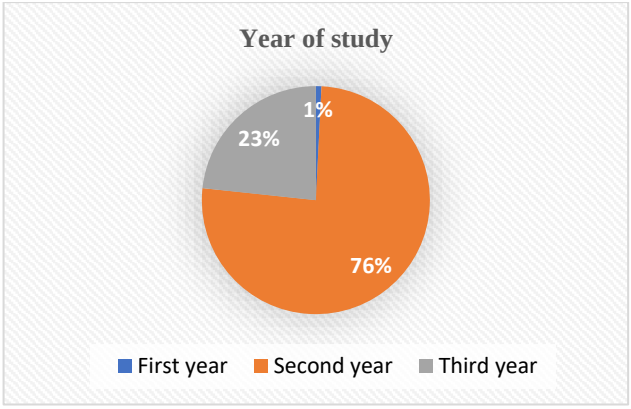

**Figure 3.1 - Survey results by year of study**

The study sampled 253 hospitality and tourism students from top institutions in Ho Chi Minh City, predominantly female (84.5%). Most participants were second-year (75.8%) and third-year students (23.3%), as first-year students focus on general courses and fourth-year students are engaged in internships.

### 3.2. Data Analysis and result

The author utilized SmartPLS 3 for data analysis, as this software allows for simultaneous modeling of relationships, yielding more accurate estimates than evaluating models individually. The author acknowledged that the sample size of 253 observations was limited compared to ideal standards but noted that the model, which included four latent variables, was relatively straightforward. To ensure rigor, the author performed statistical checks to verify data quality and confirmed that collinearity among the observed indicators remained within acceptable limits. The author employed a combination of descriptive statistics and structural equation modeling (SEM) to test hypotheses concerning the influence of the independent variable EL, USR and GWC on other variables, as well as the mediating roles of USR and GWC. Additionally, the author examined the effects of control variables on the green voice behavior (GVB).

An evaluation using SMARTPLS 3 identified low outer loadings (<0.708) for EL2, EL4, EL6, and GVB5, leading to their removal (Hair et al., 2016). The remaining items showed acceptable loadings: EL (0.713–0.833), USR (0.820–0.886), GWC (0.762–0.820), and GVB (0.763–0.864). All scales achieved Cronbach's Alpha and Composite Reliability (CR) above 0.7, ensuring high reliability, while AVE values exceeded 0.5, confirming convergent validity (see Table 3.2a).

**Table 3.2a - Reliability and validity of variables**

Construct Reliability and Validity

| | Cronbach's Alpha | rho_A | Composite Reliability | Average Variance Extracted (AVE) |
|---|---|---|---|---|
| EL | 0.893 | 0.895 | 0.917 | 0.611 |
| GVB | 0.899 | 0.899 | 0.925 | 0.712 |
| GWC | 0.914 | 0.915 | 0.930 | 0.626 |
| USR | 0.899 | 0.901 | 0.923 | 0.666 |

**Table 3.2b - The discrimination of the variables**

Fornell-Larcker Criterion

| | EL | GVB | GWC | USR |
|---|---|---|---|---|
| EL | 0.782 | | | |
| GVB | 0.600 | 0.844 | | |
| GWC | 0.731 | 0.731 | 0.791 | |
| USR | 0.778 | 0.727 | 0.810 | 0.816 |

Heterotrait-Monotrait Ratio (HTMT)

| | EL | GVB | GWC | USR |
|---|---|---|---|---|
| EL | | | | |
| GVB | 0.669 | | | |
| GWC | 0.802 | 0.806 | | |
| USR | 0.864 | 0.809 | 0.890 | |

The square root of the Average Variance Extracted (AVE), indicated by the first value in each column, exceeds the correlations among the latent variables, as shown by the correlation coefficients positioned below these values. This confirms discriminant validity. Additionally, all HTMT values are below 0.9, further supporting the differentiation among the constructs (see Table 3.2b).

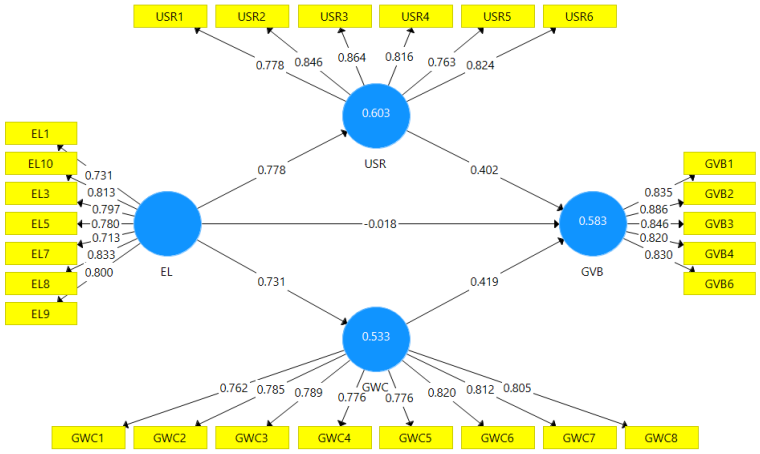

**Figure 3.2 - Revised SEM Using SmartPLS 3**

Students' perceptions of university social responsibility (USR) and green work climate (GWC) significantly impact green voice behavior (GVB) (P < 0.05) with standardized regression coefficients of 0.402 and 0.419. Teachers' ethical

leadership also strongly influences GWC (0.731) and USR (0.778) ($P < 0.05$). However, students' perceptions of teacher ethical leadership had no direct effect on GVB ($P = 0.785$). Instead, its impact on GVB occurs indirectly through the mediating roles of GWC and USR (see Table 3.2c).

**Table 3.2c - Direct effects of Ethical Leadership on University Social Responsibility, Green Work Climate, Green Voice Behaviors**

Mean, STDEV, T-Values, P-Values

| | Original Sample (O) | Sample Mean (M) | Standard Deviation (STDEV) | T Statistics (\|O/STDEV\|) | P Values | |
|---|---|---|---|---|---|---|
| **EL -> GWC** | 0.731 | 0.731 | 0.041 | 17.828 | **0.000** | **H1 Support** |
| **GWC -> GVB** | 0.419 | 0.424 | 0.074 | 5.652 | **0.000** | **H2 Support** |
| **EL -> GVB** | -0.018 | -0.020 | 0.067 | 0.273 | **0.785** | **H4 Not support** |
| **EL -> USR** | 0.778 | 0.776 | 0.039 | 19.739 | **0.000** | **H5 Support** |
| **USR -> GVB** | 0.402 | 0.401 | 0.078 | 5.177 | **0.000** | **H6 Support** |

**Table 3.2d - Mediation Effects of Ethical Leadership via University Social Responsibility and Green Work Climate on Green Voice Behaviors (Bootstrap 5000 Samples)**

Mean, STDEV, T-Values, P-Values

| | Original Sample (O) | Sample Mean (M) | Standard Deviation (STDEV) | T Statistics (\|O/STDEV\|) | P Values | |
|---|---|---|---|---|---|---|
| **EL -> GWC -> GVB** | 0.306 | 0.310 | 0.060 | 5.129 | **0.000** | **H3 Support** |
| **EL -> USR -> GVB** | 0.312 | 0.312 | 0.066 | 4.732 | **0.000** | **H7 Support** |

The mediating effects of university social responsibility (USR) and green work climate (GWC) are significant ($P < 0.01$), with standardized regression coefficients of 0.312 and 0.306, respectively (see Table 3b). Bootstrap analysis (5,000 samples) confirms mediation, as confidence intervals exclude 0 (see Table 3.2d). Thus, GWC and USR fully mediate the impact of teachers' ethical leadership on students' green voice behavior. All Inner Variance Inflation Factor (VIF) values are below 5, indicating no multicollinearity: EL to GVB (2.743), EL to USR (1.000), EL to GWC (1.000), GWC to GVB (3.150), and USR to GVB (3.709) (Hair et al., 2011).

**Table 3.2e - Confidence Intervals of Mediation Effects for Ethical Leadership on Green Voice Behavior via Green Work Climate and University Social Responsibility**

Confidence Intervals

| | Original Sample (O) | Sample Mean (M) | 2.5% | 97.5% |
|---|---|---|---|---|
| **EL -> GWC -> GVB** | 0.306 | 0.309 | 0.201 | 0.432 |
| **EL -> USR -> GVB** | 0.312 | 0.311 | 0.184 | 0.442 |

The model's explanatory power is reflected in the adjusted R-squared values: 0.603 for university social responsibility (USR) and 0.533 for green work climate (GWC) based on perceptions of ethical leadership, while it accounts for 58.3% of the variance in students' green voice behavior (GVB). Effect size ($f^2$) analysis shows that GWC (0.135) and USR (0.105) have a small impact on GVB ($\geq 0.02$) (Cohen, 1988). However, ethical leadership (EL) significantly impacts GWC (1.148) and USR (1.529), indicating a substantial effect ($\geq 0.35$).

**Table 3.2f - R Squared Value for Measuring the Impact on the Dependent Variable**

R Square

| | R Square | R Square Adjusted |
|---|---|---|
| **GVB** | 0.588 | 0.583 |
| **GWC** | 0.534 | 0.533 |
| **USR** | 0.605 | 0.603 |

**Table 3.2g - effect size**

f Square

| | EL | GVB | GWC | USR |
|---|---|---|---|---|
| **EL** | | **0.000** | **1.148** | **1.529** |
| **GVB** | | | | |
| **GWC** | | 0.135 | | |
| **USR** | | 0.105 | | |

The model explains 58.3% of the variance in green voice behavior (GVB) (Table 3.2f), though the effect size ($f^2$) of independent variables on GVB is small (≥ 0.02 but < 0.15) (Cohen, 1988). The mediated path from ethical leadership (EL) to GVB via green work climate (GWC) and university social responsibility (USR) is highly significant (Table 3.2g). Hair et al. (2019) classifies the model as having medium predictive power ($Q^2$ = 0.25–0.5), with out-of-sample predictive power values of 0.410 for GVB, 0.327 for GWC, and 0.395 for USR (Stone, 1974).

**Table 3.2h - Predictive Power of the Model (Q-Squared)**

Total

| | SSO | SSE | $Q^2$ (=1-SSE/SSO) |
|---|---|---|---|
| **EL** | 1771.000 | 1771.000 | |
| **GVB** | 1265.000 | 745.748 | 0.410 |
| **GWC** | 2024.000 | 1362.931 | 0.327 |
| **USR** | 1518.000 | 917.767 | 0.395 |

The author also examined the impact of control variables, including gender, age, and student year (first, second, third, and final years). The results indicated that these variables did not have a significant influence on the dependent variable, green voice behavior (GVB). Specifically, the P-values for gender, age, and student year were 0.270, 0.133, and 0.243, respectively. This suggests that these student demographic differences do not significantly affect their green voice behavior, and other factors within the model may better explain this aspect of student conduct.

### 3.3. Discussion

While Ethical Leadership is recognized for its significant role in promoting employee voice behaviors both directly and indirectly (Zeng & Xu, 2020), this study finds no direct influence of Teacher's EL on students' Green Voice Behaviors. Nevertheless, the analysis confirms that Teacher's EL positively impacts students' Green Work Climate and the USR toward both social and non-social stakeholders. This study clearly demonstrates that teachers who exhibit ethical leadership play a crucial role in fostering a positive climate and act as a bridge to communicate the university's social responsibility initiatives to students. Teachers' EL shapes students' perceptions of social responsibility and the green climate, influencing their green voice behavior. It fosters a positive environment and motivates sustainable actions. However, while student's GWC and USR impact student's GVB, their effect remains modest.

Regarding the mediating role hypothesis, this study highlights the importance of considering the combined pathways to understand how Teacher's EL specifically influences these variables. The results indicate that teachers' EL, as perceived by students, significantly impacts behavior through the full mediation of university social responsibility (USR) and green work climate (GWC). Wood et al. (2021) also supports this mediating effect based on their research in the hospitality industry. This finding aligns with AMO theory, which suggests that green behaviors are inherently voluntary and conscious, indicating that opportunity and motivation are essential factors in fostering such behaviors. Additionally, there are no differences in green voice behavior based on variations in student gender, age, or year of study. This finding suggests the potential to generalize these results across demographic differences and to formulate related recommendations.

## IV. CONCLUSION

### 4.1. Managerial Implications

The study's findings suggest that promoting ethical leadership among teachers is crucial for fostering green behaviors in students. While teachers' ethical leadership does not have a direct impact on students' Green Voice Behavior, it influences them indirectly by cultivating a sense of university social responsibility and creating a green

work climate. To promote teachers' ethical leadership, it is essential to invest in professional development initiatives, such as workshops or seminars on ethical leadership, which can inspire teachers to become trusted role models and instill a strong ethical framework within the institution.

Meaningful social responsibility initiatives, such as committing to energy-saving regulations, effective waste management, and the promotion of recyclable materials on campus, can enhance students' awareness of the university's environmental efforts. These initiatives also encourage their participation in eco-friendly activities. Furthermore, university social responsibility efforts, including charitable work, environmental volunteering opportunities, and sustainability-focused events, help students recognize the institution's commitment to social responsibility. Additionally, requiring or recommending university social responsibility reporting, in collaboration with hospitality education stakeholders, is essential for assessing performance and reinforcing the institution's social responsibility.

For students to effectively contribute to green initiatives, institutional support and faculty guidance are essential. Educators can integrate social responsibility education into their curricula, fostering an academic environment where students are encouraged to present and develop their ideas within the classroom setting. University-affiliated organizations and administrative bodies can facilitate this process by organizing thematic seminars, academic conferences, and competitions focused on environmental sustainability. Additionally, implementing structured programs that promote eco-friendly behaviors within the academic community and beyond can further reinforce these efforts. Through experiential learning and active engagement, coupled with mentorship from faculty and institutional support, students can emerge as key agents of change, driving the dissemination of sustainable initiatives and fostering a culture of environmental consciousness.

Universities can develop an evaluation system to assess the effectiveness of faculty ethical leadership in fostering students' environmentally responsible behavior and social responsibility. To further encourage faculty engagement, institutions may implement reward mechanisms and strict regulations that cultivate a supportive environment for sustainability initiatives. The adoption of such an evaluation framework will not only motivate faculty members to uphold ethical leadership but also create a positive institutional culture that inspires students to adopt sustainable practices.

For ethical leadership to have a lasting and widespread impact, it must be implemented in a comprehensive and coordinated manner, involving both faculty and administrative departments. Establishing collaborative programs and robust information-sharing platforms among departments is essential for synchronizing leadership efforts and ensuring the effectiveness of initiatives that promote sustainability among students.

### 4.2. Limitations and Future Research

Despite analyzing students' green voice behavior, this study has limitations. The sample from five hospitality institutions may not be fully representative, requiring broader participation for generalization. Self-report questionnaires risk social desirability bias, suggesting the need for longitudinal studies or multiple data sources. Adapting business research scales may cause misunderstandings, highlighting the value of stakeholder interviews. Future research should also explore additional factors beyond university social responsibility (USR) and green work climate (GWC) to deepen understanding of green voice behavior (GVB).

### 4.3. Conclusion

This paper highlights the vital role of ethical leadership in enabling teachers to foster students' positive behavior by reinforcing institutional social responsibility and a green climate. Green voice behavior arises not just from modeling or persuasion but from a supportive climate and motivation shaped by instructors. Through social learning theory, teachers with moral leadership remain a trusted influence, serving as key role models in an ever-evolving society.

# EXPLORING THE RELATIONSHIP BETWEEN GREEN SPACES, EXTRACURRICULAR ACTIVITIES, AND PRO-ENVIRONMENTAL BEHAVIOR AMONG HIGHER EDUCATION STUDENTS

**Pham Thi Ngoc Thu[1], Le Thi Kim Thao[2]**

[1] Faculty of Economics, Nong Lam University, Ho Chi Minh City, Vietnam
[2] Faculty of Economics, Nong Lam University, Ho Chi Minh City, Vietnam

**ABSTRACT**

This study explores the impact of green spaces and extracurricular activities on pro-environmental behavior (PEB) among higher education students, integrating Attention Restoration Theory (ART), Connectedness to Nature Theory, and the AMO (Ability, Motivation, Opportunity) model as the theoretical framework. The research was conducted at universities and colleges in Ho Chi Minh City with green campuses. A quantitative approach was used to assess how these factors influence students' environmental attitudes and actions. The findings show a positive relationship between green spaces, extracurricular activities, and PEB, with key mediators identified as environmental knowledge (Ability) and a strong connection to nature (Motivation). The Structural Equation Modeling (SEM) analysis reveals an R-squared value of 0.424, indicating that the model explains 42.4% of the variance in pro-environmental behavior and demonstrating a moderate level of explanatory power. Based on the responses of 390 students, the results highlight the importance of integrating green spaces and environmental activities into higher education institutions to foster pro-environmental behavior among students.

*Keywords:* “Green spaces”, “Extracurricular activities”, “Pro-environmental behavior”, “Connectedness to Nature”, “AMO model”, “Environmental knowledge”.

## I. INTRODUCTION

### 1.1 Background of the study

Nature conservation is currently facing a pair of significant issues that are interconnected: the first is caused by human activities such as the use of fossil fuels, the emission of carbon monoxide, deforestation, and the second is caused by climate change, resource scarcity, and environmental degradation (Markey et al., 2019). Environmental protection is frequently considered as a critical topic (Akhtar et al., 2022). People are the main drivers in dealing with environmental challenges and climate change, and they have their own advantages in environmental sustainability. To identify a resolution, we need to begin by educating about the current condition of the environmental issues and how to deal with them. Students who live in cities require further research since they spend most of their time in the building surroundings (Hashimoto-Martell et al., 2012). In Canada, initiatives to promote environmentally friendly behaviours for students have been implemented, including integrating environmental education into the curriculum, upgrading gardening infrastructure, and providing step-by-step instructions for incorporating sustainable management into the curriculum (Breunig et al., 2014). This highlights that, throughout the decade of education for sustainable development, there has been an increase toward a stronger emphasis on environmental education.

In this setting, universities, both direct and indirect environmental stakeholders, must work collaboratively to preserve the environment. However, such efforts cannot be entirely effective unless they involve the university's students (Zamora-Polo et al., 2019). There is an urgent need to look into how sustainable campus initiatives (e.g., extracurricular activities, green campus projects) impact student views and actions toward achieving environmental objectives (Chakraborty et al., 2017). Students as well as learners in general are undeniably important stakeholders in environmental efforts at universities. Sustainability subjects are also integrated (environmental, social, economic, and cultural) (Giard and Schneiderman, 2013), indicating that educators recognize students' engagement value. Environmental knowledge formation can be a key predictor of pro-environmental behavior change, which is the intervention's targeted result (cole et al., 2019). Furthermore, understanding students' perceptions of university sustainability practices is vital because it provides policymakers with better guidance, such as how students perceive their university's green campuses following efforts to build and preserve green spaces (Shafei & Maleksaeidi,

2020). The appeal for quantitative research, which is now mostly done in Europe, should be expanded to include Asian institutions (Abubakar et al., 2016; Akhtar et al., 2020). AMO theory has been shown to be highly useful in figuring out how to inspire and shape behaviors, particularly voluntary behaviors; nevertheless, pro-environmental behaviors in education that are explained through AMO are sometimes neglected (Pinzone et al., 2016; Anwar et al., 2020). Thus, pro-environmental behavior is a necessary behavior to explain employing AMO theory. Previous research has also found that environmental awareness and knowledge have an impact on individual concern and effectively reduce environmental problems while also promoting this type of behavior in organizations (Fawehinmi et al., 2020).

Green spaces offer multiple favorable impacts that researchers have investigated and proven on human wellness, including stress reduction, enhanced mindfulness, reduced physical health issues, and comprehensive positive effects (Li et al., 2019). Despite these advantages, green space research frequently focuses on urban areas, exploring residents' perceptions and behaviors toward green spaces, as He and Zhu (2018) conducted interviews to conduct research on residents' behaviors and attitudes, and Zhou and Li (2015) analyzed the quality of green spaces. However, an important aspect of greening is the green campus in universities, where there are sufficient conditions to promote green campus development but insufficient attention (Washington-Ottombre et al., 2018), resulting in a lack of understanding of students' perceptions of green spaces in universities. Thus, green spaces in universities are both a benefit to students and a source of study into the attitudes and behaviors that result from green spaces.

The present societal development in Vietnam is causing a shift in the overall educational system. Educational innovation requires the development of curriculum and procedures aimed at improving learners' knowledge, abilities, and qualities (Hoduc et al., 2022). Current educational reform must still follow a certain procedure due to its structural organization, making it difficult to consistently keep up with change. As a result, informal education, with its flexibility, may aid in the reform process by facilitating students in embracing societal changes. As a result, activities that are conducted beyond the traditional curriculum are referred to as extracurricular activities, and they are becoming more prevalent in today's educational system. The advantages include not just enriching the academic program, but also increasing the learner experience, contributing to personal capital, soft skills, essential competencies, and interactions with others that may be constructed through extracurricular activities (Kosarikov & Davydova, 2022). Effective tactics are required for impacting the younger generation's green actions. Government organizations advocate boosting awareness through non-academic activities such as seminars, conferences, campaigns, and advertising collateral directed at young people, such as students (Saifullah et al., 2017).

Pro-environmental behaviors among the younger generation must be included in the attempts to construct green spaces in universities. It benefits people around it, and while the positive effect of green spaces on humans is often recorded, research on the opposite impact on the environment remains limited. Extracurricular activities aimed at supplementing the primary curriculum have been researched; nevertheless, studies on students' engagement in campaigns have been limited in terms of their influence on environmentally friendly behaviors. This article attempts to clarify the primary influence of green spaces in major institutions in Ho Chi Minh City, as well as students' extracurricular activities, on their environmentally friendly behaviors, with the goal of offering implications for naturally forming fundamental beneficial environmental behaviors.

The purpose of this study is to examine the students' perceptions of green space at university, as well as their engagement in voluntarily extracurricular activities that result in pro-environmental behavior. Moreover, the author investigates the mediating link between environmental knowledge and connectedness to nature, both of which are thought to be closely linked to involvement in green spaces and extracurricular activities. Therefore, the research question is as follows:

Question 1: How do green spaces affect students PEB?

Question 2: What impact does extracurricular activity involvement play in improving students' PEB?

Question 3: What significance do mediators, such as environmental awareness and a connectedness to nature, serve in the link between green space and extracurricular activity involvement and student PEB?

**1.2 Theoretical background and hypotheses**

Pro-environmental behavior is one of the extra-role behaviors that AMO theory may explain through integrating

elements like ability (A), motivation (M), and opportunity (O). These factors together will yield optimal performance, in which ability is the skills and expertise that an individual requires to perform a specific task, followed by the individual's desire to decide whether to perform that specific action - motivation, and finally the individual can perform and desires to succeed but demands more possibilities - the surrounding forces that facilitate or prevent their behaviors and are beyond what they can influence (Morales-Sánchez & Pasamar, 2020).

Pro-environmental behavior (PEB) is characterized by Runhaar et al. (2019) as an intentional act undertaken by a person or together that positively impacts the environment, either directly or indirectly. This activity may be characterized as participation in structured activities that seek sustainable practices by decreasing or eliminating harmful environmental consequences, as noted by Rezapouraghdam et al. (2018). It may also be simplified by minimizing trash, turning off lights when unneeded in the workplace, cycling, decreasing paper consumption while printing, and advocating environmental activities (Akhtar et al., 2022).

Research indicates that green spaces at universities, which provide a connection with nature, are crucial for human well-being and serve as a strong positive predictor of environmental attitudes and behaviors (Nisbet et al., 2009). Students' engagement in green spaces on campus—through walking, relaxation, group study, outdoor activities, and clean-up initiatives—can enhance involvement in significant green initiatives (Krasny & Delia, 2015). The AMO theory may be used to argue that green spaces serve as an inspiration for behavioral motivation, since exposure to such environments fosters a sense of commitment and connection to nature, prompting individuals to prioritize preserving of such spaces before addressing broader environmental concerns. The author thus posits the following hypothesis:

H1: Campus green spaces positively influence students' pro-environmental behaviors.

H2: Connectedness to Nature positively influence students' pro-environmental behaviors.

H3: Campus green spaces positively influence student’s environmental knowledge.

H4: Campus green spaces positively influence student’s connectedness to nature.

According to their study, Kosarikov and Davydova (2022) have stated that extracurricular educational programs are truly applicable to the post-industrial shift because they are organized following the associated initiatives on development, that promote sustainable growth, and intended to stabilize the climate and reduce humanity's environmental impact. This is in addition to the fact that these programs are suitable in helping students become familiar with and aware of the real-world circumstances. These perceptions and experiences will shape students' orientation. According to the author, extracurricular activities provide youngsters the chance to interact with the environment, learn about environmental issues, explore the beauty of nature, and take an effort to preserve it. As a result, the author suggests the following of hypotheses:

H5: Extra-curricular activities positively influence students' pro-environmental behaviors.

H6: Extra-curricular activities positively influence students' environmental knowledge.

H7: Students' environmental knowledge positively influence students' pro-environmental behaviors.

Due to environmental issues, encouraging pro-environmental behavior has become a priority in both developed and developing nations, since both are dealing with many environmental issues (Amoah & Addoah, 2020). An individual who understands more about the environment is more likely to participate in ways that aid the environment, according to several research (Van Birgelen et al., 2009; Amoah et al., 2018). But where do students learn about the environment? Sustainable development goals have forced educational systems to concentrate on learning by doing, a popular approach that enhances students' practical expertise in areas including the environment. In addition to having a direct effect on students' PEB, involvement in extracurricular activities and appreciation green space also has an indirect effect. Students will also feel more linked to nature because of caring for and participating in green settings, which will relate them to eco-friendly behaviors. As a result, the author puts up the following hypotheses on the mediating role:

H8: Students' knowledge regarding the environment mediates the association between campus green space and pro-environmental behavior (PEB).

H9: The connection of students to nature mediates the link between their campus green spaces and their pro-environmental behavior (PEB).

H10: The environmental knowledge of students mediates the relationship between their extracurricular participation and pro-environmental behavior (PEB).

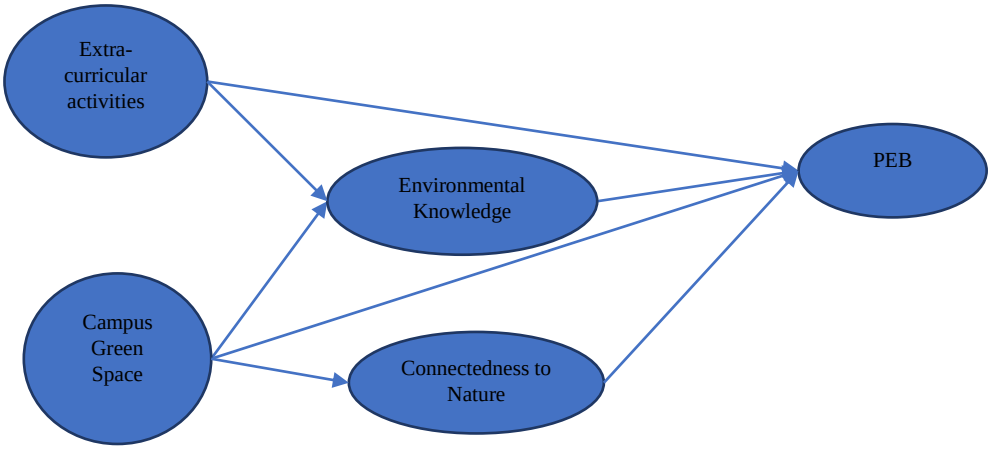

**Figure 1. Proposed conceptual model.**

## II. RESEARCH METHOD

### 2.1. Procedure, questionnaire design and data collection

To learn about green spaces at their schools and to acquire their thoughts on extracurricular activities, the author interviewed two professors who teach public economics and the restaurant and hotel business at two separate institutions. The author then conducted interviews with students to learn more about their viewpoints on the extracurricular activities they took part in. Lastly, to test the scale ahead of the formal survey, the author surveyed students and professors.

A final questionnaire was designed to elicit students` pro-environmental behavior. The objective of research and the importance of truth answers were clearly stated in order to reduce hypothetical bias. Accordingly, only colleges and universities with green campus space were targeted. Furthermore, a brief literature review was performed to identify relevant studies and explore instruments of items used. The survey covered 6 main constructs, including demographic information, environmental knowledge, connectedness with nature, green space campus, extra-curricular activities, and pro-environmental behavior. The instrument used a Likert scale ranging from 1- Totally disagree to 5- Totally agree. Questions for demographics were also included.

Data for this research were collected through online distribution between October and November 2024. The questionnaires were sent to a various universities and colleges with green space campuses in Ho Chi Minh city. A total of 390 respondents participated in this survey.

### 2.2. Data analysis

Data were analyzed by using Structural Equation Modeling (SEM) test in Smart PLS. SEM is a multivariate statistical technique that is used to analyze complicated relationships among observed and latent variables (Hair et al., 2019). This study applied Partial Least Squares Structural Equation Modeling (PLS-SEM) to evaluate the measurement model. The measurement model was examined to confirm the validity and reliability of the constructs. Cronbach's alpha and Composite Reliability (CR) were used to assess reliability, with criteria of 0.7 or greater (Thorndike, 1995). Moreover, convergent validity was confirmed using Average Variance Extracted (AVE), with values above 0.5 being acceptable (Fornell & Larcker, 1981).

The structural model was examined to assess the proposed relationships between latent variables, and path coefficients were also estimated. The data analysis followed a two-step process. Initially, the measurement model was validated to confirm its reliability and validity. Subsequently, the structural model was evaluated to test the hypothesized relationships.

## III. RESULT AND DISCUSSION

### 3.1. Demographic profiles

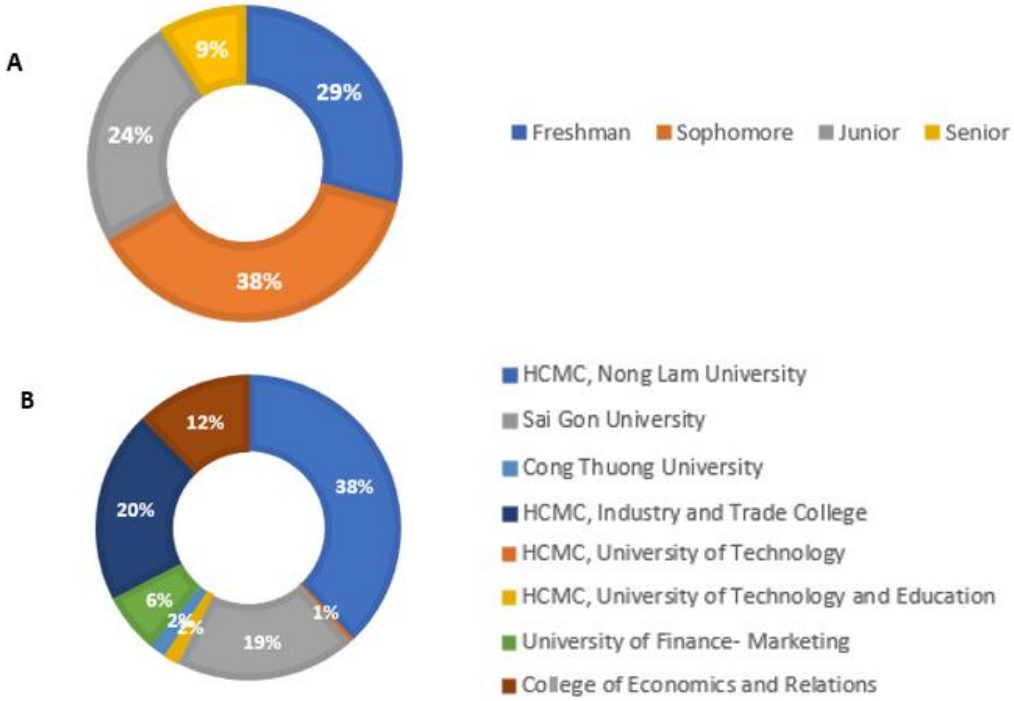

**Figure 2. Demographic profiles (A. The distribution of students across 4 academic years; B. The distribution of students across educational institutions)**

Figure 2 demonstrates the distribution of students, revealing that sophomores represent the largest group, accounting for 38%. Freshmen, juniors, and seniors follow, making up 29%, 24%, and 9%, respectively. In terms of educational institutions, Ho Chi Minh City Nong Lam University leads the group, comprising 38% of the total, followed by HCMC Industry and Trade College at 20% and Sai Gon University at 19%. Other institutions account for relatively low percentages.

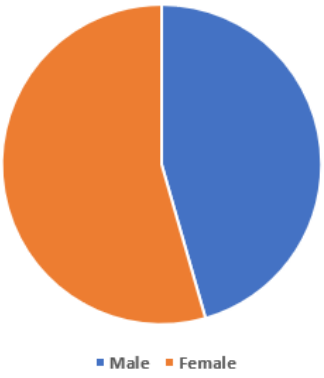

**Figure 3. Participants gender**

Figure 3 illustrates the gender distribution of the surveyed population. The group is nearly evenly split between males and females, with females slightly outnumbering males. Females represent approximately 55%, while males made up about 45% of the total.

### 3.2. Results

By emphasizing the relationships among constructs, the structural model concentrates on how they affect environmental knowledge, connectedness to nature and pro-environmental behavior. The results suggest that extracurricular activities, green spaces, and connectedness to nature are key factors influencing environmental knowledge and pro-environmental behavior. In particular, extra-curricular activities are fairly crucial in promoting environmental knowledge with a path coefficient of 0.275, and pro-environment behavior at 0.270. Likewise, green space campus positively affects environmental knowledge (0.196), and connectedness to nature (0.387), and a smaller but positive effect on pro-environment behavior (0.123). This result highlights how campus green spaces can improve

students` understanding of the environment and their sense of connectedness to the nature.

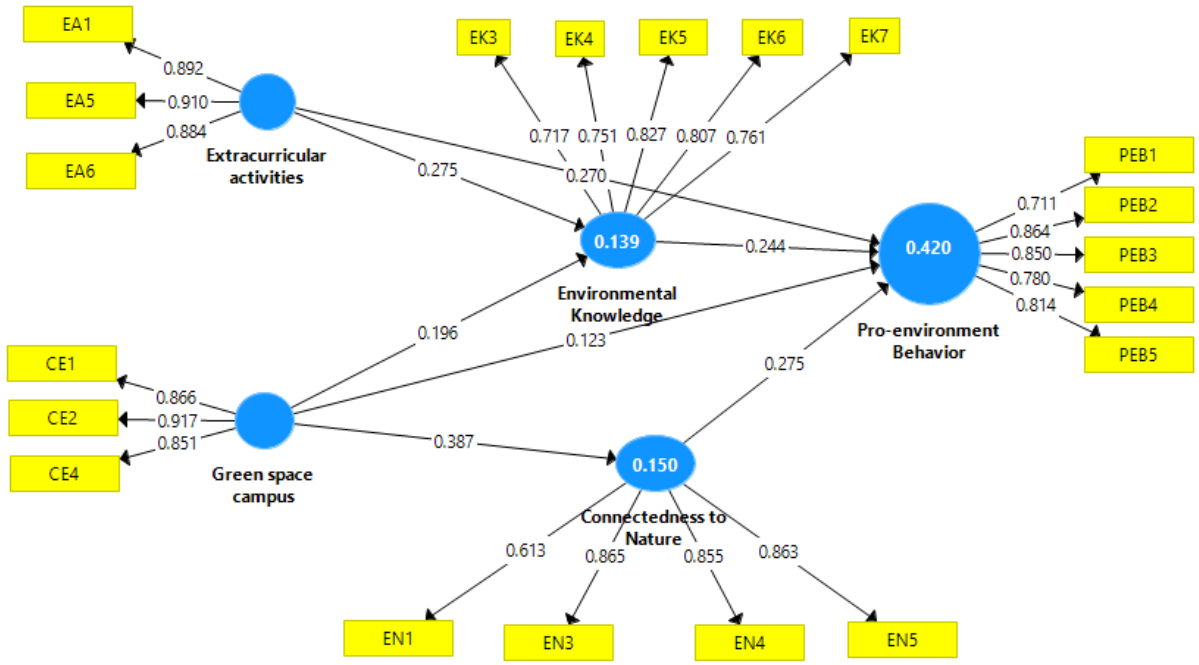

**Figure 4. The result of research model**

With a path coefficient of 0.275, connectedness to nature also has a beneficial impact on pro-environmental behavior, indicating its role as a mediator between pro-environmental outcomes and campus experiences. Furthermore, environmental knowledge had a smaller but positive impact on pro-environmental behavior (0.244), suggesting that although information influences behavior, activities and connectivity are more important. The Figure also reflects $R^2$ values, where Environmental Knowledge ($R^2$ = 0.139), Connectedness to Nature ($R^2$ = 0.150), and Pro-environment Behavior ($R^2$ = 0.420) are explained to varying degrees by their predictors.

Table 1 shows the path coefficients after running PLS Algorithm, emphasizing the relationships between constructs. extracurricular activities positively influence environmental knowledge with a path coefficient of 0.275 and pro-environment behavior with a coefficient of 0.270, while green space campus positively affects connectedness to nature (0.387), environmental knowledge (0.196), and pro-environment behavior (0.123). In addition, connectedness to nature has a positive effect on pro-environment behavior with a path coefficient of 0.275, while environmental knowledge also contributes positively to pro-environment behavior (0.244).

**Table 1. Results of beta coefficient**

| **Beta coefficient** | | | |
|---|---|---|---|
| | Connectedness to Nature | Environmental Knowledge | Pro-environmental Behavior |
| **Connectedness to Nature** | | | 0275 |
| **Environmental Knowledge** | | | 0.244 |
| **Extracurricular activities** | | 0.275 | 0.270 |
| **Green space campus** | 0.387 | 0.196 | 0.123 |
| **Pro-environmental Behavior** | | | |

Table 2 test the construct reliability and validity of variables based on survey results. With a standard value greater than 0.7 and consistent highest values between variables, the reliability of the variables are validated. AVE values for all constructs are above 0.5, meeting the criterion for convergent validity. The lowest AVE is 0.598 (Environmental Knowledge), while the highest is 0.802 (Extracurricular Activities).

As shown in the Table 3, there is a significant interaction among variables including green space campus, extracurricular activities, connectedness to nature and environmental knowledge in influencing the behavior of students towards environment. The table shows the bootstrapping results for path coefficients, which illustrate their statistical significance using Bias-Corrected Confidence Intervals (CI). All path coefficients are significant as their confidence

intervals (2.5%–97.5%) do not include 0, indicating strong support for the relationships. Furthermore, the original sample values of the study range from 0.123 to 0.387, with small bias values close to zero, indicating that the estimates are stable and unbiased. The results suggest positive and significant relationships between the constructs. Thus, it is evident that the proposed model relationships are well-supported.

**Table 2. Construct reliability and validity of variables**

| | Cronbach's Alpha | rho_A | Composite Reliability | Average Variance Extracted (AVE |
|---|---|---|---|---|
| **Connectedness to Nature** | 0.817 | 0.853 | 0.880 | 0.650 |
| **Environmental Knowledge** | 0.832 | 0.839 | 0.881 | 0.598 |
| **Extracurricular activities** | 0.877 | 0.895 | 0.924 | 0.802 |
| **Green space campus** | 0.852 | 0.863 | 0.910 | 0.772 |
| **Pro-environmental Behavior** | 0.864 | 0.871 | 0.902 | 0.649 |

**Table 3. Confidence intervals bias corrected data**

| Hypothesis | Path coefficients | Original Sample (O) | Sample Mean (M) | CI | 2.50% | 97.50% | Result |
|---|---|---|---|---|---|---|---|
| H1 | Green space campus -> Pro-environment Behavior | 0.123 | 0.123 | 0.000 | 0.025 | 0.214 | Support |
| H2 | Connectedness to Nature -> Pro-environment Behavior | 0.275 | 0.278 | 0.003 | 0.176 | 0.370 | Support |
| H3 | Green space campus -> Environmental Knowledge | 0.196 | 0.199 | 0.002 | 0.092 | 0.305 | Support |
| H4 | Green space campus -> Connectedness to Nature | 0.387 | 0.388 | 0.001 | 0.278 | 0.483 | Support |
| H5 | Extracurricular activities -> Pro-environment Behavior | 0.270 | 0.269 | -0.001 | 0.166 | 0.374 | Support |
| H6 | Extracurricular activities -> Environmental Knowledge | 0.275 | 0.278 | 0.003 | 0.161 | 0.367 | Support |
| H7 | Environmental Knowledge -> Pro-environment Behavior | 0.244 | 0.246 | 0.002 | 0.144 | 0.345 | Support |
| H8 | Green space campus -> Environmental Knowledge ->> Pro-environment Behavior | 0.046 | 0.047 | 0.016 | 2.917 | 0.004 | Support |
| H9 | Green space campus -> Connectedness to Nature ->> Pro-environment Behavior | 0.112 | 0.115 | 0.026 | 4.360 | 0.000 | Support |
| H10 | Extracurricular activities -> Environmental Knowledge ->> Pro-environment Behavior | 0.068 | 0.068 | 0.020 | 3.312 | 0.001 | Support |

### 3.3. Discussion

The effect size of $O$=0.275 indicates a positive and fairly substantial association between pro-environmental behavior and being connected to nature. This finding is consistent with earlier research that highlights the importance of emotional and cognitive ties to nature in promoting pro-environmental behavior, such as (Mayer & Frantz, 2004). In another study, Daniel J. Anderson and Tobias Krettenauer explored that pro-environmental behavior is significantly

predicted by a strong emotional connection to nature (Anderson & Krettenauer, 2021). Connectedness to nature plays an important role to encourage pro-environmental behavior, even enhance well-being among university students (Ibáñez-Rueda et al., 2020).

Environmental knowledge also positively influences pro-environment behavior, which is in line with in line with studies like Hines, Hungerford, and Tomera. In Hines et al`s research, environmental knowledge is a key prerequisite for responsible behavior, though it might not always be sufficient to guarantee action without additional motivators (Hines et al., 1987).

In terms of the importance of extracurricular activities dimension, it obviously significantly enhances environmental knowledge and has a direct positive relationship with pro-environment behavior. These results are consistent with previous related studies by Cheng and Monroe (2012) and Zint et al (2014). Cheng and Monroe reveals that active participation in environmental programs improved cognitive understanding of environmental issues (Cheng & Monroe, 2012). In their research Zint indicates that if students take part in more or particular kinds of environmental acts, they are more likely to develop environmental stewardship traits (Zint et al., 2014).

This study also reveals that green space on campus has the strongest effect on connectedness to nature, highlighting its vital role in creating a strong emotional connection with the natural world. Additionally, green space campus also positively influences environmental knowledge, which aligns partially with Barton and Pretty's (2010) research on experiential learning opportunities in green environments (Barton & Pretty, 2010). Another critical result is the relationship between green space campus and pro-environmental behavior. Although this is the weakest relationship in the model, it is still significant. This result implies that green spaces on campus indirectly impact behavior through constructs like connectedness to nature and environmental knowledge, which is a novel finding.

Table 3 shows that students' knowledge regarding the environment mediates the association between campus green space and pro-environmental behavior with a path coefficient of 0.046 and a p-value of 0.004. This implies that having green space on campuses enhances individuals` understanding of the environment, which in turn promotes sustainable behavior. Moreover, a stronger mediation influence is observed for Connectedness to Nature in the relationship between Green Space Campus and Pro-environment Behavior with a path coefficient of 0.112, which emphasizes how experience and emotion connections to nature are in for encouraging sustainable behavior among students. A significant positive relationship was also identified in the relationship among Extracurricular Activities, Environmental Knowledge and Pro-environment Behavior, with a path coefficient of 0.068. Extra activities give students practical opportunities to learn about environmental issues and stimulate feasible solutions. This enhanced knowledge equips them with the skills and awareness to involve in pro-environment actions.

## IV. CONCLUSION AND RECOMMENDATIONS

This study uniquely integrates extracurricular activities and green space campus variables, providing a comprehensive perspective on environmental education. The findings also reveal that pro-environmental behavior is significantly mediated by both environmental knowledge and connectedness to nature. By exploring the association among these factors, the study provides valuable insights for practical applications and management policies.

Universities should prioritize green campus initiatives and extracurricular activities to encourage sustainable practices. By creating and maintaining green campus spaces and providing diverse extracurricular activities, universities can enhance students` connectedness to nature and translate into meaningful behavioral changes. Universities that prioritize sustainability can create a strong identity as their value, attracting more potential students. Moreover, educational programs should be considered to integrate into extracurricular activities. Engaging in activities like guided nature walks or outdoor environmental workshops can deepen students' knowledge and also strengthening their connection to nature. These practical applications not only enrich the learning experience but also encourage students to adopt sustainable actions in their lifestyles.

From a strategic management perspective, higher institutions need to incorporate sustainability into their mission and vision. In order to achieve this, commitment to promote green policies, setting measure sustainable targets should be required, ensuring that institutional culture embraces environmental responsibility. Adopting eco-friendly practices including green designs, water conservation systems and eco-friendly materials can further reinforce the institutions`

commitment.

However, this study only provides a snapshot of the relationships between variables at a single point in time. Therefore, this limits the ability to draw conclusions about the long-term effects of green spaces and extracurricular activities on pro-environmental behavior. Further research is essential to explore how these factors influence behavior over time. In additional, other potential factors including family background, socioeconomic status, or prior environmental education may be also considered in future research to expand the scope.

# FACTORS INFLUENCING NET ZERO GOALS IN TOURISM – A MIXED-METHODS ANALYSIS

**Lam Bao Anh[1*]**

[1] Faculty of Commerce and Tourism, Industrial University of Ho Chi Minh City
* Corresponding: lambaoanh@iuh.edu.vn)

**ABSTRACT**

This study explores the factors influencing the achievement of Net Zero goals in the tourism industry, aiming for a sustainable future. Using a mixed research method, we combined a quantitative survey of 180 tourism sector participants with in-depth interviews with 20 experts. The research model includes five independent variables: the extent of green technology adoption, investment in renewable energy, waste management practices, participation in ecotourism, and the application of circular economy principles; with the dependent variable being the level of Net Zero achievement.

Quantitative data analysis using SPSS shows that investment in renewable energy and the application of circular economy principles have the strongest impact on achieving Net Zero. The expert interviews further provide insights into the challenges of implementing sustainable solutions and the opportunities for technological innovation in the tourism industry.

This study contributes to both theory and practice by identifying key factors for achieving Net Zero in tourism and proposing a strategic framework for tourism businesses. The research results provide a basis for policy planning and business strategy, aimed at promoting sustainable tourism development and effectively responding to climate change. These findings are not only significant for tourism managers and policymakers but also offer valuable guidance for tourism businesses in transitioning their business models towards Net Zero.

*Keywords*: “net zero”, “sustainable tourism”, “green technology”, “circular economy”, “climate change”

## I. INTRODUCTION

The tourism industry faces mounting pressure to achieve Net Zero emissions while maintaining economic viability (UNWTO, 2023; Lenzen et al., 2021). As one of the world's largest industries, tourism significantly contributes to global carbon emissions through transportation, accommodation, and tourist activities, making it a critical focus for climate action (Rico et al., 2019; Sun et al., 2019). While recent studies have highlighted the importance of sustainable practices in tourism (Font et al., 2021; Peeters, 2022), the specific factors influencing Net Zero achievement remain inadequately explored.

This study addresses this knowledge gap by investigating five key factors influencing Net Zero achievement in tourism: green technology adoption, renewable energy investment, waste management practices, ecotourism participation, and circular economy principles (Gössling & Higham, 2021; Hall et al., 2023). Through a mixed-methods approach combining quantitative analysis of 180 tourism sector participants with qualitative insights from 20 industry experts, this research provides a comprehensive understanding of how these factors impact Net Zero goals.

The research contributes to both theory and practice by developing a framework for understanding Net Zero achievement in tourism (Gössling & Scott, 2023) and providing practical guidance for stakeholders. Our findings have significant implications for tourism managers and policymakers in developing effective sustainability strategies (Becken & Higham, 2023).

## II. LITERATURE REVIEW AND THEORETICAL FRAMEWORK

### 2.1 Net Zero Achievement in Tourism

Net Zero achievement in tourism represents the state where the sector's greenhouse gas emissions are balanced by removal from the atmosphere (Becken & Higham, 2023). This concept has become increasingly critical as the tourism industry faces pressure to address climate change while maintaining economic viability (Scott & Gössling, 2022). Recent studies emphasize comprehensive transformation in tourism operations (Font et al., 2022), particularly in carbon

management and environmental impact (Gössling et al., 2021).

To provide a stronger theoretical foundation, this section incorporates key models related to Net Zero achievement in tourism:

Tourism and Climate Change Nexus Model: This model highlights the bidirectional relationship between tourism and climate change, emphasizing how tourism contributes to climate change while being affected by it. It advocates for adaptive strategies and carbon reduction policies (Gössling & Hall, 2022).

Sustainable Tourism Development Model: This framework underscores the balance between economic growth, environmental sustainability, and social equity, stressing the need for long-term planning and stakeholder collaboration in achieving Net Zero targets (Sharpley, 2021).

Circular Economy Model: Focused on minimizing waste and resource use, this model encourages tourism businesses to adopt recycling, reuse, and resource-efficient practices, aligning with Net Zero goals through sustainable operations (Miller & Johnson, 2023).

Ecotourism Development Model: This model promotes low-impact tourism, environmental education, and community involvement, providing a pathway for tourism sectors to reduce emissions while enhancing conservation efforts (Buckley, 2023).

Incorporating these models enriches the theoretical framework, offering multidimensional perspectives on achieving Net Zero in tourism. The study builds upon these models to explore the influence of green technology adoption, renewable energy investment, waste management, ecotourism participation, and circular economy principles on Net Zero outcomes.

### 2.2 Factors Influencing Net Zero Achievement

#### 2.2.1 Green technology adoption

The adoption of green technology has emerged as a crucial factor in reducing tourism's environmental impact. Recent research by Zhang and Wall (2023) found that hotels implementing smart energy management systems reduced their carbon emissions by up to 30%. Similarly, Lee et al. (2022) demonstrated that tourism businesses adopting green technologies showed significant improvements in their environmental performance. Therefore:

*H1: Green technology adoption positively influences Net Zero achievement in tourism.*

#### 2.2.2 Investment in Renewable Energy

Investment in renewable energy represents a fundamental pathway to achieving Net Zero goals in tourism. A comprehensive study by Sustainable Tourism Partnership (2023) revealed that tourism facilities powered by renewable energy reduced their carbon footprint by up to 60%. This finding is supported by Sun and Kim's (2022) research showing a strong correlation between renewable energy adoption and reduced emissions in the hospitality sector. Thus:

*H2: Investment in renewable energy positively influences Net Zero achievement in tourism.*

#### 2.2.3 Waste Management Practices

Effective waste management has been identified as a critical factor in achieving Net Zero goals. Research by Thompson et al. (2023) demonstrated that hotels implementing comprehensive waste management systems reduced their carbon emissions by 25%. Additionally, Rico and Martinez (2022) found that proper waste management practices significantly contribute to reduced environmental impact in tourism operations. Therefore:

*H3: Advanced waste management practices positively influence Net Zero achievement in tourism.*

#### 2.2.4 Participation in Ecotourism

Buckley's (2023) extensive review of ecotourism practices revealed that destinations actively participating in ecotourism initiatives showed better progress toward Net Zero goals. This finding is supported by Chen and Wong (2022), who documented significant emission reductions in eco-certified tourism operations. Thus:

*H4: Participation in ecotourism positively influences Net Zero achievement in tourism.*

#### 2.2.5 Circular Economy Principles

The application of circular economic principles has shown promising results in achieving Net Zero goals. Research by Miller and Johnson (2023) demonstrated that tourism businesses implementing circular economy practices reduced their resource consumption by 40%. These findings align with Hall's (2022) study showing the positive impact of circular economic adoption on environmental sustainability in tourism. Therefore:

*H5: Application of circular economy principles positively influences Net Zero achievement in tourism.*

## III. RESEARCH METHODOLOGY

This study adopts a quantitative research approach to examine the factors influencing Net Zero achievement in tourism, following methodological recommendations from Hair et al. (2022). Data was collected through a structured questionnaire distributed to tourism businesses and organizations from October to December 2024, targeting senior managers and sustainability officers. Using stratified random sampling as suggested by Kline (2023), we achieved 180 valid responses from 250 distributed questionnaires, representing a 72% response rate. The measurement scales were adapted from previous studies, with Green Technology Adoption (5 items) from Zhang and Wall (2023), Renewable Energy Investment (4 items) from Sun and Kim (2022), Waste Management Practices (4 items) from Thompson et al. (2023), Ecotourism Participation (5 items) from Buckley (2023), Circular Economy Principles (5 items) from Miller and Johnson (2023), and Net Zero Achievement (6 items) from Becken and Higham (2023), all measured using a five-point Likert scale. Data analysis followed a systematic approach, beginning with descriptive statistics to understand sample characteristics (Anderson et al., 2023), followed by reliability analysis using Cronbach's alpha with a threshold of 0.7 (Peterson & Kim, 2023). We then conducted Exploratory Factor Analysis (EFA) using principal component analysis with Varimax rotation, applying standard criteria including KMO > 0.5, factor loadings > 0.5, and cumulative variance explained > 60% (Field, 2023). Finally, multiple linear regression analysis was employed to test the hypothesized relationships, following Tabachnick and Fidell's (2022) guidelines, including assessment of assumptions, multicollinearity diagnosis (VIF < 5), and model fit assessment ($R^2$, adjusted $R^2$, F-test).

The regression model was specified as:

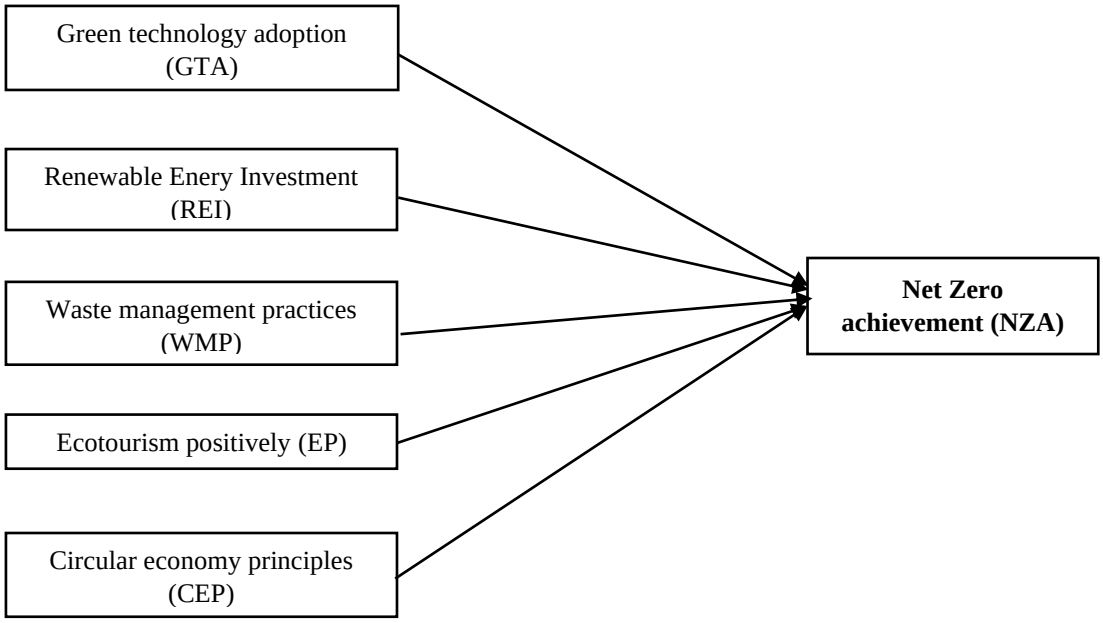

**Figure 1: Research model**

*Source: Author's proposal, 2024*

$NZA = \beta_0 + \beta_1 GTA + \beta_2 REI + \beta_3 WMP + \beta_4 EP + \beta_5 CEP + \varepsilon$, where NZA represents Net Zero Achievement, and the independent variables correspond to the five factors under investigation.

## 4. RESEARCH RESULTS AND DISCUSSION

### 4.1. Descriptive Statistics of Research Sample

**Table 1: Organizational and Respondent Characteristics**

| Characteristic | Category | Frequency | Percentage (%) |
|---|---|---|---|
| Position of Respondent | CEO/General Manager | 45 | 25.0 |
| | Sustainability Manager | 62 | 34.4 |
| | Operations Manager | 48 | 26.7 |
| | Other Senior Managers | 25 | 13.9 |
| Organization Type | Hotels & Resorts | 65 | 36.1 |
| | Tour Operators | 45 | 25.0 |
| | Tourism Attractions | 32 | 17.8 |
| | Transportation | 28 | 15.6 |
| | Other | 10 | 5.5 |
| Organization Size | Small (<50) | 42 | 23.3 |
| | Medium (50-250) | 85 | 47.2 |
| | Large (>250) | 53 | 29.4 |
| Years in Operation | < 5 years | 25 | 13.9 |
| | 5-10 years | 58 | 32.2 |
| | 11-20 years | 62 | 34.4 |
| | > 20 years | 35 | 19.4 |
| Sustainability Certification | Yes | 132 | 73.3 |
| | No | 48 | 26.7 |

*Source: Survey data analysis*

Table 1 presents the characteristics of the surveyed organizations and their representatives. Most respondents were in senior management positions, with Sustainability Managers (34.4%) forming the largest group, followed by Operations Managers (26.7%) and CEO/General Managers (25.0%). Hotels and resorts represented the largest sector (36.1%), and most organizations were medium-sized enterprises (47.2%). More than half of the organizations (53.8%) had been operating for over 10 years, and a significant majority (73.3%) held sustainability certifications, indicating a mature sample with strong environmental commitments.

### 4.2. Reliability Analysis Results

The reliability of measurement scales was assessed using Cronbach's Alpha coefficient. According to Hair et al. (2022), scales with Cronbach's Alpha values greater than 0.7 are considered reliable. Table 2 presents the reliability analysis results for all constructs used in this study.

**Table 2: Scale Reliability Analysis Results**

| Construct | Number of Items | Cronbach's Alpha | Item-Total Correlation Range |
|---|---|---|---|
| Green Technology Adoption (GTA) | 5 | 0.875 | 0.682 - 0.841 |
| Renewable Energy Investment (REI) | 4 | 0.893 | 0.715 - 0.858 |
| Waste Management Practices (WMP) | 4 | 0.862 | 0.694 - 0.825 |
| Ecotourism Participation (EP) | 5 | 0.881 | 0.701 - 0.834 |
| Circular Economy Principles (CEP) | 5 | 0.896 | 0.728 - 0.863 |
| Net Zero Achievement (NZA) | 6 | 0.908 | 0.745 - 0.872 |

*Source: Survey data analysis*

The reliability analysis results demonstrate that all scales exhibited good internal consistency. Cronbach's Alpha values ranged from 0.862 to 0.908, well above the recommended threshold of 0.7. The item-total correlations for all items were above 0.6, indicating strong relationships between individual items and their respective scales. These results suggest that the measurement instruments used in this study are reliable and suitable for further analysis.

### 4.3. Exploratory Factor Analysis Results

Exploratory Factor Analysis (EFA) was conducted using Principal Component Analysis with Varimax rotation to examine the construct validity of the measurement scales. Prior to performing EFA, the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy and Bartlett's test of sphericity were assessed to ensure the appropriateness of the data for factor analysis.

**Table 3: KMO and Bartlett's Test Results**

| Test | Value |
|---|---|
| Kaiser-Meyer-Olkin Measure | 0.893 |
| Bartlett's Test of Sphericity (Chi-square) | 3.245.672 |
| Degrees of freedom | 435 |
| Significance | 0.000 |

*Source: Survey data analysis*

**Table 4: EFA Results - Rotated Component Matrix**

| Items | (GTA) | (REI) | (WMP) | (EP) | (CEP) |
|---|---|---|---|---|---|
| GTA1 | 0.845 | | | | |
| GTA2 | 0.832 | | | | |
| GTA3 | 0.818 | | | | |
| GTA4 | 0.806 | | | | |
| GTA5 | 0.792 | | | | |
| REI1 | | 0.856 | | | |
| REI2 | | 0.841 | | | |
| REI3 | | 0.828 | | | |
| REI4 | | 0.815 | | | |
| WMP1 | | | 0.834 | | |
| WMP2 | | | 0.822 | | |
| WMP3 | | | 0.808 | | |
| WMP4 | | | 0.795 | | |
| EP1 | | | | 0.848 | |
| EP2 | | | | 0.835 | |
| EP3 | | | | 0.821 | |
| EP4 | | | | 0.809 | |
| EP5 | | | | 0.792 | |
| CEP1 | | | | | 0.862 |
| CEP2 | | | | | 0.845 |
| CEP3 | | | | | 0.831 |
| CEP4 | | | | | 0.818 |
| CEP5 | | | | | 0.804 |

*Source: Survey data analysis*

The EFA results demonstrate strong construct validity of the measurement scales. The KMO value of 0.893 and significant Bartlett's test ($p < 0.001$) confirm the data's suitability for factor analysis. Five distinct factors emerged, explaining 75.62% of the total variance, with factor loadings ranging from 0.792 to 0.862 and no significant cross-loadings. These findings support the proposed five-factor structure of the theoretical framework.

### 4.4. Correlation Analysis Results

Pearson correlation analysis was conducted to examine the relationships between variables and check for potential multicollinearity issues. Table 5 presents the correlation matrix along with means and standard deviations for all variables.

**Table 5: Descriptive Statistics and Correlation Matrix**

| Variables | Mean | SD | GTA | REI | WMP | EP | CEP | NZA |
|---|---|---|---|---|---|---|---|---|
| GTA | 3.82 | 0.74 | 1 | | | | | |
| REI | 3.65 | 0.82 | 0.485** | 1 | | | | |
| WMP | 3.94 | 0.68 | 0.412** | 0.438** | 1 | | | |
| EP | 3.78 | 0.71 | 0.395** | 0.428** | 0.445** | 1 | | |
| CEP | 3.71 | 0.76 | 0.442** | 0.468** | 0.432** | 0.415** | 1 | |
| NZA | 3.58 | 0.85 | 0.512** | 0.624** | 0.508** | 0.485** | 0.558** | 1 |

*Source: Survey data analysis*

The correlation analysis reveals that all independent variables (GTA, REI, WMP, EP, and CEP) have significant positive correlations with the dependent variable (NZA), with coefficients ranging from 0.485 to 0.624. The correlations among independent variables range from 0.395 to 0.468, indicating no serious multicollinearity issues as all values are below 0.7.

### 4.5. Multiple Regression Analysis Results

Multiple regression analysis was performed to test the hypothesized relationships between the independent variables and Net Zero Achievement. The results are presented in Table 6.

**Table 6: Multiple Regression Analysis Results**

| Model | | Coefficients are not standardized | | Standardized coefficient | Coefficient (t) | Coefficient (Sig.) | Multicollinearity statistics | |
|---|---|---|---|---|---|---|---|---|
| | | Coefficient (B) | Standard deviation | Beta coefficient | | | Tolerance | Variance magnification factor |
| 1 | (Constant) | 0.425 | 0.149 | - | -2845 | 0.005 | - | - |
| | GTA | 0.216 | 0.059 | 0.216 | 3.682 | 0.000 | 0.654 | 1.528 |
| | REI | 0.384 | 0.061 | 0.384 | 6.245 | 0.000 | 0.609 | 1.642 |
| | WMP | 0.185 | 0.057 | 0.185 | 3.248 | 0.001 | 0.678 | 1.475 |
| | EP | 0.162 | 0.055 | 0.162 | 2.924 | 0.004 | 0.696 | 1.436 |
| | CEP | 0.245 | 0.059 | 0.245 | 4.156 | 0.000 | 0.661 | 1.512 |

*Source: Survey data analysis*

$R^2 = 0.625$ Adjusted $R^2 = 0.614$ F-value = 58.246 ($p < 0.001$)

The regression model explains 61.4% of the variance in Net Zero Achievement (Adjusted $R^2 = 0.614$). The F-statistics are significant ($F = 58.246$, $p < 0.001$), indicating good model fit. All VIF values are below 2, confirming the absence of multicollinearity. All independent variables show significant positive relationships with Net Zero Achievement, with Renewable Energy Investment ($\beta = 0.384$, $p < 0.001$) having the strongest impact, followed by Circular Economy Principles ($\beta = 0.245$, $p < 0.001$) and Green Technology Adoption ($\beta = 0.216$, $p < 0.001$).

### 4.6. Discussion of Research Results

Based on the analysis results from the research, five main factors influencing the achievement of Net Zero goals in tourism have been identified. Renewable Energy Investment (REI) emerges as the most influential factor ($\beta = 0.384$, $p < 0.001$), aligning with Sun and Kim's (2022) research, showing that tourism organizations investing more in renewable energy infrastructure are making better progress toward Net Zero targets. Next, the application of Circular Economy Principles (CEP) is the second strongest factor ($\beta = 0.245$, $p < 0.001$), confirming Miller and Johnson's (2023) findings on the importance of circular economy practices in sustainable tourism. Green Technology Adoption (GTA) also shows significant positive impact ($\beta = 0.216$, $p < 0.001$), supporting Zhang and Wall's (2023) research on the role of green technologies in environmental performance. Waste Management Practices (WMP) demonstrates positive influence ($\beta = 0.185$, $p < 0.001$), supporting Thompson et al.'s (2023) research on the importance of effective waste management in reducing carbon emissions in the tourism sector. While showing the lowest coefficient among the five factors,

Ecotourism Participation (EP) still maintains a significant positive impact (β = 0.162, p < 0.004) on Net Zero Achievement, aligning with Buckley's (2023) findings on the relationship between ecotourism practices and environmental performance. These findings highlight the multifaceted nature of achieving Net Zero goals in the tourism sector and suggest that a comprehensive approach incorporating all five factors, with particular emphasis on renewable energy investment and circular economy principles, would be most effective in achieving Net Zero targets. The strong explanatory power of the model (Adjusted $R^2$ = 0.614) indicates that these five factors collectively account for a substantial portion of the variation in Net Zero Achievement, providing valuable insights for policy and practice in sustainable tourism development.

The findings demonstrate that investment in renewable energy (β = 0.384) and circular economy principles (β = 0.245) are the most influential factors in achieving Net Zero, aligning with the Circular Economy Model (Miller & Johnson, 2023) which emphasizes resource efficiency. Green technology adoption (β = 0.216) supports Zhang and Wall's (2023) work on smart energy management in tourism. Waste management practices (β = 0.185) resonate with Thompson et al.'s (2023) findings on emissions reduction through waste systems, while ecotourism participation (β = 0.162) aligns with the Ecotourism Development Model (Buckley, 2023). The study enhances the Tourism and Climate Change Nexus Model by demonstrating practical pathways to Net Zero, contributing to the Sustainable Tourism Development Model through actionable strategies for industry stakeholders. These insights provide tourism managers with evidence-based strategies and inform policymakers on effective sustainability policies.

## V. CONCLUSIONS AND MANAGERIAL IMPLICATIONS

### 5.1. Conclusions

This research examined the factors influencing Net Zero Achievement in the tourism sector through a comprehensive analysis of five key variables. The findings demonstrate that all identified factors significantly contribute to Net Zero Achievement, with Renewable Energy Investment and Circular Economy Principles emerging as the most influential factors. The research model explains 61.4% of the variance in Net Zero Achievement, indicating the robustness of the theoretical framework.

Studying makes several important contributions to both theory and practice. Theoretically, it extends the understanding of Net Zero achievement in tourism by empirically validating the relationships between key factors and Net Zero outcomes. Practically, it provides a framework for tourism organizations to prioritize their sustainability initiatives and allocate resources effectively.

### 5.2. Managerial Implications

#### 5.2.1. Investment in Renewable Energy Infrastructure

Given that renewable energy investment emerged as the strongest predictor of Net Zero achievement (β = 0.384), tourism organizations should prioritize their investments in renewable energy solutions. This includes implementing solar panels, wind energy systems, and energy storage facilities as part of a comprehensive long-term energy transition plan. Organizations are encouraged to establish strategic partnerships with renewable energy providers and technology suppliers, while exploring innovative financing mechanisms such as green bonds or sustainability-linked loans to support these investments. Such an integrated approach to renewable energy adoption will significantly contribute to achieving Net Zero targets in the tourism sector.

#### 5.2.2. Implementation of Circular Economy Practices

As the second most influential factor (β = 0.245), circular economy principles should be deeply embedded in tourism operations. Organizations should focus on developing comprehensive waste reduction programs and designing services with circularity in mind. This can be achieved through establishing partnerships with environmentally conscious suppliers, providing thorough staff training in circular economy practices, and implementing robust monitoring systems to measure outcomes. The integration of these practices will create a more sustainable operational model while supporting Net Zero objectives.

#### 5.2.3. Green Technology Integration

With a significant impact on Net Zero achievement (β = 0.216), green technology adoption represents a crucial area for investment. Tourism organizations should focus on implementing smart building management systems and energy-efficient technologies while adopting eco-friendly transportation solutions. Regular assessment of technology

effectiveness and comprehensive staff training programs are essential to maximize the benefits of these technological investments. This integration of green technologies should be viewed as a strategic tool for achieving long-term sustainability goals.

#### 5.2.4. Enhancement of Waste Management Systems

Waste management practices ($\beta = 0.185$) play a vital role in achieving Net Zero targets. Organizations should implement comprehensive waste sorting and recycling programs, supported by investments in waste reduction technologies. Establishing partnerships with specialized waste management companies and setting clear reduction targets are crucial steps. Regular monitoring and reporting of waste metrics will help track progress and identify areas for improvement in the organization's waste management strategy.

#### 5.2.5. Promotion of Ecotourism Initiatives

While showing the lowest coefficient ($\beta = 0.162$), ecotourism initiatives remain a significant contributor to Net Zero achievement. Tourism organizations should focus on developing sustainable tourism products and experiences that minimize environmental impact while maximizing educational value. This involves partnering with local communities, implementing environmental education programs, and obtaining relevant eco-certifications. Regular monitoring and transparent communication of environmental impact will help maintain stakeholder trust and support continuous improvement.

### 5.3. Policy Recommendations

Based on the research findings, policymakers should establish a comprehensive support system for Net Zero achievement in tourism. This system should encompass four key elements: a clear regulatory framework with specific implementation guidelines and carbon reduction targets; robust financial support mechanisms including tax incentives and green funding programs; comprehensive capacity building programs through industry training and knowledge sharing platforms; and standardized monitoring and reporting systems to track environmental performance. Special attention should be given to supporting small and medium-sized tourism enterprises through these initiatives. The successful implementation of these recommendations requires coordinated efforts between government agencies, industry bodies, and tourism organizations, supported by regular review and updates to ensure their continued effectiveness in driving the sector toward Net Zero goals.

**ABSTRACT**

Destination image plays a crucial role in enhancing a destination's appeal. It is also a key factor influencing tourists' decision-making processes. Previous studies on destination image have concentrated on the relationship between destination image, satisfaction, and behavioral intentions. However, there is a lack of research concerning destination image and memorable tourism experience. Furthermore, empirical studies examining the impact of tourist-resident interaction through which memories related to tourism experiences are formed are scarce, as is research on its effect on tourists' perceptions of the destination image. Consequently, this study aims to establish the relationship between tourist-resident interactions (TRI), destination image (DI), memorable tourism experience (MTE), and tourists' intention revisit by utilizing the Stimulus-Organism-Response (SOR) model. To achieve this goal, this paper proposes a conceptual model that reflects hypotheses about the interdependence among these factors. The proposed conceptual framework not only lays the groundwork for further empirical research but also aids tourism stakeholders in developing strategies for marketing tourism experiences.

*Keywords*: "destination image", "memorable tourism experience", "revisit intention", "tourist-resident interaction".

## I. INTRODUCTION

Destination image (DI) is a key factor influencing tourists' decision-making process when choosing a destination (Chen & Tsai, 2007). If tourists leave with a positive image of a destination, their intention to return will be stronger. Therefore, many studies have examined the relationship between DI, satisfaction, and tourists' behavioral intentions. From the perspective of using a positive DI to evaluate overall satisfaction, it serves as a basis for measuring tourists' intention to return to the destination. However, compared to satisfaction, memorable tourism experiences (MTE) is considered the most significant factor influencing tourists' behavioral intentions (Zhang et al., 2018; Zhong et al., 2017).

Tourist-resident interactions (TRI) play a crucial role in shaping both tourists' experiences and their perceptions of a destination (Tung & Ritchie, 2011; Wei et al., 2019). While extensive research has examined TRI in the context of tourism development using various models and variables, most studies focus on residents' attitudes toward tourism or the emotional bonds formed between tourists and locals. However, there is limited empirical research on how TRI contributes to the formation of memorable tourism experiences (MTE) and influences tourists' perceptions of the destination. Therefore, in this study, the author aims to explore the relationship between TRI, MTE, and the intention to revisit the destination. This constitutes the innovative aspect and the principal research gap that this study seeks to address.

Previous studies have examined various antecedents and behavioral outcomes of MTE (Chandralal & Valenzuela, 2013; Chen & Rahman, 2018; Kim, 2014; Zhang et al., 2018). However, there is a lack of research that integrates these factors into a comprehensive model. Few studies examine how these relationships shape tourists' future behavior. (Melón et al., 2021; Zhang et al., 2018). Therefore, the current study seeks to contribute to the existing literature by applying the SOR (Stimulus-Organism-Response) model to propose a conceptual framework. This framework integrates key antecedents, including DI and TRI, as well as the outcome of RI mediated through MTE.

Unlike previous models such as the Theory of Planned Behavior (TPB), which primarily focuses on attitudes,

norms, and perceived control to predict behavioral intentions (Ajzen, 1991), the SOR framework offers a dynamic lens to explore how external stimuli (e.g., TRI) trigger internal cognitive and emotional processes (e.g., DI and MTE) that lead to behavioral responses (e.g., RI). This integration provides a more holistic understanding of tourist behavior by emphasizing the experiential and interactional dimensions often overlooked in traditional models.

The purpose of this article is twofold: (1) to review foundational theories and relevant literature on TRI, DI, and MTE, identifying key research gaps; and (2) to develop a conceptual framework that elucidates the relationships among TRI, DI, MTE, and RI using the Stimulus-Organism-Response (SOR) model. The SOR model, originally proposed by Mehrabian and Russell (1974), posits that external stimuli influence individuals' internal states, subsequently driving behavioral responses. In this study, it serves as a theoretical lens to explore how TRI (stimulus) shapes DI and MTE (organism), ultimately influencing RI (response). The findings are expected to provide evidence on how DI and interactions with local residents can enhance MTE, thereby promoting tourists' revisit intentions, with significant implications for shaping marketing strategies and improving tourism experiences for sustainable development.

## II. MATERIAL AND METHOD

### Material

#### Revisit intention (RI)

RI is a significant research theme in tourism literature, particularly in exploring the antecedents and motivators that drive tourists to revisit a destination. Overall, studies have extensively examined the factors influencing tourists' revisit intentions and demonstrated that these intentions result from an accumulation of effects based on multiple variables, necessitating consideration of diverse impacts. Among these, destination image, perceived value, and satisfaction are fundamental components in selecting a destination and forming revisit intentions (Chen & Tsai, 2007). Additional factors have also been incorporated in recent studies, including service quality (Hasan et al., 2020), co-creative experiences (Meng & Cui, 2020), and MTE (Zhang et al., 2018).

#### Destination image (DI)

DI is a valuable concept that has garnered widespread academic attention due to its significance as one of the most influential factors shaping consumer behavior, such as destination selection and visitation intention (Baloglu & McCleary, 1999; Beerli & Martín, 2004; Erawan, 2020). Since the 1960s, the concept of image has been utilized in fields such as social and environmental psychology, consumer behavior, and marketing, representing individuals' perceptions of objects, events, and behaviors driven by impressions, feelings, and beliefs (Crompton, 1979). In the field of tourism, extensive research on DI has been conducted, which can primarily be categorized into four main streams: (1) the definition and measurement of DI (Crompton, 1979; Echtner & Ritchie, 1991; Gallarza et al., 2002), (2) factors influencing DI (Baloglu & McCleary, 1999; Beerli & Martín, 2004), (3) the formation of DI in the minds of tourists (Baloglu & McCleary, 1999; Gallarza et al., 2002; Gartner, 1994), and (4) the impact of DI on behavioral intentions (Chen & Tsai, 2007; Chi & Qu, 2008; Marques et al., 2021; Qu et al., 2011; Tasci & Moreno-Gil, 2024).

Despite extensive research on DI, there is no consensus on its definition and components. Most studies agree that DI is a subjective interpretation of a destination, often categorized into cognitive, affective, and conative dimensions Most researchers, however, consider DI from the tourists' perspective and define it as the subjective interpretation of a destination stored in their minds. For example, Crompton (1979) defined DI as the combination of beliefs, thoughts, and impressions an individual holds about a specific destination. Various approaches have been taken to conceptualize DI. Echtner & Ritchie (1991) clarified a tri-component approach, including attribute-holistic, functional-psychological, and common-unique dimensions. Gartner (1994) simplified this by proposing that DI encompasses cognitive, affective, and conative components. Afshardoost & Eshaghi (2020) classified prior research into overall image, cognitive image, affective image, and conative image. Some scholars argue that DI comprises only two components: cognitive and affective (Zhou et al., 2024). Most studies treat DI as an abstract construct, often adopting a two- or three-component approach (Baloglu & McCleary, 1999; Gartner, 1994). Nevertheless, researchers tend to emphasize the integrative nature of DI by referring to it as an "overall image." In this context, the overall image represents tourists' comprehensive perception of a destination, integrating cognitive and affective components or being influenced by cognitive, affective, and conative dimensions (Stylos et al., 2016). The overall image has also been identified as a third

component, comparable to cognitive and affective images (Baloglu & McCleary, 1999).

**Memorable tourism experience (MTE)**

Tourist experiences lie at the core of the tourism and hospitality industry (Kim, 2014; Melón et al., 2021). Destinations must design and deliver MTE to enhance competitiveness and retain tourists (Neuhofer et al., 2012; Pine & Gilmore, 1998). MTE are among the most critical and powerful drivers of tourists' future behavior (Kim, 2014; Zhang et al., 2018). As a result, MTE have emerged as one of the key topics in recent tourism experience research. A review of the literature indicates that researchers have advanced the understanding of MTE around three major themes: (1) the nature of MTE (Chandralal & Valenzuela, 2015; Kim & Chen, 2019; Kim et al., 2012; Tung & Ritchie, 2011), (2) tools to measure MTE (Chandralal & Valenzuela, 2015; Kim et al., 2012; Stone et al., 2017; Tung & Ritchie, 2011), and (3) antecedents and outcomes of MTE (Kim & Ritchie, 2014; Wei et al., 2019; Wong et al., 2020).

The process of recalling a tourism experience is not merely about remembering all the events that occurred but involves a selective and reconstructive process shaped by each tourist's feelings and evaluations of the destination experience (Kim & Ritchie, 2014; Kim et al., 2012). Notably, while ordinary experiences tend to fade quickly over time, MTE have a unique ability to create enduring imprints and associations in tourists' minds (Kim, 2018). The key distinction between an ordinary experience and an MTE lies in the depth of its emotional impact and the meaningful value it provides to the individual (Zhang et al., 2018).

In the field of MTE research, scholars have proposed several notable definitions. For example, Tung & Ritchie (2011) defined MTE as positive experiences that tourists actively recall and reimagine after their trip. Chandralal & Valenzuela (2015) emphasized that MTE are extraordinary and vivid memories formed after tourists have experienced a destination. Particularly, Jong Hyeong Kim, known as a pioneer in this research area, proposed a widely recognized academic definition, describing MTE as tourism experiences stored in memory and positively recalled after the events have concluded (Kim, 2010; Kim et al., 2012).

Although there is general consensus that MTE represent a multidimensional construct, the specific dimensions that provide the most valid and reliable measures remain unclear (Chandralal & Valenzuela, 2015). Tung & Ritchie (2011) identified four essential elements that constitute MTE: affect, expectations, consequences, and recollection. Specifically, emotional aspects (affect) involve positive feelings and perceptions related to the experience; unexpectedness (expectations) is expressed through the fulfillment of goals and unanticipated experiences; meaningfulness (consequences) reflects the value and significance perceived by tourists; and memorability (recollection) is captured through efforts to retain and recall the experience. Complementing these findings, Chandralal et al. (2015) analyzed travel blogs and identified seven key factors contributing to MTE: local culture, personally meaningful experiences, shared experiences, novelty perception, serendipity perception, professional tour guides and services, and emotional engagement. Similarly, Stone et al. (2017) identified five components leading to memorable culinary experiences: food or drink consumed, location/context, companions, events, and travel-related factors. However, a synthesis of the literature reveals that when examining the impact of MTE on behavior intentions, researchers frequently utilize the MTE dimensions proposed by Kim et al. (2012). These dimensions suggest that individuals with MTE recall seven dimensions: hedonism, novelty, local culture, refreshment, meaningfulness, involvement, and knowledge.

**Tourist-resident interaction (TRI)**

TRI refers to the social communication and exchanges between tourists and local residents at a destination. These interactions can include conversations, cultural exchanges, or shared activities (Tabaeeian et al., 2023; Xiong et al., 2021). Interaction facilitates a connection between tourists and locals, representing a reciprocal process where individuals share information and emotions to develop relationships (Li et al., 2024). Even brief and hurried interactions, such as a genuine smile from a local resident, can make a significant difference (Xiong et al., 2021). TRI plays a crucial role in tourists' spending behavior, satisfaction, and locals' attitudes toward tourism development (Eusébio et al., 2018; Pizam et al., 2000). Furthermore, such social interactions also enable value co-creation in tourism experiences (e.g., a friendly conversation between tourists and residents contributes to the destination experience for both parties). Positive interactions between tourists and locals, including staff members, can enhance tourists' affective

and conative destination image, ultimately improving their overall experience and loyalty to the destination (Stylidis, 2020; Tabaeeian et al., 2023).

Previous studies have explored several aspects of TRI measurement, which include the frequency and quality of interactions (Aleshinloye et al., 2019; Xiong et al., 2021). Interaction frequency refers to how often social communication activities occur between tourists and local residents at the destination. Interaction quality, from the perspective of tourists, highlights the extent to which the interactions are perceived as positive, pleasant, helpful, and enjoyable (Xiong et al., 2021).

Much of the existing research on tourist-resident relationships tends to focus on issues such as conflict, the impacts of tourism on local communities, and residents' attitudes toward tourism development (Hien, 2023; Huang et al., 2024; Su et al., 2021; Woosnam et al., 2014). Through synthesizing the scientific contributions from international studies on tourist-resident relationships, it is evident that the research works by Woosnam and colleagues stand out with comprehensive studies conducted at various tourism destinations. However, the majority of these studies concentrate on the emotional connection between tourists and residents (Woosnam et al., 2014; Woosnam et al., 2020). There remains a lack of experimental studies that investigate how TRI contributes to the formation of tourism-related memories, such as MTE, and its implications for tourists' perceptions of DI.

**Stimulus-Organism-Response Model (SOR Model)**

This study adopts the SOR framework (Mehrabian & Russell, 1974) to examine the role of TRI in shaping DI, MTE, and their impact on RI. Given the intangible nature of tourism products and services, the SOR model is highly applicable for understanding tourist behavior (Jiang, 2022; Sthapit et al., 2024). The SOR framework explains how external stimuli influence individuals' cognitive and emotional states, leading to behavioral responses. The model consists of three key components: stimulus, organism, and response. The SOR model was selected over alternative frameworks, such as the Expectancy-Value Model or Social Exchange Theory, due to its ability to capture the sequential process from external stimuli (TRI) to internal psychological states (DI and MTE) and subsequent behavioral outcomes (RI). Unlike Social Exchange Theory, which focuses on reciprocal benefits in interactions, SOR emphasizes the emotional and cognitive transformations triggered by stimuli, making it particularly suitable for examining how memorable experiences and destination perceptions mediate revisit intentions.

TRI as Stimulus (S); DI, MTE as Organism (O); RI as Response (R)

In tourism, external stimuli such as natural landscapes, green practices, and storytelling (Jiang, 2022; Yuxin et al., 2024) impact tourists' experiences. TRI is a critical stimulus, fostering emotional and cognitive responses through conversations and cultural exchanges, enhancing curiosity and understanding of local culture (Yu & Lee, 2013; Tabaeeian et al., 2023).

DI serves as a cognitive and affective filter in the SOR framework, transforming external stimuli into subjective perceptions (Mehrabian, 1974; Rasoolimanesh & Lu, 2024). It includes tangible elements (e.g., landscapes) and intangible ones (e.g., atmosphere), influencing tourist behavior. DI evolves over time based on new stimuli, interactions, and personal experiences (Tasci & Moreno-Gil, 2024).

MTE emphasizes tourists' lasting emotional and subjective impressions (Kim, 2010). Authentic and personalized interactions with locals create memorable stories and emotions, reflecting the intrinsic processes of the SOR model (Pine & Gilmore, 1998; Tung & Ritchie, 2011).

The "response" in the SOR model represents tourists' final behavioral actions, such as revisit intention, driven by preceding stimuli and processes (Rasoolimanesh & Lu, 2024). This study identifies TRI as the "stimulus," DI and MTE as intermediaries ("organism"), and RI as the "response." Existing research confirms DI and MTE mediate behavioral intentions, underscoring the SOR model's relevance in explaining tourist decision-making (Asyraff et al., 2024).

**Methodology**

To conduct this study, the authors adopted a literature review method, systematically searching, collecting, analyzing, and synthesizing research findings from domestic and international sources. These sources included peer-reviewed articles from academic journals, books, reports, and scientific papers in English and Vietnamese, focusing on

TRI, DI, MTE, and RI. Documents were selected based on their relevance to the research objectives, determined by the presence of keywords such as "tourist-resident interaction," "destination image," "memorable tourism experience," and "revisit intention" in titles, abstracts, or full texts. The analysis process involved a qualitative synthesis of findings to identify patterns, contradictions, and gaps, which were then used to formulate hypotheses within the SOR framework.

Additionally, to develop the conceptual framework, the authors utilized the conceptual exploration method, which is the outcome of qualitative theorization processes (Jabareen, 2009). Through constructing the conceptual framework, the elements of TRI, DI, MTE, and RI are interconnected, thereby clarifying the specific phenomena of each factor while also supporting and complementing one another to establish a concrete research framework. Following Jabareen's (2009) approach, the process of developing a conceptual framework primarily includes the following four steps:

First, The research group conducted an initial classification and screening of selected documents by reviewing secondary data sources obtained through keyword searches on academic e-databases (Scopus, Web of Science, Google Scholar, Nasati). The research team accessed documents through academic e-databases (Scopus, Web of Science, Google Scholar, Nasati) to ensure a comprehensive and credible literature base. During the preliminary screening phase, the research team read the titles and abstracts of documents to select studies relevant to the research topic. Subsequently, the team proceeded to read the full texts, engaging in self-reflection and critical evaluation to select representative case studies most effectively corresponding to the research context. This process of selecting documents was based on the literature evaluation framework proposed by Boote and Beile, which consists of five criteria: (1) comprehensiveness, (2) synthesis, (3) research methodology, (4) significance, and (5) interpretation (Boote & Beile, 2005).

The next step involved identifying research gaps. Specifically, during this stage, the team read and reread the selected documents, analyzing their content and "detecting" gaps within the existing literature. The third step was the development of hypotheses for the study. The goal of this stage was to synthesize the concepts and formulate hypotheses into a conceptual framework.

The fourth step entailed validating the conceptual framework. To ensure the theoretical and practical relevance of the proposed framework, the research team discussed its feasibility with academics from three institutions: Hoa Sen University, School of Hospitality and Tourism-Hue University, and Saigon University. Feedback was obtained, and the framework was revised accordingly.

## III. RESULT AND DISCUSSION

### 3.1. Research Gaps

Through a comprehensive review of existing literature, the following research gaps have been identified:

First, although many prior studies acknowledge the role of DI in shaping tourists' behavioral intentions, most of these studies primarily focus on the relationship among DI, satisfaction, and behavioral intentions. These studies largely evaluate RI (RI) through positive DI as a basis for assessing overall satisfaction (Chen & Tsai, 2007; Chi & Qu, 2008; Marques et al., 2021; Prayag et al., 2016; Ragab et al., 2020; Yuxin et al., 2024). However, according to Kim (2018), MTE are considered more influential than satisfaction in predicting tourists' behavioral intentions. Similarly, Zhong et al. (2017) highlighted that MTE are a stronger predictor of emotional commitment compared to satisfaction. Nevertheless, MTE remain an emerging topic (Hosany et al., 2022), with limited studies investigating the antecedents and outcomes of MTE (Melón et al., 2021; Zhang et al., 2018).

Second, while there has been research examining the relationship between DI and MTE, the direction and nature of this relationship remain contradictory (Stavrianea & Kamenidou, 2022; Zhou et al., 2024). Some scholars argue that MTE influence tourists' perceptions of DI (Chang, 2022; Kim, 2018; Kladou et al., 2022; Pappas et al., 2022; Phuc, 2023; Rasoolimanesh & Lu, 2024), whereas others believe that a positive DI can foster MTE (Çevrimkaya & Zengin, 2023; Kutlu & Ayyıldız, 2021; Melón et al., 2021; Rasoolimanesh et al., 2021; Seyfi et al., 2024; Stavrianea & Kamenidou, 2022; Zhang et al., 2018; Zhou et al., 2024).

Within this relationship, most studies view DI as a cognitive construct, focusing on destination attributes primarily associated with tourists' activities and needs, such as the natural environment (scenery, climate, beaches), amenities (accommodations, restaurants, shopping), attractions (activities, heritage, culture/events), accessibility (transportation,

connectivity), and social environment (friendliness, safety, value for money). However, DI is a fluid concept influenced by both cognitive and emotional evaluations of individuals. Um and Crompton (1990) argued that a destination's overall impression is more significant than its individual attributes, as an overall image reflects multiple dimensions beyond those measured through distinct attributes (Baloglu & McCleary, 1999; Echtner & Ritchie, 1991).

Echtner & Ritchie (1991) noted that DI operates as an overarching evaluative structure, measuring tourists' comprehensive impressions of a destination. Similarly, Zhang et al. (2014) and Afshardoost & Eshaghi (2020) emphasized in their meta-analyses that the overall image strongly represents DI. Despite this, only Melón et al. (2021) considered DI as an overall image encompassing cognitive, affective, and general impressions. Moreover, the specific characteristics and resources unique to a destination play a role in shaping the relationship between DI and MTE (Kim, 2014, 2022). Consequently, the same destination can evoke varying images among potential consumers, influencing different decision-making processes based on the information they perceive (Zhang et al., 2018). Hence, findings from prior studies conducted at global destinations may not be wholly applicable to other specific destinations.

For MTE, the majority of studies identify seven dimensions of MTE, as developed by Kim et al. (2012), which include hedonism, novelty, knowledge, meaningfulness, involvement, local culture, and refreshment, all leading to strong memorability. However, some studies have raised concerns about the applicability of Kim et al.'s (2012) scale. For instance, Sthapit et al. argued that using student samples in Kim et al.'s research limits generalizability, as students do not fully represent typical tourists (Sthapit & Coudounaris, 2018; Sthapit et al., 2020). Students differ from non-students in terms of skills, personality traits, and experiences, with most student samples coming from narrow age ranges and higher education levels (Sthapit et al., 2020). Additional research has confirmed distinctions between student and non-student samples (Jones & Sonner, 2001; Ok et al., 2008). Therefore, it is necessary to conduct further studies to examine the seven dimensions of MTE across diverse research contexts.

More importantly, TRI contributes to both the overall experience and the shaping of tourists' perceptions of visited destinations (Tung & Ritchie, 2011; Wei et al., 2019). Despite numerous studies exploring the relations between tourists and locals in the context of tourism development—employing diverse models and variables—most focus on residents' attitudes toward tourism development or their emotional connections (Han, 2019; Hien, 2023; Su et al., 2021; Woosnam et al., 2020). While TRI plays a critical role in creating tourism experiences and shaping DI, empirical studies on this topic remain insufficient and fragmented.

Thus, this paper aims to provide a more comprehensive investigation into the interrelationships among TRI, DI, MTE, and RI to destinations. These identified research gaps present opportunities for further exploration. The findings of this study are expected to offer meaningful insights for tourism managers, particularly regarding the initiation of local community involvement in tourism development, enhancing DI and tourist experiences through interactions between locals and tourists.

### 3.2 Research Hypotheses

#### Tourist-resident interaction and destination image

It is challenging to separate tourists' perceptions of a destination from its local residents. This is particularly evident given that very few tourism destinations exist without local communities residing there. In reality, individuals often choose a destination to visit because of the opportunity to interact with locals and learn about customs, traditions, heritage, and culture. Several studies have suggested a connection between locals, tourists, and the development of a DI. For instance, Baloglu and McCleary (1999) and Echtner and Ritchie (1991) argue that the overall image a person develops of a destination encompasses a comprehensive impression of that place. Tourists may struggle to fully understand a destination or its overall image without acknowledging the role of local residents in shaping this image through interactions and subsequent relationships.

Tourists can form their DI from multiple sources of information, such as marketing channels, social media, and through their actual experiences when visiting the destination (Beerli & Martín, 2004; Gartner, 1994). The tourists' real or perceived image of a destination may be influenced by their perspectives and experiences with local residents. This implies that the behavior of locals, whether positive or negative, can significantly impact DI from the tourists' perspective. For example, the hospitality and reception provided by local residents play a critical role in measuring

tourists' perceptions of DI (Echtner & Ritchie, 1991). Positive behaviors from locals, such as interactions and engagement, can reinforce the view that locals are hospitable and friendly, whereas irresponsible behaviors such as shouting at tourists could have a severely negative impact on tourists' perceptions of the community and destination (Kour et al., 2020).

Further investigations into the sources of information used by tourists conclude that word-of-mouth communication from friends, family, and practical experiences are important factors in shaping DI (Baloglu & McCleary, 1999; Gartner, 1994). Within the tourism context, locals are often considered destination experts due to their familiarity with the location. They actively provide information, promote attractions, highlight amenities, and suggest unique activities to tourists, effectively acting as place marketers (Stylidis et al., 2022). Stylidis (2020) contended that locals' perceptions of their destination are communicated to tourists through direct encounters and interactions, subsequently influencing tourists' DI and actual experiences (Stylidis, 2020).

Similarly, this principle extends to employees within the tourism and hospitality sector, whose professional expertise, knowledge, and personal experiences contribute to enhancing tourists' experiences, thereby improving DI (Cheng et al., 2018; Stylidis, 2020). Based on these insights, the following hypothesis is proposed:

H1: TRI has a direct positive effect on DI

**Tourist-resident interaction and memorable tourism experience**

In destinations where local communities coexist with tourism resources, the activities of these communities directly impact tourists' experiences (Su et al., 2021). In many cases, locals participate in the provision of certain goods (e.g., local products, souvenirs) and services (e.g., guided tours, homestays) for tourists, as the nature of purchasing and consuming tourism products involves service interactions between tourists and locals. Co-creation of value is characterized by the active participation and positive interaction of tourists with both other tourists and local residents throughout the tourism experience (Sthapit et al., 2020). Tourists enhance their experiences through their active collaboration with destination locals (Lee et al., 2024).

In today's world, TRI in the co-creation process is further strengthened by information and communication technologies. Locals are often actively engaged in various social media platforms (e.g., Facebook, TripAdvisor), providing guidance and answering questions related to local tourism. This support helps tourists in trip planning and contributes to the co-creation of value. Additionally, through their expertise as tourism staff, some locals play critical roles in building tourists' memorable experiences (Shi et al., 2023). Empirical studies have also confirmed that co-creation between tourists and locals influences the memorability of tourism experiences (Meng & Cui, 2020; Sthapit et al., 2020; Sthapit et al., 2024).

Moreover, the creation of MTE is primarily influenced by the quality of experiences (Tung & Ritchie, 2011), in which tour guides and local residents can significantly impact the quality of tourism experiences (Tabaeeian et al., 2023). TRI helps tourists form lasting impressions and enhances their MTE through various activities. Stylidis et al. (2022) showed that constructive interactions between tourists and locals foster a deeper understanding of local culture, traditions, norms, and rituals. This phenomenon can provide tourists with a heightened sense of authenticity, as they have the opportunity to fully participate and integrate into the surrounding community (Cifci, 2021).

In the context of heritage tourism experiences, Rasoolimanesh et al. demonstrated that authenticity and tourist engagement positively influence MTE (Rasoolimanesh et al., 2021). Kim and Ritchie highlighted that, beyond destination attributes, local residents' behavior and hospitality contribute to creating MTE (Kim & Ritchie, 2014). Similarly, Wong et al. confirmed that TRI with local minority communities plays a crucial role in shaping memorable ethnic tourism experiences (Wong et al., 2020). Tabaeeian et al. (2023) also verified that host-tourist interaction affects MTE through the quality of relationships and service quality. Based on these findings, the following hypothesis is proposed:

H2: TRI has a direct positive effect on MTE.

**Tourist-resident interaction and revisit intention**

The presence of local residents at a destination creates numerous opportunities for tourists to engage in interactions

with them, which can influence tourists' attitudes, behaviors, and future destination decisions (Stylidis, 2020). Tourists might consciously or unconsciously interact with locals at a destination. Woosnam et al. (2020) identified meeting and interacting with local residents as one of the most significant motivators for tourism. Additionally, tourists often need the assistance of locals when visiting unfamiliar destinations.

While Choo & Petrick (2014) did not find a relationship between TRI and RI in the context of farm tourism, several recent studies have revealed that the sincerity of hosts positively influences tourists' behavioral intentions (Wu et al., 2024). A study by Tabaeeian et al. (2023), based on social exchange theory, demonstrated that host-tourist interaction influences tourists' RI through service quality and the quality of relationships. Similarly, Stylidis (2020) confirmed that the quality of interactions between locals and tourists positively correlates with tourists' behavioral image, in which the conative component of DI is often construed as tourists' intentions to revisit or recommend the destination to others (Gartner, 1994). When tourists feel connected to the local culture or form strong relationships with local residents, they develop a sense of emotional attachment, which often motivates them to return to the destination to maintain and deepen these relationships (Aleshinloye et al., 2019). Based on these findings, the following hypothesis is proposed:

H3: TRI has a direct positive effect on RI.

**Destination image and memorable tourism experience**

According to Baloglu & McCleary (1999), DI is a crucial factor shaping tourists' expectations and experiences. A positive DI regarding landscapes, culture, and people encourages tourists to engage more deeply in activities at the destination, thereby fostering meaningful and memorable experiences (Pine & Gilmore, 1998; Tasci et al., 2007). High expectations derived from a positive DI, when met or exceeded, often lead to more impressive experiences while influencing how tourists approach and process information about the destination (Melón et al., 2021).

Empirical studies have demonstrated a strong relationship between MTE and DI. Personal experiences at the destination help make DI more realistic, creating a positive image for tourists (Kim, 2018; Kladou et al., 2022). Conversely, DI also directly impacts MTE by enhancing the perception of value and quality of the experience (Chen & Tsai, 2007). Attributes such as local culture, hospitality, infrastructure, and service quality all contribute to forming a cognitive DI, thereby promoting MTE (Kim, 2014, 2022; Zhang et al., 2018).

The study by Zhou et al. (2024) emphasizes that both cognitive and affective DI positively influence MTE, with cognitive DI playing a dominant role. Moreover, Kutlu & Ayyıldız (2021) point out that cognitive DI has a strong impact on aspects such as culture, novelty, engagement, and meaningful experiences. These studies confirm that a positive DI not only generates high expectations but also serves as a key determinant of memorable experiences, increasing tourists' RI if the actual experiences align with the promoted image. Therefore, the following hypothesis is proposed:

H4: DI has a direct positive effect on MTE.

**Destination image and revisit intention**

DI, in the context of tourism as a country, city, or region, is considered a crucial factor influencing tourists' destination selection, evaluation, and future behavioral intentions (Stylos et al., 2016; Zhang et al., 2018). It represents tourists' beliefs, knowledge, emotions, and feelings about a destination (Afshardoost & Eshaghi, 2020). DI is a core component of successfully promoting a tourism destination, as it establishes the distinctiveness and unique qualities of the destination compared to others. A positive DI enhances tourists' satisfaction with their trip (Marques et al., 2021; Prayag et al., 2016; Ragab et al., 2020; Yuxin et al., 2024). Such satisfaction serves as a powerful motivator for tourists to recommend the destination and revisit it. An impressive DI can foster destination brand loyalty (Zhou et al., 2024). Tourists may return because they trust the quality and value that the destination offers. Therefore, maintaining and developing a positive DI, combined with effective marketing strategies, can help tourism destinations enhance revisit rates and cultivate loyalty (Echtner & Ritchie, 1991; Tam, 2024; Tasci et al., 2007).

Previous studies have suggested that RI (RI) can be influenced by the overall DI (Qu et al., 2011; Stylos et al., 2016). Stylos et al. (2016) assert that DI is a significant predictor of tourists' revisit intention. Afshardoost and Eshaghi (2020) found that DI directly affects behavioral intentions, including RI. Marques et al. (2021) indicate that when

tourists are satisfied with the DI, they are more likely to recommend the destination and its products to others. DI not only serves as an initial draw but also acts as a key driver encouraging tourists to return. While the majority of studies acknowledge that DI positively influences behavioral intentions, some cases have shown contradictory results. For example, Shahijan et al. (2015) discovered that DI does not significantly impact RI. More recently, Asyraff et al. (2024) have found that cognitive DI does not significantly influence RI to the destination. Assaker et al. (2011) recognized that the impact of DI on RI may diminish over time, particularly among tourists seeking novelty. Based on the foregoing, the following hypothesis is proposed:

H5: DI has a direct positive effect on RI.

**Memorable tourism experience and revisit intention**

MTE is considered the ultimate level of experience that consumers aspire to attain (Tung & Ritchie, 2011). In practice, after a vacation, what remains with tourists are their memories of the experiences at the destination (Sthapit & Coudounaris, 2018). Consequently, tourism studies emphasize the importance of memorable experiences because memory serves as the most essential source of information for an individual when making decisions about revisiting and word-of-mouth communication (Chen & Rahman, 2018). Memories can influence the destination selection process and consumers' future behaviors (Kim & Ritchie, 2014). Furthermore, when tourists have MTE, they tend to believe that revisiting will bring similar value and enjoyment, fostering attachment to the destination. Thus, MTE not only affects tourists' satisfaction but also motivates them to revisit or recommend the destination to others.

Several empirical studies have confirmed that MTE is found to be a highly influential determinant of RI and the development of destination loyalty among tourists (Kim, 2018; Melón et al., 2021; Zhang et al., 2018; Zhou et al., 2024). Specifically, when tourists have unforgettable memories of their trip, they tend to share these experiences on social media platforms. As a result, the destination becomes more popular, and revisit rates increase. This argument, initially proposed by Wei et al. (2019), has been supported and validated by numerous studies, further affirming the pivotal role of MTE in predicting tourists' word-of-mouth behavior and revisit intentions. Therefore, the following hypothesis is proposed:

H6: MTE has a direct positive effect on RI.

**The mediating role of memorable tourism experience**

Further research is needed to examine MTE from diverse perspectives (Zhang et al., 2018). However, there remains a scarcity of empirical studies investigating MTE as a mediating factor. Specifically, Zhou et al. (2024) explored the mediating role of MTE in the relationship between cognitive DI and RI among local tourists visiting historical towns. Similarly, Çevrimkaya and Zengin (2023) identified the significant influence of MTE and tourist satisfaction on the relationship between DI and tourists' destination recommendation intentions.

MTE encompasses moments or events that leave a deep and lasting impression on tourists' minds, often shaped by positive and meaningful interactions. For instance, a tourist may remember a special evening when they were invited to participate in a traditional festival with local residents, where they not only enjoyed unique culinary delights but also immersed themselves in the local culture. Such experiences not only reinforce a positive DI but also enhance future revisit intention. This highlights the idea that positive interactions can lead to memorable experiences, thereby increasing the likelihood of tourists seeking to return to a destination. Empirical research on MTE has similarly demonstrated the positive and direct relationships between tourist-resident interaction, destination image, and MTE, as discussed in H2, H4, and H6. Thus, the following hypotheses are proposed:

H7: MTE mediates the relationship between DI and RI

H8: MTE mediates the relationship between TRI and RI.

**The mediating role of destination image**

The interaction between tourists and local residents often creates profound experiences and impressions, directly influencing how tourists perceive a destination (Tse & Tung, 2021). Such interactions can enhance the DI in the minds of tourists, making the destination more appealing. DI, as a set of perceptions and emotions associated with a place, can strongly impact tourists' RI (Chen & Tsai, 2007). When this image is improved through positive interactions, the

likelihood of tourists wanting to return also increases (Stylidis, 2020). Therefore, DI is not only an outcome of interaction but also an important mediating factor that links TRI with revisit intention, creating a positive feedback loop that promotes sustainable tourism.

For instance, a tourist visiting Hoi An who engages in friendly interactions with local residents—such as learning about the history of the ancient town or being invited to sample unique local delicacies—may develop a positive impression of Hoi An as a hospitable and culturally rich destination. This positive impression then fosters a stronger intention to revisit the destination in the future.

The mediating role of DI in the relationship between perception and behavior has been acknowledged in several studies. Specifically, Zhou et al. (2024) demonstrated that affective DI serves as a mediator between cognitive DI and revisit intention, where the cognitive aspect of DI in their study was related to learning about local customs. Stylidis (2020), based on contact theory and the mere exposure effect, provided insights into how tourists form destination images through their interactions with local residents and tourism staff at a destination in Greece, and how these images influence RI through behavioral image. Furthermore, empirical studies on DI have shown a positive and direct relationship with TRI and revisit intention, as discussed in hypotheses H1 and H5. Thus, the following hypothesis is proposed:

H9: DI mediates the relationship between TRI and RI.

Based on the above hypotheses, the conceptual framework of this study is proposed as presented in Figure 1.

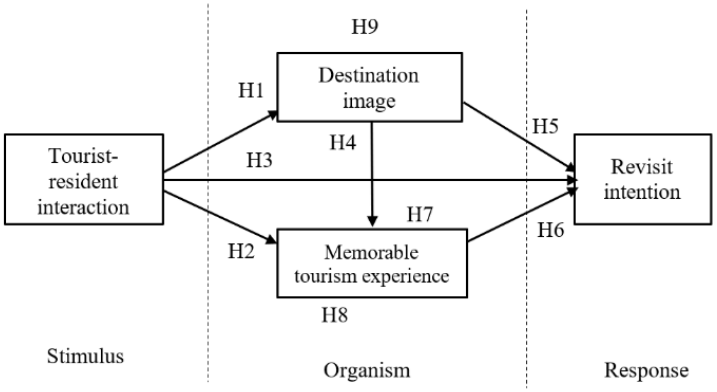

**Figure 1. A Conceptual Framework of DI, MTE, TRI and RI**

While this study establishes a conceptual foundation, empirical validation is necessary to confirm the proposed relationships. Future research could employ quantitative methods, such as structural equation modeling (SEM), to test the hypotheses using survey data collected from tourists at diverse destinations. A mixed-methods approach, combining surveys with qualitative interviews, could further explore how TRI shapes DI and MTE across different cultural and contextual settings. Such empirical testing would provide robust evidence to support or refine the conceptual framework, enhancing its applicability to real-world tourism management.

## IV. CONCLUSION

### Discussion

While scholars acknowledge the importance of examining the relationship between DI and MTE, current research reveals two opposing perspectives: some suggest that MTE influences DI, while others argue that DI fosters MTE. Additionally, DI is often examined cognitively, focusing on specific attributes, yet it is a dynamic concept influenced by emotional evaluations, with limited research addressing its overall image. Regarding MTE, reliance on Kim et al.'s (2012) seven-dimensional model raises concerns about sample representativeness, necessitating further investigation across diverse contexts. Notably, the lack of empirical studies on TRI's influence on MTE and its impact on DI underscores the need for this conceptual framework. By applying the SOR theory, this study integrates TRI, DI, MTE, and RI, offering theoretical insights and practical recommendations for enhancing tourism experiences and promoting sustainable development. Nine hypotheses are proposed, encompassing six direct and three indirect effects, providing a

comprehensive perspective on these interrelationships.

**Conclusion**

This study proposes a conceptual framework integrating DI, MTE, TRI, and RI, offering significant theoretical and practical implications. Theoretically, it introduces a novel model within the SOR framework, positing that TRI (stimulus) influences DI and MTE (organism), driving RI (response). This contributes to understanding tourist behavior and supports validation of the MTE scale across contexts. Practically, it emphasizes enhancing TRI to strengthen DI and MTE, aligning actual experiences with promoted images, and engaging local communities to improve tourist experiences and revisit intentions—key to sustainable tourism.

However, this study has limitations as a conceptual paper lacking empirical validation. Future research should test the framework empirically, potentially using surveys or experimental designs at specific destinations, to confirm its applicability. Exploring moderating factors, such as cultural differences or tourist demographics, could further refine the model. These efforts will enhance its theoretical rigor and practical utility for destination management.

**ABSTRACT**

In recent years, the construction sector has seen a significant rise in $CO_2$ emissions due to increasing energy demands for heating, cooling, and lighting. In 2022, operational energy-related emissions reached 10 gigatons of $CO_2$, reflecting a 5% rise from 2020 levels (UNEP). With the construction industry responsible for over 40% of global carbon emissions, there is a critical need for sustainable solutions. This study focuses on the role of green buildings in promoting sustainable development. Using a systematic analysis of scientific literature and case studies, the research evaluates low-carbon materials, and sustainable design principles. The findings show that green buildings significantly reduce energy consumption and emissions through features such as renewable energy systems, and sustainable materials. Despite these benefits, adoption remains slow due to insufficient policies and incentives. The study concludes that green buildings are essential for sustainable development by addressing climate change and resource efficiency.

*Key words:* $CO_2$ reduction, construction industry, energy efficiency, green buildings, sustainable development

## I. INTRODUCTION

In 2024, the global population reached 8.2 billion and is expected to increase to 10.3 billion by 2080. Back in 2015, approximately 54% of people lived in urban areas. Projections suggest that by 2050, this urban percentage will rise to 66% (United Nations, 2022). Cities account for over 70% of global $CO_2$ emissions (Oh et al., 2016). In addition to the significant fossil fuel consumption by industrial and motorized transport systems, the construction industry is responsible for over 40% of global energy use and more than 30% of carbon emissions (Oh et al., 2016)

The sector's $CO_2$ emissions related to operational energy reached ten gigaton of $CO_2$ equivalent, marking a five percent increase from 2020 and a two percent rise compared to the peak levels in 2019 before the pandemic. In 2021, the energy demand for heating, cooling, lighting, and building equipment increased about four percent from 2020 and three percent from 2019 (UNEP, 2022; IEA, 2022). According to Inger Andersen, Executive Director of the United Nations Environment Program (UNEP), "Years of warnings about the impacts of climate change have now materialized. If we do not swiftly reduce emissions in line with the Paris Agreement, our situation will worsen significantly" (UNEP, 2022).

There is a broad consensus that cities in the 21st century must evolve to be both greener and smarter, which has led to a strong emphasis on sustainable urban development, especially among developing nations. The concept of sustainability encompasses a wide range of issues that are intricately linked and involve detailed analysis of various factors related to people, the environment, and society. This global concern addresses the need for cities to adapt to environmental challenges by adopting practices that reduce ecological impact while enhancing the quality of life for their inhabitants. As urban areas expand and evolve, integrating sustainability into city planning and development becomes increasingly critical, aiming to balance economic growth with environmental stewardship and social well-being.

Recently, there has been an increasing focus on the advancement of green. These buildings are crafted with a commitment to high standards of quality while prioritizing the conservation of resources and the protection of the environment. Green buildings aim to do more than just reduce pollution; they are designed to be healthy, efficient, and comfortable for people to live and work in (Basbagill et al., 2013). By integrating sustainable practices into their design and construction, green buildings seek to foster a more balanced and harmonious interaction between human activities and the natural world. This approach aims to minimize the ecological footprint of buildings while enhancing the well-being of their inhabitants and contributing positively to the surrounding environment.

Also referred to as eco-friendly buildings, aim to reduce their environmental impact at every stage of their lifecycle. They emphasize resource efficiency, reduced energy consumption, and lower emissions (Basbagill et al., 2013). The main goal of green buildings is to obtain specific environmental certifications, such as LEED (Leadership in Energy and Environmental Design) or BREEAM (Building Research Establishment Environmental Assessment Method), which serve as standards for sustainability.

## II. LITERATURE REVIEW

### 2.1. Sustainable development

This principle shows that the idea of sustainable development isn't entirely new, especially when considering its widely recognized definition: "Sustainable development refers to progress that satisfies current needs without hindering future generations' capacity to fulfill their own needs," as outlined in the Brundtland Commission Report from 1987 (Green et al., 2012).

The sustainable development concept covers four key dimensions: environmental, social, economic, and institutional, with the institutional aspect becoming more widely acknowledge (Doan et al., 2017) . The environmental dimension examines how human activities affect natural ecosystems, including resource use and pollution. The social dimension focuses on human well-being and community impacts, such as health, welfare, and fairness in society. The economic dimension is related to economic development and the fair distribution of resources. The institutional dimension involves governance, collaboration, and regulatory frameworks that influence social interactions. Key indicators of institutional sustainability include political engagement, equal access to education, social welfare systems, and gender equality.

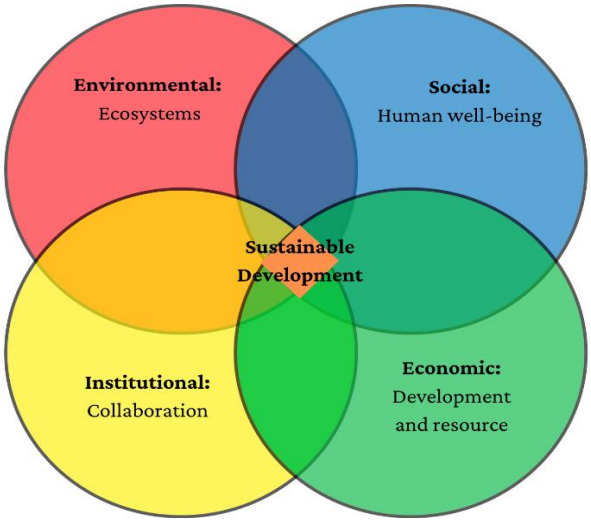

**Fig. 2.1 Sustainable development's 'fourth circle'**

*Source:own source*

### 2.2. Green building:

A green building was initially defined as "design strategies that minimize negative impacts on the environment and ecosystems compared to conventional construction methods." (Doan et al., 2017)

The green building movement started in the 1970s to address environmental issues, is transforming construction. It focuses on creating energy-efficient, healthy buildings that boost productivity. The aim is to reduce buildings' negative impacts on urban, local, and global ecosystems. By prioritizing sustainability and efficiency, the movement seeks to lessen environmental harm and improve the harmony between built and natural environments. This shift changes how buildings are designed, constructed, and operated, aiming to enhance life quality while protecting resources (Yudelson, 2010).

Investing in green buildings increases because of the crucial role in both human well-being and environmental health. Since approximately 90% of our time is indoors, the design and construction of buildings can have profound effects on our living conditions. According to the U.S. Environmental Protection Agency (2004), as referenced by

Klepeis and Tsang et al. (1995), buildings can impact our environment in numerous ways, both beneficial and detrimental. On one hand, buildings provide essential shelter and protection from environmental extremes. On the other hand, they can emit volatile organic compounds, which pose significant health risks.

Buildings are major resource consumers, using 50% of global energy and 70% of timber, along with other raw materials. This heavy resource use emphasizes the need for green building practices. Sustainable methods can reduce environmental impacts, improve indoor health, and lessen the strain on resources.

Buildings generate significant waste throughout their lifecycle, from construction and operation to demolition. This waste comes from materials, energy use, and maintenance processes. Buildings also contribute to air and noise pollution, increase landfill use, and affect water quality through runoff. These issues highlight the environmental challenges of traditional building practices and the need for more sustainable solutions (Amaral et al., 2020).

However, the importance of green buildings becomes even more pronounced in the critical effort to combat carbon dioxide emissions, which are driving global climate change. By focusing on optimizing energy consumption and incorporating renewable energy sources, green buildings play a crucial role in significantly lowering greenhouse gas emissions. This directly tackles the pressing global issue of climate change (Oh et al., 2016).

In the early stages, those involved in green building were relatively few, and their aspirations to minimize the environmental impact of construction were often viewed as ambitious and unrealistic. Today, however, the green building movement is gaining momentum, largely due to advancements in technology that have made these goals more attainable. Modern green builders utilize recycled materials, which helps to decrease the amount of waste sent to landfills. Additionally, they work to lessen the environmental footprint of buildings by reducing their overall energy demands. A key approach is using alternative, clean energy sources to reduce environmental impact. These practices help green buildings promote a sustainable future by tackling resource use and emissions (Oh et al., 2016).

Today, green building is understood as: " a structure designed and constructed to provide a safe, healthy, and efficient living and working space while harmonizing with nature. It optimizes the use of resources (energy, land, water, materials), reduces environmental impact, and minimizes pollution throughout its lifecycle." (Doan et al., 2017)

**2.3. Key features of green building**

Green buildings are characterized by several key features that minimize or eliminate negative impacts and create positive effects on the climate and the natural environment. (Debrah et al., 2022)

Energy Efficiency: One of the primary goals of green buildings is to minimize energy consumption. This is accomplished using strategies like improved insulation, energy-efficient heating and cooling systems (HVAC), and renewable energy technologies such as solar panels (Sun, 2024). By optimizing these aspects, green buildings significantly reduce their overall energy use and carbon footprint.

Water Conservation: Green buildings prioritize reducing water consumption by incorporating water-saving fixtures, rainwater harvesting systems, and advanced wastewater treatment technologies. These strategies conserve water resources and improve water management throughout the building's lifecycle (Basbagill et al., 2013).

Sustainable Materials: The selection of materials for green buildings is guided by the principles of sustainability. This involves choosing materials that are not only environmentally friendly but also locally sourced, which helps to lower the environmental impact associated with transportation and resource extraction. Sustainable materials contribute to reducing the overall ecological footprint of construction projects.

Indoor Air Quality: Green buildings enhance indoor air quality by using advanced ventilation and air filtration systems. These systems reduce pollutants and provide clean, fresh air, creating healthier living and working spaces for occupants (Sinha et al., 2013)

Waste Reduction: The method is achieved through practices such as recycling and reusing materials whenever possible. By reducing the amount of construction waste that ends up in landfills, green buildings contribute to a more sustainable approach to waste management and resource use.

These characteristics collectively enhance the environmental performance and livability of green buildings, making them a vital component of sustainable development.

**2.4. Green building rating system:**

Green buildings emphasize environmental performance and often seek certification through established standards. Rating systems for green buildings include the Building Research Establishment Environmental Assessment Method (BREEAM), Leadership in Energy and Environmental Design (LEED) in the United States, the Comprehensive Assessment System for Built Environment Efficiency (CASBEE) in Japan, and the Deutsche Gesellschaft für Nachhaltiges Bauen (DGNB) in Germany. The robust advancement of green buildings is a crucial strategy for promoting sustainable development within the construction industry (Sinha et al., 2013). However, the actual impact of green buildings on $CO_2$ emissions is still not fully demonstrated.

In the United States, communities now have more opportunities than ever to support greener building practices and development. Numerous organizations have created model codes and rating systems that communities can use to establish green building programs or update building regulations.

**Table 2.1. Rating of Green Building Systems and Their Cooperation**

| Standard | Project types | Subject Area |
|---|---|---|
| The U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED®)<br>A set of rating systems designed to improve the environmental and health performance of buildings, sites, and neighborhoods.<br>/Rating and certification system/ | New building<br>Existing constructions | Sustainable sites<br>Energy efficiency<br>Water efficiency<br>Materials and resource use<br>Indoor environmental quality<br>Emissions<br>Operations and maintenance |

**2.5. Emission reduction in the green building construction process.**

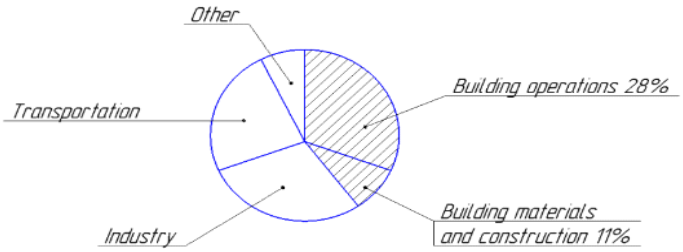

**Fig 2.2 The percentage of CO2 emission by human activities**

*Source: Dolmatov et al., 2022)*

Buildings are major resource consumers, using 40% of global energy and are responsible for significant $CO_2$ emissions. Within this total, the construction activities themselves contribute 28% of the emissions each year. Additionally, the production and transportation of building materials, often termed as embodied carbon, account for another 11% of the annual emissions. This division highlights the significant environmental impact of both the actual construction processes and the lifecycle emissions associated with building materials (Huang et al., 2018).

Construction can greatly impact environmental resources, so adopting eco-friendly practices is crucial. These methods can reduce site disruption, lower landfill waste, and cut down on resource use. They also help improve indoor air quality, creating healthier spaces for occupants. Moreover, sustainable practices can lead to cost savings by minimizing waste and enhancing resource efficiency, making green building strategies financially viable. Thus, environmentally conscious development benefits both the planet and the project's budget.

When performing a comparative analysis of the carbon emissions associated with various building materials or construction methods, several critical factors should be considered to ensure a comprehensive evaluation:

– Type of Material: The specific characteristics of each building material, including its composition and the environmental impact of its production, play a significant role in determining its overall carbon footprint. Different materials have varying levels of emissions associated with their extraction, manufacturing, and application.

– Transportation and Logistics: The emissions generated from transporting materials to the construction site are an essential component of the overall carbon footprint. This includes the fuel consumption and emissions from vehicles and logistics operations involved in the delivery of materials.

– Consumption Volumes: The quantity of materials used in construction projects affects the total emissions. Higher volumes of material consumption generally lead to increased emissions, both from the production phase and the logistical process.

– Product Life Cycle and Recycling: Evaluating the entire life cycle of a product, from its production to its end-of-life disposal, is crucial. This includes assessing the potential for recycling and the environmental impact of disposal methods. Materials that are easily recyclable or have longer life spans typically contribute to lower overall carbon emissions.

By examining these key indicators, a more accurate and thorough comparison of the carbon emissions associated with different building materials and construction techniques can be achieved. This approach helps in making informed decisions that balance environmental impact with practical considerations in construction projects.

The modern industry manufactures a diverse array of construction and thermal insulation materials, utilizing varying numbers of components with different levels of processing, as well as differing amounts of energy and labor. Typically, as the number of technological steps involved in producing these materials increases, so does their overall carbon footprint. Moreover, construction materials are often used far from their production sites, which inevitably incurs additional costs for packaging, storage, loading, and transportation. Conversely, materials that are produced from local resources and used close to their production locations help to reduce CO2 emissions significantly.

A substantial portion of the Ecological Footprint, exceeding 16%, is linked to transportation and related services. To fully assess the impact of transportation on CO2 emissions, it is important to consider both the emissions from vehicles and the ecological footprint of the materials used in road and facility construction. Unfortunately, current trends are unfavorable. For instance, greenhouse gas emissions from industrial processes and the use of industrial products rose from 218.5 million tons of CO2 in 2015 to 243.1 million tons of CO2 in 2018 (Dolmatov et al., 2022). Utilizing local raw materials for building production and minimizing transportation distances can significantly reduce emissions. Additionally, the quality and quantity of packaging used play a vital role in the potential for disposal and recycling of packaging materials.

The consumption of construction materials is determined by various elements, such as the specific material needs of a product and the expectations and requirements of the end user. The effectiveness of production methods and the integration of raw materials further affect this consumption. Presently, there is a noticeable upward trend in consumer

demand.

People are unwilling to relinquish the comfort of having their own vehicle and residing in homes that surpass the basic acceptable consumption levels. This trend reflects aspects of consumer psychology, which continues to evolve with a steady upward trajectory (Dolmatov et al., 2022). During the design phase, comparing alternative construction methods allows for informed decisions about the viability and benefits of different technologies and solutions. However, if a product is already in use—such as an existing residential building—an analysis of its lifecycle might indicate that it no longer meets current standards and requirements, potentially suggesting the need for decommissioning or renovation (Dolmatov et al., 2022). This approach ensures that both new and existing constructions align with contemporary environmental and sustainability goals.

## III. METHODOLOGY

The methodology used in this study is systematic method which follows a clear process, including searching for relevant articles, extracting data, and reporting the results.

The following databases were chosen for the literature search based on the high number of results: IEEE Explore, ScienceDirect, PubMed, Google Scholar, and Web of Science. This study chose a group of scientific articles based on keywords related to sustainable development and reducing emissions in green building construction. These keywords included terms like "sustainable development," "green buildings," "carbon emissions," and "building materials." Most of the articles were published between 2010 and 2023. Articles were screened based on their abstracts, ensuring they covered both sustainability and construction-related aspects.

The study used content analysis to analyze the articles, which focus on finding important strategies for reducing emissions and choosing materials in green building projects. The final selection included 26 articles, chosen based on their relevance to the research questions and methodological rigor. These articles served as the foundation for developing the study's criteria and indicators for evaluating green building strategies.

The study followed a systematic approach to answer the research questions (RQs):

For RQ1: How does green building contribute to sustainable development? the study looked at the abstracts of the articles to make sure they were related to both sustainability and construction. Then defined what sustainable development means, considering both the environment and society. The study highlighted the main features of sustainable buildings, focusing on energy efficiency, low-carbon materials, and long-term benefits for the environment.

For RQ2: How can emission reductions be achieved in green building construction? the study reviewed materials and case studies to find methods that can reduce emissions from construction activities and from materials used in buildings. The research focused on the benefits of green building practices, like using low-carbon materials, improving energy efficiency, and adding renewable energy sources. The study used data about carbon emissions from construction activities, to understand how emissions can be reduced throughout a building's life.

Finally, the study looked at the results and concluded the future of reducing emissions in green building construction. The findings offered new insights and avoided repeating what has been said in previous studies. This approach highlights how green building strategies help reduce emissions and looks forward to future solutions in this area.

## IV. RESULTS AND DISCUSION

### 4.1. The present market for green building

With the increasing availability of compelling evidence about climate change, those who were previously uncertain are now recognizing that adopting green building practices is a prudent choice. Many are beginning to understand the link between global environmental issues and the potential financial implications for their operations. Beyond the immediate benefits, such as operational cost savings, marketing advantages, and design efficiencies, there is a growing awareness of the long-term advantages of green building. These include protection against fluctuating energy prices, enhanced energy security, and other related factors (Kathleen O’Brien, owner of a green building design firm in Seattle, USA).

The green building market encompasses a diverse range of structures, including commercial, institutional, and

residential buildings, as well as properties owned by public, educational, nonprofit, and corporate entities. Green buildings are present across the globe, spanning a variety of types and functions, from large museums and libraries to animal shelters and industrial facilities. The scope of green building projects is extensive, covering both new constructions and the renovation of historic buildings. These projects can occur in various settings, including urban infill sites, brownfield redevelopment areas, and suburban "greenfield" locations. The scale of these projects varies widely, ranging from small buildings of a few thousand square meters to large developments exceeding one million square meters. (Zhang et al., 2019)

However, green buildings still account for only a small fraction of total construction investments. It is estimated that by 2030, the investment opportunity in green buildings will reach $24.7 trillion, whereas the total investment in construction in 2019 was $5.6 trillion, with only $148 billion allocated to green buildings. This highlights the need for greater efforts to promote the growth of green buildings, with green finance being one of the key solutions to address this challenge (Debrah et al., 2022).

**4.2. Criteria, indicators, and weighting**

Creating a specific framework with clear criteria, indicators, and weights is important to suit different regional and local needs. This study presents a methodology for establishing such a framework while comparing it with established certification systems, particularly integrating key principles from the LEED v4 certification system.

Each criterion is measured using specific indicators. About half of these are based on actual data, while the rest focus on policies or trends.

The weight given to each criterion shows how important it is for sustainability. These weights can change based on local priorities. For example, developed regions may focus on reducing emissions, while developing regions might prioritize saving water or adding more green spaces.

Indicators are rated on a simple scale (e.g., 0–10 points). Scores for each criterion are then multiplied by its weight to find the total score. Standards are used to keep results consistent, helping projects compare their performance to best practices:

– High Scoring Indicators (10/10): Renewable energy use, carbon emissions, and energy savings are essential for getting a green building certification. These factors are given high importance because they directly affect the building's energy use and environmental impact.

– Moderate Scoring Indicators (8/10): Waste reduction, air quality, and access to public transport are important, but they may have a slightly smaller effect on the overall certification compared to energy use and carbon emissions.

– Lower Scoring Indicators (7/10): Indicators like recycled materials and access to natural light are still important for sustainability, but they are not as crucial as energy savings or waste management when determining certification.

The study incorporates core principles from the LEED v4 certification system to develop a structured and adaptable evaluation framework for green buildings. LEED v4 prioritizes sustainability across multiple categories, and its key elements align closely with the criteria and weighting system used in this research. The integration of LEED v4 principles is reflected in the following ways:

**Table 4.1 Criteria, indicators, and weights *(own source)***

| **Criteria**<br>Reeder (2010), Doan et al. (2017), and Stephanie Vierra (2016) | **Indicators name**<br>Reeder (2010), Doan et al. (2017), and Stephanie Vierra (2016) | **Weight scale (100%)** |
|---|---|---|
| **Energy Efficiency** | Renewable energy use<br>Energy savings | 25 |
| **Water Efficiency** | Water consumption per capita<br>Recycling | 20 |
| **Material and Resources** | Recycled materials<br>Waste reduction | 15 |

| | | |
|---|---|---|
| **Indoor Environmental Quality** | Air quality<br>Access to natural light | 15 |
| **Site Sustainability** | Proximity to public transport<br>Green spaces | 10 |
| **Innovation and Design** | Advanced sustainable technologies | 10 |
| **Emissions and Carbon Footprint** | Carbon emissions<br>carbon offset programs | 5 |

The number of points required for a building to achieve green building certification depends on the certification system being used.

– LEED (Leadership in Energy and Environmental Design), Buildings earn points across various categories, such as energy efficiency, water efficiency, and sustainable materials. The certification levels are as follows: Certified (40–49 points), Silver (50–59 points), Gold (60–79 points), and Platinum (80+ points) with the maximum possible points of 110 (Reeder, 2010).

– BREEAM (Building Research Establishment Environmental Assessment Method) also awards points in categories like energy, water, and materials. Its certification levels are: Pass (≥ 30% of the total score), Good (≥ 45%), Very Good (≥ 55%), Excellent (≥ 70%), and Outstanding (≥ 85%) (Reeder, 2010).

### 4.3. Application of Green building concept: Olympic House

The building was completed in 2019 and is an office space with a size of 135,000 square feet. It holds prestigious rankings, including LEED V4 Platinum, SNBS Platinum, and Minergie P certifications. The design was carried out by 3XN Architects.

Olympic House has attained LEED Platinum certification, the pinnacle of the global LEED green building standard. As reported by the U.S. Green Building Council (USGBC), the organization behind LEED, this building has earned the highest number of points 93 in the LEED v4 new construction category to date. (Olympic News, 2019)

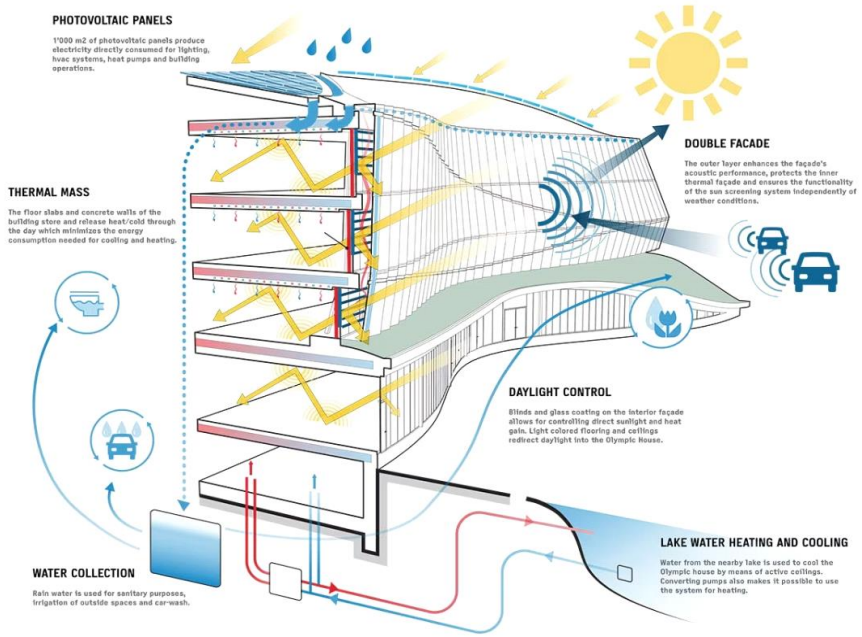

**Fig 4.1 Green building application**

*Source: Olympic News, 2019*

A significant 80 percent of the investment in the construction of the building was allocated to local businesses, supporting the regional economy. Additionally, over 95 percent of the materials from the previous International Olympic Committee (IOC) headquarters were either reused or recycled, demonstrating a strong commitment to sustainability and waste reduction.

The building features cutting-edge renewable energy technologies, such as solar panels and heat pumps that use

water from Lake Geneva. These innovations significantly lower the building's environmental impact. It is estimated that the new building will use 35 percent less energy and 60 percent less municipal water than a typical new construction, demonstrating a major improvement in energy efficiency and water conservation. (Olympic News, 2019)

**Table 4.2 Apply score on case study *(own source)***

| Criteria | Indicators name | Scheuer & Keoleian (n.d.), Basbagill et al. (2013), Debrah et al. (2022), Sun (2024), and Reeder (2010) | Score (1-10) |
|---|---|---|---|
| **Energy Efficiency** | Renewable energy use | using significant renewable energy like solar panels or wind power | 9 |
| | Energy savings | energy-efficient with smart systems but not fully optimized | 8 |
| **Water Efficiency** | Water consumption per capita | Using efficient water-saving technologies like low-flow fixtures | 8 |
| | Recycling | having a robust water recycling system, such as rainwater harvesting or greywater reuse | 8 |
| **Material and Resources** | Recycled materials | using some recycled materials, but not extensively | 7 |
| | Waste reduction | waste management strategies are in place | 8 |
| **Indoor Environmental Quality** | Air quality | has good ventilation and air filtration | 8 |
| | Access to natural light | a significant amount of natural light throughout the building | 8 |
| **Site Sustainability** | Proximity to public transport | located near public transport hubs | 9 |
| | Green spaces | includes green spaces, but not an abundance | 8 |
| **Innovation and Design** | Advanced sustainable technologies | using some cutting-edge technologies for sustainability | 8 |
| **Emissions and Carbon Footprint** | Carbon emissions | having minimized its carbon footprint | 9 |
| | carbon offset programs | using carbon offset programs | 10 |

In total, Olympic House has earned nearly 80 point based on its sustainability efforts across various categories. This high score reflects the building's strong performance in energy efficiency, waste reduction, carbon emissions management, and its innovative use of sustainable technologies. With this score, Olympic House achieved a LEED V4 Platinum certification (Olympic News, 2019).

## V. CONCLUSION

Green buildings offer numerous benefits and should be recognized as a practical solution to address development challenges and the increasing demand for construction in developing nations. These challenges include rapid population growth, excessive urbanization, uncertainties in energy supply, and the negative environmental effects of climate change. By providing sustainable and efficient solutions, green buildings can help mitigate these issues effectively.

Despite their advantages, the adoption of green building practices has been slow, facing criticism due to limited government support. To accelerate progress and integrate these practices more effectively, the government must implement stronger policies. This could include stricter regulations mandating green building standards or incentives that encourage sustainable construction. Such measures would facilitate the transition to environmentally friendly building practices while contributing to broader sustainability and environmental protection goals.

Vietnam’s green building sector is anticipated to expand significantly, driven by growing environmental awareness and the government's commitment to achieving carbon neutrality by 2050. Applying green building principles will be crucial for attaining sustainable development objectives. Successful projects like the Olympic House provide valuable insights into how Vietnam can incorporate energy-efficient designs, resource conservation, and urban sustainability into its construction industry. Establishing a structured scoring system will help assess green buildings, promote innovation, and ensure accountability. While challenges persist, key drivers such as strategic investments, regulatory improvements, and heightened public awareness will be essential for advancing Vietnam’s green building sector and achieving long-

term sustainability.

# INVESTIGATING SOME FACTORS INFLUENCE THE ADOPTION OF TELEMEDICINE SERVICES AMONG THE YOUNG IN HO CHI MINH CITY

**Doan Tuong Nhu Y[1*], Nguyen Pham Khai Minh[2], Pham Dang Khai Minh[3], Tran Thi Kim Yen[4]**

[1]Faculty of Business Administration, Ho Chi Minh City University of Foreign Languages -Information Technology, Vietnam

* Corresponding: ydtn@huflit.edu.vn

**ABSTRACT**

In the rapidly evolving healthcare landscape, telemedicine services, though relatively new in Vietnam, have emerged as a crucial tool for enhancing access to medical treatment. This study investigates the factors influencing the adoption of telemedicine services among the youth in Ho Chi Minh City, utilizing the Technology Acceptance Model (TAM) as the theoretical framework. Data were collected from 116 young individuals in Ho Chi Minh City through a systematic questionnaire, employing non-probability and convenience sampling methods. The data, analyzed using structural equation modeling (SEM), reveal that perceived utility (PU), perceived ease of use (PEOU), and perceived behavioral control (PBC) significantly impact the adoption (ADO) of these services. By elucidating the factors affecting telemedicine adoption, this paper underscores the importance of user-centered approaches to enhance the acceptability and utilization of telemedicine among young people. Thus, these findings have significant implications for healthcare professionals and policymakers aiming to promote telemedicine as a viable healthcare alternative in urban settings.

*Key words:* "telemedicine", "adoption", "TAM"

## I. INTRODUCTION

### 1.1. Background of the study

Conventional healthcare is transitioning to digital platforms owing of COVID-19 and other illnesses. Telemedicine and swift technical advancements facilitate remote healthcare (Suci Megawati, 2024). The global healthcare system must implement innovative infection-reduction technology while maintaining patient outcomes. The utilization of telemedicine in medical professions has surged since the pandemic, notwithstanding continuous developments (Andrés R. Latorre-Rodríguez, 2024).

Telemedicine is described as the use of telecommunications technology, such as telephones and computers, to provide clinical health care from a distance (American Medical Association, 2024). Over the years, it has progressed since the epidemic. Dermatology, allergies, and immunology are among the fields where telemedicine is used. Indeed, it has several advantages; yet, young people in Vietnam, particularly in Ho Chi Minh City, are skeptical (Natale Daniele Brunetti, 2015). There has been limited study into telemedicine acceptability among teenagers in Ho Chi Minh City. To overcome this gap, this study evaluates many approaches for encouraging young people to use telemedicine and increasing acceptance.

Human attributes, technical skills, and organizational components all have an impact on healthcare technology adoption. Several ideas identify factors influencing the adoption of healthcare technology. Notable models include the Technology Acceptance Model (TAM) (Rahimi, Nadri, Lotfnezhad Afshar, & Timpka, 2018), Extended Technology Acceptance Model (TAM2) (AlQudah, Al-Emran, & Shaalan, 2021), Unified Theory of Acceptance and Use of Technology (UTAUT) (Ursavaş, 2022), Theory of Planned Behavior (TPB) (Ajzen & Schmidt, 2020), and the Diffusion of Innovations Theory (Ohkubo, Limaye, & Harlan, 2015). Despite substantial study, the extent to which children in growing urban areas use telemedicine is unknown. As a result, the purpose of this study is to investigate the factors influencing young people's acceptance of telemedicine services, using TAM as a foundation model.

This study examines the key factors influencing telemedicine adoption among the youth in Ho Chi Minh City. The study examines the telemedicine readiness of young individuals and identifies potential adoption drivers. The findings empower healthcare practitioners, technology developers, and policymakers to address the telemedicine demands of Ho Chi Minh City's people.

This paper delineates two theoretical and practical breakthroughs. This theoretical study, grounded on the Technology Acceptance Model (TAM), investigates the acceptability of telemedicine among juveniles in Ho Chi Minh City. The TAM posits that perceived usefulness (PU) and perceived ease of use (PEOU) influence technology adoption. Young individuals perceive telemedicine healthcare as attractive and straightforward, as evidenced by perceived usefulness (PU) and perceived ease of use (PEOU). The model evaluates young engagement with the advantages and effectiveness of telemedicine. Furthermore, the study enhances the model by integrating attitude, facilitating factors, and perceived behavioral control. Telemedicine, along with its theories and models, is analyzed.

### 1.2. Vietnamese telemedicine background

Vietnam has been improving its telemedicine services, especially since COVID-19 required remote care. The Vietnamese government has encouraged telemedicine to alleviate the physician scarcity and resource shortage, especially in rural areas. For hospitals to provide teleconsultation to smaller provincial and district institutions, the Ministry of Health launched the Telehealth Project in 2020. In its first year of implementation across all medical categories, this enabled about 1,000 virtual consultations (Ministry of Health Vietnam, 2020). However, Vietnam must overcome many obstacles to use telemedicine. Due to limited internet and digital device access, rural infrastructure remains a major issue. The World Bank estimates that 73% of Vietnamese use the internet, emphasizing a large gap between urban and rural populations. Nguyen et al. found that healthcare practitioners and patients lack the digital skills to use telemedicine services. Telemedicine is growing in Ho Chi Minh City, thus there are opportunities. IT-savvy residents live in a city with strong infrastructure and many hospitals. Telemedicine is growing in Vietnam because to business, especially health technology businesses like Doctor Anywhere and eDoctor (Nguyen & Tran, 2022). These companies offer remote consultations, prescription delivery, and electronic health records, increasing the chance of telemedicine adoption.

Due to their technological prowess and smartphone ownership, Ho Chi Minh City youth are likely to adopt telemedicine. Statista (2023) predicts that 74% of Vietnam's population used smartphones in 2022, with 73% aged 18–34. This generation uses mHealth apps and teleconsultation the most, reflecting the global trend among digital health technology customers (Le et al., 2021). Due to the fast pace of their life and the growing focus on primary and secondary prevention, Ho Chi Minh City adolescents are open to alternative treatments. Pham and Do (2022) found that young, urban people choose telemedicine to reduce clinic time. In decision no. 749/QD-TTg, government telemedicine initiatives are supported by digital healthcare technology programs. Health IT entrepreneurs are tailoring their services to younger consumers. Social and fitness tracking, mental health support, and child-friendly interfaces are the main features. According to Nguyen et al. (2022), a new startup hub in the city has increased digital health solution investment over the previous five years. The findings show that Ho Chi Minh City's younger clients are particularly engaged in telemedicine and crucial to Vietnam's digital healthcare future.

## II. LITERATURE REVIEW

### 2.1. Theoretical framework

The Davis (1989) Technology Acceptance Model (TAM) is widely used to study user adoption of technology. According to the Theory of Reasoned Action (TRA), the TAM was created to explain computer usage. This adaptability and ease of application make it important in many fields, not only healthcare technology. TAM found that Perceived Usefulness and Perceived Ease of Use (PEOU) are the two main elements affecting an individual's Attitude Toward Use and Behavioral Intention to Use a technology. Perceived Usefulness (PU) is the extent to which an individual believes a system will boost productivity, according to Davis (1989). Telemedicine could enhance medical treatment and consultation times for PU. Second, Perceived Ease of Use refers to how much work a system requires. Healthcare professionals must recognize that a user-friendly telemedicine system will boost PEOU. Conduct, system adoption goal, and user usage behavior are directly related (Venkatesh & Davis, 2000). TAM predicts a large amount of users' acceptance behavior across technological contexts, making it important in technology adoption studies. The TAM is a benchmark in technology adoption research due to its simplicity and predictive power (King & He, 2006).

TAM has been used to study user attitudes regarding telemedicine systems that enable remote consultation, diagnosis, and EHR adoption. In their study of hospital information system adoption, Chau and Hu (2002) used the

TAM to study physicians' telemedicine adoption and found that perceived usefulness and simplicity of use influenced their attitudes. Thereafter, Aggelidis and Chatzoglou (2009) found that perceived usefulness (PU) influenced behavioral intention more than perceived ease of use (PEOU). During the COVID-19 pandemic, Huang et al. (2021) found that PU and PEOU strongly influence patients' telemedicine utilization. They also stressed that Internet connection and system support were vital for building perceived value amid the rapid growth of digital health services. These data confirm the model's ability to explain patient and provider adoption. Telemedicine in Vietnam is new, thus the TAM can be used to study behavioral trends. In a mixed-methods cross-sectional survey on telemedicine's acceptability during the pandemic, Nguyen et al. (2021) used the TAM and found that perceived usefulness was a key factor in adoption. If telemedicine's convenience and cost are adequately advertised to the Vietnamese public and young consumers, uptake may improve. TAM continues to provide vital insights about technology acceptability through its extensions and relevance to healthcare applications. It can be used to explain how people understand and use new health technologies, such as telemedicine.

### 2.2. Hypothesis formation

TAM is useful for assessing telemedicine use, especially among urban youth in Ho Chi Minh City. According to Davis (1989), Perceived Usefulness (PU) and Perceived Ease of Use (PEOU) affect Attitude Toward Use (ATT), which affects adoption behavior. These constructions are not the only ones relevant to youngsters in Ho Chi Minh City. Telemedicine usage is influenced by smartphone access, reliable internet, and user-friendly interfaces. Nguyen & Do (2022) found that urban teenagers will use telemedicine more if infrastructure is not a problem. Another control variable that impacts adoption behavior is perceived behavioral control (PBC), which is the perceived ability to use telemedicine services (Ajzen, 1991).

Based on the TAM framework and additional factors, the following hypotheses are proposed:

H1: Perceived usefulness positively impacts attitude toward telemedicine adoption.

H2: Perceived ease of use positively impacts attitude toward telemedicine adoption.

H3: Attitude positively influences telemedicine adoption.

H4: Facilitating conditions positively influence telemedicine adoption.

H5: Perceived behavioral control positively influences telemedicine adoption.

The study model expands on the TAM components by identifying the link between PU and PEOU with Attitude, and FC and PBC with Adoption behavior. This methodology is especially important for studying the usage of Telemedicine among young individuals in Ho Chi Minh City.

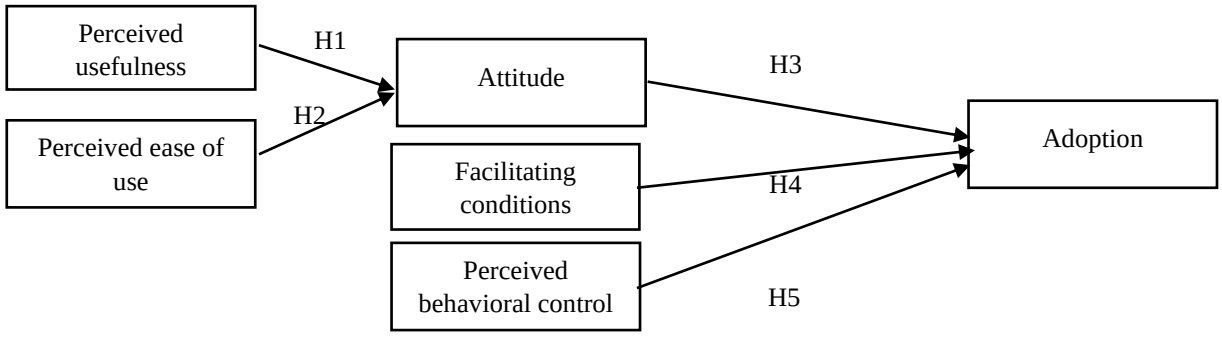

**Figure 2.1 - Research model**

#### 2.2.1. Perceived usefulness

The definition of perceived usefulness (PU) is "the degree to which a person believes that using a particular system would enhance his or her job performance." - in Davis' study "Perceived Usefulness, Perceived Ease of Use, and User Acceptance of Information Technology" (1989). The authors broaden the definition of "perceived usefulness" to include "the degree to which users believe that using a specific service will improve their personal performance." - in "A Theoretical Extension of the Technology Acceptance Model: Four Longitudinal Field Studies" by Venkatesh and Davis (2000).

### 2.2.2. Perceived ease of use

Perceived ease of use (PEOU) is the degree to which a person feels that utilizing a specific system would be effortless (Davis, 1989) or the degree to which consumers believe that using a given service will be simple (Venkatesh & Davis, 2000). Furthermore, the amount to which users feel that utilizing a service would require no physical or mental effort - "User Acceptance of Information Technology: Toward a Unified View" Venkatesh, V. et al. (2003).

### 2.2.3. Attitude

Ajzen, I. (1991) defines attitude (AT) as the degree to which a person has a positive or negative judgment of the conduct in issue. Furthermore, in the early study of Fishbein M. & Ajzen I. (1975), AT refers to the taught inclination to respond consistently favorably or unfavorably to a particular item.

### 2.2.4. Facilitating conditions

According to Venkatesh et al. (2003), facilitating circumstances (FC) refer to an individual's belief that a technological infrastructure exists to help them when using a new service. Furthermore, enabling conditions refer to individuals' views of the availability of technology and/or organizational resources, such as knowledge, resources, and opportunities, that may be leveraged to overcome obstacles to service usage (Venkatesh et al. 2003). Thus, FC minimizes perceived obstacles to service uptake through support and help (Blok et al., 2020).

### 2.2.5. Perceived behavioral control

Perceived behavioral control (PBC) is the perceived ease or difficulty of doing the task at hand (Ajzen, 1991). Following that, Baker et al. (2002) found that PBC is a strong predictor of service acceptability and usage intention in a range of contexts.

### 2.2.6. Adoption

Adoption (AD) is described by the Cambridge Dictionary as accepting or starting to use something new, choosing or taking something as your own, and the process of beginning to utilize a new product or service.

## III. METHODOLOGY

This study targets HCMC individuals aged 18-30 who have basic knowledge of telemedicine. This group, which represents a sizable section of the population that is technologically adept and receptive to new ideas, is critical to understanding telemedicine adoption determinants because they frequently embrace new solutions first and may give useful insights regarding its usability and acceptance. This group is critical to the study because their actions have a direct impact on telemedicine uptake. Without a comprehensive adolescent telemedicine registry, non-probability sampling should be performed. Purposive selection will identify telemedicine specialists, ensuring that the sample accurately represents HCMC's youthful telemedicine customers. Examining a cohort can reveal telemedicine service utilization trends and their implications for healthcare accessibility and efficiency. Identifying the primary factors influencing telemedicine adoption among young people in HCMC can aid in the development of user-centered telemedicine solutions tailored to this demographic's needs and preferences. This project seeks to advance our understanding of how to use telemedicine in healthcare in order to enhance service delivery and patient outcomes.

Surveys are used to investigate human behavior because they give empirical data based on real-world observations (Kelley et al., 2003). Surveys were employed in this investigation. This study's online questionnaire was made available using Google Forms. We revised all questionnaire items based on a thorough literature review to guarantee content validity. Based on variable definitions, the survey was written in English. Every questionnaire item corresponds to a topic-related variable. It was translated from English to Vietnamese before being administered in Vietnamese, Vietnam's official language and the language spoken by the majority of young people, to ensure translation equivalence. The questionnaire ensures confidentiality and respects privacy. The 7-point Likert scale, which goes from (1) strongly disagree to (7) strongly agree, was chosen for assessment because it provides better dispersion and has fewer neutral responses. The inquiry relied on the equation $N > 50 + 8*m$. This guideline sets sample size based on the number of predictor variables in the model, ensuring regression analysis and robust findings. The formula (Cohen, 1988) calls for 50 samples, where N is the minimum sample size and m is the research model's predictor variables. The model has six predictor variables, hence N surpasses $50 + 8 * 6$ (Green, 1991). Thus, our sample of 116 is adequate because the study

requires 98 samples.

After gathering study data, partial least squares structural equation modeling is used to assess and draw conclusions on the factors impacting young people's telemedicine adoption in Ho Chi Minh City. Table 1 shows data dependability. In model structure analysis, the outer loadings coefficient represents the relationship between observable variables and latent variables, demonstrating the capacity to explain latent variable variation. Joseph F. Hair (2017) recommends an outer loading factor of 0.7 or greater. Table 1 shows that AT2, FC1, PBC1, PBC3, PEOU3, PU3, and PU4 all have outer loading coefficients less than this threshold: 0.677, 0.604, 0.624, 0.618, 0.571, 0.590, and 0.683. Exclude data with outer loading factors less than 0.4 from the model. If the Composite Reliability (rho_c) and Convergent Validity (AVE) indicators for that component are between 0.4 and 0.7, the coefficient will be retained (Joseph F. Hair, 2017). SmartPLS 4 provides three indicators for evaluating internal consistency reliability: Cronbach's alpha (ρA), composite reliability (rho_a), and composite reliability (rho_c). The focus should be on the reliability indicators ρA and CR for numerous fundamental reasons. Initially, ρA is the key measure for analyzing intrinsic consistency, displaying item similarity based on criteria. Values of 0.7 or above are deemed acceptable. The quantity of items in the criterion may influence this statistic, resulting in lower scores despite the criteria's dependability. In contrast, the CR assesses dependability more accurately by taking into account the normalized load of observed values and their mistakes, offering a more focused perspective in complicated models. A CR value of 0.7 or more is more reliable than ρA since it considers the load of each criteria item, especially in models with several variables. The ρA coefficient frequently underestimates dependability, whereas CR overestimates it. As a result, when evaluating results, both indicators must be considered; the acceptable dependability value often falls between these two coefficients, increasing variable reliability and boosting research quality and accuracy (Joseph F. Hair, 2017).

## IV. DATA ANALYSIS AND RESULT

### 4.1. Assessing the outer measurement model

**Table 4.1 – Loadings, cronbach's alpha, composite reliability (rho_c) and average variance extracted (AVE)**

| Constructs | Items | Outer loadings | Cronbach's alpha ($\rho_A$) | Composite reliability (rho_c) | Average variance extracted (AVE) |
|---|---|---|---|---|---|
| **AD** | AD1 | 0.716 | **0.696** | 0.813 | 0.521 |
| | AD2 | 0.713 | | | |
| | AD3 | 0.723 | | | |
| | AD4 | 0.734 | | | |
| **AT** | AT1 | 0.730 | **0.536** | 0.764 | 0.52 |
| | AT2 | **0.677** | | | |
| | AT3 | 0.754 | | | |
| **FC** | FC1 | **0.604** | **0.611** | | 0.554 |
| | FC2 | 0.77 | | | |
| | FC3 | 0.838 | | | |
| **PBC** | PBC1 | **0.624** | **0.626** | 0.78 | **0.473** |
| | PBC2 | 0.771 | | | |
| | PBC3 | **0.618** | | | |
| | PBC4 | 0.725 | | | |
| **PEOU** | PEOU1 | 0.759 | **0.473** | 0.741 | **0.493** |
| | PEOU2 | 0.758 | | | |
| | PEOU3 | **0.571** | | | |
| **PU** | PU1 | 0.739 | **0.638** | 0.787 | **0.483** |
| | PU2 | 0.755 | | | |
| | PU3 | **0.59** | | | |
| | PU4 | **0.683** | | | |

*Note(s): AD = Adoption; AT = Attitude; FC = Facilitating Conditions; PBC = Perceived Behavioral Control; PEOU = Perceived Ease of Use; PU = Perceived Usefulness.*

The validity of the data reported in Table 1 is assessed using the outer loadings coefficient. The suggested outside loadings indicate that a decent observation number should be more than 0.7. However, Table 1 reveals seven observations—AT2, FC1, PBC1, PBC3, PEOU3, PU3, and PU4—with outer loading values of 0.677, 0.604, 0.624, 0.618, 0.571, 0.59, and 0.683, respectively, all of which fall below this criterion. Observations with outer loading coefficients of less than 0.4 should be omitted from the model. When the coefficient is between 0.4 and 0.7, the choice to keep or remove an observation is based on the composite reliability (rho_c) and average variance extracted (AVE) for the relevant construct (Joseph F. Hair, 2017).

To ensure the reliability of the criteria, it is essential to focus on two key indicators: ρA and CR. The ρA indicator measures the internal consistency of items within the criteria, with values above 0.7 deemed acceptable. Similarly, a CR value of 0.7 or higher is considered satisfactory, as it accounts for the outer loadings of individual items. CR is particularly useful in models with multiple latent variables, offering a more precise reliability measure than ρA (Joseph F. Hair, 2017). In this study, all ρA values fell below the 0.7 threshold, suggesting insufficient reliability, which could compromise the accuracy of the findings. However, ρA values can be affected by the number of items, potentially resulting in low values even when the criteria are reliable. Therefore, we also examined the CR indicator, and the results showed that all CR values exceeded 0.7, confirming the reliability of the criteria used in this study.

Next, we will assess the convergent validity of the criteria using the Average Variance Extracted (AVE) index, as shown in Table 1 on SmartPLS. Convergent validity analysis suggests that when two distinct criteria measure the same concept and exhibit a high correlation, their convergence is considered strong (Kenneth S. Shultz, 2013). A criterion demonstrates good convergent validity if its AVE is 0.5 or higher, indicating that the latent variable accounts for at least 50% of the variance in each observed variable. If a criterion's AVE is below 0.5, we will incrementally remove observations with the lowest outer loadings to improve the AVE (Michael Hock, 2010). The AVE coefficient analysis results for the model variables, presented in Table 1, reveal that only AD, AT, and FC meet the threshold for ensuring convergent validity (AVE > 0.5). The remaining variables do not meet the required threshold.

**4.2. Inspecting the inner structural model**

**Table 4.2 - Heterotrait-monotrait ratio (HTMT)**

| | **Heterotrait-monotrait ratio (HTMT)** |
|---|---|
| **AT <-> AD** | 0.673 |
| **FC <-> AD** | 0.583 |
| **FC <-> AT** | **1.218** |
| **PBC <-> AD** | 0.770 |
| **PBC <-> AT** | **0.986** |
| **PBC <-> FC** | **1.062** |
| **PEOU <-> AD** | 0.594 |
| **PEOU <-> AT** | 0.841 |
| **PEOU <-> FC** | **0.868** |
| **PEOU <-> PBC** | 0.806 |
| **PU <-> AD** | 0.604 |
| **PU <-> AT** | **0.854** |
| **PU <-> FC** | 0.761 |
| **PU <-> PBC** | 0.807 |
| **PU <-> PEOU** | 0.838 |

*Note(s): AD = Adoption; AT = Attitude; FC = Facilitating Conditions; PBC = Perceived Behavioral Control; PEOU = Perceived Ease of Use; PU = Perceived Usefulness.*

We aim to evaluate the discriminant validity of the variables in our research model using the HTMT index. A construct is considered to have good discriminant validity if it not only shows distinctiveness from other constructs but also avoids overlap or redundancy in measurement. If the HTMT value for a pair of constructs exceeds 0.9, it indicates a violation of discriminant validity, suggesting an overlap between the variables. Values below 0.85 ensure good

discriminant validity, while those between 0.85 and 0.9 are acceptable (Henseler, 2015). The PLS-SEM analysis results show that the HTMT indices for the pairs AT ↔ AD, FC ↔ AD, PBC ↔ AD, PEOU ↔ AD, PEOU ↔ AT, PEOU ↔ PBC, PU ↔ AD, PU ↔ FC, PU ↔ PBC, and PU ↔ PEOU demonstrate good discriminant validity, confirming the independence and lack of overlap between these variables, with all indices below 0.85. However, pairs such as FC ↔ AT, PBC ↔ AT, and PBC ↔ FC have coefficients exceeding 0.9, indicating potential overlap. Additionally, PEOU ↔ FC and PU ↔ AT have HTMT coefficients of 0.868 and 0.854, respectively, suggesting some similarities. Despite this, values within this range are still considered acceptable but require careful monitoring to ensure true independence and avoid confusion in the research (Henseler, 2015).

**Table 4.3 - Outcome of the structural model examination (1)**

| Latent Construct | Items | VIF | R-square | R-square adjusted |
|---|---|---|---|---|
| **AD** | AD1 | 1.198 | 0.296 | 0.277 |
| | AD2 | 1.321 | | |
| | AD3 | 1.366 | | |
| | AD4 | 1.445 | | |
| **AT** | AT1 | 1.152 | 0.302 | 0.289 |
| | AT2 | 1.106 | | |
| | AT3 | 1.177 | | |
| **FC** | FC1 | 1.173 | | |
| | FC2 | 1.263 | | |
| | FC3 | 1.225 | | |
| **PBC** | PBC1 | 1.293 | | |
| | PBC2 | 1.445 | | |
| | PBC3 | 1.108 | | |
| | PBC4 | 1.223 | | |
| **PEOU** | PEOU1 | 1.224 | | |
| | PEOU2 | 1.193 | | |
| | PEOU3 | 1.038 | | |
| **PU** | PU1 | 1.471 | | |
| | PU2 | 1.440 | | |
| | PU3 | 1.072 | | |
| | PU4 | 1.218 | | |

*Note(s): AD = Adoption; AT = Attitude; FC = Facilitating Conditions; PBC = Perceived Behavioral Control; PEOU = Perceived Ease of Use; PU = Perceived Usefulness.*

**Table 4.4 - Outcome of the structural model examination (2)**

| PLS Path | Original sample (O) | Sample mean (M) | Standard deviation (STDEV) | T statistics (\|O/STDEV\|) | P values | f-square | Remark |
|---|---|---|---|---|---|---|---|
| **AT -> AD** | 0.189 | 0.192 | 0.148 | 1.282 | **0.2** | 0.024 | **unsupported** |
| **FC -> AD** | -0.01 | 0.019 | 0.144 | 0.066 | **0.947** | **0.000** | **unsupported** |
| **PBC -> AD** | 0.421 | 0.43 | 0.138 | 3.047 | 0.002 | 0.133 | supported |
| **PEOU -> AT** | 0.244 | 0.256 | 0.117 | 2.09 | 0.037 | 0.067 | supported |
| **PU -> AT** | 0.392 | 0.402 | 0.099 | 3.961 | 0.000 | 0.174 | supported |

*Note(s): AD = Adoption; AT = Attitude; FC = Facilitating Conditions; PBC = Perceived Behavioral Control; PEOU = Perceived Ease of Use; PU = Perceived Usefulness.*

The analysis results in Table 3 show that the R-square value for the variable AT is 0.302, indicating that the independent variables PU and PEOU explain 30.2% of the variance in AT. This suggests that when users develop a positive attitude towards using a service, PU and PEOU contribute 30.2% to this attitude, while other factors account for the remaining 69.8%. Similarly, the dependent variable AD has an R-square value of 0.296, meaning that AT, FC,

and PBC together explain 29.6% of the variance in AD. This implies that these three factors play a modest role in young people's acceptance of telemedicine services. Therefore, addressing these factors alone does not ensure user acceptance of telemedicine. Additionally, unlisted factors account for 71.4% of the variance, indicating a significant influence from other variables.

To determine whether the influence of these factors is evenly distributed, we must examine the f-square index in Table 4. The analysis results reveal an uneven distribution of influence. An f-square value below 0.1 indicates negligible effect, values between 0.1 and 0.15 are considered very low, values between 0.15 and 0.35 indicate moderate influence, and values above 0.36 demonstrate strong influence (Fox, 2016). The effects of PU on AT and PBC on AD are quantified as 0.174 and 0.133, respectively, suggesting a moderate level of impact. The other factors—AT → AD, FC → AD, and PEOU → AT—show minimal impact, with f-square values of 0.024, 0.000, and 0.067, respectively. Next, we will assess the statistical significance of our assumptions by examining the p-value to determine if the majority of respondents share a consistent understanding.

The p-value indicates the reliability of the previously presented hypothesis. A factor is deemed trustworthy when it meets a minimal degree of consistency, with 90% being the lowest. The degree of dependability is separated into three thresholds: 90%, 95%, and 99% (Freedman, 2007). The reason is that statistics is never based on exact numbers; inaccuracies are unavoidable since not everyone thinks alike. The first p-value for the AT coefficient is 0.200, or 20%, suggesting that the surveyed group's opinions are 80% identical. This value is insufficient to confirm AT's influence on the adoption of telemedicine services among young people, rendering the AT factor statistically insignificant. Conversely, the p-value for FC is 0.947, showing that only 5.3% of respondents believe FC influences telemedicine adoption, which is also statistically unreliable. In contrast, the p-values for PBC, PEOU, and PU are 0.002, 0.037, and 0.000, respectively, all surpassing the 95% confidence threshold. This indicates that over 95% of the surveyed group share the same viewpoint, making these results highly reliable and statistically significant. Notably, the PU coefficient has the highest f-square value among the five factors, at 0.174, and a p-value of 99%, signifying a substantial level of influence.

In summary, only three of the five factors—PBC, PEOU, and PU—are statistically significant and influence the adoption of telemedicine services among young people. Due to insufficient data, the factors AT and FC will be temporarily disregarded as their impact cannot be confirmed. Therefore, when making recommendations about the factors influencing the adoption of telemedicine services among young people in Ho Chi Minh City, focus should be directed towards the significant factors, as AT and FC do not show statistical significance or importance.

## V. DISCUSSION

Perceived usefulness stands out as the most influential factor shaping young people's attitudes toward telemedicine services, with an f-square coefficient of 0.174 and a p-value of 0.000, underscoring its high statistical significance. Telemedicine saves time and effort, which is crucial for students and busy individuals. It allows young people to book appointments without traveling to hospitals, enhancing healthcare convenience. Perceived ease of use (PEOU) also positively impacts service adoption, as indicated by an f-square coefficient of 0.067 and a p-value of 0.037. Technical support from healthcare providers helps users resolve issues quickly, improving their overall experience and encouraging continued use and recommendations to friends and family. While user attitudes might influence service adoption, the research shows an f-square coefficient for attitude of 0.024 and a p-value of 0.2, suggesting that attitude is not a decisive factor in adopting telemedicine services. This may be due to a lack of information about telemedicine benefits or skepticism about its effectiveness compared to in-person consultations. Additionally, without support from friends or family, young people's attitudes toward these services are unlikely to improve. Facilitating conditions do not significantly impact telemedicine adoption among young people, as shown by an f-square value of 0.000 and a p-value of 0.947. Modern youth are comfortable with technology and do not see infrastructure as a major barrier. Technological advancements in Ho Chi Minh City further ease access to these services, reducing concerns about physical facilities. Perceived behavioral control (PBC) significantly influences telemedicine acceptance, with an f-square value of 0.133 and a p-value of 0.002. Young individuals feel empowered to make decisions about telemedicine, from scheduling appointments to communicating with doctors. Their confidence in using technology facilitates easy access to these services.

Research on the adoption of telemedicine services among young people in Ho Chi Minh City produced significant insights but also highlighted notable limitations. A key issue is that the survey sample was predominantly composed of students, which may not accurately represent the broader population. Students often share similar lifestyles, habits, and health perceptions, meaning the data may not fully capture the perspectives and needs of other groups, such as workers, married individuals, or middle-aged people. This homogeneity within the sample provides an incomplete view of telemedicine acceptance. Students' shared habits and needs could lead to conclusions that do not apply to the wider community. In contrast, working adults may have greater health awareness and financial capacity to afford healthcare services, advantages that students might lack.

## VI. RECOMMENDATIONS AND CONCLUSION

This study primarily focused on students, a group with similar lifestyles, technological familiarity, and information habits. While the survey provides valuable insights into the opinions and behaviors of this subgroup, it may not fully represent all young people. Students, having grown up in a digital environment, tend to be optimistic about technology, which may not reflect the views of other young individuals, such as those who are working or have not attended university. To address this limitation, future surveys should include young working adults and non-graduates. This approach will capture a broader range of perspectives and behaviors, offering a more comprehensive understanding of service acceptability criteria. Including participants from diverse demographics and technology usage habits will enhance the persuasiveness of the results and help service providers make more informed recommendations. Additionally, conducting periodic surveys and monitoring the attitudes and behaviors of these groups will allow us to track service usage patterns and adjust hypotheses for future studies more effectively.

**APPENDIX**

Appendix: Questionaire

Investigating some factors influence the adoption of telemedicine services among the young in Ho Chi Minh city

**Part 1: Demographic characteristics**

| **Demographic variable** | |
|---|---|
| Gender | Female |
| | Male |
| Age | Less than 20 |
| | 21-25 years old |
| | 26-30 years old |
| | Above 30 years old |
| Education level | No College Degree |
| | Associate's Degree |
| | Bachelor's Degree |
| | Master's Degree |
| Current occupation | Student |
| | Employed full-time |
| | Employed part-time |
| | Unemployed |
| Monthly income | Less than 3M VND |
| | 3M VND – 5M VND |
| | 5M VND – 7M VND |
| | 7M VND – 10M VND |
| | Above 10M VND |
| Do you have experience in using telemedicine services? | Yes |
| | No |

**Part 2. Measurement scale**

| **Constructs** | **Items** |
|---|---|
| Perceived Usefulness (PU) | PU1: Using telemedicine services will help me perform health-related tasks more effectively.<br>PU2: Utilizing telemedicine services will lead to better health outcomes in my daily life.<br>PU3: Telemedicine services can enhance my quality of life by providing convenience and quick access to medical care. |
| Perceived Ease of Use (PEOU) | PEOU1: Using telemedicine services will require minimal effort on my part.<br>PEOU2: Accessing telemedicine services will be very easy and convenient for me.<br>PEOU3: Using telemedicine services will not involve significant physical or mental strain. |
| Attitude (AT) | AT1: I have a favorable opinion about using telemedicine services for my healthcare needs.<br>AT2: I believe telemedicine services are a positive approach to healthcare.<br>AT3: Overall, I feel positive about the use of telemedicine technology for medical consultations. |
| Facilitating Conditions (FC) | FC1: I feel confident that the technical infrastructure is sufficient to effectively support my use of telemedicine services.<br>FC2: The support and assistance I receive make it significantly easier for me to adopt telemedicine services.<br>FC3: I believe I have access to the necessary resources and knowledge to |

| | |
|---|---|
| | navigate telemedicine services without issues. |
| Perceived Behavioral Control (PBC) | PBC1: I believe that using telemedicine services is easy for me to do.<br>PBC2: I feel confident in my ability to use telemedicine services effectively.<br>PBC3: I think that I can easily access and navigate telemedicine services when needed.<br>PBC4: I feel that I have the necessary resources and support to successfully use telemedicine services. |
| Adoption (AD) | AD1: I have accepted telemedicine services as a viable option for my healthcare needs.<br>AD2: I feel comfortable starting to use telemedicine services for my healthcare.<br>AD3: I consider telemedicine services to be an integral part of my healthcare routine.<br>AD4: I have begun to use telemedicine services regularly for my healthcare needs. |

# SUSTAINABLE TOURISM DEVELOPMENT WITH THE CULTURAL HERITAGE OF SOUTHERN VIETNAMESE TRADITIONAL HOUSES

**Pham Do Hoang An[1], Nguyen Thi Kim Cuc[2], Phung Thi Diem My[3,*]**

*Corresponding: pdhan@ntt.edu.vn

**ABSTRACT**

The cultural heritage of Southern ancient houses possesses unique historical and architectural value, making an important contribution to the sustainable development of tourism in Vietnam. This research examines the potential and challenges associated with the conservation and utilization of ancient buildings in Southern Vietnam to cultural heritage and sustainable tourism, the article evaluates the contributions of Southern ancient houses in creating distinctive tourism products, educating visitors about cultural values, and supporting local economies. The results indicate that, while these heritage sites hold significant potential to attract visitors and raise awareness about cultural heritage, their conservation and utilization face challenges such as visitor-related pressures, inadequate funding, and structural deterioration. The study suggests solutions including controlled renovation, the application of promotional technologies, streamlined tourism processes, and the empowerment of local communities. With a well-planned conservation and development strategy, the heritage of Southern ancient houses can serve as a central element in fostering sustainable cultural tourism in Vietnam within the context of contemporary societal development.

*Keywords:* "cultural heritage", "heritage preservation", "southern ancient houses", "sustainable tourism"

## I. INTRODUCTION

Vietnam, with its rich and diverse cultural heritage, is home to an invaluable repository of cultural treasures. Among these, the heritage of Southern Vietnamese traditional houses stands as an integral part, contributing significantly to the uniqueness of this cultural legacy. These traditional houses are not only architectural marvels bearing profound historical imprints but also serve as symbols of the cultural, social, and spiritual life of the Southern Vietnamese people. Closely tied to local communities, this heritage has emerged as a distinctive highlight in the journey toward sustainable tourism development in the region. The Southern Vietnamese traditional houses were established during the exploration and settlement of the southern lands in the 17th century, when people from northern and central Vietnam migrated southward. These houses represent a refined combination of cultural, architectural, and spiritual elements, creating a unique architectural identity that is unmistakable. Constructed primarily from wood, bricks, stone, tiles, and other traditional materials, they are well-adapted to the tropical monsoon climate and the geographical conditions of the southern region.

Beyond their role as residences, these traditional houses are living evidence of the deep cultural values of Southern Vietnamese communities over centuries. They reflect a harmonious relationship between humans and nature while preserving family traditions, ancestral worship practices, and distinctive customs of the Southern people. These elements collectively create a unique cultural heritage, highlighting the confluence of diverse cultural influences such as Vietnamese, Chinese, Khmer, and other traditions passed down through generations. With the robust growth of the tourism industry, Southern Vietnamese traditional houses have become one of the most attractive destinations, drawing the interest of both domestic and international tourists. Sustainable tourism, which aims to develop tourism while preserving heritage values, represents a vital and necessary direction. However, harnessing the tourism potential of Southern Vietnamese traditional houses requires strategic planning and practical approaches to both protect and promote their cultural values while generating economic opportunities for local communities [3].

Sustainable tourism development is a strategic approach that ensures a balance between economic, cultural, and

environmental factors to conserve natural and cultural resources while promoting long-term development. In this context, the preservation of traditional Southern Vietnamese houses plays a significant role in maintaining the unique cultural values of the region. It also serves as an effective tool to stimulate economic growth and enhance community awareness about heritage values. For instance, in Phú Yên [7], the preservation of heritage sites such as Tháp Nhạn and the organization of traditional festivals have demonstrated the effectiveness of harmonizing economic development with the protection of cultural values. Similarly, the experience from the Tremiti Islands shows that sustainable management policies can reduce environmental impacts while preserving heritage values [4], creating favorable conditions for sustainable tourism models, such as those involving traditional Southern Vietnamese houses. These examples emphasize that sustainable tourism is not only a goal but also a comprehensive solution for long-term development.

Travel tourism revenue in the Southeast and Mekong Delta region in 2023 is estimated at VND 33,659.1 billion out of a total of VND 68,966.6 billion, accounting for 48.8%. According to data from the General Statistics Office in 2024, service activities account for 42.36% of the country's GDP with an average growth rate of 9.0%, equivalent to VND 6,391 trillion. The development of the tourism industry not only contributes to creating jobs for workers but also promotes other supporting economic sectors such as accommodation and catering increased by 12.9%, travel services increased by 16%, passenger transportation increased by 8.3%, and freight transportation increased by 14% compared to the previous year. In addition, the number of international visitors to Vietnam also increased by 39.5%, reaching 17,583 thousand people. Vietnam's tourism industry not only contributes to economic growth but also creates many opportunities for social and cultural development, making tourism an important and indispensable economic sector in the region's sustainable development strategy [11][12].

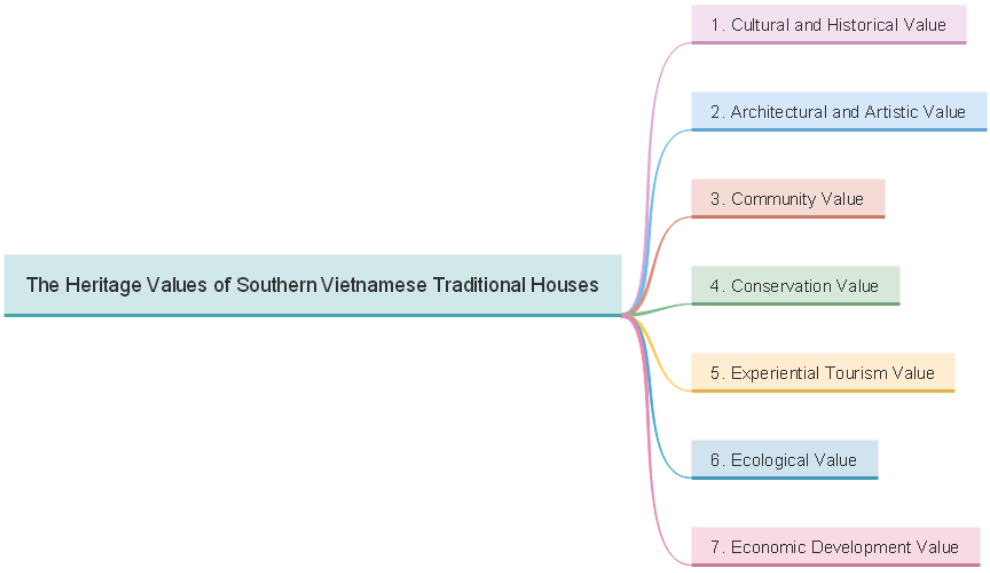
Sustainable tourism development linked to Southern Vietnamese traditional houses is not merely about preserving and enhancing architectural heritage. It is also a long-term strategy to raise community awareness, protect the environment, and create economic opportunities tied to local culture. This is the primary goal of this paper: to elucidate the role and value of Southern Vietnamese traditional houses in sustainable tourism development and to propose strategic directions for their preservation and promotion in a contemporary context. By integrating heritage conservation with tourism development, we can harness the distinctive cultural values of Southern Vietnamese traditional houses. Simultaneously, this approach contributes to building a robust, sustainable, and socially responsible tourism industry. Sustainable tourism development not only ensures the preservation of cultural values for future generations but also delivers long-term benefits for the local economy and communities.

## II. CULTURAL HERITAGE AND SUSTAINABLE TOURISM DEVELOPMENT

Modern perspectives on heritage management increasingly emphasize the intricate relationship between preservation and the sustainable utilization of heritage values. This approach seeks to create opportunities to leverage heritage potential, thereby generating resources to reinvest in conservation and restoration efforts. Such a cyclical process ensures the sustainable development of these cultural values for future generations.

As Gaetano M. Golinelli (2018) has asserted, cultural heritage and its intrinsic values are inseparable from the broader social and economic context. The integration of culture and tourism must be approached harmoniously, as it not only reflects the identity of local communities but also plays a pivotal role in driving economic development and safeguarding cultural values. Cultural tourism goes beyond merely attracting visitors; it serves as a means of preserving and promoting heritage values, thus creating revenues to support long-term conservation efforts [7].

The International Council on Monuments and Sites (ICOMOS), during its conference on "Contemporary Tourism and Humanism," defined cultural heritage tourism as a form of tourism aimed at exploring historical sites and structures. These sites are not only cultural resources but also invaluable heritage assets that require thoughtful and sustainable utilization. Heritage tourism encompasses diverse forms and demands a balanced integration of preservation and development. Tourism, in this context, becomes more than a tool to attract visitors—it constitutes a cultural activity, while heritage conservation emerges as a driver for sustainable economic and social development.



In the context of sustainable tourism development, Butowski (2019) identified and proposed key principles for sustainable tourism. The author emphasized that sustainable tourism must align with cultural heritage preservation,

environmental protection, and community development. Similarly, Huibin (2021) outlined four primary goals of sustainable tourism: conserving and maintaining the cultural identity of communities, promoting active participation of local populations, developing new markets, and establishing modern infrastructure with community involvement [10].

Sustainable tourism development linked to heritage preservation not only safeguards historical and cultural values but also contributes to economic growth, enhances community awareness, and supports the conservation and promotion of invaluable heritage. This comprehensive strategy harmonizes economic development with the preservation of cultural and historical values, addressing current needs while protecting cultural assets for future generations.

## III. THE HERITAGE VALUES OF SOUTHERN VIETNAMESE TRADITIONAL HOUSES

Southern Vietnamese traditional houses are one of the most distinctive cultural assets of the region, embodying profound values related to culture, history, architecture, and community. These houses are not merely unique architectural structures; they also serve as vibrant symbols of the life, traditions, beliefs, and significant historical milestones of the Southern Vietnamese people. To ensure the sustainable development of tourism associated with this heritage, it is essential to identify and promote these values within a harmonized framework. This approach aims to simultaneously preserve traditional elements while fostering local economic growth. By balancing conservation with sustainable development, the heritage of Southern Vietnamese traditional houses can serve as both a cultural cornerstone and an economic catalyst for the region.

**Figue 1: The values of the Southern ancient house heritage**

*Cultural and Historical Value*: The cultural and historical significance forms the core foundation of the heritage of Southern Vietnamese traditional houses. These structures are not merely architectural landmarks but also repositories of historical narratives, reflecting the trials, triumphs, and transformations of communities across generations. They represent invaluable heritage, offering visitors deeper insights into the formation and development of Southern Vietnam, from the migration of Vietnamese people to the South to pivotal historical events such as wars and cultural exchanges among ethnic communities. Southern Vietnamese traditional houses serve as living witnesses to the historical evolution of the region, encapsulating profound values related to social life, conflicts, and the coexistence of diverse ethnic groups. Preserving the cultural and historical values of these traditional houses not only helps sustain national identity but also establishes them as intellectually enriching tourism destinations. This, in turn, enhances community awareness of the importance of conserving and promoting these heritage assets for future generations.

Traditional Southern Vietnamese houses are not merely architectural structures but also cultural symbols reflecting the settlement history and way of life of the local people. From unique architectural elements to traditional customs, these houses embody distinct cultural values and play a crucial role in educating younger generations about local identity and fostering community cohesion. This heritage is not only a place of residence but also a bridge connecting the past and present, contributing to the promotion of cultural tourism [2]. According to research in Hồ Chí Minh City [5], when utilized effectively, cultural heritage can attract 50% to 80% of international tourists, generating substantial

economic benefits. Similarly, in Phú Yên [7], heritage assets such as fishing village architecture and traditional festivals highlight values akin to those of Southern Vietnamese houses, showcasing the role of cultural heritage in enhancing tourism appeal. This underscores that, with proper preservation and development, traditional Southern Vietnamese houses can become valuable tourism resources, contributing to economic growth and the preservation of regional cultural identity.

*Architectural and Artistic Value:* The architectural and artistic significance of Southern Vietnamese traditional houses is a particularly prominent and distinctive feature. These structures exhibit a harmonious blend of Eastern and Western architectural styles across historical periods, reflecting the interplay between indigenous culture and influences from Chinese, Khmer, and French colonial architecture. The design of these traditional houses, characterized by tiled roofs, wooden pillars, garden spaces, and intricate decorative details such as dragon and phoenix motifs, as well as the "four sacred animals" (*tứ linh*) and "four noble plants" (*tứ quý*), highlights the remarkable craftsmanship of artisans from past generations. These houses transcend their function as mere residences to serve as works of art, offering exceptional aesthetic value. Tourism development can leverage the architectural allure of these heritage sites to attract visitors interested in exploring classical architectural styles and traditional construction techniques. This approach not only enhances cultural appreciation but also contributes to the preservation and promotion of the artistic values embodied in Southern Vietnamese traditional houses. The development of tourism must address the challenge of preserving traditional architecture and materials while implementing necessary renovations to accommodate visitor demands. This process ensures the provision of appropriate amenities for tourists while maintaining the integrity and cultural value of the heritage site.

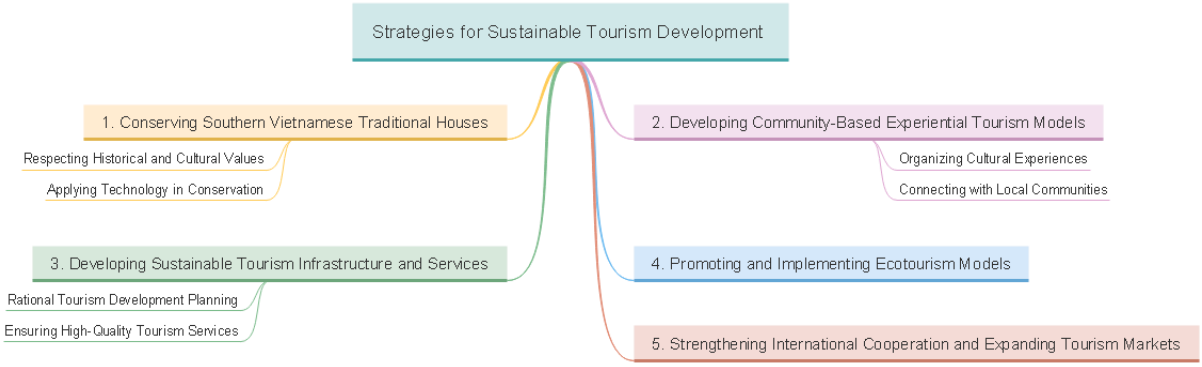
*Community Value:* Community value is an indispensable factor in the sustainable development of tourism associated with the heritage of Southern Vietnamese traditional houses. These houses are deeply intertwined with the daily lives of local residents, encompassing traditional practices, occupations, and community relationships. The active participation of local communities is a prerequisite for sustainable tourism development. Communities not only act as guardians of heritage but can also directly benefit from tourism activities. Experiential tourism programs, where visitors engage in activities such as gardening, preparing traditional dishes, or participating in local festivals, allow tourists to gain deeper insights into the lives of local people and the unique cultural values of the region. By fostering meaningful interactions between visitors and local residents, these programs not only protect the heritage of traditional houses but also generate tangible benefits for local communities. This dual approach ensures that both heritage preservation and community well-being are integral to the sustainable development of cultural tourism.

*Conservation Value*: Heritage conservation is a fundamental value and an indispensable requirement in any sustainable tourism development project. The preservation of Southern Vietnamese traditional houses must ensure their integrity, not only through restoration and rehabilitation efforts but also by fostering educational initiatives and raising community awareness about the importance of safeguarding historical and cultural values. Conservation extends beyond the physical repair of traditional houses to include the protection of the natural environment and ecosystems surrounding these heritage sites. Sustainable tourism can attract attention to these historical structures, but it must also mitigate negative impacts such as overtourism, which can diminish the heritage's value or contribute to environmental degradation. By adopting a holistic approach to conservation, which integrates ecological preservation, community involvement, and responsible tourism practices, the long-term sustainability of Southern Vietnamese traditional houses can be secured while enhancing their cultural significance for future generations.

The preservation of traditional Southern Vietnamese houses faces significant challenges, ranging from physical degradation of structures to a lack of investment resources for maintenance and restoration. Additionally, the pressure from mass tourism, characterized by high visitor volumes, has placed a heavy burden on these heritage sites, increasing the risk of commercialization and the loss of cultural authenticity. Furthermore, a lack of consensus and coordination among stakeholders, including authorities, local communities, and businesses, has undermined management and conservation efforts. According to studies in Cần Thơ [6], the management of historical and cultural sites faces major difficulties due to limitations in investment and planning. Similarly, experiences from the Tremiti Islands [4] indicate that high tourist densities and negative impacts on natural environments are common challenges, requiring more effective planning measures. These issues highlight the urgent need to implement sustainable conservation solutions to

ensure the protection and optimal utilization of traditional Southern Vietnamese houses.

*Experiential Tourism Value:* Experiential tourism has become increasingly important in attracting modern travelers, who seek not only to visit destinations but also to immerse themselves in local cultures. The heritage of Southern Vietnamese traditional houses offers an exceptional opportunity for visitors to experience the daily life of local communities. Tourists can learn to prepare traditional dishes, participate in agricultural or artisanal activities, and explore distinctive regional customs and traditions. This model of experiential tourism enhances the connection between visitors and local communities, fostering mutual understanding and appreciation. Moreover, it provides long-term and sustainable benefits for both parties. As an ideal tourism model, it not only preserves and promotes the values of cultural heritage but also generates income for local communities, motivating them to protect and maintain their heritage. By integrating cultural immersion with economic incentives, experiential tourism ensures that Southern Vietnamese traditional houses remain vibrant and sustainable assets for both tourism and heritage conservation.



*Ecological Value:* Ecology serves as a critical support for the cultural and community values of Southern Vietnamese traditional houses. Many of these heritage sites are closely connected to natural landscapes, such as fruit orchards, ponds, or medicinal plant gardens. Sustainable tourism must prioritize the protection and maintenance of these natural ecological elements, ensuring habitats for flora and fauna while safeguarding the integrity of the local ecosystems. Preserving the ecosystems surrounding these heritage sites not only maintains their natural beauty but also enhances the visitor experience. Tourists can engage in environmentally focused activities such as tree planting, wildlife conservation, and other ecological initiatives. These activities not only enrich the tourist experience but also contribute to environmental awareness and the sustainable development of both the heritage sites and their surrounding environments. The surge in tourist numbers can cause structural damage to the foundations, brick walls, tiled roofs, and natural surroundings of heritage houses. Environmental pollution from tourism-related waste, noise, and artificial lighting may disrupt the authentic living space. Therefore, strict regulations on visitor capacity, regular maintenance, and conservation measures are essential to mitigate negative impacts on heritage sites. Organizing diverse eco-tourism experiences enables tourists to immerse themselves in local life while minimizing potential threats to the regional ecological environment.

*Economic Development Value:* Economic value, though presented last in this discussion, is no less significant. Tourism development associated with Southern Vietnamese traditional houses has the potential to generate stable income streams for local communities and regional governments. However, such tourism must be developed responsibly to ensure that it does not compromise the cultural and historical integrity of the heritage. A sustainable tourism model allows local communities to benefit economically from tourism while preserving natural resources and cultural heritage for future generations. Additionally, tourism development can improve the quality of life for local residents by creating employment opportunities, fostering the growth of ancillary industries, and facilitating the construction of essential community infrastructure. By balancing economic benefits with cultural preservation, sustainable tourism can serve as a catalyst for local development while safeguarding the enduring value of Southern Vietnamese traditional houses. The values outlined serve as the foundational framework for the sustainable tourism development strategies proposed in the following section. These values emphasize the significance of Southern Vietnamese traditional houses as a multifaceted cultural asset, requiring a holistic approach that integrates conservation with economic and community development. Based on these principles, specific action strategies are proposed to promote sustainable tourism associated with them.

A sustainable tourism model will enable local communities to generate increased revenue from tourism while preserving natural resources and cultural heritage for future generations. However, tourism must be developed responsibly and managed effectively at all levels, from governance to individual community members, to minimize disruptions to traditional lifestyles and prevent excessive commercialization. Unregulated tourism development may lead to residents abandoning heritage houses due to rising property prices or changes in their living environment, ultimately eroding the vibrant cultural landscape as local inhabitants relocate. Additionally, cultural activities may become distorted to cater to tourists, compromising their authenticity and diminishing their intrinsic historical and social value.

## IV. STRATEGIES FOR SUSTAINABLE TOURISM DEVELOPMENT LINKED TO THE CONSERVATION AND PROMOTION OF SOUTHERN VIETNAMESE TRADITIONAL HOUSES

The heritage of Southern Vietnamese traditional houses, with its unique architectural beauty and profound cultural significance, plays a crucial role in the sustainable tourism development of the region. However, a clear and comprehensive strategy for sustainable tourism is essential. Such a strategy must tightly integrate the conservation and promotion of these heritage sites, creating long-term economic and social benefits for local communities.

**Figue 2: Strategies for Sustainable Tourism Development Linked to the Conservation and Promotion of Southern Vietnamese Traditional Houses**

### 4.1 Conserving Southern Vietnamese Traditional Houses

Southern Vietnamese traditional houses are not merely architectural landmarks but also historical witnesses to the culture and lives of generations in the region. Thus, their conservation is fundamental and indispensable in any sustainable tourism development strategy.

*Respecting Historical and Cultural Values:* The conservation of traditional houses should begin with the recognition and respect of their historical and cultural values. Effective conservation requires scientific measures, from assessing the structural quality of these houses to applying traditional restoration techniques. Heritage sites must be safeguarded from the adverse impacts of overtourism, such as damage to architectural details or the erosion of their integrity. Raising awareness among local communities and visitors about the importance of heritage conservation is critical to preserving these values for future generations.

*Applying Technology in Conservation*: Modern technology can play a pivotal role in the conservation and promotion of Southern Vietnamese traditional houses. Virtual reality (VR) and augmented reality (AR) technologies can recreate the spaces and histories of these houses, offering visitors immersive experiences without compromising the physical structures. Digital platforms, such as websites and mobile applications, can provide information about the heritage and promote tourism effectively before visitors arrive.

The application of Virtual Reality (VR) can digitally reconstruct the architectural space of traditional heritage houses through three-dimensional (3D) modeling, allowing visitors to explore these structures remotely without compromising their physical integrity. The development of VR-based virtual museums or immersive virtual heritage tours expands accessibility, particularly for individuals who lack the opportunity to visit these sites in person. Furthermore, VR can be utilized to restore the original state of deteriorated architectural structures or simulate historical transformations of heritage houses over time, thereby enhancing their educational value. Meanwhile, Augmented Reality (AR) can be integrated into mobile applications to provide interactive and real-time information at heritage sites. Tourists can use their personal devices to scan QR codes or activate AR content, enabling them to view historical imagery, architectural details, or even simulations of traditional daily life activities within heritage houses. This technology not only enhances visitor engagement and interaction but also assists tour guides in delivering information in a more immersive and compelling manner. Additionally, AR holds significant potential for organizing cultural events, interactive art exhibitions, and historical reenactments, as well as supporting educational programs on architecture and history. Beyond enhancing the tourism experience, AR and VR also play a crucial role in the preservation and management of heritage assets. The development of a digital heritage database for traditional Southern Vietnamese houses not only facilitates systematic documentation and archival storage but also supports experts in

analyzing, restoring, and safeguarding these structures from the risks of deterioration due to environmental factors and the passage of time.

To preserve and sustainably develop traditional Southern Vietnamese houses, the application of modern technology and the establishment of experiential tourism models involving local communities are critical solutions. AR/VR technology allows for the detailed recreation of the architecture and life associated with these houses, providing authentic and immersive experiences for visitors [1]. This not only enhances the value of the heritage but also expands opportunities to promote local culture beyond the region. According to research on Vietnam's tourism development, the use of AR/VR has proven effective in enhancing visitor experiences and spreading heritage values to diverse audiences. Additionally, building experiential tourism models where local communities play a central role will encourage active participation in conservation and development. Research in Phú Quốc [8] suggests that developing unique tourism products tied to culture and the local environment not only attracts tourists but also protects cultural values. These solutions not only safeguard and promote the heritage of traditional Southern Vietnamese houses but also ensure sustainable tourism development, balancing economic and cultural benefits.

**4.2 Developing Community-Based Experiential Tourism Models**

Experiential tourism has become an increasingly popular trend in modern tourism, particularly as travelers seek not only to visit destinations but also to immerse themselves in the cultural and traditional life of local communities. For the heritage of Southern Vietnamese traditional houses, the development of experiential tourism represents an effective approach to both preserving and promoting heritage values while simultaneously generating sustainable economic benefits for local communities.

*Organizing Cultural Experiences*: Southern Vietnamese traditional houses can serve as venues for cultural activities that allow visitors to explore the lives of local people through generations. Tourists can participate in traditional agricultural practices, gardening, or artisanal activities such as weaving, pottery-making, or basketry. Culinary experiences can also be organized, where visitors learn to prepare traditional Southern Vietnamese dishes such as *bánh xèo*, *canh chua*, or festive dishes associated with traditional celebrations. These activities not only enrich the tourist experience but also enhance the cultural appreciation of the region.

*Connecting with Local Communities*: When local communities understand the significance of their heritage and are involved in decisions regarding its utilization, they become active participants in preserving and safeguarding cultural values. Training programs on tourism management, heritage conservation, and economic development through tourism should be conducted to enhance local capacities. Such initiatives help foster community awareness of the importance of protecting heritage while simultaneously empowering them to benefit from tourism. A community-centered approach ensures that sustainable tourism development supports cultural preservation and provides long-term economic opportunities.

Local communities play a central role in resource management and the preservation of traditional cultural values, especially in the context of sustainable tourism development. Their participation not only ensures authenticity and vitality for tourism activities but also raises awareness of heritage conservation. A fair benefit-sharing mechanism from tourism activities will help improve the livelihoods of local residents while fostering their commitment and responsibility to protect cultural values. Research in Hồ Chí Minh City [1] highlights the importance of communities in sustainably preserving and utilizing cultural heritage, yielding long-term benefits for both economic and social development. Similarly, experiences in Saudi Arabia [2] show that the active involvement of local communities not only aids in protecting heritage values but also drives economic development by creating jobs and improving incomes. With effective support and coordination, local communities can become the driving force for the sustainable preservation and development of cultural values [9], such as traditional Southern Vietnamese houses.

**4.3 Developing Sustainable Tourism Infrastructure and Services**

The sustainable development of tourism associated with the conservation and promotion of Southern Vietnamese traditional houses requires thoughtful investment and development of tourism infrastructure and services. These efforts must ensure that heritage elements remain intact while supporting visitor engagement and local economic growth.

*Rational Tourism Development Planning*: Tourism development planning around heritage sites must follow a

scientific approach to avoid disrupting the structural integrity of traditional houses or adversely affecting the surrounding environment. Infrastructure projects such as roads, parking areas, and visitor facilities should be designed harmoniously to blend with the heritage landscape, preserving the historical ambiance of the area. Overdevelopment of modern structures must be avoided to maintain the authenticity and charm of these cultural sites.

*Ensuring High-Quality Tourism Services*: Tourism services related to traditional houses must meet high standards, ranging from visitor engagement to the organization of activities. Tour guides should receive professional training in the history, culture, and architecture of the heritage to provide accurate and compelling information to visitors. Accommodation, dining, and other visitor services should retain traditional characteristics while offering the comfort and convenience expected by modern tourists.

### 4.4 Promoting and Implementing Ecotourism Models

The development of ecotourism is a strategic approach to preserving the natural environment surrounding Southern Vietnamese traditional houses. The areas around these heritage sites can be planned as green spaces, allowing visitors to engage in activities such as forest walks, exploring fruit gardens, or participating in wildlife conservation projects. Visitors can also contribute to ecological sustainability through activities like tree planting, environmental cleanup efforts, and learning about local ecosystems. These initiatives not only enhance the visitor experience but also promote environmental stewardship and sustainable practices.

### 4.5 Strengthening International Cooperation and Expanding Tourism Markets

Finally, fostering international cooperation and expanding tourism markets are critical components of sustainable tourism development for Southern Vietnamese traditional houses. Partnerships with international organizations, heritage conservation experts, and tourism development specialists can provide valuable knowledge and expertise to help local managers and communities craft effective tourism strategies. Collaborative efforts can facilitate knowledge exchange, resource sharing, and access to global markets, thereby promoting the heritage of Southern Vietnamese traditional houses to a wider audience while supporting sustainable growth in the region.

The development of tourism linked to the heritage of traditional Southern Vietnamese houses should focus on building cultural tourism routes that connect these heritage sites with other tourism types to create diversity and appeal for visitors. These routes not only highlight the unique cultural values of traditional houses but also effectively utilize other cultural and natural resources in the region. Additionally, enhancing promotional activities, particularly emphasizing the distinctiveness and historical significance of the heritage, will help attract more international visitors. Experiences from Cần Thơ demonstrate that constructing tourism routes connecting historical and cultural sites has significantly increased the value of destinations [6]. Similarly, in the Tremiti Islands, the strategy of developing sustainable tourism routes based on the conservation of heritage values and natural environments has proven successful in balancing preservation and development [4]. These directions, if applied to the heritage of traditional Southern Vietnamese houses, will not only promote cultural tourism but also contribute to the sustainable preservation of the region's unique heritage values.

## V. CONCLUSION

Southern Vietnamese traditional houses are not only historical architectural structures but also vital cultural assets that reflect the identity, spiritual beliefs, and way of life of the Southern Vietnamese people. Their preservation and promotion in the context of sustainable tourism development must go beyond mere economic exploitation and be closely aligned with the conservation of cultural, historical, and community values. The integration of heritage conservation with tourism fosters economic growth, improves local livelihoods, and enhances public awareness of the significance of preserving cultural heritage. Furthermore, the implementation of experiential and ecological tourism models strengthens the connection between visitors and local communities while minimizing negative environmental impacts. From a practical perspective, sustainable tourism development linked to Southern Vietnamese traditional houses offers numerous tangible benefits. Economically, it provides stable income streams for local communities, attracts investments in green tourism infrastructure, and stimulates the growth of related sectors such as hospitality, handicrafts, and cultural enterprises. Socially, it helps to preserve traditional crafts, culinary heritage, and local customs by actively involving residents in tourism activities. Environmentally, the adoption of circular economy principles and

low-impact tourism strategies reduces waste, minimizes energy consumption, and safeguards the natural landscape surrounding heritage sites.

However, the successful implementation of these strategies requires strong institutional support and well-defined policy frameworks. Government agencies must establish dedicated heritage conservation funds and introduce tax incentives for businesses that integrate digital technology (such as AR/VR) into heritage tourism. Public-private partnerships should be encouraged to foster collaboration between technology firms, tourism startups, academic institutions, and conservation organizations. Additionally, pilot projects should be launched to test the feasibility of smart heritage management solutions, incorporating real-time visitor monitoring, AI-driven data analysis, and blockchain-based financial transparency in heritage conservation funding. Furthermore, digital transformation in heritage tourism management should be prioritized. The use of AI and Big Data to analyze visitor trends and predict tourism demand can help mitigate over-tourism and ensure the sustainable use of heritage assets. The integration of Blockchain technology can enhance financial accountability in conservation projects, allowing transparent tracking of funds allocated for restoration and maintenance efforts. Additionally, the creation of immersive virtual heritage platforms using AR/VR can expand access to heritage tourism for global audiences while reducing the environmental footprint associated with mass tourism.

Ultimately, the sustainable development of tourism centered on Southern Vietnamese traditional houses must be viewed as a multi-dimensional approach that balances conservation, community engagement, and economic viability. By implementing effective policies, fostering innovation through technology, and promoting responsible tourism practices, these heritage assets can serve as catalysts for long-term cultural sustainability and economic resilience. Through a well-coordinated strategy that bridges tradition and modernity, Southern Vietnamese traditional houses can continue to thrive as symbols of national identity while driving sustainable tourism growth in the contemporary era.

# DIFFERENTIAL ANALYSIS FRAMEWORK PROPOSAL OF INDIVIDUALS TELLING THE TRUTH AND LYING IN THEIR MOTHER TONGUE AND IN A FOREIGN LANGUAGE

**Vigier Maxime**[1*]

[1]Ho Chi Minh City University of Economics and Finance.
* Corresponding: vigierm@uef.edu.vn

**ABSTRACT**

In an endeavor to deepen insights on misinformation detection, this study presents a framework for multilingual cognitive states analysis. Ultimately, we would want to create a machine learning system that would have the potential to improve current deception detection technologies.

We will analyze time reaction, verbal and facial cues of individuals telling the truth and lying both in their native language and in a foreign language. It is believed that the « cognitive load » when speaking a foreign language is heavier than in a native tongue. Cognitive load is a construct rooted in the understanding that human working memory (WM) has limited processing capacity, which plays a pivotal role in tasks requiring memory storage, information processing, and attention. (Baddeley & Hitch 1974). Speaking a foreign language requires retrieving words directly from one's memory or adding an extra translation step while at the same time tailoring the content of the message. We will distinguish pre-verbal preparation of the content of a message and then verbalization. The analysis involved a "within-subjects" studies of four individuals in their native language, Vietnamese, and in a foreign language, English.

*Key words*: "misinformation", "deception detection", "verbal cues", "nonverbal cues", "automated methods"

## I. INTRODUCTION

### 1.1 Background of the study

Lying is a technique enabled by speech (Bloch, 2008) that entails, according to the predominant view in the philosophical literature, a believed-false proposition (Zuckerman et al., 1981; Reins, 2021). The mechanism is that a speaker A asserts to a listener B that proposition *p* is true, knowing that p is false (Feehan and Chisholm 1977, Stokke, 2018; Viebahn, 2019). Studying how people tell lies is called « deception detection ». It refers to the investigative methods used to assess a person's sincerity and trustworthiness taking into account behavioral and physiological indicators as well as wider contextual and situational data (Ekman, 2021). However, since the creation of the first polygraph in 1921, deception have failed to identify successful methods of lie detection (Synnott, Dietzel & Ioannou, 2015). And, in 2007, it was still premature to assume that lie detection wizards did exist (Bond Jr and Uysal, 2007). Researchers in the field consider humans to be very bad at lie detecting. We are barely able to pick up lies on the basis of nonverbal cues (Brennen & Magnusen, 2023). In fact, humans are much better liars than they are at detecting lies, despite a hundred years research on the topic (Denault et al., 2022).

One reason is that there is not one typical pattern of deceptive behaviour and that nonverbal and verbal cues to deception are ordinarily faint and unreliable (Vrij, 2000). This makes lie detection a difficult task, as there is no nonverbal or verbal cue that lie detectors can truly rely upon (Vrij, 2011). More recent studies have involved the use of functional Magnetic Resonance Imaging technologies (fMRI). A brain region in the prefrontal cortex has been found to indicate that someone may be lying when there is an elevated blood level in that area. However, even if emotion, mentalizing, and risk-taking during deception elevates blood level in an area cannot logically infer that someone is lying and we can't conclude that deception is taking place (Sip, McGregor, Roepstorff & Frith, 2008). Mere observation of brain activity is not enough to make revert inferences. Differences in response to lies and truth that become evident when calculating the average results of a group do not necessarily show up in each individual. Similar to knowing the average height of children of eight years old can't prove that a child who is exactly that height is eight years old. Making reverse inferences from physiology to mental states may be erroneous as it could simply indicate that this person is thinking about lying. In the cognitive process of thinking of a lie, deciding whether to lie or not involves the

same brain region. Someone may decide to invent and tell a lie but revert to just telling the truth. The is why the use of fMRI cannot be an ultimate indicator of deception. Ultimately, the best general advice from the psychological literature on verbal lie detection remains simply that a person is lying if we can identify that what they say is inconsistent either with other things that they have said or with other evidence (Brennen & Magnussen, 2022). Besides, even if a brain region for lies has been identified, no clear brain region is associated with truth telling. So, the use of fMRI still cannot prove or disprove that someone is lying (Vrij, 2011). Ultimately, what this shows is that deception detection studies on large groups of people to gather large amounts of data in order to each group averages have not been conclusive but on the other hand, "within-subjects" studies may seem to be the way (Vrij, 2016). There is a consensus that there exists no unique lie response, and therefore evaluating whether a response is truthful or not always requires its comparison to an appropriate "baseline" (Meijer et al., 2016). In this experiment, the baseline would be telling the truth in Vietnamese.

It is pointed out that the best indicator for deception is that a liar has more difficulties giving details than someone who is telling the truth. Detecting deception still evolves mostly on identifying inconsistencies and contradictions. To differentiate truth tellers from liars, interviewees are encouraged to provide more information. The richer an account is perceived to be in detail, the more likely it is to be believed (Bell & Loftus, 1989; Johnson, 2006; Johnson, Foley, Suengas, & Raye, 1988).

### 1.2 Research Questions and objectives

We will assess the differences in verbal and non-verbal cues when telling the truth and lying. Here's the cross-table that offers the basis of our study.

| | Native Language | Foreign Language |
|---|---|---|
| Telling the truth | Telling the truth in a native language | Telling the truth in a foreign language |
| Telling a lie | Telling a lie in a native language | Telling a lie in a foreign language |

**Fig. 1 The four "psycho-linguistic" categories of analysis**

However, one important aspect of deception, namely « guilt knowledge », is not included as part of the procedure of the experiment because the participants were specifically asked to lie. In deception, the intention to deceive is crucial. (Sip, McGregor, Roepstorff & Frith, 2008). A specific test, the Guilty Knowledge Test (GKT), a psychophysiological questioning technique which purports to assess whether suspects conceal « guilty knowledge », will thus not be used in this study. In this present study, the intention does not come from the liar, because if someone is *instructed to lie*, they know that they are not deceiving anyone. Besides, as "within-subjects" studies are found to be more fruitful, we have decided to do an in-depth within-subjects study of only four willing participants, but who have decided to remain anonymous. A total of 6 respondents have up to now participated, but only 4 out of the 6 responded seriously enough in order to gather valid data.

#### Response Times (RT)

The cognitive approach to deception holds that lying is cognitively more challenging than truth telling. (Suchotzki, Verschuere, Bockstaele& Crombez, 2017). We believe that it takes more time for someone to think of a lie and to create a lie than to tell the truth.

#### Cognitive Load

Not only creating a lie in one's mother tongue may take more time than telling the truth, but also, in a foreign language, there is an extra cognitive load (Adler, 2024), so we believe response times to increase when lying in a foreign language.

## II. MATERIAL AND METHODOLOGY

The research is based on video-taped interviews in which participants answer a questionnaire of ten questions. Each question is repeated four times to have a comparable base of study. Respondents will reply by telling the truth then by telling lies in their native language, and in the foreign language. All questions are personal and are « easy » questions that are not aimed at making the respondents feel challenged and more comfortable. American Security investigators are instructed to observe the interviewees' normal mode of behaviour (baseline behaviour) when asking non - threatening background questions (Frank, Yarbrough, & Ekman, 2006)

**Questionnaire**

| | Question | Nature of the information | Nature of the lie |
|---|---|---|---|
| 1 | What's your name ? | « Identity truth » | Everything except my name |
| 2 | How old are you ? | « Identity truth » | Everything except my age |
| 3 | Where do you come from ? Where were you born ? | « Identity truth » | Everything except the place I was born |
| 4 | How many brothers and sisters do you have ? | « Identity truth » | Everything except the exact number of brothers and sisters the respondant has |
| 5 | What do you like doing in your free time ? | Interest truth – hobbies and interests may evolve over time, this is a « more complex truth » | |
| 6 | What did you do yesterday ? | The protagonist/informant needs to dig a bit in their short-term memory. | The protagonist/informant needs to dig a bit in their short-term memory but also to create a lie different from what the respondant can recall from their short-term memory |
| 7 | What is it ? (show a pen or any tangible object) | The identification of the nature of an object | |
| 8 | Can you swim ? | Yes/No question about personal skills | |
| 9 | Can you fly ? | Yes/No question about personal skills | |
| 10a | So, what can you do then ? So what else can you do ? | Open question about personal skills | |
| 10b | What are you going to do tomorrow ? | Telling the truth about an intention, a specific kind of lie | Lying about an intention or « future lie » may be corrected or confirmed when the intention is executed or not |

**Fig. 2 The ten questions of the questionnaire**

We suggest a categorization of these different kinds of deceptive information. Questions 1-4 and 7 involve an « everything except » kind of lie. Question 5 depends on a « volatile truth ». Consequently, it would imply a « volatile lie ». Question 6 could be considered as a memory lie for which the truth could be fragile. Questions 8 and 9 revolve around « yes/no truths » and consequently « yes/no lies ». Considering Ekman's terminology of lies (1991), the lies we are studying here correspond all to his broad category of « fabrications ». We may suggest that fabricated lies go through a 3-phase cognitive paradigm namely 1) identification of the actual truth, 2) inhibition of that truth, 3) fabrication of the lie.

While our questionnaire and the setting of the experiment does not imply the intention to deceive, it might still be more "natural" than using a "misstatement statement paradigm" (Zhang, 2020) where participants were instructed by the screen to make a correct or a false statement about an animal and its color presented in the material.

## III. RESULTS AND DISCUSSION

### 3.1 Verbal cues

The table below presents the verbal responses of participant 4. We will not give names to keep the participants anonymous.

| | **Tiếng Việt Sư Thật – truth** | **TV nói dối** | **English truth** | **English lie** | |
|---|---|---|---|---|---|
| 1 | Tên em là Tuyệt. | Em tên Hân. | My name is Kim Tuyen. | My name is Nhu. | Different lie |
| 2 | Em 18 tuổi. | Em 21 tuổi. | I'm 18 years old. | I'm 21 years old. | Same lie |
| 3 | Em sinh ra o Long An | Em sinh ra ơ Binh Chanh. | In Long An | I'm born in HCMC. | Different lie |
| 4 | Có, 1 chị | Em không có anh chị em. | I have only 1 sister | I don't have any sister. | Same lie |

| | | | | | |
|---|---|---|---|---|---|
| 5 | Em đi ngũ. | Em thích đọc sách. | I just sleep. | I do homework and I read book. | 50% same lie |
| 6 | Em chỉ là ngũ và học bài. | Ah, hôm qua em đa giúp mẹ làm từ thiện. | I do a lot of homework and sleep. | I just don't do nothing. | Different lie |
| 7 | Cài bút dỏ. | Cài này là một cài bút màu xanh. | This is a red pen. | Uh, I think this is a blue pen. | Same « identity adjective lie » |
| 8 | Em biệt bơi một chút. | Em không biệt bơi. | Yes, I swim a little. | No, I don't know. | Same lie |
| 9 | Không, em không biệt bay. | Em biệt bay. | No, I don't. I can't fly. | Yes, I fly like an airplane. | Same but Exagerated lie |
| 10 | Em chỉ biệt bơi một chút, và chơi cầu lông. | Em không biệt làm gà nựa. | I can do some badminton and some sport. | I can not do nothing. | Same lie |

**Fig. 3 The verbal responses of participant 4**

An interesting verbal output of this experiment comes with the choice of the lie. As the respondant was asked to repeat lying at the same question, and also knowing that the choice of the lie was open, it was interesting to find out that for 7 out of 10 times, the lie was repeated. Out of the four participants of the study, one participant created new lies each time (10 times out of 10), but the three others mostly kept the same lies. The explanation may simply rely on the fact that it's easier to repeat the same lie rather that coming up with a new fabricated lie. In this exercise, we may identify a glimpse of what could be done in a subsequent experiment to study the « journey of lies » and Interpersonal Deception theory because the present exercise does not involve a conversation but a setlist of questions.

### 3.2 Response Times

The original hypothesis about Response Times (RT) was that telling the truth was easier than lying, and that lying in a foreign language would be the hardest. So, we were expecting that Time Responses would gradually increase from questionnaire A (telling the truth in Vietnamese) to questionnaire D (Lying in English).

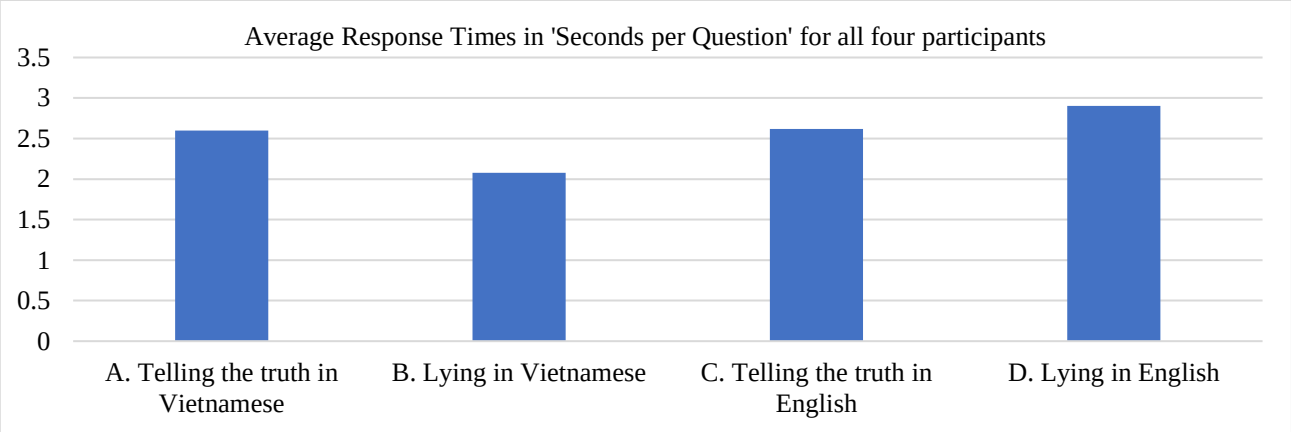

**Fig. 4 The average response times in seconds per question for each of the four questionnaires**

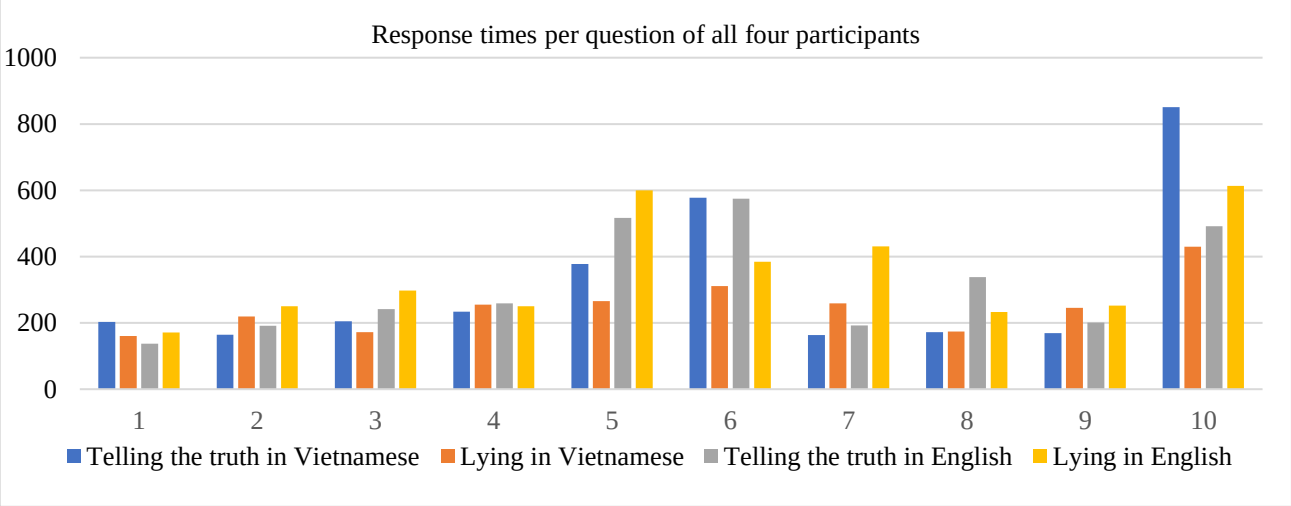

**Fig. 5 Response times per question for each of the four questionnaires**

The graph in figure 4 contradicts our first prediction. The average response time of telling the truth in Vietnamese

was longer than telling the truth. This result corroborates the fact that truth-tellers give more details (Bell & Loftus, 1989; Johnson, 2006; Johnson, Foley, Suengas, & Raye, 1988) which consequently takes more time to do than answering without giving details. In fact, the previous experiments that found out that lying implied longer response times related to what we may refer to as "mechanical truths/lies". One experiment (Sheridan, 2010) involved replying by lying or by telling the truth about whether a number was larger or smaller than another one. Mechanically, it took longer to identify the truth, and then to reply by the opposite because it involved an extra cognitive step. In our present experiment, the questions were personal and the respondants made more effort in trying to be more precise when telling the truth, whereas when they were told to lie, they merely fabricated a lie different from the truth.

More remarkarble findings are identified when comparing response times for each questions. For example, the respondents had to remember what they did the day before (question 6), or what they truly intended to do the next day (question 10). The search for the truth took much longer than the make-up of a « random lie », a lie that bears no consequences which may be a shortcoming of the experiment, which is that the participant could make up any lie which, instead of a « real lie » could only be considered as a "non-truth". We may also consider the emotional resonance when someone speaks their first language (Caldwell-Harris, Ayçiçeği-Dinn, 2009) which in contrast, implies an emotional distance when speaking a foreign language. From this perspective, the participants could have feel more "emotionally detached" when lying in a foreign language. Consequenlty, lying may become easier in a foreign language. This has been confirmed in experiments (Suchotzki, Gamer, 2018) that revealed smaller response time differences between lying and truth telling in the foreign language compared to response time differences in lying and truth telling in a native language. An experiment that involved Turkish university students who had learned English as a foreign language found reduced skin conductance responses (SCRs) when listening to emotional phrases in English compared to Turkish, their native language (Caldwell-Harris, Ayçiçeği-Dinn, 2009). Interviews, surveys, and studies of autobiographical memory indicate that bilingual speakers experience reduced emotion when speaking their second language (Altarriba and Santiago-Rivera, 1994, Bond and Lai, 1986, Dewaele, 2004, Dewaele, 2008, Gonzalez-Reigosa, 1976, Marian and Kaushanskaya, 2004, Pavlenko, 1998, Pavlenko, 2002, Pavlenko, 2005, Schrauf, 2000, Schrauf and Rubin, 1998).

Figures 4 and 5 present the combined statistics of all four participants, but as pointed by (Vrij, 2016), lying is idiosyncratic. This means that deception detection can only be validated by within-subject studies. In fact, we see strong variations of time differences between participants.

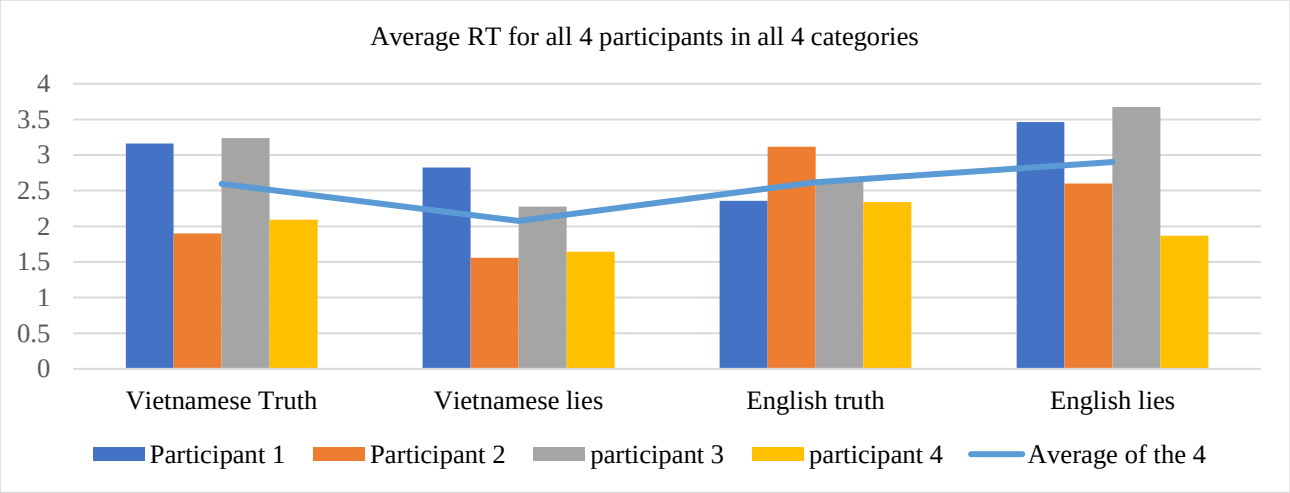

**Fig. 6: Average response times in 'seconds per question' of each participants for each of the 4 questionnaires**

Figure 6 presents the average reponse time per question for all questions per participant and per questionnaire. Participants 1 and 3 were the slowest at replying in Vietnamese, and in lying in English. Participant 2 differs from participant 3 mainly for being slower at telling the truth in Enligsh. We may wonder what the reason could be. One pattern emerges for participant 4 which is that this participant was the fastest at replying for each of the different questionnaire. This is one idiosyncratic, or "within-subject" element that we will want to identify, which is the average RT in general, for all questionnaires, and all languages.

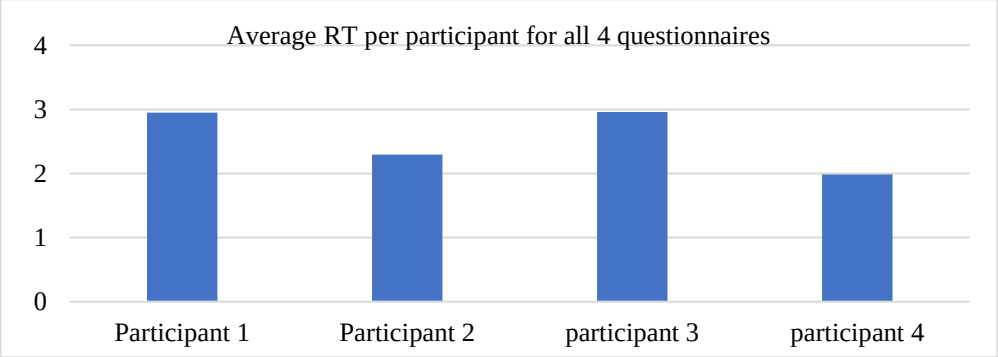

**Fig. 7 Average response times in seconds per question of each participant and for all questionnaires**

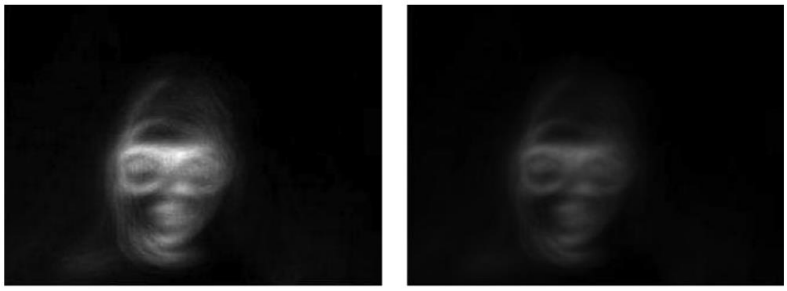
Figure 7 shows that participant 4 is, in general, the quickest to answer to questions presents the average reponse time per question for all questions per participant and per questionnaire. Participants 1 and 3 have the same average of response times.

### 3.2 Nonverbal cues

Kress and van Leeuwen (2006) prove that the image not only has lexis like language but also the has grammar as in the following: "Just as grammars of language describe how words combine in clauses, sentences and texts, so our visual 'grammar' will describe the way in which depicted elements –people, places and things- combine in visual 'statements' of greater or lesser complexity and extension." (Kress and van Leeuwen, 2006: p. 1) In the process of studying deception, we are also studying cognitive states. In recent years, numerous studies have been published that employ a range of machine learning classifiers and feature extraction techniques (Islam, Saha, Chowdhury, Sorowar and Rab, 2021), a list of visual features is provided in table of Facial Action Units (FAU). They may also be referred to as 'micro expressions' (Ekman, 2009) which are brief, involuntary facial expressions that can reveal when a person is lying or experiencing a negative emotion (. Video analysis distinguishes top and intermediate levels where actions and activities are taking place and at the most primitive level, *movement*, motions easily charaterized by a defiite space-time trajectory (Bobick, 2001)



DESCRIPTION OF VISUAL FEATURES

| *Action Unit(AU)* | *Description* |
|---|---|
| 1 | Inner Brow Raiser |
| 2 | Outer Brow Raiser |
| 4 | Brow Lowerer |
| 5 | Upper Lid Raiser |
| 6 | Cheek Raiser |
| 7 | Lid Tightener |
| 9 | Nose Wrinkler |
| 10 | Upper Lip Raiser |
| 11 | Nasolabial Deepener |
| 12 | Lip Corner Puller |
| 13 | Cheek Puffer |
| 14 | Dimpler |
| 15 | Lip Corner Depressor |
| 16 | Lower Lip Depressor |
| 17 | Chin Raiser |
| 18 | Lip Puckerer |
| 20 | Lip stretcher |
| 22 | Lip Funneler |
| 23 | Lip Tightener |
| 24 | Lip Pressor |
| 25 | Lips par |
| 26 | Jaw Drop |
| 27 | Mouth Stretch |
| 28 | Lip Suck |
| 41 | Lid droop |
| 42 | Slit |
| 44 | Squint |
| 45 | Blink |

**Fig. 8 List of identified micro-expressions and visual features**

Coded Behaviors with Interrater Agreement Scores between two coders (Pearson Correlations) will be identified (Mann, Vrij, Bull, 2004). They are gaze aversion (in number of seconds in which the participant looked away from the interviewer, smiles (frequency of smiles and laughs), blinking, head nods, head shakes, (each sideways movement may be counted as a separate shake), shrugs (one or both shoulders are briefly raised in an "I don't know" type gesture), self-manipulations, hand and/or finger movements.

To identify « Biomarkers of deceit » and notably in nervousness, an existing tool is called Motion Energy Image could be used. For representing and analyzing human action, the Motion Energy Image (MEI) and the Motion History Image (MHI), can summarize the spatio-temporal content in a single image (Bobick and Davis, 2001). This tool would allow to identify spatio-temporal descriptors, through weighting Motion Energy Images (wMEIs) as to present an archetypal expression of the face when telling a lie and when telling the truth.

(a) (b)

**Fig. 8 Examples of weighting Motion Energy Images with different normalization techniques. Normalization with respect to (a) the maximum accumulated pixel value, and (b) the duration of the video. (Bobick and Davis, 2001)**

More recent technologies such as machine learning offer a more efficient and effective way to obtain the desired outcome but the choice of the technology, commerical or open-source, still has to be done. In the meantime, we still want to establish a valid theoretical framework. We will first try the framework manually before using machine learning technologies that will be programmed to capture the video sequences automatically. The suggested framework will be composed of 4 video sequences. Step 1 includes the facial features while the respondant is listening to the question. Step 2 refers to the response time and the facial features just after the end of the question of the interviewer and before the beginning of the verbalization of the answer. Step 3 refers to the start of the lie. The first short answer. Step 4 refers to ending the lie. Step 5 is the moment just after when the respondent is silent and during which the facial features are analyzed.

### 3.3 Qualitative results using the framework

The table below shows how the framework was used for participant 2 answering the truth (for question 1) in the native language, which would be considered the participant's « baseline » behavior (Meijer et al., 2016).

| Q1 | Phase 1 | Phase 2 | Phase 3 | Phase 4 | Phase 5 |
|---|---|---|---|---|---|
| Truth in native language | Blinking three times while listening to the question | Heads tilts back while inhaling | Heads recovers straight position | One nod | Another consecutive nod |
| Lie in native language | No blink straight eyes controlled face (doesn't move) | No blink straight eyes controlled face (doesn't move) | One blink | Head tilts back | Head repositions down 1 nod |
| Truth in English | Straight face | Straight face | Heads circles right, up, left | One nod | One long blink |
| Lie in English | Straight face | Looks down | Looks down | Looks back up | Controlled shake |

The next table shows the framework for participant 2 answering the truth of question 5 in the foreign language.

| Phase 1 | Phase 2 | Phase 3 | Phase 4 | Phase 5 |
|---|---|---|---|---|
| Blinking while listening to the question | Looks up, inhales, looks back down | Looks to the right, blinks, tilts the head to the left | Heads moves to the left | Nods again as to confirm the answer |

The next table shows the framework for participant 3 answering question 2 by a lie in the foreign language.

| Phase 1 | Phase 2 | Phase 3 | Phase 4 | Phase 5 |
|---|---|---|---|---|
| Controlled smile, looks to the right | Looks up, eyebrows raising | Looks back straight | Controlled nod | Just after telling the lie, the respondant « increased » the smile, and then closed eyes |

The next table shows the framework for participant 4 answering question 10 with a lie in the foreign language.

| Phase 1 | Phase 2 | Phase 3 | Phase 4 | Phase 5 |
|---|---|---|---|---|
| Blinks | Sits up straight | Blinks, looks right | Eyebrows raised | Eyes look straight, haid remains neutral, controlled shaling of the head |

A correlation was found between verbal and non-verbal cues in participant 3's behaviour, as in phase 5 of lying, a definite smile (9 out of 10 times), and a controlled smile (1 out of 10) was displayed. This participant was the one who created new lies for 10 of the 10 questions. On the other hand, Participant 4 did not smile but instead shook his head 9 times of out of 10. This proves that these tests are only valid for within-subjects studies.

## IV. CONCLUSION

To effectively validate the proposed framework, this study would have to be applied to a larger population scale to create a corpus that would allow for data mining. In the meantime, we may use available datasets such as the Real-life trial dataset by Michigan University and/or the Miami University deception detection dataset (Perez-Rosas, 2015, 2022).

### 4.1 Limitations

A procedural shortcoming of this experiement was the lack of « guilt knowledge ». In this manner, this study did not cover the analysis of « complete » but of « partial » lies. One interesting finding, however, was to see that, out of the four participants, one easily created new lies but the others did not. This would be an element of differential psychology to include in any further studies. As « there are large individual differences in people's behaviour, speech, and physiological responses (DePaulo & Friedman, 1998). A hypothesis is that an archetypal expression of deception, or of truth, can not be universal, but may only be identified individually similarly to how fingerprints or DNA are. This « within-subject » notion has to be taken seriously. Some people typically make many movements, while others do not; some people are eloquent, others are not; some people show large variations in physio-logical responses, others do not. Therefore, a simple decision rule such as 'He makes many movements, so he must be lying' or 'He does not say much, so he must be lying' will not work.

### 4.2 Further studies

This study may have paved the way to what could be called « honesty studies ». In the field of deception studies, a special focus on honesty is missing in the field (Vrij, 2008). Truth tellers can be detected from liars when encouraged to provide more information. If truth tellers provide more information, they are more likely to be believed, because the richer an account is perceived to be in detail, the more likely it is to be believed (Bell & Loftus, 1989; Johnson, 2006; Johnson, Foley, Suengas, & Raye, 1988). Besides, the questions we tackled may not only apply to how telling a lie in a familiar language differs from lying in a foreign language, but could also be expanded to an international study that could analyze cultural differences in telling lies. More further studies would involve Interpersonal Deception for which the deception occurs during a conversation (Nyroos, 2023) for which we would analyze the « journey » of a lie in which an individual who tells « lie A » and then « lie B » must have to « validate » and « not contradict » lie A. The protagonists, moreover, will be more or less inclined to believe each other. We would have to dig more into Interpersonal Deception theory (Buller, 1994) in which deceivers make choices depending on the type and amount of information to deliver, the actions appropriate to the context and the necessary behavior to build credibility (Buller, 1994). Conversation flow analysis may be an opportunity given by emerging technologies. Artificial intelligence (AI)

may enhance lie detection systems (Oravec, 2022) and are generating significant enthusiasm regarding their potential in this field, especially on its latest development in deep learning and machine learning.

# LIABILITY FOR NON-CONTRACTUAL DAMAGES IN THE AGE OF ARTIFICIAL INTELLIGENCE

**Lam To Trang[1*], Ha Le Thuy[2]**

[1] Head of Department of Civil Law, Faculty of Law, Ho Chi Minh City Open University, Vietnam.
[2] Deputy Head of Faculty of Criminal Law, University of Law, Hue University, Vietnam.
*Corresponding: trang.lamt@ou.edu.vn.

**ABSTRACT**

In the digital age, the application of artificial intelligence in production, business and daily life activities is becoming more and more popular. Beside the potential and benefits, artificial intelligence begins to pose challenges to humans in many fields of science and technology. The emergence of artificial intelligence also entails many related legal issues, particularly, the legal aspect of intellectual property, labor, non-contractual compensation for damages or tort law, etc. Promoting the application of artificial intelligence in human life raises the need to protect people from the challenges of science and technology, especially when the law is showing signs of slowing down compared to the current remarkable progress of science and technology. The article focuses on liability for non-contractual damages caused by artificial intelligence and determining the subject status of artificial intelligence, from there, propose the recommendations in order to improve the current Vietnamese legal system.

*Keywords:* artificial intelligence, damages, subject, tort law.

## I. INTRODUCTION

The Fourth Industrial Revolution is also known as the digital age with the strong development of digital technology, artificial intelligence and other new technologies. Artificial intelligence (hereinafter referred to as AI) is mentioned as one of the outstanding achievements that brings many opportunities for change to society and the global economy (Thiên Kim, 2024). Research and development of AI has become a global trend, in which the US and China are the two countries leading in investing in this technology, followed by the UK and Israel. Accordingly, investment in development and research has produced typical AI products such as: GPT-4 (US), AI Ernie (China) (Phan Văn Hoà, 2024)...

With the continuous progress of science and technology today, AI is developing rapidly, being applied in all fields from culture to the world economy, occupying an important position in the digital age (Kinh tế số, 2023). In the medical field, AI is widely applied to improve professional qualifications and work efficiency such as supporting disease diagnosis, medical imaging diagnosis, assisting surgeons, collecting, storing and managing medical records (Sở Y tế TP. HCM, 2020). For education, AI is applied to research, developing computer software, automating and performing administrative activities to improve teaching and learning (Đinh Thị Mỹ Hạnh & Trần Văn Hưng, 2021). The advent of AI has helped commercial banks and businesses detect fraud, forecast market trends and make smart investment decisions; analyze customer data, manage credit risks. Thanks to that, credit institutions can improve customer experience, increase operational efficiency and reduce costs (Võ Lê Phương Khách & Trương Quang Vinh, 2023).

In Vietnam, since 2014, artificial intelligence has been is included in the list of high technologies prioritized for investment and development. The Vietnamese government identifies this as one of the technologies breakthrough, the spearhead of the Fourth Industrial Revolution. In early 2021, the Prime Minister issued the National Strategy on research, development and application of artificial intelligence by 2030 in Decision nº 127/QD-TTg dated January 26, 2021. In Vietnam, AI has many positive impacts, improving control efficiency in exit and entry management. AI collects, analyzes and processes big data, builds a database system that ensures scientific and accurate nature, helping authorities conveniently manage and improve the efficiency of exit and entry procedures (Nguyễn Mạnh Hùng, 2023). In addition, AI is also applied in a number of other fields such as services, communications, transportation, production and agriculture (Thạch Thị Mỷ Quyên, 2024). Besides, a number of enterprises and corporations have quickly updated the world's artificial intelligence trends and initially had specific products and applied to the production and business process in a number of industries and fields such as finance, banking, information and communication, healthcare,

education, tourism, transportation, e - commerce, restaurant chatbots, etc. Vietnam has important opportunities for research, development and AI applications in the future. As of 2021, Vietnam has strongly developed artificial intelligence technology, up 14 places compared to 2020, becoming the 62nd most developed country in the world and ranked 6th among ASEAN countries in the AI Readiness Index (Khánh Nguyễn, 2022).

In the innovation of science and technology, the use of AI is expected to bring many benefits to society. However, in the process of AI, if the operations of machines, products, services… have errors, it will cause damages, sometimes extremely important, to social life, which is inevitable. In Vietnam, artificial intelligence technology has created audio, image and video technology products that fake real-life objects with very high accuracy. In recent years, the situation of fraud and appropriation of assets in cyberspace has become very complicated, with scammers using messages asking for money transfers, especially using more sophisticated tricks, taking advantage of Deepfake technology to fake video calls in order to appropriate assets and cause damage to victims (Văn Phong, 2025). However, this article only focuses on liability for non-contractual damages caused by artificial intelligence from the perspective of civil law, especially determining the subject status of artificial intelligence, from there, propose the recommendations in order to improve the current Vietnamese legal system.

## II. MATERIAL AND METHOD

A descriptive statutory approach through legal research is the first method applied in this article. In addition, the analysis of regulations related to liability for non-contractual damages caused by artificial intelligence is also used in this study. Moreover, a comparative method is adopted throughout this article in order to compare the provisions of European and Vietnamese legal systems related to the determination of subject of artificial intelligence. Therefore, the article proposes the recommendations related to liability for non-contractual damages caused by artificial intelligence in Vietnam.

The three main sources of law used for description, analysis and comparison are as follows.

*Firstly*, the Artificial Intelligence Act of the European Union was published in the Official Journal of the European Union and entered into force on August 1, 2024.

*Secondly*, the Civil Code in Vietnam was promulgated by Law no 91/2015/QH13 of 24 November 2015 and entered into force on January 1, 2017.

*Thirdly*, the current Draft Law on Digital Technology Industry in Vietnam.

## III. RESULT AND DISCUSSION

### 3.1. Conception of liability for non-contractual damages caused by artificial intelligence

Artificial intelligence is a branch of computer science that deals with the automation of intelligent behavior. Alan Turing's 1950 work Computing Machinery and Intelligence raised the question of whether machines could think, conducted a study known as the "*Turing test*" to determine whether machines had intelligence and thus introduced the concept of machine thinking. In 1956, John McCarthy introduced the term "*artificial intelligence*" into a scientific conception at the Dartmouth conference, marking the birth of this term (Lev Craig, Nicole Laskowski, Linda Tucci, 2024). Currently, the term artificial intelligence is becoming more and more popular thanks to the development of intelligent technology and its usefulness when applied to many different fields. Through research on artificial intelligence, there has not yet been an official, non-standard conception to define AI.

The conception of AI is presented by many authors according to their personal views, showing different perspectives on the nature and purpose of applying AI in many fields. Among them, two authors, Stuart Russel and Peter Norvig, in the famous book "Artificial Intelligence: A modern approach" have many definitions of AI. For exemple, artificial intelligence is the actions of machines associated with human thinking, such as decision making or problem solving; artificial intelligence is the art of creating machines that can perform functions that require intelligence when performed by humans (Trần Minh Tâm, 2019). In another research article in Vietnam, Nguyen Manh Hung also gave the view on AI as a system of machines or application software programs created by humans that can automatically perform intelligent behaviors such as the ability to behave, communicate with humans, can learn and intelligently adapt to many situations (Nguyễn Mạnh Hùng, 2023).

From the above analysis, it can be understood that AI is basically a machine or computer system created by humans and programmed to have logical thinking in order to perform and handle problems similar to humans. In addition, AI's ability to learn and provide optimal solutions is also very important for unexpected situations (Yurii Khodyko, 2024).

Artificial intelligence has been widely applied, so it is inevitable that new challenges will arise for society in many aspects. In particular, in the legal field, the existence of AI has affected many aspects, such as labor, intellectual property, compensation for damages, etc. According to the article 13 of the 2015 Civil Code in Vietnam, compensation for damages is the act of compensating all damages of the party that infringes civil rights to the party whose rights are infringed. From there, it can be understood that compensation for damages is a form of civil liability in which the party causing the damage must be responsible for their illegal acts. Evidence of the responsibility to compensate for damages is the remedy of consequences, through compensation for material or spiritual losses. In Vietnam, compensation for damages is stipulated in the articles 360 and 584 of the 2015 Civil Code in two types, including liability for damages due to breach of contract and liability for damages outside of contract. Compensation for non-contractual damages in the era of artificial intelligence is understood as a type of legal liability, applied when all conditions prescribed by law are met, accordingly, forcing the subject causing damage to compensate for material and spiritual losses caused by artificial intelligence, where that act is an illegal act that infringes upon the life, health, honor, dignity, reputation, property, rights and legitimate interests of another subject.

### 3.2. Meaning of liability for non-contractual damages caused by artificial intelligence

According to the articles 584 and 585 of the 2015 Vietnamese Civil Code, compensation for damages is a form of civil liability that forces the party causing damage to remedy the consequences by compensating for material and spiritual losses to the injured party. Compensation for damages in general and compensation for damages in the era of artificial intelligence in particular have many meanings as analyzed below.

*Firstly*, the liability for damages in the era of artificial intelligence aims to restore the original state. The application and implementation of the liability for damages aims to restore the rights and interests of the injured party that have been violated. However, this restoration is only relative, in some cases, the injured party has had the damage remedied but still cannot return to the original state.

In particular, smart cars are a testament to the incompleteness of the law in this area. When a driverless car causes an accident to a pedestrian, for example leading to death, the responsibility lies with its creator or with the car user. In this case, although the total material and spiritual loss has been compensated, the fatal damage cannot be restored to its original state. The same question is also raised in the medical field, with surgical robots or with AI systems used to detect diseases (Lê Thiên Hương, 2021). In the case of applying AI to surgery but encountering an unexpected incident that causes damage to health or violates life, no matter how large the compensation is, it cannot replace the original health condition or, more dangerously, cannot replace the human life caused by AI. Therefore, in the above cases, compensation for damages is only aimed at restoring the original state, not completely restoring it to the state before the damage occurred. Another example is that recently, a software error by security firm CrowdStrike caused many computers using Microsoft operating systems to freeze, thereby causing more than 5,000 flights to be canceled and affecting a series of industries, from retail, transportation to hospitals. CrowdStrike's security software update caused this system error, causing many businesses to lose revenue, workers to waste time and reduce labor productivity. Even some airlines such as Delta Airlines have had to cancel hundreds of flights to date because they have not recovered (Băng Băng, 2024). Thus, although security firm CrowdStrike has fixed this error, the damage that Delta Airlines has suffered still cannot be restored to its original state.

*Secondly*, the responsibility for compensation for damages in the era of artificial intelligence aims to propagate and educate the awareness of law compliance, while respecting the rights and legitimate interests of other subjects. The application of the responsibility for compensation for damages, in addition to the purpose of restoring the rights and legitimate interests of infringed subjects, also aims to educate the awareness of law compliance, respecting the rights and legitimate interests of other subjects. Moreover, any subject that commits an illegal act that causes damage to others is responsible for compensation. Therefore, the provisions related to the responsibility for compensation for damages will make the subjects in civil relations think carefully about the possible consequences before acting to choose a

behavior in accordance with the provisions of law.

*Finally*, the responsibility to compensate for damages in the era of artificial intelligence also has the meaning of protecting the life, health, honor, dignity, reputation, property, rights and legitimate interests of the victim, which is clearly demonstrated through the economic impact that forces the person responsible for compensating for damages to compensate the victim. The responsibility to compensate for damages in the era of artificial intelligence helps restore the rights and legitimate interests of the victim in order to restore balance in social life.

In Vietnam, the 2015 Civil Code has provided regulations on liability for compensation for damages in order to protect the legitimate rights and interests of other entities. This is a solid legal basis for competent authorities to quickly and accurately resolve disputes related to liability for compensation for damages, thereby ensuring the principle that damages caused must be compensated in full and timely which lawmakers aimed for when drafting the article 585 of the current Civil Code.

In short, compensation for damages in the era of artificial intelligence is extremely important for civil relations between subjects in society through protecting the legitimate rights and interests of people whose lives, health, honor, dignity, reputation, property and other legitimate rights and interests of others are violated; ensuring the fairness of the law, increasing deterrence for subjects to comply with legal regulations correctly and fully. Thereby, the implemention of the provisions of civil law in general and the provisions of other legal documents in particular are increasingly more serious and responsible.

**3.3. Determining the subject of liability for non-contractual damages caused by artificial intelligence**

In Vietnam, the 2015 Civil Code stipulates a separate regime for the subject responsible for compensation for damages when damage occurs, which can be an individual or a legal entity (Thúy Hiền, 2022). According to article 13 of the 2015 Vietnamese Civil Code, individuals and legal entities whose civil rights are violated are entitled to full compensation for damages. However, the provisions on the subject of compensation for damages are only general and are mainly mentioned in a few areas. In addition, when being drafted, the 2015 Civil Code did not foresee the case where products in social life using AI technology infringe upon the life, health, honor, dignity, reputation, property, rights and other legitimate interests of civil law subjects. In particular, in the context of applying high-level technology and science to social life, to perform the function of compensation for non-contractual damages, the injured party must request compensation for damages and that request must be accepted by the Court, the injured party must identify the person causing the damage, then file a lawsuit, moreover, have to prove that the person causing the damage caused the loss. Therefore, the cost is quite large while it is not always possible to prosecute the person responsible for compensation for damages even if a lawsuit is filed in the Court. In addition, in cases where many people commit acts causing damage, filing a lawsuit is not simple and even if a lawsuit is filed, establishing evidence to prove the causal relationship between the harmful act and the loss is not easy.

Nowadays, even though it is called an AI product, the program unit (pre-programmed) is not considered an independent physical entity. In most cases, AI is understood as a robot equipped with artificial intelligence or in other words, robot = artificial Intelligence + machine science. With that reasoning, it is said that an AI program itself cannot be discussed as responsible for its negative impact on society and artificial intelligence only when combined with machine science with an appearance like a robot can be discussed as responsible for compensation for damages (Nguyễn Thị Phương Châm, 2024).

Self-driving cars use AI, in case of a traffic accident due to AI operations being mistaken during the process of collecting self-learning and self-operating data, the question is who is responsible for compensating for the damage. Even when AI operations are mistaken, there are many situations that lead to damage to both businesses in general and individuals in particular. AI makes mistakes in judging traffic conditions due to errors in data collection (big data), along with that judgment leading to wrong behavior and causing accidents. In other situations, AI recognizes that the situation is beyond its control and returns control to the driver, but the driver is not paying attention, leading to an accident...

The next situation is that an exceptional traffic situation arises that is not foreseen in the programming and design of AI, leading to the inability to judge, handle and cause accidents. In many cases, such as self-driving cars, satellites

are used to take pictures or transport goods, but due to incorrect judgment, the satellite AI causes damage to people and property (Phóng viên, 2021)... In addition, a pharmaceutical or medical device manufacturing company signs a purchase contract with a robot design and manufacturing company. Then, the robot manufacturing company signs a contract with an AI manufacturing company, designing the AI program to install on the robot. During use, the AI makes a manufacturing error that creates pharmaceuticals or medical devices that cause damage to the health and property of consumers (Sở Y tế TP. HCM, 2019)... Furthermore, in the case of businesses using AI to collect data, analyze data and then give advice to investors in stocks, real estate…, in the case of AI making an error, giving unsatisfactory advice, causing damage to investors (Thảo Vân, 2024). Finally, nursing homes use robots to act as nurses to take care of the elderly such as feeding and giving injections. In cases where robots misjudge the elderly's injection status or at the wrong time or overdose, leading to death, etc (Phương Vũ, 2020).

Compensation for non-contractual damages in the era of artificial intelligence is an issue related to a third party that is not a party to the contract such as the relationship between the AI designer and the AI machine manufacturer or the relationship between the seller of AI-based products and the buyer of the product when one or more parties in the contractual relationship violate the obligations arising from the agreement of the parties. Therefore, all issues arising in the relationship of compensation for non-contractual damages are not foreseen by the parties and resolved in the terms related to the contract. For these cases, there must be direct provisions of the governing law. In addition, when being formulated, Vietnamese law has not foreseen the case of products in social life using AI technology that infringe upon the property, life, health and other legitimate rights and interests of civil law subjects, so it is not yet certain whether the application of current regulations is completely appropriate and brings positive value.

First of all, from the above situations, it can be seen that the legal relationship on compensation for non-contractual damages in cases of applying AI technology becomes very complicated due to the participation of many subjects. *Firstly*, the enterprise providing data and programs; the enterprise designing artificial intelligence. *Secondly*, the enterprise manufacturing products using artificial intelligence or the enterprise providing services using artificial intelligence. *Thirdly*, the user of machines and services with artificial intelligence design. Fourthly, the injured party, the person receiving damage and loss or the third party through the use of machines and services with artificial intelligence design by others. According to Ms. Le Thi Van Anh, Deputy Director of the Department of Criminal and Administrative Law, Ministry of Justice, there are four related subjects related to AI, including (i) the subjects that create AI, the programmers and authors who design the software, (ii) the owners of AI, the manufacturers and investors, (iii) the users, the people who put AI into operation, monitor the operation process and finally (iv) the AI entity itself (Đỗ Mến, 2024).

While advances in AI technology have had a positive impact on human life, there are still risks and accidents caused by robot errors. This reminds us that AI technology still has many limitations. In 1981, a robot killed a worker at the Kenji Urada motorcycle factory in Japan because it mistook him for a danger (Larry Alton, 2017). In 2015, a 22-year-old engineer working at a Volkswagen factory in Germany was in the process of finishing parts for a robot when he was lifted up by the robot and thrown against metal plates, resulting in his death due to serious injuries (Mỹ Loan, 2015). Also in 2015, a worker named Ramji Lal was killed at the Haryana Manesar factory in India when he approached the robot from behind (Nguyễn Thị Thu Vân, 2023). While adjusting a metal plate, he was pierced by the robot's welding rods (Trung Nguyễn, 2017). On March 18, 2018, the first fatal accident involving a self-driving car occurred when Elaine Herzberg was hit by an Uber self-driving car while crossing the street (Bảo Duy, 2018). In April 2021, another accident killed two people while driving a Tesla Model S self-driving car (Bằng Hưng, 2024). From the above damages, it can be seen that although AI technology brings many benefits to human life, it also poses unforeseen risks. Accidents caused by robots and self-driving cars not only raise questions about the safety of the technology but also emphasize the need to improve and perfect these systems. This affirms the urgent need to research, develop and apply safety solutions to protect people, while ensuring that AI technology is deployed effectively and reliably in the future.

The Artificial Intelligence Act of the European Union (hereinafter referred to as AIA) is considered the world's first legal framework on AI until now. AIA was adopted with the aim of protecting fundamental rights, democracy, the rule of law, promoting innovation and making Europe a leading region in the field of AI (Hùng Tuấn, 2024). AIA

provides regulations and guidelines on some AI applications that threaten citizens' rights and will be prohibited in order to protect their rights and minimize the risk of AI systems causing unintended consequences for people and society. At the same time, AIA also helps shape a common standard on AI, ensuring unity and integration in the management and development of AI technology in the EU region. Although the AIA of the European Union does not have specific provisions on compensation for damages caused by the behavior of AI systems, if manufacturers, suppliers and user importers violate AIA regulations, they are obliged to pay a fine depending on the severity of the violation (Matt Kosinski & Mark Scapicchio, 2024). Similar to the AIA of the European, Russian law is very cautious in granting legal status to AI, because regardless of the robot's autonomy, the country imposes all responsibility on the developer, operator or manufacturer of the robot. Accordingly, the Robot Agent acts as a party to legal relations and the owner will be liable for damage caused by activities that create an increased danger to the community, regardless of the fault (Đặng Lê Phương Uyên, 2023).

In Vietnam, in the liability for compensation for non-contractual damages, according to the clause 3 of the article 584 of the 2015 Civil Code, if property is the subject causing damage, the owner of this property or the possessor of the property must be responsible for compensation for damages, except in cases of force majeure, due to the fault of the damaged party or in cases where there is another agreement or the law provides otherwise. It can be seen that property here, according to the article 105 of the 2015 Civil Code, is objects, money, valuable papers and property rights. Therefore, in this case, is artificial intelligence considered as property or not, if AI is considered as property, who will compensate for the damage caused by AI? (Đỗ Giang Nam, Đào Trọng Khôi, 2022). The current Vietnamese civil law still does not have any specific regulations recognizing the legal subject to be responsible for compensation for damages or not.

According to the Draft Law on Digital Technology Industry in Vietnam, the bill dedicates a chapter to regulate AI with the orientation that this is one of the most core digital technologies. The bill also dedicates a section on digital assets. Pursuant to the clause 1 of the article 10 of the Draft Law on Digital Technology Industry, digital assets are digital technology products created, issued, transferred and authenticated by blockchain technology, with value and property rights according to the provisions of civil law and relevant laws. In addition, the regime of compensation for non-contractual damages is stipulated in the clause 3 of the article 584 of the 2015 Civil Code, accordingly, in case property causes damage, the owner or possessor of the property must be responsible for compensating for the damage. Thus, if considered as a type of property (Nguyễn Mỹ Linh, 2024), when AI causes damage to the life, health, honor, reputation, dignity, property, rights and legitimate interests of others, the subject responsible for compensating for the damage belongs to the owner or possessor of the AI.

## IV. CONCLUSION

With the rapid development of scientific and technological advances, a society where humans and AI entities that are no different from humans live together is no longer a fantasy. At that time, many regulations will no longer be appropriate, current standards of legal responsibility will not be sufficient in cases where damage is caused entirely by decisions made by robots independently or if machines are designed to choose partners themselves, agree on contract terms, sign and decide how to implement those agreements, it is clear that the usual principles will not apply to them. According to current Vietnamese law, damages caused by illegal acts of others must be compensated. However, the problem is that up to now, Vietnamese law does not recognize AI as a legal subject. This means that AI cannot be personally responsible for the damages it causes (Dương Quỳnh Hoa, 2020). Determining the subject of compensation for damages in the era of artificial intelligence is very necessary. It is thought that the current trend in the world is to expand the scope of subjects of rights instead of just for the traditional subjects of human individuals. Therefore, Vietnam needs to prepare for the above demands of society in order to ensure that AI can be protected and controlled by law. Recognizing AI as a digital asset in the current Draft Law on Digital Technology Industry in Vietnam, thereby determining the status of subjects in the relationship of compensation for damages outside the contract in the era of artificial intelligence is in line with the current trend of countries.

# LEGAL FRAMEWORK FOR APPLYING ARTIFICIAL INTELLIGENCE TO PROMOTE SUSTAINABLE INNOVATION

**PhD Candidate Van Thi Hong Nhung[1*]**

[1] University of Economics and Law, Vietnam National University Ho Chi Minh City

*Corresponding: nhungvth23709@sdh.uel.edu.vn

**ABSTRACT**

Artificial Intelligence (AI) is currently a core technology across various sectors of social life with its capacity to optimize performance, mitigate risks, conserve resources, and protect the environment, thereby promoting sustainable innovation globally. However, alongside its significant advantages, AI also presents potential risks and impacts on human rights. Therefore, a legal framework for AI not only serves to regulate effective AI development but also ensures its safe, ethical, and responsible application.

At present, countries worldwide adopt different approaches to building an AI legal framework, which creates challenges in regulating cross-border AI activities. This paper clarifies the requirements and role of a legal framework in applying AI to foster sustainable innovation. It delves into key legal aspects of AI application and governance, social responsibility policies, and data security. Additionally, it provides solutions to improve this legal framework to promote sustainable innovation in the digital era.

*Keywords*: “Legal framework”; “Artificial Intelligence”; “AI governance”; “innovation”...

## I. INTRODUCTION

### 1.1 Background of the study

In the digital era, AI has transformed from a mere supporting tool into a key driver of societal change. With its advancements in performance optimization, risk mitigation, and environmental sustainability, AI is reshaping modern operational paradigms. From smart factories to medical diagnostic systems, from autonomous vehicles to sustainable energy solutions, AI has firmly established itself as a cornerstone for fostering global innovation. However, alongside these substantial benefits, AI raises critical legal and ethical challenges that demand comprehensive regulatory assessment[3].

In this context, A well-defined legal framework is essential for fostering responsible and ethical AI deployment, ensuring both innovation and accountability. Nations around the world are adopting diverse approaches to AI regulation, ranging from stringent provisions such as the European Union's AI Act to advisory guidelines prevalent in many developing countries. While this diversity reflects the unique characteristics of various legal systems, it also creates considerable challenges in managing cross-border AI activities.

In the context of Vietnam's efforts to implement the National Strategy on Artificial Intelligence by 2030, developing an appropriate legal framework is not merely a technical requirement but an urgent necessity to ensure sustainable development. Challenges such as limited resources, inconsistencies among legal documents, and the rapid pace of technological advancement demand a multidimensional and comprehensive approach.

Therefore, clarifying the role and requirements of a legal framework for applying AI to promote sustainable innovation becomes particularly crucial. By analyzing key legal aspects of AI governance, including social responsibility policies and data security measures, this paper not only provides an overview of the current state of AI-related legislation but also proposes specific solutions for enhancing the legal framework governing AI. Ultimately, the goal is to strike a balance between fostering innovation and ensuring safety and ethical compliance in AI applications, thereby contributing to the achievement of sustainable development objectives within the digital era.

### 1.2. The Importance of a Legal Framework in AI Governance

As AI continues to integrate into all facets of society, the establishment and refinement of a legal framework for AI governance has become an urgent necessity. A comprehensive legal framework creates a secure and accountable environment for AI development, establishing clear standards and rules that stakeholders are obliged to adhere to. This framework not only protects users' rights and interests but also fosters responsible AI innovation among businesses and organizations4.

In the realm of human rights protection, the legal framework plays a pivotal role in mitigating the potential adverse impacts of AI. For instance, regulations addressing personal data protection, privacy rights, and anti-discrimination in AI algorithms ensure that this technology serves human interests without infringing upon fundamental rights. Moreover, the framework establishes mechanisms for oversight and accountability, enabling the clear allocation of responsibility in cases of incidents or violations related to AI.

From the perspective of fostering innovation, the legal framework provides certainty and trust for investors and businesses. When rules are clearly defined, market participants can confidently allocate resources to AI research and development, assured that they are operating within a predictable and equitable environment. Furthermore, the legal framework encourages fair competition and prevents monopolistic practices in the AI sector, thereby promoting diversity and creativity in technological advancement.

In the context of globalization, the legal framework is equally vital in facilitating international cooperation on AI. Harmonizing legal regulations across nations helps reduce barriers to technology exchange and promotes cross-border collaborative projects. This is particularly crucial in addressing global challenges such as climate change, cybersecurity, and public health issues, where AI can make significant contributions to finding solutions. For example, the European Union's AI Act, with its stringent standards for safety and accountability regarding high-risk AI applications, serves as a benchmark. Similarly, countries like Singapore and Japan, with their AI-friendly legal policies, have created favorable environments for AI startups to thrive. Conversely, legal ambiguity or excessively restrictive regulations can dampen innovation incentives, potentially resulting in setbacks in the global technological race5.

In Vietnam, the National Strategy for Research, Development, and Application of AI by 2030 aims to position AI as a driving force for socio-economic development6. However, to maximize its effectiveness, the legal framework must be designed with flexibility and adaptability to keep pace with the rapid advancements in AI technology. This necessitates a careful balance between ensuring safety and fostering innovation, as well as protecting user rights while promoting technological growth. Additionally, the effective implementation of legal regulations requires close collaboration among regulatory agencies, businesses, and the scientific and technological community.

## II. MATERIAL AND METHODOLOGY

### 2.1. Research Theories

#### 2.1.1. Legal Regulation Theory for AI

This theory examines the relationship between law and the development of AI technology, developed by numerous authors through diverse perspectives yet sharing certain commonalities.

According to Calo (2015)[7], law plays a pivotal role in guiding and regulating AI through the establishment of rules and standards. Meanwhile, Brownsword and Yeung (2019)[8] emphasize that the legal framework must ensure a balance

[4] Kinney, M., Anastasiadou, M., Naranjo-Zolotov, M., & Santos, V. (2024). Expectation management in AI: A framework for understanding stakeholder trust and acceptance of artificial intelligence systems. *Heliyon, 10*(e28562)

[5]https://www.navex.com/en-us/blog/article/the-evolving-ai-regulatory-landscape-in-asia-what-compliance-leaders-need-to-know, accessed on November 12, 2024.

[6] https://en.baochinhphu.vn/national-strategy-on-rd-and-application-of-artificial-intelligence-11140663.htm, accessed on November 13, 2024.

[7]Calo, R. (2015). Robotics and the lessons of cyberlaw. California Law Review, 103(3), 513-563.

[8] Brownsword, R., & Yeung, K. (2019). Regulating technologies: Legal futures, regulatory frames and technological fixes. Hart Publishing.

between fostering innovation and protecting core societal values.

However, scholars have generally agreed on three foundational principles in the legal regulation of AI as follows: transparency and explainability of AI systems, accountability and allocation of legal responsibility in cases of damage, and the protection of legitimate rights and interests. Transparency and explainability are fundamental requirements to ensure that users can comprehend how AI makes decisions (Wachter et al., 2017)9. Accountability mechanisms establish clear processes to determine the liability of relevant parties when an AI system causes harm (Kingston, 2016)10. Lastly, protecting legitimate rights and interests, particularly safeguarding user privacy and personal data in the AI environment, remains a crucial element of the regulation (Giovanella & Duarte, 2019)11.

Building on this theoretical foundation, the study systematically analyzes and evaluates the effectiveness of existing legal frameworks governing AI in various countries. Specifically, by applying the three foundational principles mentioned above, the research preliminarily identifies specific criteria to assess the comprehensiveness of legal frameworks, providing a basis for proposing suitable solutions to construct and refine a scientific and effective legal framework for AI regulation in Vietnam.

**2.1.2. Theory of Responsible AI Governance**

The theory of responsible AI governance focuses on integrating ethical principles throughout the entire lifecycle of AI systems, from design and development to deployment.

In this context, Floridi and Cowls (2019)[12] proposed a unified framework comprising five core principles for AI in society: beneficence, non-maleficence, fairness, explainability, and human autonomy. These principles were synthesized from an analysis of 84 global documents on AI ethics. Furthermore, Dignum (2020)[13] emphasized that responsible AI governance should be founded on three pillars: ethical responsibility, legal responsibility, and social responsibility. Additionally, Hagendorff (2020)[14] highlighted that implementing ethical principles in AI requires a combination of technical tools and an appropriate legal framework.

This theory not only provides an analytical framework for evaluating the effectiveness of current legal regulations but also helps to identify management gaps. It facilitates the proposal of suitable monitoring mechanisms to ensure that AI development complies with ethical principles and meets its social responsibilities.

**2.1.3. Techno-Legal Theory**

The Techno-Legal Theory examines the dialectical relationship between technological development and the evolution of legal systems.

Brownsword (2018)[15] identified three key challenges that technology presents to the legal system: aligning existing regulations with emerging technologies, ensuring enforceability, and devising mechanisms to effectively regulate new and emerging technologies. Similarly, Hildebrandt (2015)[16] introduced the concept of "smart law," proposing three approaches for adapting legal frameworks to technological advancements: revising existing regulations, creating new specific regulations, and developing technology-neutral principles.

---

[14] Hagendorff, T. (2020). The ethics of AI ethics: An evaluation of guidelines. Minds and Machines, 30(1), 99-120.

[15]Brownsword, R. (2018). Law, technology and society: Re-imagining the regulatory environment. Routledge.

[16] Hildebrandt, M. (2015). Smart technologies and the end(s) of law: Novel entanglements of law and technology. Edward Elgar Publishing.

Furthermore, Veale and Edwards (2018)[17] emphasized the necessity of establishing flexible legal mechanisms capable of accommodating the rapid advancements in AI technology.

Incorporating this theory into the study facilitates the identification of suitable approaches for developing a flexible and adaptive legal framework for AI in Vietnam. It ensures that the legal system evolves in alignment with technological advancements while establishing a solid foundation for sustainable development in the future.

**2.1.4. Institutional Innovation Theory**

This theory explores the role of institutions in driving innovation and fostering technological development. North (2005)[18] formulated an analytical framework emphasizing how institutions—defined as sets of rules, norms, and enforcement mechanisms—shape economic and technological advancements by regulating societal behavior. Acemoglu and Robinson (2012)[19] highlighted the critical function of inclusive institutions in safeguarding property rights, promoting competition, and creating equitable opportunities for innovation. Building on this, Etzkowitz and Zhou (2017)[20] introduced the "Triple Helix" model, which underscores the collaborative dynamics among three primary actors in the innovation ecosystem: governments, businesses, and research institutions.

In the context of developing a legal framework for AI, this theory serves as a fundamental foundation for understanding how institutions can establish an enabling environment for technological progress. It also stresses the need to develop institutional frameworks that encourage the responsible growth of AI technologies. By leveraging the Triple Helix model, this study aims to propose actionable solutions to strengthen stakeholder collaboration in the development and regulation of AI. These efforts will significantly contribute to refining the legal framework that governs this transformative technology.

**2.2. Research Methods**

This study employs a combination of research methods to comprehensively address the research questions outlined by the author, emphasizing three primary approaches:

Firstly, the documentary research method is applied to collect and analyze legal texts, policies, and academic studies on AI regulatory frameworks worldwide. This method provides the foundation for selecting and integrating relevant theoretical perspectives while creating a robust database to support the formulation of informed recommendations.

Secondly, the comparative legal analysis method evaluates diverse approaches to constructing AI regulatory frameworks across nations, with a focus on the experiences of the European Union, the United States, Japan, and China (Migliorini, 2024)21. This comparative perspective facilitates the derivation of lessons applicable to Vietnam, considering the nation’s socio-economic development level and legal infrastructure.

Thirdly, the analytical method is employed to examine international and domestic legal provisions, assess the effectiveness of existing legal instruments in managing AI technologies, and foster sustainable innovation (Comunale & Manera, 2024)22.

The integration of these methods allows the study to conduct a comprehensive evaluation of the legal landscape in the AI domain. This systematic approach ensures the formulation of scientifically grounded and contextually relevant

solutions for refining Vietnam's AI regulatory framework.

## III. RESULT AND DISCUSSION

### 3.1. Vietnam's Current Legal Framework for Artificial Intelligence and AI Governance

With efforts to promote digital transformation and technological development, Vietnam has made significant progress in establishing and improving its legal framework for AI governance. Numerous AI-related legal documents have been enacted, laying the foundation for AI regulation, development, and application across various sectors, leading to notable achievements.

Fundamentally, the most recent and highly regarded legal document in Vietnam's current AI governance is the "National Strategy for Artificial Intelligence Research, Development, and Application through 2030," approved by the Prime Minister in Decision No. 127/QD-TTg dated January 26, 2021[23]. This document establishes fundamental principles and orientations with the vision of transforming the country into an ASEAN innovation and AI development hub. Additionally, several other legal documents play crucial roles in creating a legal framework for AI development and application, including the 2018 Cybersecurity Law, the 2023 Personal Data Protection Law, and various decrees on digital identification and authentication. These have initially addressed fundamental issues in AI governance, such as personal data protection, cybersecurity assurance, and the establishment of inter-agency coordination mechanisms in the state management of AI[24].

However, compared to advanced legal frameworks in the EU, United States, Japan, and China, Vietnam's AI governance system remains underdeveloped, lacking systematic structure and facing notable limitations.

*Firstly*, Vietnam's absence of specialized AI legislation means that clear legal definitions of AI and related technologies, as well as specific regulations on legal responsibilities for AI development and application entities, have not been transparently and consistently established. Meanwhile, AI possesses unique technological characteristics and high-risk potential requiring safe, transparent, and responsible governance. This has resulted in AI development enterprises struggling to determine their rights and obligations, limiting certain investments in this sector.

*Secondly*, although current legal documents can be applied to address basic issues in AI development and application, these regulations are dispersed across various legal documents and lack uniformity, creating implementation challenges. This leads to overlapping management and supervision, causing resource waste and reduced enforcement effectiveness. In the future, as AI development and application investment continue to grow, the need to improve and standardize AI governance regulations becomes increasingly urgent with higher standards.

*Thirdly*, the absence of regulations on technical standards, quality assurance procedures, and risk management mechanisms for AI systems poses potential safety risks for users, diminishing the competitiveness of Vietnamese AI products in the international market. Notably, the lack of a specialized state management agency for AI not only limits effective legal monitoring and enforcement but also reduces foreign investment attraction due to the absence of an official focal point for investor consultation and support[25].

In the coming period, improving the legal framework for AI governance will not only help resolve current limitations and contribute to domestic AI development but also enhance Vietnam's position in the international AI community, advancing toward the goal of becoming a regional innovation and AI development hub.

### 3.2. AI Governance Models and International Lessons

#### 3.2.1. The European Union

The European Union is a pioneer in establishing a comprehensive legal framework for AI, centered on the AI Act – the world's first legislative document that classifies AI applications based on risk levels. The Act categorizes AI

[23] Prime Minister's Decision No. 127/QD-TTg dated January 26, 2021, on the National Strategy for Artificial Intelligence Research, Development and Application through 2030.

[24] Le, M. T. (2024). Artificial intelligence law in Vietnam: Current status and solutions. *Journal of State and Law*, 2(410), 45-60.

[25] Pham, H. L., & Do, T. M. (2023). Challenges in state management of artificial intelligence in Vietnam. *Journal of State Management*, 327, 35-40.

applications into levels ranging from "unacceptable" risks, such as facial recognition for public surveillance, to "high-risk" areas such as healthcare, education, and finance, which require stringent control and transparency. Minimal-risk applications, like chatbots, only need to provide clear information, while low-risk applications are exempt from strict compliance requirements26. The framework is further reinforced by the General Data Protection Regulation (GDPR), which ensures privacy and accountability in all AI operations, safeguarding human rights. However, this approach presents challenges, particularly in terms of high compliance costs, which may burden small and startup businesses and potentially slow down innovation. The EU provides valuable lessons on risk classification and the construction of a comprehensive legal framework. However, to be effective in Vietnam, adjustments are necessary to align with the country's emerging AI ecosystem and limited resources27.

**3.2.2. The United States**

The United States is progressively establishing a comprehensive legal framework for artificial intelligence (AI) through the issuance of several significant federal-level documents. Beginning with the American AI Initiative in 2019, followed by the National AI Initiative Act of 2020, this framework was further reinforced by the Executive Order on Safe, Secure, and Trustworthy AI issued in October 2023. Notably, to implement this Executive Order, the Biden administration introduced two critical documents: the Office of Management and Budget Memorandum (M-24-10) governing AI use in the civilian sector and the National Security Memorandum on AI (NSM) applicable to national defense and security[28].

Fundamentally, the U.S. AI legal framework is structured around three main pillars: fostering innovation and maintaining leadership in AI development, ensuring the safe and responsible use of AI, and protecting the rights and interests of citizens. To realize these objectives, the U.S. government has established several specialized agencies, such as the Office of Science and Technology Policy (OSTP) and the AI Safety Institute under the National Institute of Standards and Technology (NIST), while also creating inter-agency coordination mechanisms.

Importantly, this framework not only emphasizes the regulation of technical standards but also prioritizes privacy protection, combating discrimination, and ensuring transparency in AI systems. Additionally, the United States actively promotes international collaboration in AI governance through initiatives such as the Hiroshima AI Statement and the International Framework for Trustworthy AI, aiming to establish global norms for the responsible development and use of AI.

**3.2.3. Japan**

Japan has developed a comprehensive legal framework for AI under the vision of "Society 5.0"[29] positioning AI as a key technology to address social challenges. Beginning with its first *National AI Strategy* in 2017, Japan has continuously refined this framework through updates in 2019, 2022, and the most recent advancements in 2024. Notably, the *2024 AI Strategy* emphasizes fostering responsible AI development to address pressing societal issues, such as an aging population, natural disasters, and the digital transformation of public services. This strategy reflects Japan’s ambition to be a global leader in responsible AI innovation.

Institutionally, Japan has established the *AI Strategy Council* under the Cabinet Office to coordinate AI policies across various ministries. The *Ministry of Economy, Trade, and Industry (METI)* has also played a pivotal role by issuing the *AI Quality Management Guidelines* in 2019, which provide technical standards and quality assurance procedures for AI systems. These guidelines continue to evolve to incorporate emerging best practices and international standards.

Japan has been a pioneer in embedding ethical considerations into AI governance. The *Social Principles of Human-*

[26] Article 3, Artificial Intelligence Act 2024 (EU).

[28] https://www.whitehouse.gov/briefing-room/presidential-actions/2024/10/24/memorandum-on-advancing-the-united-states-leadership-in-artificial-intelligence-harnessing-artificial-intelligence-to-fulfill-national-security-objectives-and-fostering-the-safety-security/

[29] Study Group on New Governance Models in Society 5.0. (2021). *Governance Innovation: Redesigning Law and Architecture for Society 5.0*. Tokyo: Ministry of Economy, Trade and Industry (METI), Japan.

*Centric AI*, introduced in 2019, emphasize values such as respect for human dignity, transparency, and accountability. In the area of data protection, the *Act on the Protection of Personal Information (APPI)* was amended in 2020 and further revised in 2024 to address challenges posed by AI technologies. The updated provisions include stricter requirements for handling personal data in AI systems, user rights over AI-driven decisions, and enhanced safeguards against misuse of data.

Following the *G7 Hiroshima Summit* in 2023, Japan has intensified its efforts in promoting international cooperation on AI governance through the *Hiroshima AI Process*. This initiative aims to establish global principles for the safe and responsible development of AI, aligning with broader international norms such as those outlined by the OECD and UNESCO. Japan's leadership in this area underscores its commitment to fostering both technological innovation and ethical stewardship in the AI era.

**3.2.4. China**

China has developed a comprehensive legal framework for artificial intelligence (AI) with a clear strategic direction through the issuance of several key regulations. A significant milestone was the promulgation of the Interim Measures for the Management of Generative AI Services in July 2023, which took effect on August 15, 2023. This regulation is the world's first specifically aimed at regulating generative AI. Following this, in October 2023, China released a draft Measures for the Administration of Internet Recommendation Algorithms, expanding regulatory coverage to AI systems used in Internet services. Most notably, starting March 1, 2024, China officially enforced the Measures for the Administration of Content Generated by Artificial Intelligence, the nation's first comprehensive legal document governing AI-generated content[30].

In terms of institutional structure, the Cyberspace Administration of China (CAC) serves as the primary authority responsible for overseeing and regulating AI-related activities. China's AI legal framework places a strong emphasis on national security requirements, content control, intellectual property protection, and personal data security. Providers of generative AI services are required to register with regulatory authorities, conduct security assessments, and comply with content review regulations before releasing their products or services. Additionally, China mandates the clear labeling of AI-generated content and establishes a complaint mechanism for users.

This regulatory framework reflects China's focus on balancing the promotion of technological innovation with strict oversight to ensure safety, accountability, and alignment with national interests.

**3.2.5. Key Lessons and Recommendations for Vietnam**

The study of AI legal frameworks in Europe, the United States, Japan, and China highlights several key features:

– EU: A pioneer in establishing a comprehensive AI legal framework with a risk-based classification system, ranging from "high risk" to "low risk."

– United States: Emphasizes public-private partnerships to promote AI research in areas such as defense and healthcare.

– Japan: Focuses on integrating ethical principles into AI governance.

– China: Implements strict control over AI-generated content to ensure national security.

To ensure a scientifically grounded and effective AI legal framework, Vietnam must actively study, evaluate, and learn from international legal systems and the experiences of developed nations. For instance, adopting the EU's risk-based classification model could enable Vietnam to allocate resources more efficiently to critical sectors such as healthcare and finance. Additionally, leveraging public-private investment strategies, as implemented in the U.S., could catalyze AI development across various industries. Furthermore, integrating ethical principles akin to Japan’s governance model and employing content moderation strategies similar to those of China would empower Vietnam to establish a highly adaptable and effective AI governance framework. This multidimensional approach would position Vietnam to balance innovation with accountability and responsibility, paving the way for sustainable AI growth.

[30] Migliorini, S. (2024). **China's Interim Measures on generative AI: Origin, content and significance**. *Computer Law & Security Review*, 49, 105985.

### 3.3. Legal Risks in the Development of AI

The rapid advancement of AI has brought significant opportunities to foster innovation and improve the quality of life. However, these opportunities are accompanied by complex legal risks that necessitate comprehensive management measures to mitigate negative impacts. According to the author, these legal risks primarily revolve around four key issues: human rights, personal data security, ethical responsibilities, and ensuring fairness.

#### 3.3.1. Artificial intelligence poses serious risks to human rights, particularly in applications related to surveillance and the collection of personal data

In the context of AI's unprecedented and unpredictable developments, this technology presents significant challenges to the protection of human rights, especially in areas involving surveillance and the collection of personal data. Specifically, AI systems possess the capability to collect and analyze data on an unprecedented scale, including information about geographic locations, online behavior, biometric data, and even personal interactions. This creates a substantial risk of severe invasions of individual privacy[31]. Notably, facial recognition technology and intelligent surveillance systems equipped with AI can track and identify individuals in real-time, not only in public spaces but also in private environments. This undermines citizens' rights to freedom of movement and anonymity. Particularly concerning is the use of AI in social surveillance systems, where the technology could be employed to control and restrict fundamental freedoms such as the right to freedom of expression, assembly, and speech.

Moreover, the lack of transparency in how AI collects and processes personal data, combined with the absence of effective oversight and control mechanisms, exacerbates these risks to human rights. These circumstances create an urgent need for the establishment of a comprehensive legal framework to regulate the development and use of AI. Such a framework must strike a balance between the benefits of technological innovation and the protection of fundamental human rights. Importantly, it must uphold the principle of being "human-centered" whereby technology is developed to enhance human quality of life. This ensures that AI development does not become solely driven by economic interests at the expense of human rights.

#### 3.3.2. The risks related to personal data in the era of AI manifest in complex and multifaceted dimensions

Foremost, the integration of AI into data processing systems introduces new challenges to information security. As algorithms increasingly connect and cross-analyze data from various sources, there is a heightened risk of AI reconstructing and re-identifying personal information, even when the data has been anonymized. Additionally, AI systems typically require large volumes of data for training and improving performance, leading to a tendency to accumulate and indefinitely store user data, which significantly increases the potential for data breaches and misuse.

Moreover, the complexity of modern AI models complicates the traceability and control over data usage, particularly when data is transferred through multiple intermediaries or applied across different AI applications. Looking ahead, as AI continues to evolve with self-learning and self-improving capabilities, it is conceivable that AI systems could autonomously generate detailed digital profiles of individuals by aggregating and analyzing digital footprints. Such profiles could predict user behavior, preferences, and even future decision-making trends with remarkable precision—all without explicit consent.

On the other hand, the lack of unified technical standards for safeguarding personal data in AI applications, coupled with the disparities in legal regulations among nations, may create significant gaps in the protection of user rights on a global scale. This underscores the necessity for robust international cooperation in establishing standards and regulations for personal data protection within the AI environment, as well as enhancing the capacity for monitoring and enforcement of data protection laws in this domain.

#### *3.3.3. The ethical challenges in the development of artificial intelligence are becoming increasingly prominent*

The rapid and powerful advancement of AI, while creating groundbreaking opportunities that revolutionize human life, also raises profound and complex ethical issues in contemporary society. Firstly, the ability of AI to self-learn and

[31] Williamson, S. M., & Prybutok, V. (2024). Balancing privacy and progress: A review of privacy challenges, systemic oversight, and patient perceptions in AI-driven healthcare. *Applied Sciences*, *14*(675)

make autonomous decisions poses questions about the boundaries of moral autonomy, especially when machine-made decisions can directly impact human rights and lives, particularly in critical fields such as healthcare, autonomous transportation, and national security.

Furthermore, AI's ability to generate sophisticated fake content (deepfakes) undermines societal trust and creates severe ethical challenges regarding the authenticity of information and accountability in its dissemination. By nature, AI systems are tools, machines, and algorithms devoid of human-like morality, emotions, and humane values. Unlike humans with ethical reasoning, AI lacks the capacity to weigh actions based on considerations of empathy, fairness, and reasonableness when making decisions.

Notably, with AI's increasing role in specialized tasks, education, and research, and as more decisions are entrusted to automated algorithms without thorough consideration of ethical and humanistic values, concerns arise about the potential dependency on AI and the erosion of human independent thinking. Additionally, the development of AI raises questions about fairness in the distribution of benefits and social burdens, as this technology might exacerbate existing inequalities or create new forms of inequity.

Therefore, it is imperative to establish a clear ethical framework with guiding principles to ensure that AI is developed and utilized for the common good of humanity, respecting fundamental ethical values and human dignity.

#### 3.3.4. The development of artificial intelligence carries inherent risks of unfairness and lack of transparency

While AI possesses a certain degree of objectivity and independence in decision-making, avoiding the subjective biases often associated with human actions, it still harbors risks that could lead to unfair outcomes and opaque practices.

First and foremost, AI algorithms are typically developed based on data provided by humans. This data may inherently carry long-standing societal biases or reflect the subjective intentions of those approving the input data, inadvertently reinforcing and amplifying existing inequalities in automated decision-making processes. A particularly critical issue arises with AI models that incorporate "black box" algorithms, where the reasoning process is neither clear nor explainable. This characteristic makes it extremely challenging to evaluate fairness and address potential biases.

Additionally, disparities in AI development levels, resources, and access to technology among nations, regions, and social groups can create significant divisions. Marginalized communities are at a heightened risk of being left behind in this technological revolution. Moreover, the concentration of power in the hands of a few major tech companies—organizations capable of developing and controlling advanced AI systems—could lead to monopolies that shape the future of technology and society, further exacerbating divisions and inequalities between these entities.

Furthermore, a lack of transparency in AI development not only undermines public trust but also introduces safety and security risks. Undetected vulnerabilities or errors in the system may remain unresolved, potentially leading to significant harm. In practice, the complexity of modern AI models makes independent verification and evaluation increasingly difficult, posing challenges for regulatory oversight and intervention. This highlights the need for robust legal frameworks to ensure transparency, fairness, and accountability in AI development and deployment.

### 3.4. Proposed Solutions for Transparent, Safe, and Sustainable AI Development

#### 3.4.1. The Need for a Specialized and Comprehensive AI Legislation

Currently, the existing legal provisions governing AI are scattered across various legislative documents, lacking cohesion and posing significant challenges in practical application. This fragmented approach not only complicates the management and oversight of AI activities but also creates barriers to the development of this technology. Moreover, the unique characteristics and rapid advancements of AI necessitate a distinct legal framework capable of adapting to new changes and challenges. Therefore, from the perspective of enhancing the legal system, the establishment of a specialized and comprehensive AI law serves as a foundational step in creating a robust legal framework for the sustainable development of this technology.

This specialized legislation should be designed with a clear scope of regulation, comprehensively encompassing activities related to the research, development, and application of AI. It must also delineate fundamental principles and mandatory standards to be adhered to throughout these processes.

To achieve practical effectiveness, the proposed legislation should fulfill several essential requirements to ensure

that AI is developed and applied transparently, safely, and sustainably.

Firstly, in terms of comprehensiveness, the legislation must address critical aspects of AI, ranging from defining and classifying AI systems based on risk levels to establishing detailed provisions regarding the rights and obligations of stakeholders involved. Secondly, regarding enforceability, the provisions should be sufficiently specific to enable practical application while remaining flexible enough to avoid stifling innovation within the sector. Additionally, the law should ensure compatibility with international standards and best practices for AI governance, thereby facilitating cross-border cooperation and technological exchange.

Enacting a dedicated AI law not only provides significant benefits to stakeholders but also serves as an effective legal instrument to regulate and monitor AI activities, thereby enhancing state management capabilities in this emerging technological domain. For businesses, a clear and predictable legal framework builds investor confidence, encouraging research and development in the AI sector. Notably, for the general public, such a law will establish mechanisms to protect their rights and legitimate interests when using AI applications, while simultaneously enabling access to safe and reliable AI technologies.

In the context of deepening international integration, having specialized AI legislation will further elevate the nation's position in AI governance and facilitate the harmonization of domestic laws with international standards. This is especially critical given the trend among developed countries to actively refine their AI legal frameworks, as evidenced by the European Union's Artificial Intelligence Act and similar initiatives in the United States, Japan, and Singapore.

#### 3.4.2. The Legal Framework Must Establish Mandatory Standards for Transparency and Explainability in AI Systems

As AI systems increasingly undertake critical decision-making roles that significantly impact human lives, the establishment of mandatory regulations on AI transparency and explainability has become more urgent than ever. These requirements play a pivotal role in fostering trust and ensuring accountability in the development and deployment of AI technologies. Such standards must be designed to ensure that the decision-making processes of AI systems can be understood, examined, and evaluated by stakeholders.

The necessity of these mandatory standards arises from the reality that many AI systems currently function as "black boxes," where decision-making processes remain opaque or incomprehensible to end users. This lack of clarity raises legitimate concerns about fairness, reliability, and the controllability of AI systems. Particularly in sensitive fields such as healthcare, finance, and justice, a lack of transparency can lead to severe consequences for the rights and interests of individuals[32].

To address these challenges, the legal framework must define specific core standards for transparency and explainability. First, it must mandate the disclosure of training data, including its sources, collection methods, and processing procedures. Second, developers should be required to provide detailed descriptions of AI algorithm structures and operational principles, especially the criteria and logic employed in decision-making processes. Furthermore, mechanisms for monitoring and evaluating the real-world performance of AI systems must be established, including capabilities for detecting and rectifying biases or errors.

The establishment of such standards in the AI legal framework not only safeguards users' rights but also enables developers and businesses to build trust with users and stakeholders while minimizing legal risks and reputational damage. Additionally, transparency standards in the legal framework provide regulators with the tools needed to monitor and assess the compliance of AI systems, ensuring their alignment with public interest objectives.

On a global scale, the development of specific regulations on transparency and explainability standards contributes to harmonizing AI governance across nations. As leading countries, such as the European Union, spearhead the adoption of stringent transparency requirements for AI, aligning with and adhering to similar standards will enhance

[32] Longo, L., Brcic, M., Cabitza, F., Confalonieri, R., Del Ser, J., Guidotti, R., Hayashi, Y., Herrera, F., Holzinger, A., Jiang, R., Khosravi, H., Lecue, F., Malgieri, G., Páez, A., Samek, W., Schneider, J., Speith, T., & Stumpf, S. (2023). Explainable Artificial Intelligence (XAI) 2.0: A Manifesto of Open Challenges and Interdisciplinary Research Directions. *arXiv preprint*.

international cooperation and promote the responsible development of AI technologies worldwide[33].

### 3.4.3. The Necessity of Establishing Strict Regulations for Data Collection, Processing, and Protection in AI Development and Operation

In the current digital age, data serves as the backbone of AI systems, making the establishment of stringent regulations on data collection, processing, and protection an urgent requirement. This process transcends technical rule-setting and involves ensuring privacy and information security for individuals and organizations as AI applications become increasingly widespread.

The necessity for these regulations arises from the growing challenges and risks associated with the data lifecycle in AI development. As AI systems grow more complex and demand massive datasets for training, the risks of data breaches, privacy violations, and misuse intensify. This is particularly critical in sensitive sectors such as healthcare, finance, and national security, where data breaches can have far-reaching consequences.

Effective data protection regulations for AI must cover the entire data lifecycle, from initial collection to processing, storage, and eventual disposal. During the collection phase, regulations should mandate clear requirements for obtaining user consent, ensuring that data subjects are fully informed about the purpose and scope of data use. In the processing phase, advanced technical measures such as data encryption, anonymization, and access control must be implemented to safeguard sensitive information[34].

Another critical aspect is the establishment of monitoring mechanisms and accountability frameworks for data management. This includes requiring AI developers to maintain robust systems for logging and tracking data processing activities, conducting periodic privacy impact assessments, and having contingency plans to address data breaches. Additionally, there should be clear provisions for reporting and mitigating data violations, ensuring transparency and accountability among stakeholders.

The development of robust regulations for data collection, processing, and protection in AI development will serve as a cornerstone for safeguarding user privacy and information security. Such regulations will foster user trust in AI applications, mitigate risks for businesses, and enhance their competitive edge in a market increasingly focused on security. Furthermore, these regulations will contribute to building a trustworthy and sustainable AI ecosystem.

### 3.4.4. Promoting International Cooperation and Actively Participating in Global AI Governance Initiatives and Forums

In the era of globalization and the rapid advancement of AI technology, fostering international cooperation and actively engaging in global AI governance initiatives have become imperative. This need is particularly pressing given the cross-border nature of AI applications and the shared challenges nations face in managing this transformative technology.

The necessity for strengthening international collaboration in AI governance stems from several critical reasons. First, challenges associated with AI, such as privacy protection, cybersecurity, and ethical AI practices, cannot be effectively addressed by any single nation. These issues require a collective, coordinated response to ensure uniform standards and practices globally. Moreover, the divergent approaches to AI regulation among countries could create barriers to the development and deployment of AI technologies on a global scale. The lack of international coordination might also lead to a "race to the bottom" in establishing safety and ethical standards for AI.

To promote effective international cooperation in AI governance, nations must actively engage in international forums and initiatives dedicated to this field. This includes participation in organizations such as UNESCO, OECD[35], and G20 working groups on AI. Furthermore, countries should contribute constructively to the development of international principles and guidelines for the responsible development and application of AI. This proactive

involvement not only strengthens global governance mechanisms but also ensures that diverse perspectives and experiences inform the creation of comprehensive, inclusive standards.

Another essential aspect of international cooperation is the harmonization of domestic AI regulations with global standards. This involves studying and adapting best practices and emerging trends in AI governance, particularly groundbreaking initiatives such as the European Union's AI Act. The harmonization process must be approached with careful consideration of each country's unique legal and technological environment, ensuring that the integration of international standards is practical and contextually relevant. Such alignment not only facilitates international collaboration but also enhances the effectiveness and credibility of domestic AI governance frameworks.

## IV. CONCLUSION

The rapid advancement of AI technology presents unprecedented challenges to existing legal frameworks, necessitating timely adjustments and updates to meet emerging practical requirements. The establishment of a comprehensive and effective legal framework for AI is not merely an urgent requirement but a prerequisite for ensuring the sustainable development of this technology.

The proposed legal framework must be designed based on the principle of balancing innovation promotion with safety and ethical considerations. This requires active participation and close coordination among various stakeholders, including regulatory bodies, businesses, research institutions, and end-users. Furthermore, the framework must maintain sufficient flexibility and adaptability to accommodate the continuous evolution of AI technology.

To effectively implement this legal framework, several key solutions must be executed simultaneously. The establishment of a specialized AI regulatory and oversight body with sufficient authority and resources plays a pivotal role. Concurrently, developing high-quality human resources, particularly experts with integrated knowledge of legal and AI technology, along with raising community awareness about legal and ethical aspects of AI, are indispensable elements for ensuring the framework's success.

Looking forward, as AI continues to evolve rapidly, the legal framework will require continuous refinement and updating to address new challenges. This demands ongoing efforts in research, evaluation, and adjustment of legal regulations, coupled with enhanced international cooperation in this field. Only with a robust and effective legal framework can we fully harness AI's potential in promoting innovation and sustainable development while minimizing potential risks and adverse impacts.

# CHALLENGES FOR VIETNAM WHEN IMPLEMENTING THE EUROPEAN-VIETNAM INVESTMENT PROTECTION AGREEMENT

**Dao Nguyen Phuong Thao[1*]**

[1] Faculty of Law, Ho Chi Minh City Open University.
Postgraduate at University of Economics and Law, Vietnam National University, Ho Chi Minh City
* Corresponding: thao.dnp@ou.edu.vn

**ABSTRACT**

The European - Vietnam Investment Protection Agreement (EVIPA) and the European - Vietnam Free Trade Agreement (EVFTA) has been expected that bring great economic achievements to Vietnam. However, EVIPA has not exerted its full influence due to many reasons. This has caused certain delays in Vietnam's socio-economic development plans when important legal agreements are signed when Vietnam and European Union (EU) got engaged. With recent domestic and world fluctuations, the current challenges that Vietnam faces in effectively implementing EVIPA are unforeseeable circumstances. By clarifying some of the difficulties that Vietnam is facing when implementing commitments in EVIPA, the author gave some solutions for Vietnam to resolve them.

*Key words*: "investment protection"; "EU", "EVIPA"; "Vietnam"

## I. INTRODUCTION

Despite Vietnam's efforts to speed up the ratification of EVIPA, some EU Member States are distracted by other major issues, delaying the time for investors from both sides to fully enjoy the incentives. EVIPA is one of the best solutions to increase European investment in Vietnam. Although signed in 2019 and ratified by the European Parliament and the Vietnamese National Assembly in 2020, EVIPA is still subject to ratification procedures by EU members. To date, the parliaments of 17 EU Member States have ratified the Agreement. According to the European Affairs Department of the Ministry of Foreign Affairs, the remaining countries have not yet done so due to reasons such as the ongoing efforts to deal with the Russia-Ukraine conflict and the complicated procedures in their parliaments, in which some parties do not support trade liberalization because they want to protect domestic production from unforeseen challenges (Khoi Nguyen, 2022).

To make the most of the investment attraction and expected benefits that EVIPA brings, Vietnam is identifying obstacles and ways to remove them in the process of bringing into effect and implementing this Agreement. The issues studied in this article have not been mentioned in previous works from the perspective of analyzing difficulties and finding solutions to improve the implementation of EVIPA from Vietnam.

## II. MATERIAL AND METHODOLOGY

This section is to review the main contents of EVIPA along with the ratification process of the signatories and the current difficulties for Vietnam in implementing this Agreement. The analysis and synthesis method will be the main method used for this article.

In the initial negotiation phase (from 2012 to May 2017), the EVFTA included contents on investment protection, liberalization and investment dispute settlement. However, within the European Union (EU), some new issues arose related to the division of authority to ratify free trade agreements (FTAs) between the EU and each Member, so some of the above contents were separated into EVIPA. Specifically: EVFTA (under the approval authority of the EU Parliament) regulates trade issues and all contents on direct investment liberalization previously agreed upon by the two Parties; EVIPA (under the approval authority of the European Parliament and the Parliaments of the Member States) regulates investment protection (including direct investment and indirect investment) and dispute settlement between the state and investors.

EVIPA, when it comes into effect, will replace 21 existing bilateral investment promotion and protection agreements that Vietnam has signed with EU members. The agreement consists of 4 Chapters, 92 Articles and 13 Annexes. EVIPA is mainly an investment promotion agreement based on a number of principles to ensure that Vietnam

develops relations with the EU in the spirit of respecting each other's independence, sovereignty and territorial integrity. These principles are consistent with the objectives agreed upon by the parties in the Vietnam - EU Comprehensive Partnership and Cooperation Agreement (PCA). The issues focused in the 4 chapters of EVIPA include: i) Chapter 1 stipulates the objectives and concepts used in the Agreement (to strengthen economic, trade and investment relations between the Parties in accordance with the development objectives in other FTAs); ii) Chapter 2 stipulates the scope of the Agreement and each Party's commitment to investment protection for investors who have legally invested in the territory of the other Party (except for investors' market access rights during the investment approval stage because they have been regulated in the EVFTA); iii) Chapter 3 stipulates the dispute settlement mechanism during the implementation of the Agreement (including the dispute settlement mechanism between the Parties on the interpretation and application of the Agreement and the settlement of disputes between one Party and the other Party's investors according to the standing mechanism); iv) Chapter 4 stipulates the mechanism for organizing the implementation of the Agreement (EVIPA).

EVIPA and EVFTA are expected to contribute to strengthening economic, trade and investment ties between Vietnam and the EU; contributing to enhancing Vietnam's position in ASEAN and the international arena. Complying with the commitments in EVIPA means that Vietnam must continue to improve its institutional and policy systems to make the investment and business environment increasingly favorable, equal, safe, transparent and friendly for partners and investors. This is the basis for Vietnamese leaders to believe that the implementation of the agreement will create momentum for Vietnam to promote investment attraction from the EU in industries such as processing industry, high technology, clean energy, banking and financial services, etc. and Vietnamese investors will have easier access to the EU market. During the period of accelerating the negotiation of EVIPA, investment capital from the EU has increased dramatically from 2017 to present compared to the previous period. It seems that expectations for EVIPA have been one of the driving forces attracting investment from the EU to Vietnam, with the average total investment capital in the period 2017-2021 increasing by 86% compared to the period 2015-2016. Specifically, in the period 2015-2016, FDI capital from the EU to Vietnam only reached $841.12 million while this figure increased significantly to $1,508.77 million (2017) and even in 2021, which was affected by the pandemic, it still reached $1,405.27 million (VCCI, 2023,1).

Although EU FDI in Vietnam is still modest compared to its partners in the Asian region, it is classified as high quality, with high technology content and transfer rate, advanced management methods and high added value creation, contributing significantly to the development of Vietnam. A positive sign of EU FDI in Vietnam after Vietnam ratified EVIPA is that the scope of investment is no longer focused on high-tech industries but has actively shifted to expand to services, clean energy, supporting industries, food processing and high-tech agriculture, etc.

EVIPA was directly signed by the representatives of the parties on June 30, 2019 in Hanoi, and ratified by the Vietnamese National Assembly on June 8, 2020, at the 9th Session of the 14th National Assembly with 95.45% of the total number of National Assembly deputies in favor (Training Center for Elected Representatives, 2020). On the European Parliament side, since February 12, 2020, it has ratified this Agreement along with EVFTA. However, while EVFTA has come into effect and has had positive impacts on Vietnam's economy, the implementation of EVIPA has been delayed because the EU Member States' parliaments have not completed the ratification procedures. Up to now, 10/27 EU Member States have not ratified EVIPA for various reasons. This causes certain difficulties for Vietnam in the process of integrating into the world economy in a new position as well as realizing its economic - political - social goals. And so far, the implementation of EVIPA has not been able to proceed as expected when it was signed. That is why Vietnam is making efforts to promote the ratification of the remaining EU members to be able to take advantage of the effectiveness of EVIPA as soon as possible. But perhaps, with the domestic fluctuations of the Signatories and the current world situation, this effort will be a challenging "journey" for Vietnam at present.

## III. RESULT AND DISCUSSION

### 3.1. Challenges for Vietnam in the implementation process of EVIPA

Currently, the challenges for Vietnam in implementing EVIPA mainly focus on two issues: how to speed up the implementation of this Agreement; and, the difficulties in complying with EVIPA when this Agreement comes into

effect for the Parties.

**On the first issue**, accelerating the implementation of EVIPA means promoting the ratification process of the Parliaments of the remaining EU Members. The EVIPA is under the ratification authority of the Vietnamese National Assembly (Article 29, Law on International Treaties 2016 of Vietnam) and the EU Member States also stipulate that this right belongs to their respective agencies. The Vietnamese National Assembly's ratification of EVIPA at the same time as the EVFTA aims to create an important premise for the 27 EU Member States to soon complete internal legal procedures for EVIPA to come into effect. However, as mentioned above, this is not easy, although since 2020, Vietnam has shown many efforts to influence this process. The reasons why Vietnam's efforts have not achieved the desired results can be attributed to the following reasons:

Firstly, the world political situation, especially recent armed conflicts, have dominated and negatively affected the diplomacy, military and socio-economics of EU Member States. The armed conflict between Russia and Ukraine has not only polarized the world political map but also comprehensively affected the activities and performance of global trade, especially with EU countries. The energy and food crisis in Europe due to the prolonged war, combined with recent natural disasters, has had a chain reaction on other manufacturing industries. Since the beginning of 2022, the parliaments of EU Member States have mainly focused on discussing issues to minimize the possibility of the above conflict causing damage to their countries as well as preventing the war from escalating by introducing compatible foreign policies in intra-bloc or extra-bloc meetings in the EU. Therefore, the ratification of EVIPA from the EU has also been delayed. Most Western countries, including the EU, have quickly imposed sanctions on Russia in response to the armed developments in Ukraine. These sanctions against Russia had a significant impact on the global economy, and the Vietnamese economy would not escape the consequences. Russia has been removed from the international payment messaging system SWIFT, Western countries have effectively frozen $630 billion of Russia's foreign exchange reserves, and many major banks and financial institutions have frozen Russian overseas assets worth a total of about $3 billion. Russia's removal from the SWIFT system in particular has created a crisis for businesses exporting goods to Russia, as they are now having difficulty making and receiving payments from Russian entities (VCCI, 2022). The war also caused world oil prices to rise, causing difficulties for agricultural production and the import and export of agricultural, forestry and fishery products of countries. In particular, businesses that depend on raw materials from Russia or Ukraine face the risk of direct supply shortages due to the war. This conflict has caused shortages and price increases for many commodities such as oil, gas and grain, of which Ukraine is one of the world's largest exporters. Therefore, inflation would increase and EU businesses that depend on imported raw materials but could not increase selling prices to offset increased raw material costs will face difficulties. Inflation risks are also likely to slow down consumption and FDI flows from the EU to Vietnam. The Russia-Ukraine conflict has worsened inflation and disrupted supply chains, causing the global economy to stagnate and making the international investment environment more difficult for many businesses. It can be seen that the Russia-Ukraine war has had a negative impact on both the Vietnamese economy in practice and the progress of ratification of EVIPA by EU members.

Second, the EU has not recognized Vietnam as a market economy, leading to many concerns among its members about the risks to their investors when accessing the Vietnamese market. And these countries have been waiting for further changes in Vietnam's trade mechanisms and policies to ratify the Agreement. Although it has been a member of the WTO since January 2007 and has had more than 17 years to improve the domestic trade environment according to global rules, many countries in the WTO have not yet recognized Vietnam as a market economy, including the EU. Up to now, only 72 countries out of more than 200 countries and territories have recognized Vietnam as a market economy. Political and commercial ties have led many EU members to agree with the United States in saying that Vietnam's economy has not yet achieved the elements of a true market economy. In 2015, while negotiating the EVFTA, the representative of the EU delegation noted to the press that the signing did not mean recognizing Vietnam as a market economy. Non-market economy refers to economies where the government has a monopoly or near-monopoly on trade and the state sets domestic prices. If an exporting country is considered non-marketable, the normal principles of price calculation will not be used. The importing country may use such other methods as it deems reasonable. This creates some major disadvantages for producers and exporters from economies that are considered non-market. The United States has 6 criteria to consider recognizing any country as having a market economy, including: the level of currency

conversion; wage and salary negotiations between employees and employers; the level of foreign investment in economic activities; the issue of state ownership, private ownership; the level of government control over some resources and prices; other factors (Phan Minh Hoa, 2024). With the EU, this recognition is considered based on 5 criteria: the level of government influence in allocating resources and business decisions (Vietnam has done so, according to the EU's assessment in 2015); no state intervention that distorts the daily operations of businesses; corporate governance, accounting and auditing; the existence and enforcement of some legal regimes, respect for intellectual property rights, bankruptcy and competition as well as judicial systems; financial sector (Duc Minh, 2023). Over the past 20 years, it went on, Vietnam's economy has undergone remarkable changes and development with signing and putting into practice 17 FTAs, including new-generation and high-standard FTAs with EU, the countries of the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP), and the UK, with many extensive and comprehensive commitments from the reduction of duties to the raising of labour standards, environmental protection, sustainable development, government procurement, and transparency (Nhan Dan Newspaper, 2024). The EU is the third most important import market for Vietnamese goods from 2020. Therefore, being recognized as a market economy by US and EU is of great significance to Vietnam's manufacturing and export industries.

Third, Vietnam's economic ties with China make many EU countries not ready to shift their investment flows to Vietnam. Due to geographical and historical factors, whether we like it or not, Vietnam's economy cannot be separated from China's economy, especially since Vietnam's production depends heavily on Chinese raw materials. Meanwhile, Western countries, especially the United States and its EU allies, are not very sympathetic to China when they cooperate "moderately" in trade and are trying to "Escape from Chinese influence" by finding alternative partners. This is really a disadvantage for Vietnam in its strategy of promoting trade cooperation out of Asia. The majority of Vietnam's export products are still heavily dependent on supplies from China - a barrier to the origin of goods when accessing the EU market. While the controversy over forced labor has not subsided, raw materials from China are still subject to carbon emission standards during production or harvesting, which is also a major obstacle for Vietnamese manufacturing industries, causing negative feelings among Western trade partners. According to statistics from the Ministry of Industry and Trade, from the fourth quarter of 2022, Vietnam's economic growth has slowed down, making it difficult to achieve the target for the whole year of 2023 of about 6.5% according to the Resolution of the National Assembly. In the first 9 months of 2023, the total export turnover of goods still decreased compared to the same period last year, estimated at 259.67 billion USD, down 8.2%. Of which, the domestic economic sector reached 68.86 billion USD, down 5.7%, accounting for 26.5% of total export turnover; the foreign-invested sector (including crude oil) reached $190.81 billion USD, down 9.1%, accounting for 73.5% (Tran Thi Thu Trang, 2023).

**Regarding the second issue**, when EVIPA comes into effect for all signatories, Vietnam will face a lot of pressure for compliance. Some of the burdens that Vietnam faces include: pressure on governance if many domestic enterprises do not have enough capacity and will go bankrupt when foreign investors with stronger competitiveness appear in the Vietnamese market; pressure on time to perfect the institutions, legal system as well as improve the capacity of the operating team to be compatible with the commitments in the Agreement. These pressures are not entirely caused by EVIPA when it comes into effect but mainly come from the somewhat passive and unsynchronized preparations and reforms when participating in the international environment as well as the ability to respond to fluctuations. Vietnam's passivity and ineffective implementation preparation are reflected in a number of significant manifestations such as:

Regarding mechanisms and policies, policy changes in Vietnam are still not really synchronous and frequent changes in policies will make foreign investors hesitant about their ability to adapt to Vietnam's unstable and unpredictable legal environment. Currently, the Investment Law and the Land Law of Vietnam have been amended, while the 2015 Civil Code is about to be reviewed and amended. If the regulations on assets, ownership, contracts, etc. in the current Civil Code have any changes in the future, it will certainly affect the provisions in the Land Law or Investment Law to some extent and it is not excluded that these documents will have to be amended and supplemented again. When doing business in a country with such constant changes in policies, the psychology of foreign investors will become more shaky and withdrawal from the unstable environment is inevitable.

In terms of the speed of production technology transformation, most EU countries are pioneers in environmentally friendly production techniques in the strategy of integrating sustainable development criteria into the commercial

sector. A series of global conferences initiated and held in Europe during the past time have all had representatives from Vietnam with commitments to reduce greenhouse gases, promote green production, limit coal power and methane emissions in industrial processes. Among these conferences, the 26th Conference of the Parties (COP26) of the United Nations Framework Convention on Climate Change aims to promote countries to strengthen the implementation of socio-economic development policies in the effective and long-term use of clean energy sources (green energy, alternative energy). COP26 took place from November 1 to 12, 2021 in Glasgow, Scotland, UK with the participation of representatives from nearly 200 countries. Within the framework of this Conference, in order to optimize emissions reduction, Vietnam and 39 other countries committed to eliminating coal power - a fuel source that is considered to be a major contributor to climate change globally today. However, coal power is the main fuel source for factories, especially factories specializing in exporting high-value products to Vietnam's economy (COP26: The Glasgow Climate Pact, page 3). Up to now, Vietnam currently lacks many foundations to implement these commitments and at the same time makes EU partners feel that investment and Vietnam will find it difficult to quickly achieve economic and environmental goals.

Regarding the stability of Vietnam's financial system, this can be considered the most doubtful aspect for EU partners at the present time. With the fluctuations of economic groups whose leaders have been prosecuted and brought to trial or are awaiting trial in recent times such as FLC, Tan Hoang Minh, Van Thinh Phat... have caused serious crises for the entire financial system along with related banks and individuals participating in financial products issued by these enterprises. Up to now, Vietnam has not yet resolved all the serious consequences caused by the violations caused by the above groups, leaving many serious consequences for society. Due to the slow detection of violations, the consequences left for society are too great with extremely serious damage, which also creates some negative effects. In particular, EU partners have the right to raise concerns about Vietnam's governance capacity and the possibility of similar risks in the future that may directly or indirectly affect the investment efficiency of their businesses when coming to Vietnam. If these violations recur in other companies or the consequences are prolonged, it is inevitable that foreign investors will withdraw capital from Vietnam. The level of implementation of commitments on remittance protection and compensation in case of instability in EVIPA is not guaranteed. And potential investors from the EU will be able to choose safer countries in terms of financial stability to promote investment. In the Southeast Asian region, competitors in attracting investment from the EU to Vietnam include Indonesia, the Philippines, Malaysia, etc., while in Asia, there are many other countries that can replace Vietnam in this field.

Thus, in order not to lose the opportunity to other countries, Vietnam needs effective solutions to speed up the ratification of EVIPA from EU partners and must quickly resolve domestic backlogs to complete the implementation process of EVIPA as effectively as possible.

**3.2. Some recommendations for Vietnam in responding to current challenges**

By identifying current difficulties in the implementation of EVIPA, the author proposes some compatible solutions for Vietnam to deal with the above problems, specifically as follows:

**For the first issue, accelerating the ratification of EVIPA by the remaining EU countries**, Vietnam needs to proactively make efforts first in diplomatic solutions. In the recent past, representatives of Vietnam, Government and National Assembly have increased their visits to urge the parliaments of EU member countries to soon ratify the EVIPA and consider this an important task of the National Assembly's foreign affairs in the coming time. Best of all, Vietnam should organize a conference in Vietnam with the participation of leaders of the 27 EU members to directly lobby the remaining countries in the Union to accelerate the ratification of the Agreement. Within the framework of such a meeting with all Parties, Vietnam will receive the advantage of support from the countries that have ratified and directly address the concerns of the countries that are hesitating. Furthermore, a multilateral meeting like this will save Vietnam time and money compared to traveling to lobby each partner as it does now.

In addition, Vietnam needs to speed up the process of achieving recognition as a market economy by the United States and the EU - important trade partners today. The advantage for Vietnam to achieve this important step is that Vietnam and the United States have upgraded their relationship to a comprehensive strategic partnership in 2023 after the US Secretary of State's visit to Vietnam. And on the EU side, the EVFTA has come into effect and is also greatly

contributing to the EU's re-evaluation of the criteria for a market economy for Vietnam. In the case the United States recognizes Vietnam as a true market economy, the EU will make a similar move in the near future. Achieving this achievement will improve the speed of ratification of EVIPA compared to the current situation of being treated as a non-market economy by important partners. In the coming time, the competent authorities of Vietnam shall be continued to study and analyze the arguments in the EU's economic assessment report of Vietnam to continue to supplement and complete the summary and related dossier to propose reconsideration of the recognition of Vietnam's market economy status. In parallel with this, Vietnam needs to promote the comprehensive strategic partnership with the EU, thereby promoting economic, trade and investment cooperation.

**Regarding the second issue, what should Vietnam do to effectively comply when EVIPA comes into effect?** Some solutions can help reduce pressures on Vietnam at that stage, such as:

In terms of mechanisms and policies, it is necessary to synchronize the process of amending and supplementing legal regulations related to the implementation of EVIPA. When considering and amending any regulation in the domestic regulatory system, in addition to assessing its consistency with current regulations, the National Assembly and relevant agencies need to consider its compatibility with Vietnam's commitments in EVIPA. In general, the commitments in EVIPA do not contain content contrary to the 2013 Constitution, are basically consistent with Vietnamese law and are consistent through a review of Vietnam's legal system. One of the efforts showing Vietnam's preparation for implementing EVIPA is the issuance of a Resolution recognizing and enforcing in Vietnam the judgment of the investment dispute settlement agency under the Vietnam - EU Investment Protection Agreement (VCCI, 2020). This Resolution stipulates the procedures for recognition and enforcement of the final judgment of the Dispute Settlement Body in Clauses 2, 3, 4, 5 of Article 3.57, Chapter III of EVIPA. For the remaining commitments, the National Assembly and the Government also need to take similar actions to promptly prepare for the implementation of EVIPA. In particular, the Government, as the central executive agency, is responsible for directing relevant ministries and branches to monitor the effective date of the Agreement; develop appropriate plans for synchronous implementation along with improving the capacity of the staff to respond to and handle arising situations to protect the legitimate rights and interests of the country. Since the end of 2024, Vietnam has been undergoing a strong transformation in streamlining the state apparatus in parallel with reforming the legal system so that the State can more effectively perform its domestic and foreign functions. Reforms in mechanisms and policies to serve the implementation of EVFTA and create the premise for EVIPA have been defined, including: i) amending 2/2 Laws (Law on Intellectual Property, and Law on Insurance Business); ii) amending, supplementing, and developing new 5/6 Decrees (including Decrees guiding the Law on Investment, guiding procurement bidding under EVFTA, guiding the Law on Customs, on fragrant rice certification, and issuing special preferential tariff schedules); iii) amending 01 Decision of the Prime Minister (on hiring foreign consultants in construction activities in Vietnam); iv) developing new 2/2 Circulars (including the Circular on trade defense, and the Circular on the time of submitting certificates of origin). On a broader scale, a number of other legal and institutional activities are also mentioned in the above Plans, including: conducting procedures to join 2/4 international treaties (WIPO Copyright Convention - WCT and WIPO Performances and Phonograms Convention - WPPT); develop 03 administrative documents (including the Decision of the Government and the Ministry of Industry and Trade on building a mechanism to establish a Domestic Advisory Group; and the Decision of the Prime Minister on appointing focal agencies to implement EVFTA) (VCCI, 2023,2). These plans need to be further accelerated in the current phase to accelerate the ratification process of the remaining EU members.

Regarding financial stability, Vietnam needs to have specific solutions to address recent financial instability to avoid making EU investors fear risks to their capital. The recent implementation of anti-corruption policies and handling of economic crime groups in Vietnam has created certain aftershocks for domestic and international public opinion. Major cases occurring at large Vietnamese enterprises such as Van Thinh Phat related to the operations of SCB bank, or violations at FLC, Tan Hoang Minh and most recently the violations of Phuc Son Group all involve a number of state officials. There is no guarantee that in the near future, there will be no more large enterprises violating or being discovered to violate because they have or are likely to cause serious consequences for the economy. The strong action of competent authorities in prosecuting and handling individuals who committed these violations has shown Vietnam's

determination to fight corruption in the spirit of transparency and "no forbidden zones", which is worth promoting. However, the point that needs to be improved is that management agencies need to improve their monitoring capacity as well as the ethics of their staff to avoid violations being discovered late, the consequences of which are too serious for the State and the People. This also means improving the management capacity of the Government in the field of maintaining financial stability in the face of other social fluctuations. The handling of major economic cases or corruption crimes must consider the most effective ways to prevent or remedy economic losses for other related entities. Only then can foreign investors' concerns about the safety of their projects in Vietnam be reduced.

Particularly, the transformation of production techniques combined with the search for alternative sources of raw materials will be the key to solving the first and second problems mentioned above. Gradually escaping dependence on raw materials for production that are being criticized by the EU and the West for human rights or environmental friendliness, especially the supply from China, is an urgent need for Vietnam in the face of new regulations in international trade. This is both a solution to promote investment and a solution to deal with the current barriers to Vietnamese exports. To do so, the State must reform the three growth drivers of the economy that are showing signs of reaching a limit due to the lack of fundamental changes in the economic structure: green transformation, reducing energy deficit; controlling carbon emissions; and building a circular economy to become the main forces in promoting economic growth. In the relevant international conferences, Vietnam has participated and made commitments at the macro level, however, the details of implementing those commitments are only at the draft level, not yet completed due to lack of experience. Therefore, the creation of a foundation of mechanisms and policies to implement these progressive economic reforms needs to be promoted by Vietnam in the spirit of learning from experience and calling for support from other countries. Strengthening international cooperation in the aspect of building mechanisms and policies also helps partners see Vietnam's goodwill and efforts towards its commitments.

## IV. CONCLUSION

EVIPA is a comprehensive and high-quality agreement, balancing the interests of both Vietnam and the EU, creating opportunities to promote FDI flows from the EU to Vietnam. When EVIPA is implemented, foreign investment in Vietnam is likely to increase not only from EU member countries seeking opportunities to access the Vietnamese market but also from investors from other countries seeking opportunities through Vietnam to access the EU market. Although considered a negotiation achievement and bringing great expectations for Vietnam in terms of positive impacts, the implementation of EVIPA also poses significant challenges. This requires Vietnam to continue to improve its institutions, policies, and laws; ensure consistency, synchronization, as well as the capacity of the management team and the competitiveness of Vietnamese enterprises. Instead of waiting for the remaining EU countries to ratify the Agreement, Vietnam should take advantage of this time to complete the best preparations for the implementation of the Agreement by improving the existing backlog.
